TEXT OF THE OFFICIAL GAZETTE, JULY 5 TO SEPTEMBER 27, 1892, INCLUSIVE.

INDEX TO THE DECISIONS OF THE COMMISSIONER OF PATENTS AND OF THE UNITED STATES COURTS IN PATENT CASES.

DIGEST OF DECISIONS OF THE COMMISSIONER OF PATENTS AND OF THE UNITED STATES COURTS IN PATENT CASES.

INDEX OF PATENTS AND PATENTEES FOR THE QUARTER YEAR, JULY TO SEPTEMBER, 1892.

ERRATA.

478,195, page 40, in heading, title, for "Trousers, &c., and Pattern Therefor," read *Trousers, &c., and Patterns Therefor.*

478,401, page 104, in heading, assignment, for "seven-ninths" read *five-sixths.*

478,424, page 110, in heading, name of assignee, for "Chartier Valley Gas Company" read *Chartiers Valley Gas Company.*

478,476, page 126, strike out all after number and insert WITHDRAWN.

478,484, page 128, in heading, assignment, for "five-sixths" read *one-half.*

478,663, page 196, sixth claim, line 5, after the word "bell-crank" strike out the comma, and after the word "frame," line 6, insert a comma; line 8, after the word "bell-crank" insert a comma; seventh claim, line 4, after the word "bell-crank" strike out comma; eighth claim, line 4, after "bell-crank" strike out comma, and tenth claim, line 11, for "connections" read *connection.*

478,967, page 287, in heading, name of assignee, for "Gender & Paeschke Manufacturing Company" read *Geuder & Paeschke Manufacturing Company.*

479,000, page 310, in heading, name of patentee, for "Oscar H. Hanenstein" read *Oscar H. Hanenstein.*

479,367, page 421, in claim 2, line 2, for "heating-reflecting" read *heat-reflecting.*

479,595, page 508, in drawing, for "d^{3}" read *d'*.

479,758, page 560, in heading, names of assignees, for "John A. Gunn, Abraham L. Maxim, Ivor L. Brind, and Daniel C. Dwinnell" read *John A. Gunn and Daniel C. Dwinnell.*

479,766, page 563, in claim, line 3, for "upon" read *up on;* line 6, strike out the dash after the word "part" and insert comma; line 7, strike out dash after word "frame," and same line insert comma after the word "thereon."

479,861, page 608, in heading, name of inventor, for "Casper M. Wagner" read *Caspar M. Wagner.*

479,865, page 609, strike out all after number and insert CANCELED.

479,866, page 609, strike out all after number and insert CANCELED.

480,114, page 689, in heading, foreign patent, for "No. 18,729" read *No.* 18,739.

480,326, page 772, in heading, title, for "Diazo Dye" read *Disazo Dye;* and in first claim, line 1, for "diazo" read *disazo.*

480,948, page 977, first claim, lines 3 and 4, strike out the words "and one end of each contact being in the form of a free spring" and insert same after the word "depressions," line 5; second claim, lines 4 and 5, strike out the words "and one end of each contact being in the form of a free spring" and insert same after the word "inclines," line 5, and same claim, line 5, for "inclines" read *incline.*

481,463, page 1155, in heading, name of inventor, for "Albert" read *Alfred.*

481,676, page 1235, in claim 1, line 4, for "non-conducting" read *non-contacting.*

481,788, page 1275, in claim, line 12, strike out the word "thing."

481,878, page 1302, seventh claim, line 3, for "current" after the word "said" read *circuit.*

481,902, page 1310, in heading, after residence insert *assignor to himself and Sheffield Smith, of same place.*

482,213, page 1429, in claim, line 3, for "temperature" read *temperatures.*

482,735, page 1623, in heading, strike out "assignor of part to Joseph L. Yost, same place, and Harry A. Lozier, Cleveland, Ohio.

482,863, page 1652, strike out all after the number and insert CANCELED.

482,886, page 1670, in heading, title, for "Combined Ruler-Gage and Circle-Scriber" read *Combined Ruler, Gage, and Circle-Scriber.*

483,066, page 1728, in heading, residence of inventor, for "St. Johns, Canada," read *St. Johns, Newfoundland.*

483,110, page 1741, in heading, name of inventor, for "Theodore Guilleaume" read *Theodor Guilleaume.*

483,114, page 1742, in heading, residence of assignee, for North Easton, Maine" read *North Easton, Massachusetts.*

21,675, Design, page 150, in heading, names of assignees, for "Isaac Schwarz" read *Isaac A. Schwarz.*

21,716, Trade-Mark, page 1475, in heading, name of registrant, for "Companhia Geral D'Agricultura Dos Vinhos Do Alto Douro" read *Companhia Geral D'Agricultura Das Vinhas Do Alto Douro.*

Commissioner's Decisions, page 160, first column, line 37, for "Richmore" read *Richmond;* second column, line 21, for "Richmore" read *Richmond.*

Notice.

All solicitors, agents, or attorneys who, in circulars or advertisements or otherwise, refer to the Commissioner of Patents, or to any other official of the Patent Office, for evidence of their professional standing, do so without authority.

Powers of Attorney.

(ORDER No. 766.)

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., June 25, 1892.

The attention of Examiners and the Application Clerk is called to Rule 18. General powers of attorney cannot be considered. In each application the written authorization must be filed. A power of attorney purporting to have been given to a firm or co-partnership will not be recognized, either in favor of the firm or any of its members, unless all its members shall be named in such power of attorney.

The provisions of this rule must be strictly enforced as to all applications hereafter filed.

W. E. SIMONDS,
Commissioner.

File-Wrappers—Entries On.

(ORDER No. 767.)

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., June 25, 1892.

It is directed that entries shall not be made on the back of a file-wrapper, containing the application-papers for a patent, of papers or actions which do not become a permanent part of the contents of the file.

A card (Form 2-384 Office Series of blanks, sample hereto attached) will be placed in the file showing all appellate actions.

W. E. SIMONDS,
Commissioner.

World's Columbian Exposition.

To the inventors and manufacturers of the United States:

It is the intention of the Patent Office to make at the World's Columbian Exposition at Chicago in 1893 an exhibit which will show that great advance in the several arts which is due, in large measure, to the encouragement and support afforded by our patent system. This exhibit is to consist of models of patented inventions, which will be carefully selected, to show as far as is possible the inception of each art, the stages through which the art has advanced, and the final development reached at the present time. This display of typical inventions, embodied in concrete form and properly arranged, will, it is believed, constitute a grand historical exhibit of the progress of the useful arts and one which will be of great interest not only to inventors and manufacturers, but to the public generally.

The Office collection of models has been seriously impaired by fire, and is further incomplete by reason of the fact that models have not generally been required or received during the last ten years. The Office is not, therefore, in possession of the models of many valuable inventions which might properly be included in such an exhibit, and without which, indeed, the exhibit would be incomplete. The limited appropriation for this exhibit will not permit the Office to make such models. An urgent appeal is therefore made to all inventors and manufacturers to come to the assistance of the Office in this matter, either by loans of models already built or by the construction of such models not in the possession of the Office as should properly be placed in such a collection. Of course, where models are loaned to the Office all proper credit will be given both in labels and catalogues to the parties by whom the loans are made, and such disposition will be made of the models after the close of the exhibit as the owners shall direct. Many inventors and manufacturers have already indicated a willingness to co-operate with the Office in this matter, and it is confidently expected that such a response will be made to this general appeal as will assure the unparalleled success of this attempt to graphically and concretely show the developement of American invention.

W. E. SIMONDS,
Commissioner.

Publishers' Catalogues.

This Office would be pleased to receive from manufacturers and publishers such catalogues, circulars, price-lists, or other advertisements relating to the sciences and mechanical arts as are published by them for gratuitous distribution; but notice is hereby given such manufacturers or dealers who feel disposed to send their publications that not less than three copies should be forwarded in order that the subjects may be properly indexed, classified, and subclassified in the Scientific Library for convenient and ready reference.

Women Inventors.

The Patent Office has published and has for sale a volume containing a list of women inventors to whom patents have been granted by the United States from 1790 to July 1, 1888. 44 pages. Paper covers, 50 cents.

The Official Gazette.

THE OFFICIAL GAZETTE is published every Tuesday, simultaneously with the weekly issue of patents. From January 1, 1872, (the commencement of its publication,) to June 30, 1883, it was published and bound in semi-annual volumes; since July 1, 1883, in quarterly volumes. All subscriptions must commence with the beginning of a volume; none taken for less than three months. Terms: To all subscribers within the United States and Canada, $5 per annum; to foreign subscribers, $7; single copies, 10 cents; bound semi-annual volumes, (prior to June 30, 1883,) full sheep, $4 per volume; bound quarterly volumes, (subsequent to July 1, 1883,) full sheep, $2.75 per volume. No club rates. *Payment in advance.* All orders should be addressed to "The Commissioner of Patents, Washington, D. C."

Issue of July 5, 1892.

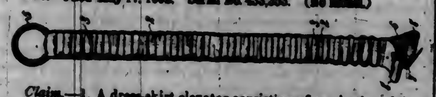
PATENTS



GRANTED JULY 5, 1892.

478,075. COFFEE-POT. JOHN W. ABBOTT, Rushville, N. Y. Filed May 27, 1891. Serial No. 394,282. (No model.)

Claim.—The combination of the reservoir or pan provided at its upper edge with a circumferential flange forming a seat, a lip arranged at one side of the reservoir or pan and enabling the same to be filled at the side, a coffee-pot arranged on the seat and having in its bottom a circular opening and a threaded flange around the opening, the removable tube having its lower end threaded and engaging the threaded flange, and its upper end closed and provided with perforations, and a cap for the spout of the pot, substantially as described.

478,076. SKIRT-ELEVATOR. JOSEPHUS ASTIN, Washington, D. C. Filed May 17, 1892. Serial No. 433,353. (No model.)

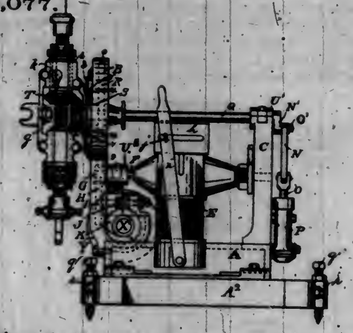
Claim.—1. A dress-skirt elevator consisting of an elastic web having at one end a finger-engaging ring and at the opposite end a skirt-engaging device and a tubular sheath formed with transverse ruffles or flutes and inclosing the elastic web continuously throughout its length between the finger-engaging ring and the skirt-engaging device, substantially as described.

2. A dress-skirt elevator consisting of an elastic web having at one end a finger-engaging ring and at the opposite end a skirt-engaging device and a fluted sheath inclosing the web and having at one end a pair of flaps arranged, respectively, at opposite sides of the skirt-engaging device, substantially as described.

478,077. PROSPECTING-DRILL. ALBERT BALL, Claremont, N. H., assignor, by mesne assignments, to the Sullivan Machinery Company, same place. Filed Dec. 21, 1891. Serial No. 415,822. (No model.)

Claim.—1. The combination of the base provided with stand B, having flanges o and with stand C, the stand extension B', connected to flange o of the stand B, the motor having a shaft F with one journal bearing in stand C and the other in stand extension B', pinion G, fast on said shaft and located between the stand and its extension, and the gear H, both gears being within the flanges o, shaft I, worm-wheel K, and shaft K, all substantially as set forth, whereby the shaft is suitably journaled in the stands and the gears are inclosed.

2. The combination of the driving-shaft F, the pinion G, the gear H on the worm-shaft I, the drum-shaft having the gear K, adapted to be driven by the gear H, through the medium of the worm-shaft, and the oil-chamber o, having cover x, said drum-shaft and worm-shaft being journaled in the walls of the oil-chamber and adapted, together with the worm and worm-wheel, to be lubricated by the contents of said chamber, and said cover being removable with the worm-shaft, substantially as set forth.



3. In a machine for drilling, the stand, the oil-receptacle having tubular extensions or boxes on opposite sides, adapted to receive tubular linings *f* and *f'*, said linings, shafts X and L fitting the same, the clutch W on shaft X fitting one of said bores, and the female clutch on shaft L, situated in the oil-chamber and having a diameter larger than the bore and fitting the oil-chamber in the direction of the length of the shafts, whereby the male clutch is made movable and the female clutch and worm-gear are held against lengthwise movement and all the parts are lubricated, substantially as set forth.

4. The drill-frame, the base, the stand B, supporting bevel-gear S, the bevel-wheel T, having a tubular shaft revolable in said drill-frame, the adjustable block m, embracing said tubular shaft, and a device for moving said block and shaft endwise to throw the bevel-wheels out of gear, substantially as set forth.

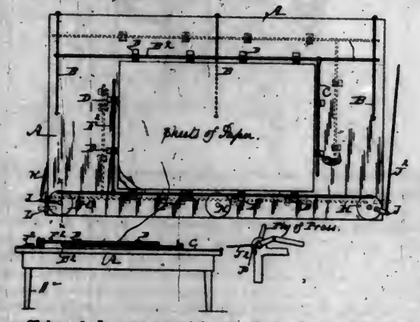
5. The drill-frame, the base, the stand B, supporting bevel-gear S, the bevel-wheel T, having a tubular shaft revolable in said drill-frame, the adjustable block m, embracing said tubular shaft, and a device for moving said block and shaft endwise to throw the bevel-wheels out of gear, consisting of the cranked shaft provided with the eccentric-pin adapted to agitably engage the block, substantially as set forth.

6. The drill-frame, the base, the stand B, supporting bevel-wheel S, the bevel-wheel T, having a tubular shaft revolable in said drill-frame, the adjustable block m, embracing said tubular shaft, and a device for moving said block and shaft endwise to throw the bevel-wheels out of gear, and the plate *l*, bearing laterally upon the said block and provided with fastening devices, substantially as set forth.

478,077.

478,078. HOISTING-PLATFORM. CHARLES F. BALL, Memphis, Tenn. Filed Feb. 11, 1892. Serial No. 421,167. (No model.)

Claim.—1. A hoisting apparatus comprising the supporting-frame provided with projecting ring-bolts in vertical alignment, a tripping-rod adapted to be inserted in two of said ring-bolts, a platform suspended in the frame, angle-bars on the platform, and a pivoted ledge adapted to be released by the tripping-rod, substantially as and for the purposes described.



2. A hoisting apparatus comprising the frame provided with an adjustable tripping-rod, a roller-platform suspended therein, angle-bars projecting from said platform in the path of the tripping-rod, and a ledge adapted to swing over the angle-bars upon contact with the tripping-rod, substantially as and for the purposes described.

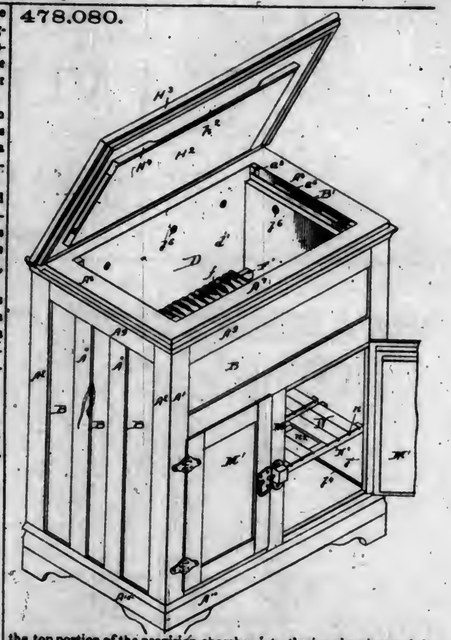
3. A hoisting apparatus comprising the supporting-frame provided with ring-bolts in vertical alignment, a tripping-rod in two of said ring-bolts, a roller-platform suspended in the supporting-frame, angle-bars on said platform, a ledge pivoted in said angle-bars, and tabs in the path of the tripping-rod adapted to be actuated and release the ledge, substantially as and for the purposes described.

4. A hoisting apparatus comprising the supporting-frame and its adjustable tripping-rod, a suspended platform in said frame, angle-bars extending from said platform, a ledge pivoted in said angle-bars, tabs provided with cam-faces mounted in the ends of the bars, and a cross-piece connecting said tabs and adapted to support the ledge in a vertical position, substantially as and for the purposes described.

478,079. PAPER-STRAIGHTENER FOR PRINTING-PRESSES.

ALFRED BERARD, Des Moines, Iowa. Filed Mar. 5, 1892. Serial No. 423,807. (No model.)

Claim.—1. In a paper-straightening device, the combination of a plurality of rods fixed to one side of the top surface of a table and extended inwardly in grooves formed in the top of the aforesaid table, a guide-bar adjustably connected with the said rods, an auxiliary guide-bar extended at right angles thereto and adjustably connected therewith, and a plurality of guides having smooth front surfaces adjustably fixed to the said guide-bars, and means for bringing sheets of paper in contact with said guides, substantially as and for the purposes stated.



2. A paper-straightening device comprising a table arranged to receive the papers from the vibrating fly of a printing-press, a plurality of crank-wheels mounted in the top of the said table, a guide-bar pivoted to the front edges of the said crank-wheels, an auxiliary guide-bar adjustably attached to the said guide-bar, guides connected with the said guide-bars at suitable distances therefrom, means for engaging the opposite edges of the papers, and means for actuating the said crank-wheels, substantially as set forth.

3. A paper-straightening device comprising a table arranged to receive the papers from the vibrating fly of a printing-press, adjustable guides attached to one side and end of the table at right angles to each other, a plurality of crank-wheels mounted on the top of the said table, a guide-bar pivoted to the front edges of the said crank-wheels, an auxiliary guide-bar adjustably attached to the said guide-bar, guides connected with the said guide-bars at suitable distances thereupon, crank-arms secured to the outer crank-wheels and extended outwardly therefrom, means for connecting one of the said crank-arms with the shaft which actuates the vibrating fly of a printing-press, a spring attached to the outer end of the other crank-arm and fixed to the table to actuate the guide-bar on its return stroke, and means for limiting the forward movement of the said guide-bars, substantially as set forth.

478,080. REFRIGERATOR.

CHARLES A. REHN, Michigan City, Ind. Filed Mar. 21, 1892. Serial No. 426,053. (No model.)

Claim.—1. In a refrigerator, the combination, with a provision-chamber and an ice-chamber above said provision-chamber, of two independent systems of or passages for air-circulation, one leading from

the top portion of the provision-chamber into the ice-chamber and the other leading from the bottom portion of the provision-chamber into the ice-chamber, substantially as specified.

2. In a refrigerator, the combination, with a provision-chamber and an ice-chamber above said provision-chamber, of two independent systems of or passages for air-circulation, one leading from the top portion of the provision-chamber into the ice-chamber and the other leading from the bottom portion of the provision-chamber into the ice-chamber, said ice-chamber having a central air passage or opening through its bottom, substantially as specified.

3. In a refrigerator having first and second walls with a non-conducting filling or packing between and an inner third wall with an air space or passage between the same and said second wall, a provision-chamber, and an ice-chamber above said provision-chamber, having a fourth or additional wall at its ends with an air space or passage between the same and said third wall of the refrigerator, said first-mentioned air space or passage communicating with the provision-chamber at its bottom and leading into the ice-chamber and said second-mentioned air space or passage communicating with the provision-chamber at its top and leading into said ice-chamber, substantially as specified.

4. In a refrigerator having first and second walls with a non-conducting filling or packing between and an inner third wall with an air space or passage between the same and said second wall, a provision-chamber, and an ice-chamber above said provision-chamber and having a fourth or additional wall at its ends with an air space or passage between the same and said third wall of the refrigerator, said first-mentioned air space or passage communicating with the provision-chamber at its bottom and leading into the ice-chamber and said second-mentioned air space or passage communicating with the provision-chamber at its top and leading into said ice chamber, said third wall of the refrigerator having an opening or air passage b^4 at its lower edge between the same and the floor, substantially as specified.

5. In a refrigerator having first and second walls with a non-conducting filling or packing between and an inner third wall with an air space or passage between the same and said second wall, a provision-chamber, and an ice-chamber above said provision-chamber and having a fourth or additional wall at its ends with an air space or passage between the same and said third wall of the refrigerator, said first-mentioned air space or passage communicating with the provision-chamber at its bottom and leading into the ice-chamber and said second-mentioned air space or passage communicating with the provision-chamber at its top and leading into said ice-chamber, said third wall of the refrigerator having an opening or air-passage b^4 at its lower edge between the same and the floor and leading into the ice-chamber through openings b^5, extending through said third wall B^3, said fourth wall B^4, and an intermediate furring strip or block a^4, substantially as specified.

6. In a refrigerator having first and second walls with a non-conducting filling or packing between and an inner third wall with an air space or passage between the same and said second wall, a provision-chamber, and an ice-chamber above said provision-chamber and having a fourth or additional wall at its ends with an air space or passage between the same and said third wall of the refrigerator, said first-mentioned air space or passage communicating with the provision-chamber at its bottom and leading into the ice-chamber and said second-mentioned air space or passage communicating with the provision-chamber at its top and leading into said ice-chamber, said last-mentioned air-passage b^4 leading into the ice-chamber through an air space or passage b^7 in the cover, substantially as specified.

7. In a refrigerator having first and second walls with a non-conducting filling or packing between and an inner third wall with an air space or passage between the same and said second wall, a provision-chamber, and an ice-chamber above said provision-chamber and having a fourth or additional wall at its ends with an air space or passage between the same and said third wall of the refrigerator, said first-mentioned air space or passage communicating with the provision-chamber at its bottom and leading into the ice-chamber and said second-mentioned air space or passage communicating with the provision-chamber at its top and leading into said ice-chamber, said first-mentioned air space or passage b^3 leading into the ice-chamber at the ends and back side thereof through openings b^6 in the vertical walls of the ice-chamber, and said last-mentioned air space or passage b^4 leading into the ice-chamber at the top and front side thereof through an air space or passage in the cover, substantially as specified.

8. In a refrigerator, the combination, with a provision-chamber and an ice-chamber above said provision-chamber, of two independent systems of or passages for air-circulation, one leading from the top portion of the provision-chamber into the ice-chamber and the other leading from the bottom portion of the provision-chamber into the ice-chamber, said last-mentioned air-passage leading into the ice-chamber through openings in the vertical walls thereof at the ends and back side, substantially as specified.

9. In a refrigerator, the combination, with a provision-chamber and an ice-chamber above said provision-chamber, of two independent systems of or passages for air-circulation, one leading from the top portion of the provision-chamber into the ice-chamber and the other leading from the bottom portion of the provision-chamber into the ice-chamber, said first-mentioned air-passage leading into the ice-chamber at the front side thereof through an air space or passage in the cover of the refrigerator, substantially as specified.

10. In a refrigerator having an ice-chamber and an ice-rack in said chamber and a drip-pipe extending from said chamber, a water seal consisting of a depression, recess, or cup d^5 in the bottom of the ice-chamber, and an inverted cup d^6, attached to the ice-rack, substantially as specified.

11. In a refrigerator, the combination, with the provision-chamber, of an ice-chamber D above the same, having bottom D^2, furnished with sheet-metal lining d', and an air-passage opening d^3 through said bottom D^2, said lining d' having an upturned flange or rim d^8, surrounding said opening, and an ice tank or pan F, having corrugations f, extending parallel to said air-passage opening d^3, substantially as specified.

12. In a refrigerator, the combination, with the provision-chamber, of an ice-chamber D above the same, having bottom D^2, furnished with sheet-metal lining d', and an air-passage opening d^3 through said bottom D^2, said lining d' having an upturned flange or rim d^8, surrounding said opening, and an ice tank or pan F, having corrugations f, extending parallel to said air-passage opening d^3, and a drip-ridge f', extending underneath said ice-pan and over said air-passage opening d^3, substantially as specified.

13. In a refrigerator, the combination, with the provision-chamber, of an ice-chamber D above the same, having bottom D^2, furnished with sheet-metal lining d', and an air-passage opening d^3 through said bottom D^2, said lining d' having an upturned flange or rim d^8, surrounding said opening, and an ice tank or pan F, having corrugations f, extending parallel to said air-passage opening d^3, and a drip-ridge f', extending underneath said ice-pan and over said air-passage opening d^3, and a water seal, depression, or cup d^5, formed in the bottom of said ice-chamber at the end of said air-passage opening d^3, substantially as specified.

14. In a refrigerator, the combination, with the provision-chamber thereof, of provision racks or trays N, having rails N', furnished with cross-grooves n, and metal slats N^3, having flanges n', fitting in said cross-grooves, said racks having air-passage openings n^3 through the same, substantially as specified.

15. The provision rack or tray for refrigerators, consisting in a pair of wooden rails N', furnished with cross-grooves n in their upper faces, and metal slats N^3, having flanges or turned edges n', fitting in said cross-grooves n, substantially as specified.

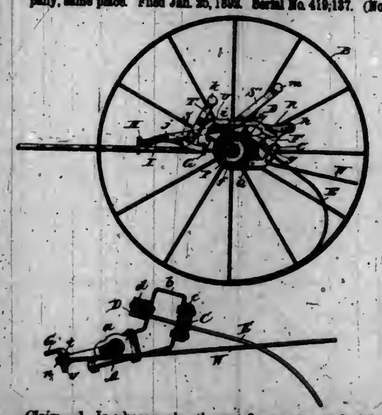
16. In a refrigerator, the combination, with the walls B B', having non-conducting filling b between, of a third wall B^3, having an air-space b^3 between it and said wall B', an intermediate side frame-piece A^5, having openings b^3 through the same, and a provision-chamber and ice-chamber, both communicating with said air-passage b^3, substantially as specified.

478,081. SYRINGE-CASE.

ALBAN B. BOSWORD, Grand Rapids, Mich. Filed Mar. 23, 1892. Serial No. 426,161. (No model.)

Claim.—The combination of a central cylindrical vessel to contain the syringe, together with a liquid, parallel side vessels attached thereto to contain the needles and having removable caps, and a screw-cap on said central vessel having packing to seal the same and engaging said side caps, substantially as described.

478,082. SHIRT.



CALLUS H. BROWN, Nashville, Tenn. Filed Aug. 26, 1891. Serial No. 403,782. (No model.)

Claim.—The improved shirt having at the rear a wide tail-flap and at the front a tail-flap of full length, the edges of which are curved in concave lines from the hip downward.

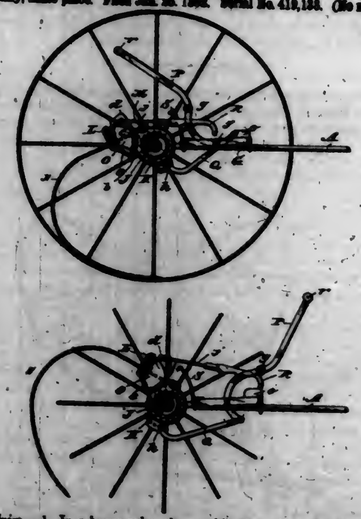
478,083. HORSE HAY-RAKE.

ARTHUR F. BROWN and WILLIAM R. KNAUB, Dayton, Ohio, assignors to the Stoddard Manufacturing Company, same place. Filed Jan. 26, 1892. Serial No. 419,187. (No model.)

Claim.—1. In a horse-rake, the seat-frame composed of the metal angle draft-bar G, having journal-arms N secured thereto, the flat metal brace-bar H, secured to the front side of the bar G and set vertically, and the tubular metal thills J, secured at their rear ends to the bar G and connected to the bar H by clips c, substantially as described.

2. In a horse-rake, the combination, with the rake-teeth and axle A, of the rake-head composed of the flat metal strap-bars b, secured to journaled boxes, the slotted flanged metal bar C, secured to the rear side of the strap-bars, and the tooth-holding metal angle-bar D, secured to the front side of the strap-bars, substantially as described

3. In a horse-rake, the combination of the metal angle draft-bar G, the metal stripper-bars oval in cross-section, with their larger diameters vertical and having their butts secured to the bar G by means of the washers *t*, provided with fingers *v* and the nuts *u*, substantially as described.



4. In a horse-rake, the combination of a lifting-wheel revolved by the traction of the machine, a tilting rake-head carrying a locking-dog for locking the rake-head to the lifting-wheel, an arm pivoted to the rake-head, a second arm pivoted to the seat-frame and to said first arm, and a pedal-arm for exerting pressure upon said last-named arms and carrying a latch-arm to engage the locking-dog with the lifting-wheel, whereby the driver by the action of his foot upon the pedal-arm can hold the rake down to work, can lock the rake-head to the lifting-wheel to effect the dump, and can regulate the return of the rake-head, substantially as described.

5. In a horse-rake, the combination of a lifting-wheel revolved by the traction of the machine, a tilting rake-head carrying a locking-dog for locking the rake-head to the lifting-wheel, an arm pivoted to the rake-head, a second arm pivoted to the seat-frame and to said first-named arm, a pedal-arm pivoted to said last-named arm and carrying a latch-arm to engage the locking-dog with the lifting-wheel, and a stop to disengage the dog from the lifting-wheel, substantially as described.

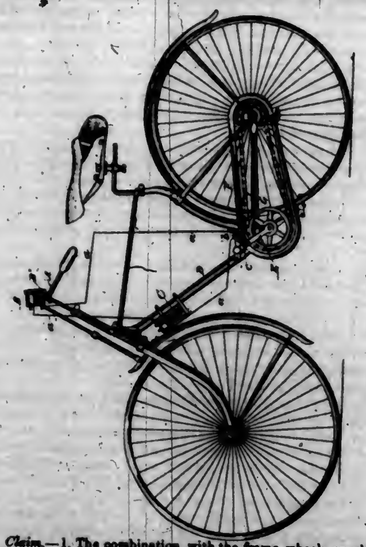
6. In a horse-rake, the combination of an axle revolved by the traction of the machine, a lifting-wheel fast on said axle, a tilting rake-head carrying a locking-dog for locking the rake-head to the lifting-wheel, an arm pivoted to the rake-head, a second arm pivoted to the seat-frame and to the said first-named arm, a pedal-arm for exerting pressure on said last-named arms and carrying a latch-arm to engage the locking-dog with the lifting-wheel, and a stop to disengage the dog from the lifting wheel, substantially as described.

7. In a horse-rake, the combination of the tilting rake-head, the lifting-wheel P, revolved by the traction of the machine, the locking-dog Q, carried by the rake-head, the arm R, pivoted to the rake-head, the arm S, pivoted to the seat-frame and to the arm R, the pedal-arm T, pivoted to the arm S and carrying a latch-arm U for engaging the dog with the lifting-wheel, and the stop V for disengaging the dog from the lifting-wheel, substantially as described.

478,084. HORSE HAY-RAKE. ARTHUR F. BROWN and WILLIAM B. KEAIS, Dayton, Ohio, assignors to the Stoddard Manufacturing Company, same place. Filed Jan. 26, 1892. Serial No. 419,188. (No model.)

Claim.—1. In a horse-rake, the combination of a pedal for holding the rake head and teeth down to work, a lifting-wheel revolved by the traction of the machine, a tilting rake-head carrying a locking-dog for locking the rake-head to the lifting-wheel, an automatic latch actuated by the partial tilting of the rake-head when pressure is removed from the pedal to cause the engagement of the dog and lifting-wheel, and a stop to cause the disengagement of the dog and lifting-wheel when the teeth have been sufficiently elevated, substantially as described.

2. In a horse-rake, the combination of a lifting-wheel revolved by the traction of the machine, a tilting rake-head carrying a locking-dog for locking the rake-head to the lifting-wheel, an arm pivoted to the rake-head, a second arm pivoted to the seat-frame and to said first-named arm, a pedal for exerting pressure upon said last-named arm, a latch connecting the pedal and locking-dog and operated by the resistance of the load to engage the locking-dog with the lifting-wheel when pressure on the pedal is relieved, and a stop to disengage the dog from the lifting-wheel, whereby the driver by the action of his foot upon the pedal can hold the rake down to work, can cause the automatic locking of the rake-head to the lifting-wheel to effect the dump, and can regulate the return of the rake-head, substantially as described.

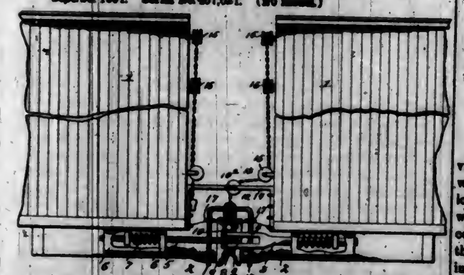


3. In a horse-rake, the combination of the revolving lifting-wheel K, the rake-head having pivoted thereto a dog *c*, the arm Q, pivoted to the rake-head beneath the axis of the same and to an arm P, pivoted to the seat-frame, the latch-arm R, engaging the arm P and connected to the dog-arm *d* by the rod *j*, the spring *n*, and the stops S *o*, substantially as described.

478,085. PRINTER'S RULE-BENDER. ELIJAH BOOK, Marshall, Mich. Filed Nov. 6, 1891. Serial No. 411,096. (No model.)

Claim.—The above-described tool, consisting of the notched blade A and cylinders *f* and *f'* of unequal diameters, having the groove *b* arranged longitudinally of the same, substantially as and for the purpose specified.

478,086. ELECTRIC CYCLOMETER FOR VELOCIPEDES. JOSEPH BUTCHER, Melrose, Mass. Filed June 20, 1891. Serial No. 397,795. (No model.)



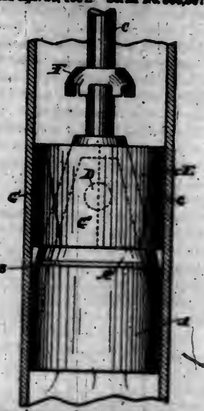
Claim.—1. The combination, with the frame, wheels, crank-shaft, cranks, sprocket-wheels, and driving-chain of a velocipede, of a registering mechanism adapted to operate intermittently, its electro-magnet, means whereby its armature-lever in its vibrations actuates said registering mechanism, a generator, a circuit of which said generator and the coils of the electro-magnet form a part, and a circuit-closer carried by one of the cranks of the velocipede and adapted to close a break in said circuit when the crank rotates, said registering mechanism, circuit, and generator being mounted on the frame of the velocipede, as set forth.

2. The combination, with the handle-bar A, the inclined bar D, and guard F of a velocipede, of the registering cyclometer B, mounted on said handle-bar, the generator C, mounted on the inclined bar D, an electric circuit of which the coils of the cyclometer magnet and the generator form a part, the terminals of the said circuit being fixed at *b* on the guard F adjacent to one of the cranks of the velocipede, the said crank, and a circuit-closer *c*, mounted thereon and adapted to close said circuit momentarily at each revolution of the crank, as set forth.

3. The combination, with a velocipede and a registering mechanism mounted thereon and adapted to operate intermittently, of the electro-magnet mounted adjacent to the registering mechanism and having pole-pieces m' and m^2, oppositely arranged, as set forth, the armature-lever pivotally mounted at its middle and having an armature at each end arranged adjacent to a pole-piece, a spring for retracting the armature, intermediate mechanism between said mechanism and the registering mechanism, whereby the vibrations of the armature-lever actuate the mechanism, a generator, an electric circuit of which the coils of said electro-magnet and said generator form a part, and a circuit-closer carried by the crank of the velocipede and adapted to close a break in said circuit when the crank is rotated, as set forth.

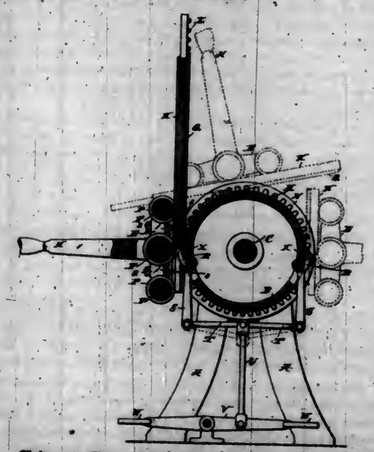
478,087. CAR-COUPLING. EDWIN M. BUTLER, Virden, Ill. Filed Sept. 28, 1891. Serial No. 407,021. (No model.)

Claim.—1. In a car-coupling, the combination, with the coupling-head having a bifurcated end with aligned holes and the coupling-link, of the vertical guides, the bumpers having pin-holding arms, the coupling-pin having lateral lugs or arms, and the operating cords or chains, substantially as described.



2. In a car-coupling, the combination, with the coupling head having bifurcated end with aligned holes, the coupling-link having rearwardly-projecting rod, the bearings for said rod, and the coiled spring encircling the same, of the vertical guides consisting of the metallic rods or bars bent over upon themselves and their ends secured to the coupling-head, the bumpers having the rods secured thereto with the ends bent upwardly and transversely and then horizontally outward, the coupling-pins having lateral headed lugs or arms, and the operating-cords, substantially as described.

478,088. MECHANICAL MOTOR. GEORGE COCHRAN, Houston, Tex. Filed Mar. 23, 1892. Serial No. 426,706. (No model.)



Claim.—The combination of a horizontal rock-shaft extending lengthwise of the machine, a horizontal connecting-piece running diagonally of and rigidly secured to said shaft, a seat for the operator, a pedal rigidly secured to said rock-shaft, said pedal serving as a single or double pedal and so arranged that the operator shall face the device to be operated, substantially as shown and described.

478,089. PUMP-PISTON AND VALVE. JOHN R. COLLIER, Rochester, Minn. Filed Apr. 30, 1891. Serial No. 390,867. (Model.)

Claim.—A pump-piston and valve comprising a hollow piston provided with a rod and having a tapering or conical upper surface through which there are apertures for the passage of water, a ring-valve in longitudinal parts loose in the containing cylinder about the piston-rod, which ring-valve has a tapering inner surface fitted and resting on the conical part of the piston and closing the apertures for water therethrough and forcing the valve against the walls of the cylinder, making the valve substantially water-tight in the cylinder, and a collar on the piston-rod at a distance from the piston to limit the travel of the several parts of the valve away from the piston, substantially as described.

478,090. MACHINE FOR BENDING METAL PLATES. LUTHER G. CROWELL, Brooklyn, assignor to Robert Hoe, Stephen D. Tucker, Theodore H. Mead, and Charles W. Carpenter, New York, N. Y. Filed Dec. 13, 1890. Serial No. 374,549. (No model.)

Claim.—1. The combination, with a stationary bending-cylinder to which the edge of the plate to be bent is secured, of a series of bending-rolls moving in an arc concentric with said cylinder and lying in a plane tangential thereto, substantially as described.

2. The combination, with a stationary bending-cylinder to which the edge of the plate to be bent is secured, of a table outside the plate, supported to travel about the cylinder while rigidly held in planes tangential thereto, and a bending-roll engaging the outer side of said table and moving in an arc concentric with said cylinder, substantially as described.

3. The combination, with a stationary bending-cylinder to which

the edge of the plate to be bent is secured and which is provided with gears at each end, of a table outside the plate, having racks at each side meshing with said gears, and a bending-roll engaging the outer side of said table and moving in an arc concentric with said cylinder, substantially as described.

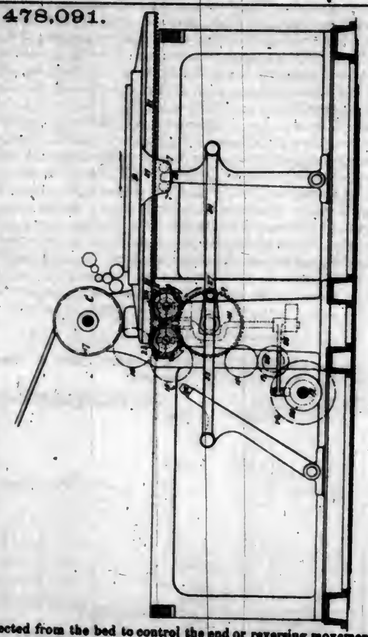
4. The combination, with a stationary bending-cylinder to which the edge of the plate to be bent is secured and which is provided with gears at each end, of a table outside said plate, having racks at each side meshing with said gears, and a series of bending-rolls engaging simultaneously the outer side of said plate and moving in an arc concentric with said cylinder, substantially as described.

5. The combination, with a stationary bending-cylinder to which the edge of the plate to be bent is secured, of a table having a rack-and-gear connection with said cylinder and means for causing said table to travel about the cylinder, substantially as described.

6. The combination, with a stationary bending-cylinder to which the edge of the plate to be bent is secured and which is provided with gears at each end, of a table outside the plate, having racks at each side meshing with said gears, and means for causing said table to travel about said cylinder, substantially as described.

7. The combination of a stationary bending-cylinder, a grip at each side for clamping the edge of the plate to be bent to the cylinder, and means for bending plates about the cylinder in either direction, substantially as described.

8. The combination of a stationary bending-cylinder, a grip on each side of said cylinder for clamping the edge of the plate to be bent to said cylinder, a toggle-joint connected to and operating both grips, and means for bending plates about the cylinder in either direction, substantially as described.



9. The combination of a stationary bending-cylinder to which the edge of the plate to be bent is secured, a table outside the plate, supported to travel about the table while rigidly held in planes tangential thereto, a stationary gear at each end of the cylinder, a rotatable bending-roll mounted outside the table to move in an arc concentric with said cylinder and in engagement with the table, and gears on said bending-roll meshing with the stationary gears, substantially as described.

10. The combination of stationary bending-cylinder B, provided with means for clamping the edges of plates to be bent, a stationary gear M at each end of the cylinder, table K outside said plates, supported by racks L at each side, meshing with gears M, arms D, swinging concentrically with said cylinder, and rotatable bending-roll F, mounted in said arms and having gears J, meshing with gears M outside the racks L, substantially as described.

11. The combination with a stationary bending-cylinder B, provided with means for clamping the edges of plates to be bent and with the gear M at each end, of table K outside the plate, supported by racks L at each side, meshing with gears M, one or more guides I on said table, and one or more bending-rolls engaging the outer side of the table and moving in arcs concentric with the bending-cylinder, said table and bending roll or rolls being provided with corresponding projections and depressions by which the table is held in position, substantially as described.

12. The combination, with a stationary bending-cylinder provided with grips at each side for clamping the edge of plates to be bent to the cylinder, of a bending abutment moving in an arc concentric with said cylinder and constructed to bend plates on its movement in either direction, substantially as described.

478,091. BED-MOTION FOR CYLINDER PRINTING-MACHINES. LUTHER C. CROWELL, Brooklyn, assignor to Robert Hoe, Stephen D. Tucker, Theodore H. Mead, and Charles W. Carpenter, New York, N. Y. Filed Mar. 30, 1892. Serial No. 427,053. (No model.)

Claim.—1. The combination, with the type-bed, its single driving-rack, and two driving-pinions constantly geared therewith and mounted loosely upon shafts driven in opposite directions, of clutches for alternately coupling said pinions to the shafts, substantially as described.

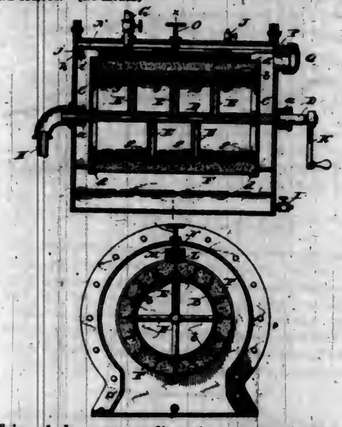
2. The combination, with the type-bed, its single driving-rack, two driving-pinions constantly geared therewith and turning freely upon shafts driven in opposite directions, and clutches alternately coupling said pinions to the shaft for driving the bed during the major part of its run in both directions, of a reversing mechanism moving in harmony with said pinions and operating to slow down and stop the bed in one direction and start and accelerate it in a contrary direction at each end of its run, substantially as described.

3. The combination, with the type-bed, its single driving-rack, two loosely-running driving-pinions therefor, clutches for alternately coupling said pinions to their actuating-shafts and uncoupling them therefrom to produce the major portion of the reciprocation of the bed, and a reversing mechanism consisting of a crank revolved in harmony with the driving-shaft of said pinions and alternately connected and disconnected from the bed to control the end or reversing movements of the bed, substantially as described.

4. The combination, with the type-bed, its single driving-rack, two freely-moving pinions, their actuating-shafts turning in opposite directions, and clutches for coupling said pinions to their shafts, of crank-actuated controlling-arms alternately engaged with and disengaged from said bed, whereby the movement of the bed in each direction is begun by one of the controlling-arms, is continued throughout its major part by one of the pinions, and is completed to a state of rest by the other of the controlling-arms, substantially as described.

5. The combination, with the bed and its single driving-rack, of the freely-mounted pinions, their actuating-shafts driven in contrary directions from the crank shaft, clutches for connecting said pinions with their driving-shafts, rocking arms 28 30, connected with the crank 27, and a socket for said arms in the bed, substantially as described.

478,092. OIL-CAN HOLDER FOR BICYCLES. JOSEPH W. COHMAN, New York, N. Y. Filed Dec. 29, 1891. Serial No. 416,431. (No model.)

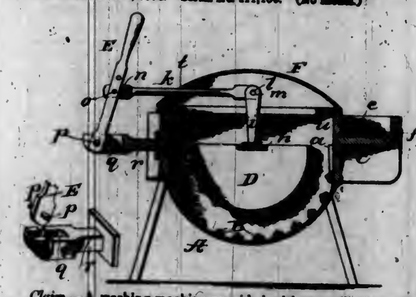


Claim.—1. An oiler-holder made of sheet metal, comprising the forwardly-projecting pieces *a* and *b*, flaring at *a'* and *b'*, as described, and the portions *d* between the portions *a* and *b*, bent backwardly and formed with straight flat portions *d'*, in combination with the independent curved plate *c* and securing devices which attach it to the parts *d'*.

2. An oiler-holder made of sheet metal, comprising the forwardly-projecting pieces *a* and *b*, flaring at *a'* and *b'*, as described, the portions *d* between the portions *a* and *b* bent backwardly and formed with straight flat portions *d'*, and a bottom piece *c*, inclined at *c'*, as described, in combination with the independent curved plate *c* and securing devices which attach it to the parts *d'*.

3. An oiler-holder made of sheet metal and having the portions *a b c* bent up to form a socket for the reception of the oiler, the intermediate portions *d*, bent in a reverse direction to form one part of the clamping-socket for the reception of the bar to which the holder is to be attached, the corrugated plate *c*, forming the other portion of said socket, and the clamping-bolts.

478,093. FILTER. SAMUEL G. DURHAM, Cincinnati, Ohio, assignor of one-half to Henry Verhage, same place. Filed Nov. 11, 1891. Serial No. 411,682. (No model.)



Claim.—1. In a pressure-filter, the combination of a filtering-chamber, the contained filtering-drum, the filtering medium therefor, composed of longitudinally-arranged sector-shaped abutting sections of stone secured together, a water-space behind said filtering medium, supporting-heads for said drum, a hollow shaft journaled through the chamber and extending through the drum, and radial pipes connecting said hollow shaft and water-space, whereby the filtered water will be collected and drawn off through the radial pipes and hollow shaft, substantially as described.

2. The combination, with the chamber A, of the filtering-drum journaled within the same and composed of the heads C, cylinder B, supported thereby, hollow shaft D, extending therethrough, stone sections F, constituting the filtering medium, surrounding the cylinder B, and radial pipes E, connecting the water-space and shaft D, substantially as described.

3. The combination, with the chamber A and filtering-drum revoluble therein, of the brush L, having the back M arranged to removably engage the bar N, and the bar N, carried by the screw O and held from turning by the pin *h*, substantially as described.

478,094. WASHING-MACHINE. MICHAEL DIEHDORF, Lebanon, Pa. Filed Nov. 7, 1891. Serial No. 411,159. (No model.)

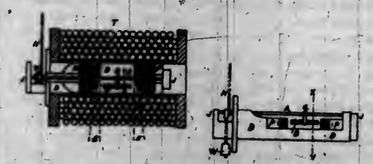
Claim.—A washing-machine provided with an oscillating rubber, a connecting-rod loosely attached to said post, and a lever having a pin at its lower end, in combination with an arm secured to one end of the machine and having a slotted outer end provided with sides having vertical slots open at their upper ends.

478,095. PRESSER-FOOT FOR SEWING-MACHINES. JOHN DOUGLAS, Elizabeth, N. J., assignor to The Singer Manufacturing Company of New Jersey. Filed Mar. 11, 1892. Serial No. 424,567. (No model.)

Claim.—1. The combination, with a single presser-foot shank, of two presser-feet, both of which are yieldingly connected with said shank and which are both vertically movable independently thereof, so that either of them is adapted to rise to accommodate a thick portion of the work passing beneath it.

2. The combination, with a presser-foot shank, of two vertically-movable presser-feet and a pivoted lever or button connecting the same, so that as one is lifted the other will be correspondingly lowered.

3. The combination, with the presser-foot shank A, provided with the recesses *a* and having a front plate or portion *a'*, provided with vertical slots *a²*, of the presser-feet *d*, having shanks *c*, provided with pins *d'*, fitting in said slots, and the pivoted button or lever E, having slots which are also engaged by the said pins.



478,096. NUT-LOCK. SAMUEL DURBIN, Brushton, Pa. Filed Oct. 24, 1891. Serial No. 409,682. (No model.)

Claim.—1. The combination, with a longitudinally-grooved bolt, of a longitudinally-grooved nut having a slot at the extremity of said groove and a spring-forked key adapted to fit in the longitudinal grooves of said nut and bolt, with the free ends of the fork-arms situated inwardly and having at the end of one of said arms a locking projection adapted to enter the said slot, substantially as and for the purposes described.

2. The combination, with a longitudinally-grooved bolt, of a longitudinally-grooved nut having a slot at the extremity of said groove, and a spring-forked key adapted to fit in the longitudinal grooves of said nut and bolt, with the free ends of the fork-arms situated inwardly, and having at the end of one of said arms a locking projection adapted to enter the said slot, and a washer to close the rear of the nut, substantially as and for the purposes described.

478,097. ELECTRIC MEASURING-INSTRUMENT. SYDNEY EVERSHED, London, England. Filed Dec. 18, 1891. Serial No. 415,499. (No model.) Patented in England Feb. 2, 1887, No. 1,932.

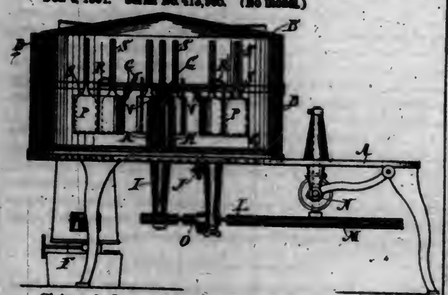
Claim.—1. In an electric measuring-instrument, a coil and blocks of magnetic material arranged therein, in combination with an arbor placed longitudinally in the axis of the coil and carrying a piece of magnetic material adapted to move always with its length parallel to the lines of magnetic force between the said blocks and means for controlling the movement of the said piece.

2. In an electric measuring-instrument, a coil and poles arranged therein having their adjacent faces beveled, so that they must closely approximate, and thus form a greatest magnetic field to one side of the coil-axis, in combination with an arbor journaled within the coil parallel to its axis, a piece of magnetic material carried by the arbor and adapted to move around the coil-axis between the said faces, its length being always parallel to the lines of magnetic force, and means for controlling the movement of the said piece.

3. In an electric measuring-instrument, a coil and an iron core therein recessed to form two poles having their adjacent faces beveled or divergent, so that they closely approximate, and thus form a greatest magnetic field to one side of the coil-axis, in combination with an arbor journaled wholly in the said core and lying in the axis of the coil, a piece of magnetic material carried by the arbor in a position parallel always to the said arbor and to the lines of magnetic force, adapted to move parallel to the axis between the said faces, means for controlling movement of the said piece, a pointer on the arbor, and a dial.

4. In an electric measuring-instrument, a plug-piece carrying an indicating mechanism, in combination with a coil and dial, substantially as set forth.

7

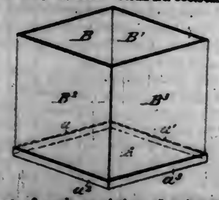


478,098. APPARATUS FOR THE MEASUREMENT OF ELECTRICAL RESISTANCES. SYDNEY EVERSHED, London, England. Filed Oct. 22, 1891. Serial No. 410,008. (No model.) Patented in England Feb. 18, 1890, No. 2,694.

Claim.—1. In an ohmmeter for the measurement of large resistances, a large current-coil wound with a large number of turns of fine wire, in series with the circuit to be tested and closely surrounding a pivoted magnetic needle and an idex-finger, in combination with a pressure coil or coils in shunt with the circuit to be tested and with its magnetic axis at right angles to and intersecting that of the current-coil, substantially as described.

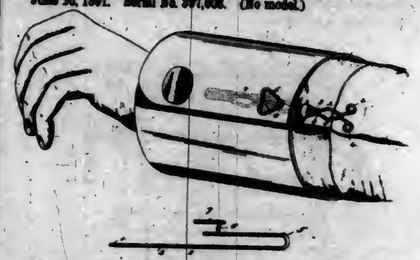
2. An ohmmeter consisting of a current-coil surrounding a magnetic needle fixed on an axis supporting a second astatic needle, the said current-coil supported in a brass frame on which a pressure coil or coils is wound with its magnetic axis at right angles to that of the current-coil, substantially as described.

478,099. MILK-TESTER. FRANK B. FARGO, Lake Mills, Wis. Filed Dec. 4, 1891. Serial No. 413,965. (No model.)



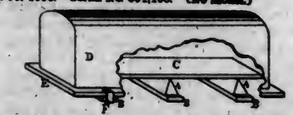
Claim.—1. In a milk-tester, the combination, with a case arranged to contain heated water, of a disk fixed on an arbor revolvable in the case, which disk is provided with peripheral recesses therein, and receptacles adapted to hold milk-test bottles, which receptacles are suspended upright on the disk in the recesses in the periphery thereof, substantially as described.

2. In an apparatus of the class described for testing milk, a revolvable disk provided with peripheral recesses and with apertures at a distance from its axis other than the peripheral recesses, which apertures are adapted to receive therein removable bottle-holding receptacles suspended on the disk; substantially as described.



3. In an apparatus of the class described for testing milk, a revolvable disk provided with peripheral recesses and hook-receiving apertures, in combination with receptacles adapted to hold milk-test bottles formed to fit detachably in the peripheral recesses in the disks, arms projecting from the receptacles, having hooks adapted to engage the disks, and downwardly projecting lugs on the disk, arranged to receive the bearing of the receptacles and prevent their tilting, substantially as described.

478,100. GAME APPARATUS. PERCY S. FAULKNER, London, England. Filed May 19, 1891. Serial No. 393,302. (No model.)

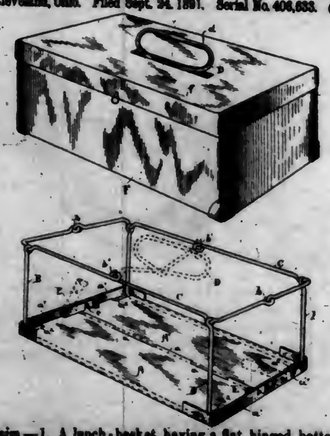


Claim.—A set of cards consisting of series distinguished from each other by indications to mark those of the different players, the cards of each series differing individually in weight and correspondingly marked with indications of different values for use in a game of card-playing by throwing or flicking, substantially as set forth.

478,101. CUFF-HOLDER. FRANK R. GARDNER, Lima, Ohio. Filed June 30, 1891. Serial No. 397,608. (No model.)

Claim.—As an improved article of manufacture, the cuff-holder made or bent from a single continuous piece of wire and consisting of the longitudinal serpentine arms having open free ends arranged side by side, the loop doubled or extended back over and above said arms, the upright stud having its lower portion extending alongside of the loop and then turned substantially at right angles thereto, and the button formed by the radial projections grouped around the stud, substantially as and for the purpose described.

478,102. GRAVE-VAULT. JOHN G. GRAY, Connersville, Ind. Filed Apr. 30, 1891. Serial No. 391,163. (No model.)



Claim.—1. The coffin or casket cover D, made air-tight, provided with flanges E, in combination with the platform C and the supports A A A, provided with projections B B B, as and for the purposes set forth and described.

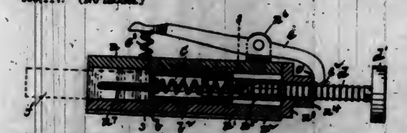
2. The coffin or casket cover D, made air-tight, provided with flanges E, the supports A A A, provided with projections B B B, the platform C, the clamps F, all combined and operating in the manner and for the purpose herein set forth and described.

3. The coffin or casket cover D, made air-tight, in combination with the supports A A A, provided with projections B B B, in the manner and for the purpose shown and described.

478,103. LUNCH-BASKET. JOHN H. HAHN and JACOB P. HERMAN, Cleveland, Ohio. Filed Sept. 24, 1891. Serial No. 406,633. (No model.)

Claim.—1. A lunch-basket having a flat hinged bottom and a skeleton-jointed frame, said frame having corner-posts pivoted in the bottom and rods pivoted in the tops of the posts and at their ends on the longitudinal center of the basket, substantially as described.

2. In a lunch-basket, a sectional bottom hinged at its longitudinal center, corner-posts pivoted on the said bottom, and two top pieces forming the top of the frame pivoted on said posts and to each other midway across the end of the basket, and a spreader to keep the sides of the basket apart, substantially as described.



3. The basket-frame herein described, consisting of a bottom having plates hinged together, pivoted corner-posts, and top rods pivoted in said posts and at their ends in line with the hinges of the bottom of the basket, in combination with a spreader for the top of the basket and locks at the bottom across the hinge thereof, substantially as described.

4. The sectional bottom having right-angled flanges at its corners, in combination with corner-posts pivoted on said bottom and bearing against said flanges, a top sectional frame supported on said posts, and a spreader for said frame, substantially as described.

5. The bottom sections hinged together and locks across the meeting line of said sections, in combination with the corner-posts pivoted in said bottom sections, the sectional top frame pivoted in said posts, and the handle-piece secured in loops to said top frame, substantially as described.

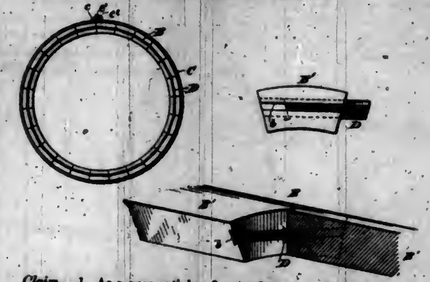
6. A basket-frame consisting of a hinged bottom and corner-posts and side and end rods supported on said posts, all of said parts jointed together, and a cross-rod provided with a handle bracing the top of said frame, in combination with a flexible cover stretched upon said frame and having an opening for the handle, substantially as described.

478,104. BRUSH-HOLDER FOR DYNAMOS AND MOTORS. MERRILL H. HATHAWAY, Springfield, Mass. Filed Oct. 8, 1891. Serial No. 408,117. (No model.)

Claim.—1. The brush-holder for dynamos and motors herein described, comprising, in combination, a holder-body adapted to receive a carbon or other brush, a follower suitably guided within said body and adapted to bear against the rear end of said brush, a notched or toothed stem guided at the rear end of said body for longitudinal movement, a spring-actuated detent engaging the notches or teeth on said stem and adapted to hold the same against rearward movement, and a spring interposed between the front end of said stem and said follower, substantially as described.

2. The brush-holder herein described, comprising, in combination, a holder-body which is closed except at the front end thereof, a follower guided within said body in said manner as to be capable of movement toward and away from said front end of the latter, a notched or toothed stem passing freely through the rear end of said body, a spring-actuated detent-lever pivotally secured to said body and engaging the notches or teeth on said stem, and a spring or springs interposed between said stem and the follower, substantially as set forth.

3. The brush-holder herein described, comprising, in combination, a holder-body adapted to receive at its front end a carbon or other brush, a follower suitably guided within said body and adapted to bear against the rear end of the brush, said follower being provided with a rearwardly-extending wing at each end thereof and with a rearwardly-projecting hub between said ends, a notched or toothed stem passing freely through the rear end of said body, a spring-actuated detent engaging the notches or teeth on said stem, and a coil-spring located within the hub on said follower and engaging the end of said stem, substantially as set forth.



4. In a brush-holder, a holder-body provided with a removable bottom and having its rear end piece connected to or formed integral with said bottom, a follower guided within said body, a notched or toothed stem passing through said rear end piece for advancing the follower within the body, a detent engaging the notches or teeth on said stem for holding the same against rearward movement, and means for locking said removable bottom and rear end piece upon the body, combined and operating substantially as described.

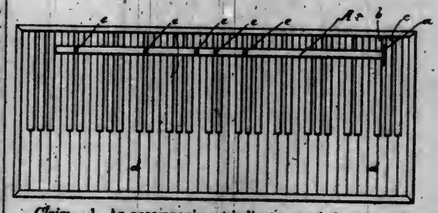
5. In a brush-holder, the combination, with the holder-body having the removable bottom and rear end piece, the follower within said body, the notched or toothed stem passing through the rear end piece, and the interposed spring, of a detent-lever pivotally connected to said body and having its rear end adapted to engage both said rear end piece and the notches or teeth on said stem and a spring normally holding said lever in such engagement, substantially as described.

6. In a brush-holder, the combination, with the holder-body, the follower guided therein, the notched or toothed stem, interposed spring, and spring-actuated detent engaging said stem, of a stop or stops located at the front end of said body for preventing the escape of the follower therefrom, substantially as described.

7. In a brush-holder, the combination, with the body *a*, having the removable bottom *a'*, and rear end piece a^2, having a rigid connection with said bottom, said end piece having projecting therefrom the hub a^3, of the follower *b*, having the rearwardly-projecting hub b^2, stem *d*, provided with notches or teeth, as described, and with a suitable head, as d', said stem passing loosely through said hub a^3, spring *c*, secured at its rear end to said stem and having its front end entering the hub on said follower, and a spring-actuated detent on said body engaging the notches or teeth on said stem for preventing rearward movement of the latter, substantially as described.

478,105. WOODEN PIPE. ARCHIE McL. HAWES, Tacoma, Wash. Filed Nov. 14, 1891. Serial No. 411,946. (No model.)

Claim.—1. As a new article of manufacture, a pipe-tube or like article formed of staves, the latter having transverse dovetailed grooves in their ends, the opposing grooved ends being united by double dovetail blocks fitting said grooves and serving to maintain the ends of opposing staves in close contact, substantially as described.



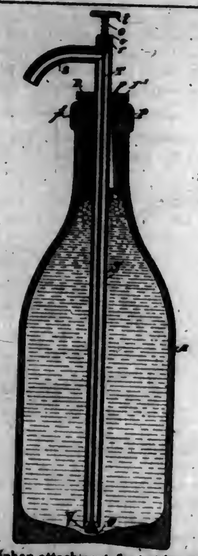
2. The herein-described impervious wooden pipe, the same being formed of staves having bands encircling the same, the bands being means for tightening them on the pipe, and the staves being united together at the ends by double dovetail blocks fitting correspondingly grooves in the opposed ends of the staves, substantially as described.

478,106. THERAPEUTICAL COATING. LUDWIG O. HEMMER, Hamburg, Germany, assignor to the Ichthyol-Gesellschaft Cordes, Hermanni & Company, same place. Filed Feb. 7, 1891. Serial No. 380,611. (No specimens.)

Claim.—1. The herein-described coating for therapeutic purposes, consisting of starch, water, and ichthyol in about the proportions set forth.

2. The herein-described coating for therapeutic purposes, consisting of starch, water, ichthyol, and carbolic acid in about the proportions set forth.

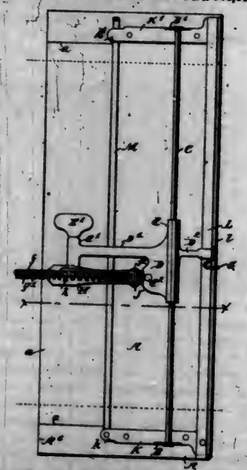
478,107. ACCOMPANIMENT-INDICATOR FOR MUSICAL INSTRUMENTS. GEORGES P. O. HIMOUX, Yamachiche, Canada. Filed Dec. 5, 1891. Serial No. 414,197. (No model.)



Claim.—1. An accompaniment-indicator consisting of a rod provided with a projection at one end adapted to be placed over the key-note between two of the keys of the instrument to prevent the longitudinal movement of the said rod and points marked upon the surface of the rod at certain distances from the said projection and arranged to come over certain of the keys which are in harmony with each other and with the said key-note, substantially as set forth.

2. An accompaniment-indicator consisting of a polyhedral rod provided with a disk at one end projecting around the rod and adapted to be placed over the key-note between two of the keys of the instrument to prevent the longitudinal movement of the rod and series of points marked upon the sides of the rod at certain distances from the said disk, each series being arranged to come over certain of the keys which are in harmony with each other and with the key-note, substantially as set forth.

478,108. SIPHON. JACOB HILBERTH, Christiania, Norway, assignor to the Norwegian Siphon Company, Limited, same place. Filed Mar. 17, 1892. Serial No. 425,260. (No model.)

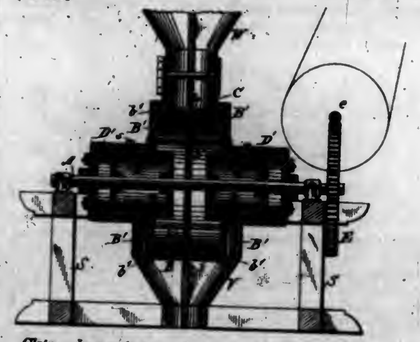


478,108.

Claim.—1. In a siphon attachment for bottles, the combination, with the siphon-pipe and valve-stem having a valve on its lower end to regulate the flow of liquid, of a conical opening in the top of said pipe, through which the valve-stem passes, an elastic packing seated in said opening, and the knob *t*, spring O, and bearing-plate *o* for simultaneously compressing the packing and operating the valve to allow the discharge of liquid, as set forth.

2. In a siphon attachment, a siphon-pipe having near its upper end an enlarged portion *u*, in combination with a discharge-pipe extending into said enlarged portion *u* of the siphon-pipe, said discharge-pipe having a flanged enlargement adapted to be secured in the neck of the bottle, and a valve-stem having at its lower end a valve adapted to seat in the corresponding end of the discharge-pipe, as set forth.

478,109. TYPE-WRITING MACHINE. ROBERT H. INGERSOLL, New York, N. Y. Filed Jan. 24, 1891. Serial No. 378,986. (No model.)



Claim.—1. In a type-writer, the combination, with a paper-holder consisting of two transverse plates, a rack-bar, and paper-guide, a spring-clip, and a guide-bar mounted thereon, of a centrally-pivoted carriage adapted to work on the guide-bar and provided with a forwardly-extending arm sustaining a type-wheel, and a rear heel-piece carrying a pawl, the arm and heel-piece being alternately depressed, substantially as described.

2. In a type-writer, the combination, with a paper-holder consisting of two transverse plates sustaining at their respective ends a paper-guide and a spring-clip, and a guide-bar mounted thereon, of a centrally-pivoted carriage adapted to work on the guide-bar and carrying a type-wheel, and a sustaining-spring secured thereto, substantially as described.

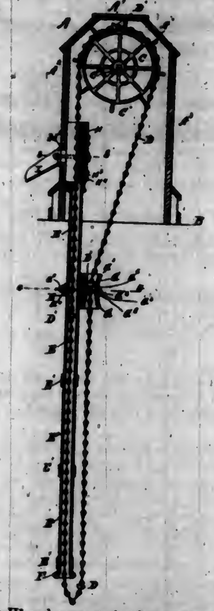
478,110. PROCESS OF REDUCING ZINC OR SPELTER FROM ORES. CHRISTOPHER JAMES, Swansea, England. Filed Aug. 18, 1891. Serial No. 402,063. (No specimens.)

Claim.—A process for the commercial treatment of zinc-sulphide ores, consisting in first calcining a part of the ore in a calcining-furnace to the form of an oxide, mixing the calcined ore with rather more than half its weight of crude ore, and smelting the same in the hearth of a neutral or slightly-reducing reverberatory furnace until reduced to zinc and SO_2, the zinc being volatilized and collected by condensation in a chamber distinct from the furnace, substantially as described.

478,111. GRAIN-MEASURING APPARATUS. KNUD G. JENSEN, Christiania, Norway. Filed Sept. 19, 1890. Serial No. 365,485. (No model.)

Claim.—In a grain-measuring apparatus, the combination, with a revolubie measuring-vessel having one or more peripheral openings for the reception and discharge of the grain, a stationary feed-hopper provided with bearing-flanges bearing on the outer periphery of the vessel and having air-vents adapted to register with said openings in the measuring-vessel, an axial piston D, adapted to be projected more or less into the vessel, adjusting-screws *d* for adjusting said piston relatively to the vessel, and a locking device *s* for locking the piston against displacement when adjusted, said parts being constructed and arranged for operation as described.

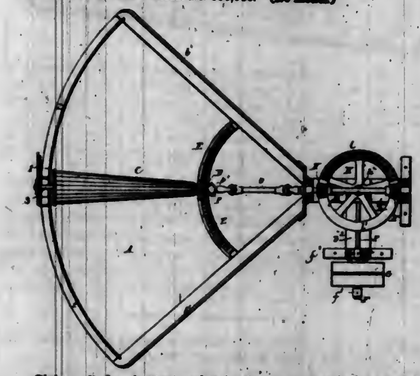
478,112. CHAIN-PUMP. DAVID K. KELLER, Montgomery, Ohio. Filed May 12, 1890. Serial No. 351,409. (No model.)



Claim.—1. In a chain-pump, the interiorly-double flared guide having groove G^2, the exterior of the guide being narrowed at its waist, and the stirrup G^3, and clamp G^4, and sleeve-coupling E', and adjacent pipe-sections E E, secured by said coupling, the coupling E' fitting into the recess formed on the exterior of the guide by the contraction of its waist, the said sleeve, pump-pipe, and flared guide being all inclosed by the stirrup and clamping-piece, substantially as and for the purposes specified.

2. In a chain-pump, the interiorly-double-flared guide having groove G^2, the exterior of the guide being narrowed at its waist and at rear provided with groove G^2, and the stirrup G^3, and clamp G^4, and sleeve-coupling E', and adjacent pipe-section E E, secured by said coupling, the coupling E' fitting into the recess formed on the exterior of the guide by the contraction of its waist, the back of the stirrup being located in said groove G^2, the said sleeve, pump-pipe, and flared guide being all inclosed by the stirrup and clamping-piece, substantially as and for the purposes specified.

3. In a chain-pump, the pump-pipe E and the interiorly-double-flared guide having peripheral depression, and stirrup G^3, and clamp G^4, and sleeve-coupling E', fitting into the recess formed on the exterior of the guide by the contraction of the waist, the said guide and pipe E being thereby secured, substantially as and for the purposes specified.



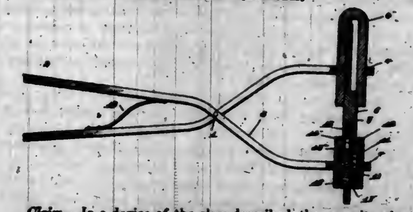
4. In a chain-pump, the pump-pipe E and the interiorly-double-flared guide having peripheral depression and stirrup G^3, and clamp G^4, and sleeve-coupling E', fitting into the recess formed on the exterior of the guide by the contraction of the waist, the said guide and pipe E being thereby secured, and the water-box provided at rear with

478,112.

two or more grooves H^2 and connected at bottom to pump-pipe E and applied to the inner side of wall A^2 of the pump-box, and the spout I, having lugs I' I' and at rear applied to the outer face of the water-box and stirrup K, whose rear portion is located in one of the grooves H^2 and whose respective limbs pass through the pump-box and through the respective adjacent lugs I' I' of the spout, and devices for retaining the stirrup in said position, substantially as and for the purposes specified.

478,113. BUTTER-WORKER. PERLEY I. KENDALL, Bellows Falls, Vt., assignor to the Vermont Farm Machine Company, same place. Filed May 6, 1890. Serial No. 350,963. (No model.)

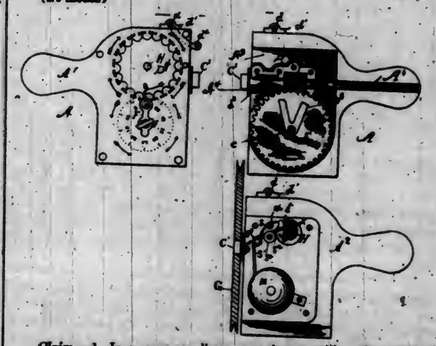
Claim.—1. In a butter-worker having a segmental tray, a spindle, and a pressure-roller thereon, a shaft for operating the spindle connected near the smaller end of the tray by a universal joint, a power mechanism whose main shaft is driven continuously in one direction, and means, substantially as described, between said power mechanism and the roller-spindle whereby said spindle will be driven alternately in opposite directions, substantially as set forth.



2. In combination with a butter-worker having a vibratory pressure-roller and a tray, a mechanism for operating the worker, adapted to be driven by power, and connected at the smaller end of the tray, and having a reversing-shaft connected by universal joints to the spindle of such roller, substantially as set forth.

3. A power-driven mechanism for butter-workers, having, in combination, a shaft adapted to be driven alternately in opposite directions, a vibratory pressure-roll, universal joints connecting said shaft by a link to the spindle of said roll, a toothed gear on such spindle, and a curved rack on the tray, engaging with such gear, all substantially as set forth.

4. In combination with a power mechanism and with the tray or table, the roller-shaft P, its supporting-sleeve, and the vibrating arm R, pivoted as described and carrying said sleeve, all substantially as set forth.



5. In combination with the roller-spindle and with means, substantially as described, for operating the same, the vibratory arm R, pivoted at its rear end, supporting the carriage I at its front end, and having a bracket p^3, connecting with the rear end of the spindle, substantially as and for the purposes set forth.

478,114. RIVETER. JOSEPH J. KROPASEK, Irving, Kans. Filed Nov. 14, 1891. Serial No. 411,907. (No model.)

Claim.—In a device of the class described, the opposite pivoted members terminating in rear of their pivot in handles and in front of the same in jaws having rings at their ends, in combination with a hollow hammer-head supported in the upper ring, an upsetting-plug mounted in the hammer-head, a set-screw for adjusting the same, a bored holder mounted in the lower ring and having an upper reduced bore, a tubular guide mounted for reciprocation in the reduced bore and provided at its lower end with an annular shoulder forming a stop, a plunger mounted in the tube and terminating at its lower end in a head, a spring coiled upon the plunger and interposed between the head of the same and the lower end of the tube, and a set-screw supporting the lower end of the plunger and threaded in the lower end of the holder, substantially as specified.

478,115. WARP OR LINE MEASURING MACHINE. WILLIAM H. KYNETT, Battle Creek, Mich. Filed June 8, 1891. Serial No. 395,542. (No model.)

Claim.—1. In a warp or line measuring machine, the combination of the shaft B, having a worm on its inner end and a wheel on its outer end, a pinion beneath said shaft engaging said worm, said pinion having a hollow internally-screw-threaded arbor, an index-finger, a thumb-screw engaging said hollow arbor and serving to adjustably secure said finger thereto, a dial-plate, a dial or registering wheel engaged and operated by said finger, an alarm-bell, and a bell-hammer operated from said dial-wheel.

2. In a warp or line measuring machine, the shaft B, having a worm at one end, a grooved wheel on the other end of said shaft, a yoke supporting said shaft, a pinion supported by said yoke beneath said shaft and engaging the worm thereof, a dial-plate, and a pointer adjustably connected to said pinion and operating therewith, as described, in combination with a casing to which said dial is secured, said casing having a chamber within which said shaft, pinion, and yoke are located.

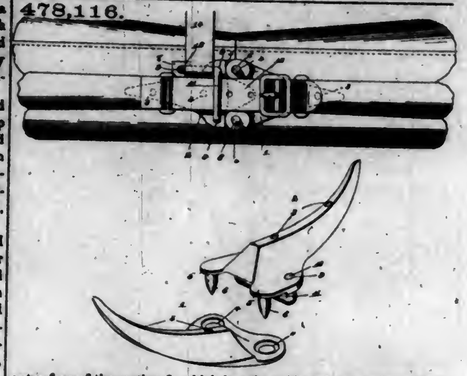
3. In a warp or line measuring machine, the combination, with a main operating-shaft and a dial-plate, of a pointer operated through intermediate connection or gearing by said shaft, a shaft H above said main shaft, a dial or registering wheel on said shaft H, operated by said pointer, and a spring-washer for holding said dial-wheel in position on its shaft and parallel with the face of the dial-plate.

4. In a warp or line measuring machine, a shaft, a wheel mounted on the outer end of said shaft and designed to be engaged by the warp or line to be measured, and a pinion geared with the inner end of said shaft, said pinion having a screw-threaded arbor, in combination with a dial-plate, a dial or registering wheel, a pointer or index-finger engaged with and operating said dial-wheel, and a thumb-screw for adjustably securing said pointer to said arbor, substantially as described, and for the purpose specified.

5. In a warp or line measuring machine, a shaft, a wheel mounted on the outer end thereof and designed to be engaged by the warp or line to be measured, and a pinion geared with the inner end of said shaft, said pinion having a screw-threaded arbor, in combination with a dial-plate, a dial or registering wheel, an alarm mechanism operated from said dial or registering wheel, an index-finger or pointer engaged with and operating said dial-wheel, and a thumb-screw for adjustably securing said pointer to said arbor, substantially as described, and for the purpose specified.

6. In a warp or line measuring machine, the shaft B, having a worm on its inner end and a wheel on its outer end, a pinion beneath said shaft engaging the worm thereof, a dial-plate, and a dial or registering wheel, in combination with an alarm mechanism connected with said dial or registering wheel, a pointer engaging and operating said dial or registering wheel, and a means for adjustably securing said pointer to the arbor of said pinion, substantially as described, and for the purposes specified.

7. In a warp or line measuring machine, the combination, with a main operating-shaft, a dial-plate and a pointer operated through intermediate connection or gearing by said shaft, of a shaft H above said main shaft, a dial or registering wheel on one end of said shaft, operated by said pointer, a cam secured to and rotating with shaft H, a bell-hammer, one end of which is located in the path of the cam, a spring engaging said bell-hammer at one end, and a bell adjacent to the other end of said bell-hammer.



8. In a warp or line measuring machine, the two-part chambered casing, main operating-shaft thereon, yoke supporting said shaft and having depending converging arms formed with an opening at their lower joined ends, a pinion E, geared with said shaft and having a screw-threaded opening, a pointer F, a thumb-screw adjustably securing said pointer in place, a shaft H, and a dial-plate D^4 thereon, all arranged, combined, and operating substantially as shown and described.

9. In a warp or line measuring machine adapted to be supported by and reciprocated on a spindle or rod projecting from a spinning-wheel, the combination of the casing having a handled portion, a main cylindrical shaft within said casing, bearings for said shaft, registering mechanism operated from said shaft, and a fixed tube passing loosely through said shaft and adapted to engage said spindle or rod of the spinning-wheel, substantially as described, and for the purposes specified.

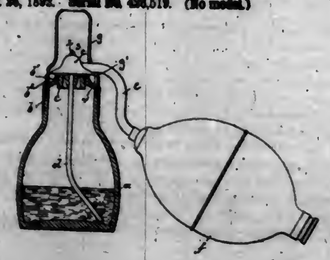
10. In a warp or line measuring machine of the character set forth, the combination of the casing having a handle portion by which it may be moved back and forth, as described, a main cylindrical shaft within said casing, bearings for said shaft, a line-wheel on the outermost extremity of said shaft, a guide secured to said casing and having eyes through which the warp or line passes on its way to said wheel, registering mechanism operated from said main shaft, and a fixed tube passing loosely through said main shaft and adapted to engage the rod or spindle upon which the device is supported and reciprocated, as set forth.

11. In a line or warp measuring machine, the casing provided with a handled portion, a main cylindrical shaft within said casing, a central hollow sleeve or tube within the cylinder of said shaft, one end of which sleeve or tube is fixed within and toward the handle portion of the casing, a line-wheel on the outermost extremity of and a worm located on an inner portion of said main shaft, and circumferential bearings fixed in said casing, a pinion engaging with the worm of the main shaft, and connected and engaging shafts, wheels, dials, and means, substantially as shown and described, for registering the linear length of the warp and for sounding a signal-bell when the predetermined revolutions of said line-wheel have been completed.

478,116. COLLAR-FASTENER. NICHOLAS LAGE, Rock Island, Ill., assignor of one-half to Isaac Lewis Sears, same place. Filed Dec. 3, 1891. Serial No. 413,898. (No model.)

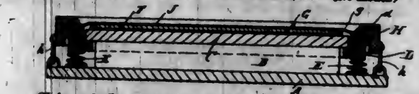
Claim.—1. The herein-described collar-fastener, comprising two opposite sections 1 and 2, the former being provided at its inner end, at opposite sides, with perforations and the section 2 being provided at its inner end with stationary studs arranged at opposite sides for engaging the perforations, and a stationary keeper arranged on the outer face of the section 2, which has the said studs, and adapted for the reception of a hame-strap, whereby the studs will be prevented from becoming disengaged from the perforations, substantially as described.

2. The combination, with the collar-sections, the opposite hame-sections, and the strap connecting the same, of the opposite concaved V-shaped metal sections secured to the collar-sections, one of said V-shaped sections having perforations tapered and formed in its opposite inner corners, the remaining section having lateral lugs offset at their inner ends and provided with stationary tapered lugs or studs extending therefrom and adapted to fit in the perforations of the section first mentioned, a perforated lug located in rear of said lateral lugs, perforations formed in the rear portions of said latter lugs, and the stationary L-shaped bar having studs formed at its ends and angle and entering these perforations and forming a transverse and longitudinal keeper, the former receiving the hame-strap and the latter the choke-strap, substantially as specified.



478,117. NATURAL-GAS BURNER. THOMAS A. LITTLE, Wheeling, W. Va. Filed Sept. 17, 1891. Serial No. 406,001. (No model.)

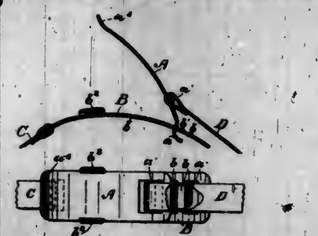
Claim.—1. A natural-gas burner consisting of the horizontal tube 6, having immovable chimney-tubes 5 projecting from its upper and lower sides, the elbow 7, attached to one extremity of the horizontal tube, the horizontal gas-conducting pipe 1, having jet-orifices 4 arranged directly under the chimney-tubes, and the elbow 3, connecting one end of the gas-conducting pipe with the elbow secured to the horizontal tube, substantially as described.



2. A natural-gas burner consisting of the horizontal tube 6, having the chimney-tubes 5 extending from its upper and lower sides and containing the foraminous shields 8 at their upper ends, the elbow 7, secured to one extremity of the horizontal tube, the gas-conducting pipe 1, having jet-orifices 4 arranged directly under the chimney-tubes, and the elbow 3, connecting one end of the gas-conducting pipe with the elbow secured to the horizontal tube, substantially as described.

478,118. ATOMIZER. RHODES LOCKWOOD, Boston, Mass. Filed Mar. 26, 1892. Serial No. 426,519. (No model.)

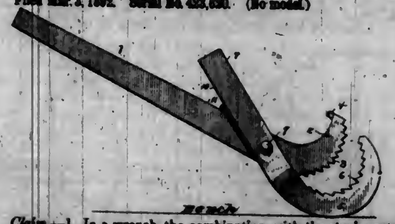
Claim.—In an atomizer, the combination of the following instrumentalities: the bottle *a*, the collar *b*, fixed upon its neck, having the vent 4, the cap or stopper *c*, inserted in said collar, atomizing-orifices 2 3, secured to said cap or stopper *c*, the liquid-tube *d*, extending down from said cap or stopper into the bottle, the air-tube *e*, projecting outwardly from said cap or stopper, and the air-forcing device *f*, connected thereto, the annular flange b^3, secured to the top of said collar *b* at its outer edge, and the nasal nozzle *g*, detachably placed within said annular flange b^3 and entirely inclosing the cap or stopper, and atomizing-orifices which are secured thereto, said nozzle being cut away or recessed at its lower edge, as at *g'*, to astride the air-tube when placed within said flange, all substantially as and for the purposes set forth.



478,119. COPYING-MACHINE. CHARLES MAINE, Three Rivers, Canada. Filed Dec. 18, 1891. Serial No. 415,560. (No model.)

Claim.—1. In a copying-machine, the combination, with the board C, of the metallic plate secured to it, the sheet of absorbent material secured on the said plate, the gelatine-covered paper, and the frames for stretching the said paper and holding its under surface in contact with the said sheet, substantially as set forth.

2. In a copying-machine, the combination, with the back board A, provided with pieces B, of the board C, resting on the said pieces, the frames D and H, the gelatine-covered paper held by the said frames, a sheet of absorbent material under the said paper, the springs interposed between the board A and the frame D, and means for securing the frame H to the board A, substantially as set forth.



478,120. BUCKLE. ALBERT G. MEAD, Boston, Mass., assignor to William B. H. Dowse, trustee. Filed Sept. 28, 1891. Serial No. 406,963. (No model.)

Claim.—1. A buckle for shoes and other articles made in two members, consisting of a draw-plate B, provided with a series of slots *b* and intermediate bars *b'*, in combination with a lever A, provided at one end with a hook *a*, adapted to engage with either of said bars, one of said members having spring-ears struck up from the material thereof to engage with the other member, substantially as and for the purposes described.

2. A buckle for shoes and other articles, consisting of a draw-plate B, provided with a resilient stud b^3, in combination with a lever A, pivoted and held at one end to the draw-plate B and adapted to engage at its other end with said resilient stud b^3, substantially as described.

478,121. WRENCH. WILLIAM MILLER, Hillsdale, Mich., and WILLIAM S. DUVALL, Washington, D. C.; said Duvall assignor to said Miller. Filed Mar. 3, 1892. Serial No. 423,630. (No model.)

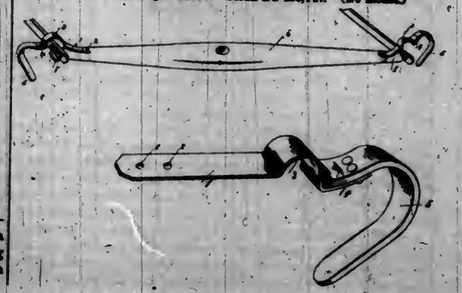
Claim.—1. In a wrench, the combination, with the stock rectangular in cross-section and having one of its corners squared to form a cutting-edge and its outer end curved to form a stationary jaw having an inner concaved and outer convexed face, the latter provided with teeth, said jaw at its outer extremity and concaved side being reduced to form a cylindrical lug adapted to engage the perforations in a gland-nut, of a curved jaw having its shank bifurcated and spread to embrace the stock, and pivoted thereto in rear of its bent end, one of said bifurcations being extended beyond the pivot some distance to form a wire-cutter and having one of its corners squared and adapted to coact with the squared cutting-corner of the stock, substantially as specified.

2. In a wrench, the combination, with a stock having its outer end curved to form a convexed toothed jaw and a concaved curved jaw adapted to embrace a gland-nut and terminating in a reduced cylindrical lug 4, of a curved jaw pivoted to the stock and having its inner face toothed and adapted to operate in connection with the teeth of the convexed jaw, substantially as specified.

478,122. SHOE-LACE FASTENER. JOHN S. MURPHEY, Greensburg, assignor of one-half to William J. Johnston, Pittsburg, Pa. Filed Feb. 9, 1892. Serial No. 420,965. (No model.)

Claim.—The herein-described shoe-lace fastener, the same consisting of a securing-plate provided with integral prongs and having at its edge an outwardly-disposed slightly-curved flange, a binding-disk having its outer face recessed to form a surrounding annular wall, and a thin bottom or back, the annular wall being convex to conform with the flange and exteriorly roughened throughout its circumference, and a rivet passing through the back wall of the disk and into the plate and eccentrically pivoting the disk upon the plate, substantially as specified.

478,123. CURLING-IRON HOLDER. GEORGE F. MCINTOSH, Gardiner, Me. Filed Aug. 5, 1891. Serial No. 401,736. (No model.)



Claim.—1. The herein-described curling-iron holder, the same consisting of a frame formed of sheet metal and having a tongue struck therefrom near its lower end, said tongue and frame being adapted to embrace a lamp-chimney, and the frame provided near its upper end with an inclined iron-supporting tongue, substantially as specified.

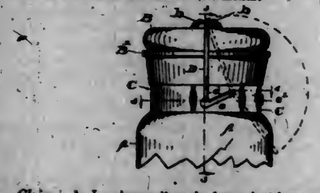
2. The herein-described curling-iron holder, the same consisting of an oblong sheet-metal frame having an upper and a lower tongue struck therefrom at contrary sides of the frame, the lower tongue being compoundly curved and the upper tongue being inclined and transversely curved, substantially as specified.

3. The herein-described curling-iron holder, the same consisting of an oblong sheet-metal frame having an upper and a lower tongue struck therefrom at contrary sides of the frame, the lower tongue being compoundly curved and the upper tongue being inclined and transversely curved, said frame having a contracted opening above its upper tongue adapted to fit the iron, substantially as specified.

478,124. HARNESS ATTACHMENT. JAMES W. MCNEILL, Fayetteville, N. C. Filed Apr. 7, 1892. Serial No. 428,147. (No model.)

Claim.—1. The combination, with a singletree or whiffletree, of a metallic spring-strip secured at its inner end and having a loop at its outer end adapted to fit over the cockeye, and a flexible strap of leather secured to the outer end of said strip, said strap normally extending inward at an oblique angle and unattached at its free end, substantially as and for the purpose set forth.

2. As an improved article of manufacture, a locking device for trace ends, consisting of a spring-metallic strip secured at its inner end and having a loop at the outer end thereof, with a terminating portion extending in a plane substantially parallel with the main body of the strip, and a flexible strap of leather connected to said terminating portion, said strap normally extending inward at an oblique angle and unattached at its free end, substantially as described.

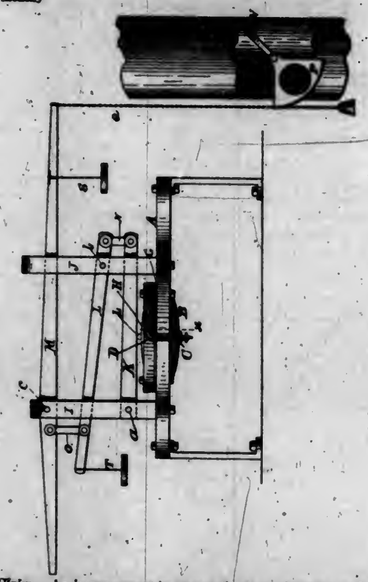


478,125. CAR-COUPLING. CHAPIN C. NEFF, Good Hope, Ill. Filed Feb. 20, 1892. Serial No. 422,186. (No model.)

Claim.—1. In a car-coupling, the combination of a draw-head, a coupling-hook mounted therein, and a hook-support pivotally mounted in the draw-head between the sides of the same and adapted to engage the coupling-hook to hold the latter elevated and to be carried out of engagement with the coupling-hook by a link to cause the hook to fall, substantially as described.

2. In a car-coupling, the combination of a draw-head, a coupling-hook pivoted therein and provided near its front end with a slot and having a shoulder, and a weighted hook-support pivotally mounted in the draw-head and provided with a tongue arranged in the slot of the hook and adapted to engage the shoulder thereof to support the hook, substantially as described.

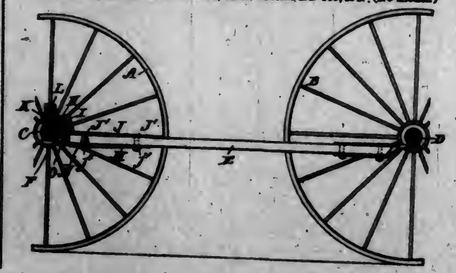
478,126. JAR-SEALING DEVICE. IRENAEUS P. NELSON, Muncie, Ind., assignor of one-half to George F. McCulloch, same place. Filed Sept. 30, 1891. Serial No. 407,256. (No model.)



Claim.—1. In a jar-sealing device, a band surrounding the neck of the jar, offsets in said band provided with inclined slots extending in the same direction from substantially diametrically-opposite points, and a bail having lower inturned ends adapted to work in said slots and which extends up over the cover of the jar.

2. The combination, in a jar-sealing device, of a jar having a reduced neck, a band secured around the reduced portion of the neck and held thereby and having substantially parallel offsets, in which are inclined slots, a bail having lower inturned ends which enter the slots and which extends up over the cover of the jar, said bail being formed to constitute also a spring, all substantially as shown and described.

3. The combination, with a fruit-jar and its cover, of a sealing device for said cover, consisting of a band secured around the neck of the jar and having offsets extending toward one side from substantially diametrically-opposite points, in which are inclined slots extending in the same direction from said substantially diametrically-opposite points, notches in the upper sides of said slots at their lower ends, and a bail having lower inturned ends which enter said slots and which extends over and is adapted to hold said cover in position.



4. The combination of a jar, a band secured around the neck of said jar, having substantially parallel offsets extending in the same direction from substantially diametrically-opposite points, inclined slots therein extending in the same direction from said points, a bail resting at a central point in a seat on the cover, with its lower inturned ends extending into said slots and having bowed-out portions providing for an inherent spring force therein, and said cover, said bail being thus adapted to occupy a central and vertical position when the jar is sealed and exert its force evenly and uniformly on the cover.

478,127. AUTOMATIC STEAM-DAMPER REGULATOR. GEORGE NEWTON, Chicago, Ill. Filed Feb. 13, 1891. Serial No. 381,893. (No model.)

Claim.—An improvement in automatic steam-damper regulators, consisting of the bed-plate A, having therein a chamber, and an opening therefrom leading up through the plate, and a steam-pipe communicating with said chamber, in combination with a flexible disk placed over the opening to the chamber, a thin annular washer placed on the flexible disk and projecting inward over the margin of the opening in the top of plate A, and a ring which secures the flexible disk and washer to said plate, and a disk which lies within the ring and is operated vertically by the flexible disk, standards secured to and projecting up from the said plate and compound levers pivoted to the standards and acted on by a bearing on the said disk, a compensating weight supported by one lever, the damper V, and connections P Q, all constructed and operating substantially as described.

478,128. CARRIAGE-GEAR COUPLING. NELSON A. NEWTON, Kalamazoo, Mich. Filed Jan. 26, 1892. Serial No. 419,491. (No model.)

Claim.—1. The reach-iron J, provided with a downwardly-facing conoidal pivot-pin H, in combination with the upwardly-facing socket F, closed at the bottom and adapted to receive the said pivot-pin, the bar G, with which the said socket is formed, and the front axle, to which the said bar is attached, substantially as set forth.

2. A vehicle-gear coupling consisting of a conoidal oil-holding socket closed at the bottom, in combination with a conoidal pivot-piece fitting therein, a cup receiving the lower end of the said socket, the front running-gear of a vehicle, and the rear running-gear thereof, the said socket being fastened to one of the said parts of the running-gear and the said pivot-piece and cup being fastened to the other of said parts of the running-gear so as to hold the socket between them, substantially as set forth.

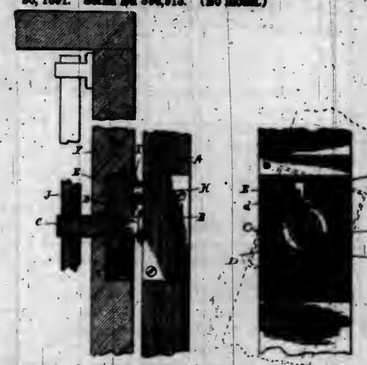
3. A vehicle-gear coupling consisting of a front running-gear of a vehicle, in combination with a conoidal oil-holding socket attached thereto, the rear running-gear, a conoidal pivot-piece attached to the latter and fitting in the said socket, and a cup or stop also attached to the rear running-gear and preventing the said pivot-piece from jumping out of the said socket, substantially as set forth.

478,129. WRITING AND DRAWING DEVICE. JOHN J. PAULA, Lyons, Iowa. Filed Feb. 9, 1892. Serial No. 420,900. (No model.)

Claim.—1. A device of the class described, comprising a body adapted to be secured to the hand, a tube depending from the body, a ball arranged within the tube and projecting from the lower end of the same, and a spiral spring arranged within the tube and interposed between the body and the ball and forming an elastic cushion, substantially as described.

2. A device of the class described, comprising a curved body having a concaved upper face, a centrally-depending tube having its upper end closed and provided at its lower end with a flange, balls arranged in the tube, one of the balls protruding through the lower end of the tube, a spring interposed between the balls and the upper end of the tube, and an elastic band extending across the upper face of the body, substantially as described.

478,130. CHAIR. ARTHUR M. RICHARDS, Bloomington, and JAMES A. GIESE, Chicago, Ill.; said Giese assignor to said Richards. Filed June 20, 1891. Serial No. 396,911. (No model.)



Claim.—1. The combination, with a chair and its back, of a pivot whereon the back may tilt, a tongue having a fixed relation to said pivot, a block having a fixed relation to said back, and spring-actuating jaws including said block and tongue between them, so as to bear simultaneously upon both said block and tongue, substantially as described.

2. The combination, with a chair and its back pivoted thereto, of a casing attached rigidly to one part and a stud attached to the other, a sleeve fitted to said stud and provided with journals for said case, a tongue on said sleeve, a block in said case, and spring-actuated jaws whose faces are adapted to make simultaneous contact with the faces of said block and the tongue of said sleeve, substantially as described.

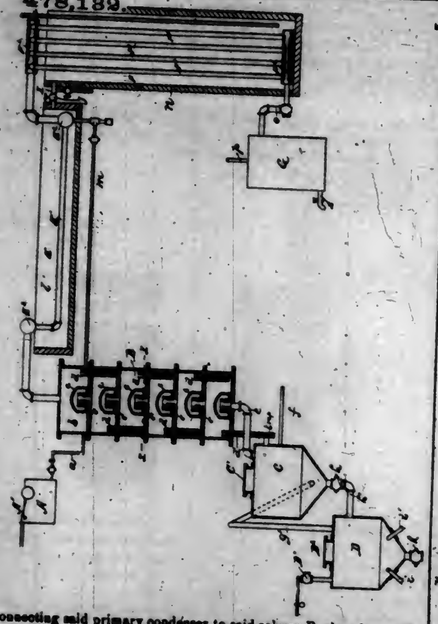
3. In a yielding pivotal attachment for chair-backs, the combination of the back, a casing secured thereto, a back-support, a stud secured to said support, a sleeve fitted to the stud and forming a journal-bearing for the casing, a tongue *f* on the sleeve, a block G, secured to the casing, jaws H I, pivoted in the casing and encircling the sleeve, and C-spring K, encircling the jaws and bearing at its ends against the ends of the jaws, substantially as described.

4. In a yielding pivotal attachment for chair-backs, the combination of the back, a casing secured thereto, a back-support, a stud attached to said support, a sleeve fitted to the stud and forming a journal-bearing for the casing, a tongue *f* on the sleeve, a block G, secured to the casing, and spring-actuated jaws pivoted in the casing and adapted to bear simultaneously on the tongue *f* and block G, substantially as described.

478,131. CHAIR. ARTHUR M. RICHARDS, Bloomington, and IRWIN VEEDER, Chicago, Ill.; said Veeder assignor to said Richards. Filed June 20, 1891. Serial No. 396,913. (No model.)

Claim.—1. The combination, with a chair and its back pivoted thereto, of a casing attached rigidly to one part and a stud attached to the other, a sleeve fitted upon said stud and forming a journal for said casing, a lug upon said sleeve, and a lug in apposition thereto attached to the case, and a C-spring surrounding said sleeve and bearing at one end against the lug on the sleeve and at the other against the lug attached to the case, substantially as described.

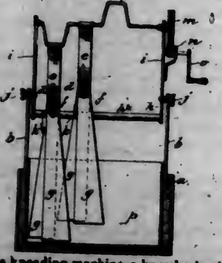
2. The combination, with a chair-back and a support therefor, of a yielding pivotal attachment consisting of a casing attached to one of said parts and a stud C, attached to the other, a sleeve rigidly seated on the stud, a casing journaled on the sleeve, a lug *d* on the sleeve, a lug *e* on the casing in apposition to said lug on the sleeve, and a spring tending to maintain contact between said lugs, substantially as described.



3. In means for pivotally attaching a chair-back to a support, the combination of the casing E, attached to one of said parts and provided with a lug *e*, a stud C, secured to the other of said parts, a sleeve D, seated on the stud and provided with a lug *d*, said casing journaled on said sleeve, a spring G within the casing C, tending to maintain contact between the lugs *d* and *e*, and a spring J, secured, respectively, at its opposite ends to the pivoted part and the support therefor.

478,132. AMMONIA-DISTILLING APPARATUS. WILLIAM L. ROWLAND, Philadelphia, Pa. Filed July 3, 1891. Serial No. 398,319. (No model.)

Claim.—1. In an apparatus for distilling ammonia, the combination, with the primary still D, provided with steam-pipes *i i*, blow-off *k*, and safety-valve D', of a secondary still C, connected to said still D, a lime-inlet pipe *f*, connected to said still C, a distilling-column B, connected to still C by pipes *e* and *d*, the latter being provided with a trap to catch any impurities, a tank provided with a float-controlled valve and discharging into the top of said column B, a horizontal primary condenser consisting of a tray containing a pair of drums connected by a series of pipes, a vertical secondary condenser formed like said primary condenser, pipes connecting the top of column B to the primary condenser and the latter to the secondary condenser, and the tank G, into which the secondary condenser discharges, and devices for supplying cold water to said condensers, all substantially as and for the purpose set forth.



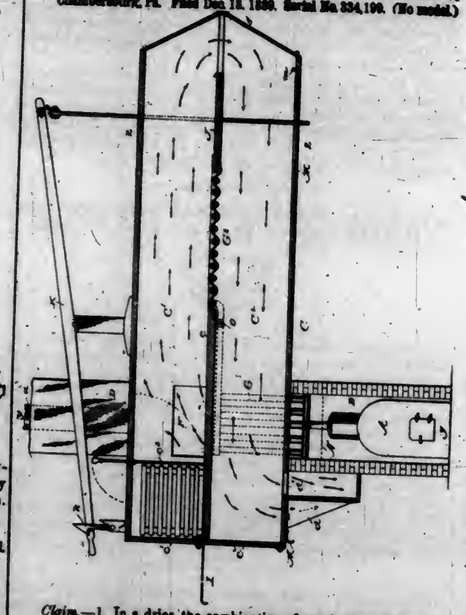
2. In an apparatus for distilling ammonia, the combination, with the primary still D, provided with a conical bottom, a blow-off *k*, steam-pipes *i i*, a safety-valve D', and manhole D², of the secondary still C, connected to said still D by pipes *g*, *g'*, and *h'*, the latter being provided with cock *h*, said still C being provided with a conical bottom, a lime-supply pipe *f*, and a manhole C', a distilling-column B, connected to still C by trapped pipe *d* and pipe *e*, a tank A, provided with float-valve A' and discharging into the top of column B, a horizontal primary condenser consisting of a pair of drums united by a series of pipes, a secondary condenser similarly constructed, but placed in a vertical position, tanks for containing water, surrounding said condensers, connections between the top of column B and said primary condenser and between the latter and the secondary condenser, an auxiliary pipe in,

478,132.

connecting said primary condenser to said column B, pipes for supplying water to said water-tanks, and a tank G, into which said secondary condenser discharges, all substantially as and for the purpose set forth.

478,133. KNEADING-MACHINE. JOHN M. RITTERSHOFF, Dixon, Ill. Filed Nov. 20, 1891. Serial No. 412,565. (No model.)

Claim.—1. In a kneading-machine, a kneader having a head and blades secured thereto, the said blades being made with one straight side and one inclined side and the inclined side of one blade arranged opposite the straight side of the adjacent blade of the same kneader, substantially as described.



2. In a kneading-machine, a crank-shaft combined with a kneader having a head constructed with a shank by which it is connected with the crank-shaft and having arms branching from each shank and blades secured to each arms and having one straight side and one inclined side, the straight side of one blade being opposite the inclined side of its companion blade on the kneader, substantially as described.

3. In a kneading-machine, the combination of a trough, a crank-shaft supported therein, kneaders secured to such shaft and adapted to receive vertical reciprocation therefrom, and guide-rods jointed to the kneaders and to a fixed portion of the machine, and thereby adapted to vibrate the kneaders as they are reciprocated, substantially as described.

4. In a kneading-machine, the combination of a trough, a crank-shaft supported therein, kneaders secured to such shaft and adapted to receive vertical reciprocation therefrom, tilting uprights in which the shaft is secured, a frame rigid with and projecting from said uprights, and guide-rods jointed to the kneaders and to the said frame to cause the kneaders to vibrate as they are reciprocated, substantially as described.

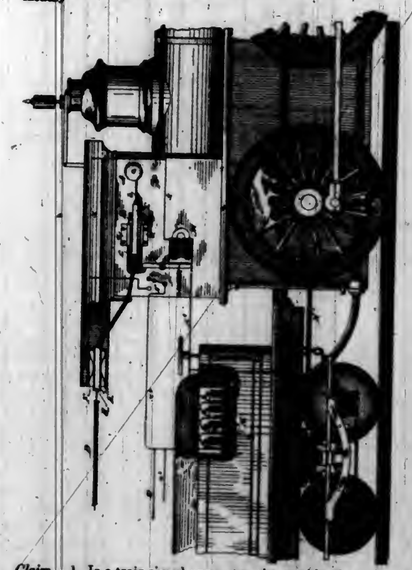
5. In a kneading-machine, the combination of a number of kneaders, each having a head and blades and each of the said blades being made with one straight side and one inclined or beveled side, the inclined side of one blade being arranged opposite the straight side of the adjacent blade of the same kneader and the inclined side of one kneader overlapping upon the path of travel of the inclined side of a blade of the next kneader, substantially as described.

478,134. DRIER FOR TRAS AND FRUITS. BENJAMIN I. RYDER, Chambersburg, Pa. Filed Dec. 18, 1889. Serial No. 334,199. (No model.)

Claim.—1. In a drier, the combination of two horizontal drying-chambers, one overlying the other and communicating at the rear end, an air-heater delivering into the forward end of the upper chamber, and a discharge-flue leading from the forward end of the lower chamber, said upper chamber constructed to admit of the introduction of trays at its forward end and their transfer at its opposite end to the lower chamber, and the latter constructed to admit of their passage through and discharge at its forward end.

2. In a drier, two drying-chambers communicating at their rear ends, lying one over the other, and provided at the front ends with doors for inserting and removing trays, in combination with a heater and air-inlet at the forward end of the upper chamber, mechanism for transferring the trays from the upper to the lower chamber at the rear end, and an outlet for the moisture-laden air at the forward end of the lower flue.

3. In combination with the chambers C C', communicating constantly at their rear end, the heater communicating with the front of the chamber C, the vertically-movable platform arranged to transfer the trays from one chamber to the other without affecting the communication between them, and devices, substantially as shown, for operating said platform, whereby a constant current of heated air may be maintained within the chambers regardless of the action of the platform.



4. In a drying apparatus in which the trays are successively introduced into an upper chamber, transferred to a lower chamber, and finally discharged, the combination of two drying-chambers, one overlying the other, doors at the forward ends of said chambers, a yielding valve at the forward end of the upper chamber, a vertically-movable platform at the rear ends of the chambers, its operating-lever, a rod for advancing the trays in the lower chamber, and a heater communicating with the upper chamber beyond the yielding valve, substantially as described.

5. In combination, the boiler, the inclosing chamber, the flues leading therefrom, the radiators in said flues, the upper drying-chamber into which the flues open, the lower drying-chamber communicating with the upper at one end, the outlet-stack communicating with the lower chamber, and the smoke-pipe located within the stack, whereby the heat radiated by the smoke-pipe will induce a flow of the moisture-laden air from the drying-chamber.

6. The combination, with the upper and lower drying-chambers and the horizontal separating-floor adapted to sustain the trays in their passage through the upper chamber, of the series of radiating-pipes lying horizontally side by side in the same plane with the floor and forming a continuation of the latter, and the separating-sheet applied alternately to opposite sides of the pipes in such manner as to form, in conjunction with the pipes, a support for the moving trays and to expose a portion of the pipes in one chamber and the remainder in the other chamber without establishing communication between the chambers.

7. In combination with the upper and lower drying-chambers, the heater and its surrounding-chamber, the flue leading from the top thereof to the upper drying-chamber, the smoke-pipe leading from the heater, the stack surrounding the same and communicating with the lower drying-chamber, and the cold-air flue extending through the stack to the bottom of the heater, whereby the heat radiated from the smoke-pipe is applied to induce the discharge of moisture-laden air from the lower chamber and to heat the air entering through the flue in the stack.

478,135. RAILWAY-TRAIN SIGNAL APPARATUS. CHARLES SELDEN, St. Louis, Mo., assignor to The Combined Electric and Trip Bell Cord Company, of Illinois. Filed Apr. 2, 1883. Serial No. 90,415. (No model.)

Claim.—1. In a train-signal apparatus, the combination, with the bell mechanism operated by the ordinary bell-cord, of an electro-magnet for actuating said mechanism and means upon a car of the train for admitting an electrical current to said electro-magnet.

2. In a train-signal apparatus, the combination, with the bell mechanism and its pull-cord extending through the train, of an electro-magnet connected with and actuating said bell mechanism, an insulated conductor in said bell-cord, and a circuit closer or breaker for controlling the connection between said conductor and the return-conductor leading to the engine and magnet.

3. The combination, in a train-signal apparatus, of an insulated conductor in the bell-cord, a stud or projection on said cord electrically connected with said cord, and an eye or guide for the cord arranged in the path of the stud and electrically connected with a return-circuit leading to the apparatus on the engine.

4. The combination of the insulated conductor in the bell-cord, the conducting-stud, and the two conducting eyes or guides on either side of said stud.

5. In a train-signal apparatus, the combination of a mechanical signal apparatus, an operating cord or rope extending through the train, an insulated electric conductor carried by said cord, a circuit-controller controlling the circuit of said conductor and operated by a pull upon the cord, an electro-magnet responsive to the operation of the circuit-controller, and a bell or signal mechanism operated by said electro-magnet.

6. The combination, in a train-signal apparatus, of a bell mechanism on the locomotive, an electro-magnet for operating the same, a conductor extending through the train and in a car or cars of the train, and an electro-magnetic signal-bell which is normally disconnected from the conductor but is included in circuit when the connection is closed between said conductor and the return-conductor.

7. The combination, with a bracket electrically connected with the car-roof, of guides I^2 I^3, bell-cord D, and stud or button I^4, electrically connected with the conductor in said cord.

8. The combination of bracket I, guides I^2 I^3, bell-cord D, stud I^4, and bell B^4, the magnet of which is electrically connected with the bracket.

9. The combination, with the bell mechanism, the bell-cord connected to said mechanism, an electro-magnet M, and an armature-lever C, which engages with or is mechanically connected to said bell mechanism.

10. The combination of the bell-cord and the contained conductor forming a portion of the circuit of the electro-magnetically-operated bell, a yielding circuit-controller interposed in the bell-cord, additional conductors combined with said cord, and movable conducting-pieces connected with the additional conductors for completing a circuit between the same and fixed electro-magnets, as and for the purpose described.

11. The combination of the circuit-controller P, the movable pieces S^2 S^3, mounted thereon, and the bell-cord carrying the multiple insulated conductors.

12. The combination, with the bell-cord carrying a conductor which forms a portion of the bell-circuit, of supplemental conductors connected with electro magnets on the car, which control the operation of the car-brake, and means upon the locomotive or other portion of the train for controlling the circuits of said supplemental conductors.

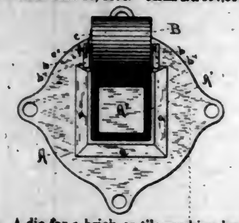
13. The combination, with the circuit-controller P, interposed in the bell-cord, of the movable cylinder S^2 S^3, connected with a magnet R^3, and a supplemental conductor in the bell-cord connected with said cylinder.

14. The combination, with the bell mechanism, of the armature connected therewith, the magnets having each two like poles acting on opposite ends of said armature, and the polarizing-coil on said armature.

15. The combination of a bell-cord extending through the train, a mechanically-operated bell to the striking mechanism to which the bell-cord is attached, an electrical conductor carried by or forming a part of said bell-cord, and an electro-magnet on the engine electrically connected with said conductor through a sliding piece, whereby the bell may be operated mechanically by said cord without interfering with the electrical connection between the conductor and the electro-magnet.

16. In a train-signal apparatus, the combination, with an electric signal upon a locomotive, of a bell-cord on the car, a circuit-controller also on the car, connected with the bell-cord so that a pull on the latter will through the operation of the circuit-controller on the car cause a bell to ring electrically on the locomotive, and a spring for restoring the parts of the circuit-controller to their normal position when the cord is relieved of tension, whereby a repetition of the signal, as desired, may be given by alternately pulling and slackening the cord.

17. The combination, in a train-signal apparatus, of a normally-open circuit extending through the train, circuit-controlling devices on the cars of the train connected with a pull-cord on the cars and adapted to complete the connection to a return-conductor, also extending through the train through increase of tension on the cord, and a spring for restoring the circuit-controlling devices to normal condition when the cord is relieved of tension.



18. The combination, with a railway-train, of a signal-magnet upon the locomotive, an electric circuit extending through the train, and on one or more cars of the train a suitable electric-circuit controller controlling said circuit, a cord or rope extending through the car, as an ordinary bell-rope, for actuating said circuit-controller, and a spring for restoring the circuit-controller to normal position when the pull on the cord ceases.

19. The combination of the bell-cord and its electric conductor forming a portion of a circuit for controlling an electric bell, of a yielding circuit-controller connected into the bell-cord, as described, so as to be actuated mechanically by a pull on the cord to open or close the circuit, a spring acting on the parts of the circuit-controller in opposition to the pull, a return-conductor leading to the source of electric current, and a conducting-piece connected with said return-conductor for completing a circuit between the same and the first-named conductor when the parts of the circuit-controller are extended by a pull, as and for the purpose described.

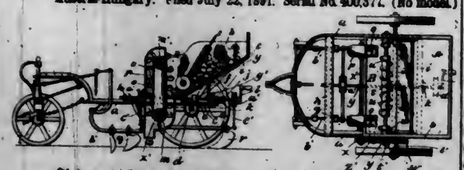
20. The combination, with a pull-cord, of two or more normally-open yielding circuit-controllers placed at various points on the cord, springs tending to hold the same open and acting in opposition to a pull, and contact-surfaces with which connection is closed on an ex-

pansion or extension of the parts of a yielding circuit-controller produced through a pull on the cord.

478,136. BRICK OR TILE MACHINE DIE. GEORGE C. SKINNER, Troy, Ohio. Filed June 29, 1891. Serial No. 397,814. (No model.)

Claim.—1. A die for a brick or tile machine, having two or more stationary sides, and a roller or rollers forming one or more sides of said die, said roller or rollers being adapted to project between the adjacent stationary sides and fit snugly between the same, substantially as specified.

2. A die for a brick or tile machine, having projecting flanges adapted to form the sides thereof, a removable plate arranged at one side of said die and within the adjacent projecting flanges, and an adjustable roller the periphery of which is substantially in line with said removable plate and having a contour corresponding to the contour of said plate, substantially as specified.



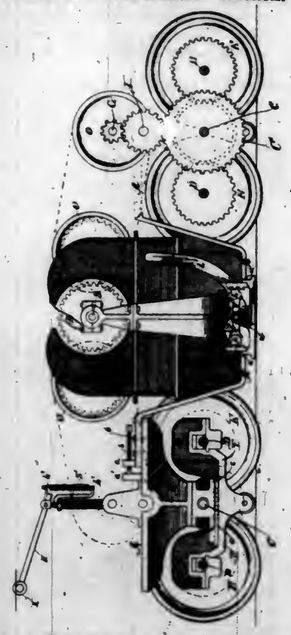
3. In a die for brick or tile machines, a roller or rollers forming one or more sides of said die, said roller or rollers being located between the adjacent stationary sides of said die, and means, substantially as described, for regulating the speed of said roller or rollers in relation to the outward movement of the brick or tile material through said die, substantially as specified.

4. The combination, with the projecting side flanges forming the walls of a die, as described, of a roller arranged in connection with said stationary walls and fitted between the same, and adjustable arms for supporting said roller, substantially as specified.

5. In a die for brick or tile machines, the combination, with the base or supporting plate, of the projecting stationary side flanges, and a removable plate arranged within said side flanges, and a roller in proximity to said removable plate, the periphery of which is of a contour corresponding to said removable plate, said roller being supported on adjustable arms, so that the operating-periphery is located between the stationary side flanges, and means, substantially as described, for regulating the speed of said roller in relation to the movement of the material passed through said die, substantially as specified.

6. In a die for brick or tile machines, a roller or rollers forming one or more sides of said die, said roller being supported on adjustable arms, and an adjustable friction device connected with said arms for varying the speed of said roller, substantially as specified.

478,137. POTATO-PLANTER. EDUARD SKORPIL, Nagy-Ugocs, Austria-Hungary. Filed July 22, 1891. Serial No. 400,377. (No model.)



Claim.—1. In a potato-planter, the combination, with the horizontal frame *a*, a seed-box movably arranged thereon, and stays for supporting the rear part thereof on the side bars of the frame *a*, and a cupped elevator in said box, of a screw-threaded spindle *g*, mounted in cross-piece *i* and bearing *e*, and crank *l*, whereby the spindle is operated and the seed-box moved longitudinally, substantially as set forth.

2. In a potato-planter, the combination, with a movable seed-box divided by slide *s* into two parts A and B, an elevator-tube in the front portion thereof, rollers, endless bands mounted on rollers located in said tube, and scoops on said bands, of a horizontal worm in chamber A, running below the slide *s*, having separate screw-threads for feeding the potatoes into chamber B, substantially as set forth.

3. In a potato-planter, the combination, with a movable seed-box divided by slide *s* into two parts A and B, an elevator-tube in the front portion thereof, endless bands mounted on rollers located in said tube, and scoops on said bands, of a horizontal worm in chamber A, running below the slide *s*, having separate screw-threads for feeding the potatoes into chamber B, furrow-opening plowshares movably arranged in front of the elevator, and covering-plowshares movably arranged at the rear of the whole device, substantially as set forth.

478,138. ELECTRIC MINE-CAR. ELMER A. SPERRY, Chicago, Ill. Filed Feb. 16, 1891. Serial No. 381,551. (No model.)

Claim.—1. In a motor tram-car, the combination of the following elements: a motor and counter-shaft mounted on the car-frame, a power-transmitting device upon the counter-shaft, a truck supporting and tractionally connected to the car-frame through the counter-shaft, power-transmitting devices upon one or more axles of the truck, having surfaces which abut against similar surfaces on the device carried by the counter-shaft, whereby power is transmitted from the motor to the truck and draft is transmitted from the axles to the car-frame through the abutting-surfaces of the transmitting devices and the counter-shaft.

2. In a motor tram-car, pivotal trucks, axles mounted on the trucks, provided with traction-wheels, a shaft mounted upon the car, power-transmitting connections from the shaft to a motor, and a wheel mounted upon such shaft by a universal-joint connection in engaging contact with wheels mounted upon the axles of the truck, the arrangement being such that through the engagement of the wheels and connecting mechanism both power and draft may be transmitted between the truck and the car.

3. In a motor tram-car, the combination of the following elements: a motor and counter-shaft mounted on the car-frame and located between the axles of the truck, a power-transmitting device upon the counter-shaft, a truck supporting and tractionally connected to the car-frame through the counter-shaft, power-transmitting devices upon one or more axles of the truck, having surfaces which abut against similar surfaces on the device carried by the counter-shaft, whereby power is transmitted from the motor to the truck and draft is transmitted from the axles to the car-frame through the abutting surfaces of the transmitting devices and the counter-shaft.

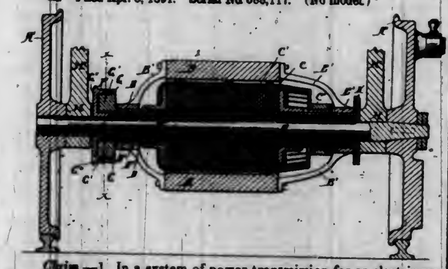
4. In a motor tram-car, pivotal truck or trucks, axles mounted on the trucks, provided with traction-wheels, a shaft mounted upon the car, and a wheel mounted upon such shaft by a universal-joint connection in engaging contact with wheels mounted upon the axles of the truck, adapted by such engagement to control the plane of rotation of the universally-mounted wheel

5. In a motor tram-car, pivotal truck or trucks, axles mounted on the trucks, provided with traction-wheels, a shaft mounted upon the car, a wheel mounted upon such shaft by a universal-joint connection in engaging contact with wheels mounted upon the axles of the truck, and devices upon such wheels adapted to maintain the universally-mounted wheel in alignment with the wheels upon the axles of the truck.

6. In a motor tram-car, pivotal truck or trucks, axles mounted upon the truck, provided with traction-wheels, a shaft mounted upon the car, power-driving connections from the shaft to a motor, a gear-wheel mounted upon the shaft by a universal-joint connection in engagement with gear-wheels mounted upon the axles of the truck, and housings upon the lateral sides of the gear-wheels in rolling contact, adapted to transmit draft between the truck and the car and to maintain the alignment of the gear-wheel.

7. In a motor tram-car, in combination with an auxiliary rail, an auxiliary wheel mounted upon the truck on one side thereof between the planes passing vertically through the axles of the truck and adapted by its travel upon the auxiliary rail to slightly raise the traction-wheels upon the side of the truck with the auxiliary wheel from traction-contact with the rail.

8. In a motor tram-car, a truck having axles and wheels mounted thereon, an auxiliary wheel mounted on the truck at one side between the axles and adapted to travel on an auxiliary rail in proximity to the main rail and to co-operate with the wheels on the other side of the truck to support the truck on three points only, substantially as shown, and for the purposes described.



9. In a motor tram-car, gear-wheels having a centrally-located radial flange for the support of the gear, teeth-housings on the lateral sides of the teeth, and radial openings between the teeth at their bases and between the central flange and the housings, substantially as shown, and for the purposes described.

10. In a motor tram-car, a trolley-arm carrying a conductor adapted to establish electric connection between the fixed conductors and the motor carried by the tram-car with a fuse-strip on the trolley-arm in circuit with the conductor thereon with binding connections for its insertion and removal.

11. In a motor tram-car, a motor supported on the car-frame and power-driving connections from the motor to the axles of the wheels, in combination with mechanism connected with the support of the axles of the wheels with reference to the car-frame, whereby the position of the axles or truck may be adjusted from one position to another upon the frame for varying or tightening the said power-driving connections.

12. In a motor tram-car, a truck connected to the car, so as to swing about a pivot, a pivot for such truck, consisting of two elements, viz: a rotating shaft and a universally-mounted wheel in engagement with each other, one engaging with the car frame, the other with the truck, flanged wheels upon the truck, and a track co-operating therewith for the support and guidance of such truck.

478,139. ELECTRIC LOCOMOTIVE. ELMER A. SPERRY, Chicago, Ill. Filed Apr. 3, 1891. Serial No. 388,117. (No model.)

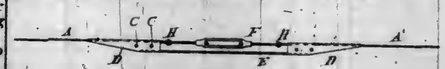
Claim.—1. In a system of power transmission for an electric machine, a crank and pitman, a revolving part of the electric machine, and an elastic power-transmitting portion between the crank and the revolving part.

2. In a system of power transmission for an electric machine, an axle, an armature provided with a hollow spindle mounted upon the axle, a bushing surrounding the axle, an elastic supporting medium between the bushing and the hollow spindle, and oil-guards at the ends of the spindle, as and for the purpose specified.

3. In a system of power transmission for an electric machine, an axle, an armature provided with a hollow spindle mounted loosely upon the axle, an elastic driving connection between the spindle and the axle, journal-bearings in proximity to said connection, and oil-guards at the ends of the journal-bearings, substantially as and for the purpose specified.

4. In combination with the revolving part of an electric machine, consisting in part of a hollow spindle, a car-axle which the spindle encircles, and an elastic supporting medium between the spindle and the axle, journal-boxes for the axle near the ends of the hollow spindle, and oil-guards mounted upon the axle between the journal-bearing and the elastic support, substantially as specified.

5. In a system of power transmission for an electric machine, an axle, a revolving part of such machine supplied with a hollow spindle encircling the axle, but separated from it by a space, a continuous bushing within the space fitting loosely upon the axle, and an elastic medium interposed between the spindle and the bushing, in combination with driving projections extending from both the axle and the spindle and engaging through an elastic medium interposed between them, substantially as and for the purpose specified.



6. In a system of power transmission for an electric machine, a crank-shaft, a revolving portion of such machine supplied with a hollow spindle mounted upon said shaft, an elastic support between the crank-shaft and the hollow spindle, and an elastic driving medium between such shaft and the revolving part.

7. In combination with the revolving part of an electric machine, consisting in part of a hollow spindle, a car-axle which the spindle encircles, an interlocking driving connection between one end of the spindle and the axle, and a removable wheel on the other end of the axle.

8. In a system of power transmission for an electric machine, the combination of the following elements: a revolving part consisting of two detached but synchronously-revolving portions, one bearing the armature and the other bearing the reciprocating connection, a reciprocating power-transmitting device, and a cushion connection mounted within the revolving part between the detached portion and the armature.

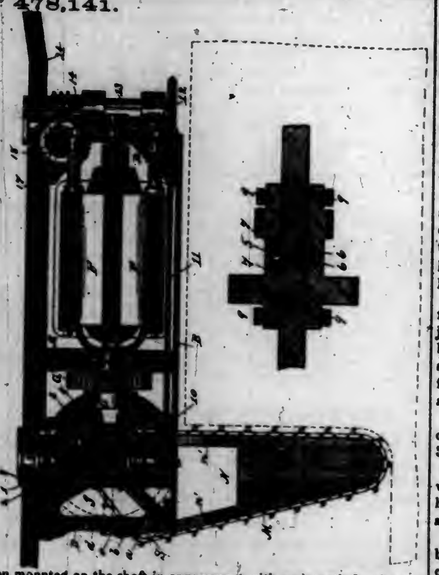
9. In a system of power transmission for an electric machine, the combination of the following elements: a revolving part consisting of two detached but synchronously-revolving portions, one bearing the armature and the other bearing a crank-pin, a reciprocating power-transmitting device, and a cushion connection mounted within the revolving part between the crank-pin and the armature.

478,140. TROLLEY-WIRE SPLICE. ELMER A. SPERRY, Chicago, Ill. Filed Apr. 18, 1892. Serial No. 429,571. (No model.)

Claim.—1. The combination of a trolley-wire, splice on such trolley-wire, tapered clamps each side of said splice, and a metallic connection, as E, between such clamps.

2. The combination of two trolley-wires approaching each other, a coupling substantially larger than the trolley-wires for resisting the strain and coupling the wires, two tapered clamps located one each side of the coupling, and a metallic connection or bridge-piece connecting the clamps.

3. The combination of two trolley-wires approaching each other, an adjustable coupling substantially larger than the trolley-wires for resisting the strain and coupling the wires, two tapered clamps located one each side of the coupling, and a metallic connection or bridge-piece connecting the clamps.



4. The combination of two trolley-wires approaching each other, an adjustable coupling substantially larger than the trolley-wires for resisting the strain and coupling the wires, one tapered clamp rigidly attached to the wire upon one side of the coupling, and another tapered clamp on the other side of the coupling, arranged to slide upon the wire.

478,141. MINING-MACHINE. ELMER A. SPERRY, Chicago, Ill., assignor to the Thomson-Houston Electric Company, Boston, Mass. Filed May 4, 1891. Serial No. 391,469. (No model.)

Claim.—1. The combination of a self-propelling mining-machine having a laterally-projecting cutting mechanism mounted upon a carriage and adapted to continuous travel, a rail extending lengthwise of the mining or face to be cut, made up of a series of sections separately joined together at their ends, so as to bend in a horizontal plane at these points to conform to the irregularities in the face to be cut, each section being provided with means for removably fixing it in position, teeth upon the rail sections, the pitch-line of which is in line of the articulations, and a pinion mounted upon the carriage to engage with the teeth upon the rail for the propulsion of the carriage, the work being performed by the side or edge of the laterally-projecting cutting device.

2. The combination of a mining-machine having a laterally-projecting cutting mechanism presenting a cutting-face along the side or edge thereof, mounted upon a traveling carriage, wheels mounted upon the carriage and bearing upon a rail on one side of the machine only for the support of the carriage, a tread upon the upper side of the rail upon which supporting-wheels bear, having a flange upon one side of the rail, vertically-disposed pintles constituting teeth and connecting the tread with a similar flat bar on the under side of the rail, a vertically disposed shaft forming a part of the machine, and a pin-

478,141.

ion mounted on the shaft in engagement with such teeth for the propulsion of the carriage.

3. In combination with a mining-machine such as described, a guiding and supporting rail consisting of a single line or series of rail-sections joined end to end, each section being formed of a top and bottom bar and perpendicular pintles connecting them at intervals, said sections pivotally and detachably joined together at their ends, jack-posts or extensible props located at one side of such line of rails at sufficient distance to allow the machine to pass, and connections between the rails and jack-posts.

4. A single line or series of rail-sections, each section provided with means for adjustably supporting it, said sections pivotally and detachably joined together at their ends, whereby a horizontal adjustment of the alignment of the several sections is permitted to conform to the irregularity of the mine-face along which the work is performed, in combination with a machine adapted to travel along such rail, and a pinion upon a vertical shaft forming a part of the machine, such pinion co-operating with the rail to feed the machine, substantially for the purpose specified.

5. The combination of a self-propelling mining-machine having a laterally-projecting cutting mechanism mounted upon a carriage and adapted to continuous travel, a rail extending lengthwise of the mining or face to be cut, made up of a series of sections separably joined together at their ends, so as to bend in a horizontal plane at these points to conform to the irregularities in the face to be cut, the sections being provided with means for removably fixing them in position at an elevation from the floor of the mine, leaving a free space under and between the rail and the floor, teeth upon the rail-sections the pitch-line of which is substantially in line of the articulations, and a pinion mounted upon the carriage to engage with the teeth upon the rail for the propulsion of the carriage, the work being performed by the side or edge of the laterally-projecting cutting device.

6. A series of rail-sections, each consisting of an upper and a lower bar and intermediate perpendicular connecting-pintles, said sections detachably and pivotally connected at each of their ends by one of the pins, forming with the other pintles members of a series of teeth, in combination with a mining-machine adapted to travel along such rail by a pinion on a vertical shaft which engages with such pintles.

7. A series of longitudinal rail-sections, each having an upper and a lower bar and intermediate connecting-pintles, said sections being separably and pivotally connected end to end by pins, forming with the pivot and also with the pintles members of a series of teeth for co-operation with a pinion on the machine, and a vertical shaft upon which the pinion is mounted.

8. In combination with a mining-machine mounted upon a traveling carriage and adapted to continuous travel along a rail, a jack-screw bearing against the floor and the roof of the mine, a bracket mounted upon the jack-screw and projecting laterally therefrom, and a rail supported on the bracket at a distance from the jack-screw, whereby the machine is permitted to travel continuously along the rail and past the jack-screw.

9. In combination with a mining-machine, substantially as described, a series of jack-screws bearing against the floor and the roof of the mine, a bracket extending laterally from each, adjustably secured to one of the members of the jack, and a series of rails upon the brackets for the support and guidance of the machine.

10. In combination with a mining-machine, substantially as described, a series of jack-screws bearing against the floor and roof of the mine, a bracket extending laterally therefrom, having an internally-threaded portion and an externally-threaded portion on one of the members of the jack, and a series of rails upon the brackets for the guidance and support of the machine.

11. A jack-post bearing against the floor and the roof of the mine, a laterally-projecting bracket supported upon the jack-screw and vertically adjustable thereon, and a rail supported upon the bracket at a distance from the jack-post sufficient to admit the passage of the machine past the same, in combination with a machine supported upon the rail provided with wheels having flanges upon both sides of the track.

12. A series of jack-posts or extensible props resting upon the floor and bearing against the roof of the mine, brackets vertically adjustable on the jack-posts, and rail-sections rigidly attached to said brackets at a distance from the jack-posts sufficient to admit the passage of the machine past the jack-screw, the various sections united forming a continuous rail and coupled by a pivot admitting of the alignment being varied.

13. As a means of securing the cutting-teeth in the chain, the combination of the chain, the cutting-teeth in pairs, the grooved plate 52, and the set-screw 53.

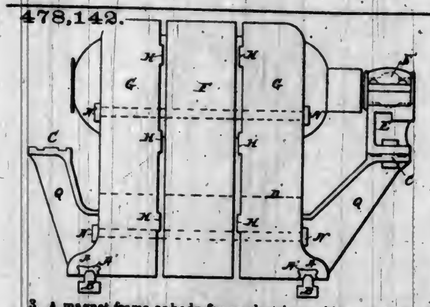
14. In a mining-machine, the combination of a projecting arm, a wheel-bearing for the cutting-chain and having a groove within the hub, and spherical balls within the groove and between the same and a centrally-located portion of the arm.

15. In a mining-machine such as described, a bearing for the outboard-wheel carrying the cutting-chain, consisting of the combination of the wheel, the balls *u*, the inner ring *p*, and the plug *r*, with the upper and lower plates *s''* of the arm.

16. The combination of the wheel having the groove within the hub and a groove on the arm, the groove on one of these elements being formed of two parts removably secured together, with balls in the grooves between the wheel and the arm.

17. The combination of the wheel having the groove within the hub, balls in the groove, a containing or supporting plate on each side of the wheel bearing two parts removably secured together and which form a groove opposing that in the hub of the wheel, and projecting flanges upon the parts which form the groove, whereby the plates are clamped together.

18. The combination of a self-propelling mining-machine having a laterally-projecting cutting mechanism mounted upon a carriage and adapted to continuous travel, a rail extending lengthwise of the mining or face to be cut, made up of a series of sections separably joined together at their ends, so as to bend in a horizontal plane at these points to conform to the irregularities in the face to be cut, the sections being provided with means for removably fixing them in position, teeth upon the rail-sections the pitch-line of which is substantially in line of the articulations, and a pinion mounted upon the carriage to engage with the teeth upon the rail for the propulsion of the carriage, the work being performed by the side or edge of the laterally-projecting cutting device, in combination with a bearing pressed upon the lateral edge or edges of the rail and located at the rear of the machine, whereby the thrust of the laterally-projecting arm is resisted.



19. In a mining-machine, a chain having a series of cutter-bearing links which have cutters inserted therein in pairs in an opening located at one side of the longitudinal middle of the link, and a plate bearing against the shank of both teeth of a pair and secured therein by a set-screw passing through the thick side of the link.

478,142. DYNAMO-ELECTRIC MACHINE OR MOTOR. ELMER A. SPERRY, Chicago, Ill., assignor to the Thomson-Houston Electric Company, Boston, Mass. Filed Nov. 16, 1891. Serial No. 411,963. (No model.)

Claim.—1. A magnet frame or body for an electric machine, consisting of a U-shaped casting without joint in the magnetic path and without bed frame or bed-plate, way-grooves in the body for its support, and brackets integral therewith extending laterally and upwardly from the horizontal portion of the magnet-body for the support of the journals.

2. A magnet frame or body for an electric machine, consisting of a U-shaped casting without joint in the magnetic path and without bed-frame or bed-plate, way-grooves in the body for its support, ways co-operating with such way-grooves for the support of the machine, the two upright portions of the U-shaped body consisting of straight portions for the reception of the magnet-coils, and brackets integral therewith extending laterally and upwardly from the horizontal portion of the magnet-body for the support of the journals.

478,143.

3. A magnet frame or body for an electric machine, consisting of a U-shaped casting without joint in the magnetic path and without bed-frame or bed-plate, way-grooves in the body for its support, pole-pieces integral therewith, and coil-spools adapted to slip over the pole-pieces, the upright portions of the U of such shape and size as to fill the magnet-spools, substantially as and for the purpose specified.

4. In an electric machine the magnets of which are made up of casting or castings without joint in the magnetic path, without bed-frame or bed-plate, having way-grooves cast therein, and ways adapted to co-operate with the grooves for the support of the machine, the organization being such that the ways are smaller than said grooves, in combination with filling inserted within the grooves between their walls and the surfaces of the ways, substantially as and for the purpose specified.

5. In an electric machine the magnets of which are made up of massive casting or castings of U shape without joint in the magnetic path, an arm cast integral therewith, joining said massive magnet-frame at a point below the upper surface of the horizontal part, protruding outward and bending upward from this point, and a journal-bearing mounted upon the extremity of the arm, the two upright portions of the U being supplied with magnet-coils, substantially as shown and described.

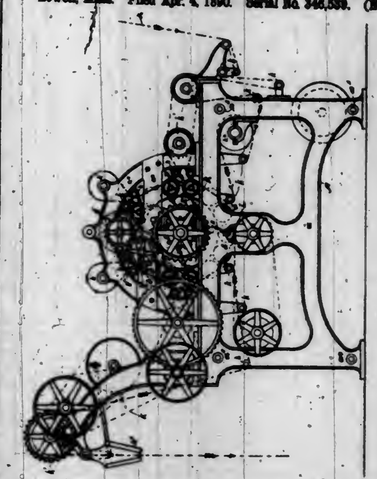
6. In an electric machine, a magnet consisting of a U-shaped casting without joint in the magnetic path, two brackets cast integral with such frame, joining same at a point below the upper surface of the horizontal portion, protruding therefrom outwardly and upwardly, and presenting surfaces at opposite ends of the armature-gap, and journal-supporting cases with concave spherical surfaces resting on such surfaces, in combination with journals with corresponding convex spherical surfaces adapted to rest within the journal-supporting cases, substantially as and for the purposes specified.

7. In a dynamo or motor, an armature the core of which is formed of slotted disks, a slotted flange on each end of the core and insulated therefrom, means for securing the flanges to the shaft and forcing them against the core, and winding-casings in the slots and extending through the flanges, whereby the core is caused to rotate with the flanges.

8. In a dynamo or motor, an armature the core of which is formed of slotted disks, slotted flanges on each end of the core, and winding-cases in the slots extending through the flanges and lapped over the flanges toward the shaft, in combination with the armature-coils.

9. In a dynamo or motor, an armature the core of which is formed of slotted disks, and winding-cases in the slots, which after the coils are wound are driven down at their lateral sides and spread out so as to cover the peripheral area of the coil or a portion thereof.

10. In a dynamo or motor, an armature the core of which is formed of slotted disks, and winding casings in the slots, said casings formed of material substantially such as described, and which after the coils are wound are driven down at their lateral sides and spread out so as to cover at least a portion of the peripheral area of the coil, in combination with a casing or insulation S, which covers all the coil and is secured by band-wires O.



11. In a dynamo or motor, an armature the core of which is formed of slotted disks, and coils within the slots, in combination with insulation which covers all the coils and which is secured by bands of soft-iron wire, which wire is wound in narrow bands the convolutions of which are soldered together, such bands being separated from each other by spaces, insulating them thereby from Foucault currents.

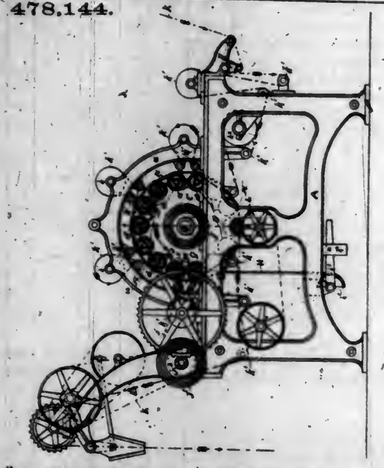
12. In a dynamo or motor, an armature the core of which is formed of slotted disks, and winding-casings in the slots, said casings formed of vulcanized fiber, rawhide, parchment, or any fibrous, tough, hard insulating material, and which after the coils are wound are driven down at their lateral sides and spread out so as to extend over at least a portion of the peripheral area of the coils, in combination with a casing or insulation S, which covers all the coils and is secured by bands of soft-iron wire, which wire is wound in small bands the convolutions of which are soldered together, and the bands separated from each other by spaces insulating them from Foucault currents.

13. In a dynamo or motor, an armature having longitudinal grooves in the periphery of its core and coils of opposite potential wound in each groove, those in any groove being wound through the diametrically-opposite groove, the coils of the same potential in any groove being in groups of two, the size and proportion of the grooves being such that the groups of two coils of the same potential are in whole or part superposed or wound upon each other and come out in even layers, with the coils of the same potential connected to the same side of the commutator.

14. In a dynamo or motor, an armature having longitudinal grooves in the periphery of its core and coils of opposite potential wound in each groove, those in any groove being wound through the diametrically-opposite groove, the coils of the same potential being in groups of two, the size and proportion of the groups being such that the groups of two coils of the same potential are in whole or part superposed or wound upon each other and come out in even layers, with flat strips of insulation between the coils of different potential in the same groove and the coils of the same potential connected to the same side of the commutator.

478,148. CLOTH-NAPPING MACHINE. EDWARD W. THOMAS, Lowell, Mass. Filed Apr. 4, 1890. Serial No. 346,569. (No model.)

Claim.—1. The combination of the napping-cylinder consisting of heads or spiders and napping-rolls journaled therein, said napping-rolls having tapering fast pulleys, a tapering driving-pulley concentric with said napping-cylinder and having its face in contact with the faces of said first-named tapering pulleys, the axes of said napping-cylinder and of all said pulleys being parallel with each other, and means of adjusting said driving-pulley in the line of its axis to increase the frictional contact between its face and the faces of said pulleys, as and for the purpose specified.



2. The combination of the napping-cylinder consisting of heads or spiders and napping-rolls journaled therein, said napping-rolls having tapering fast pulleys, a gear having an externally-screw-threaded hub and a tapering driving-pulley concentric with said napping-cylinder and having its face in contact with the faces of said first-named tapering pulleys and having an internally-screw-threaded hub to receive and engage the hub of said gear, as and for the purpose specified.

3. The combination of the napping-cylinder consisting of heads or spiders and napping-rolls journaled therein, said napping-rolls having tapering fast pulleys, a gear having a hub externally screw-threaded and provided with longitudinal slots, a tapering driving-pulley concentric with said napping-cylinder and having its face in contact with the faces of said first-named tapering pulleys and having an internally-screw-threaded hub to receive and engage the hub of said gear, and a screw turning in a hole with which said last-named hub is provided and entering one of said longitudinal slots in the hub of said gear, as and for the purpose specified.

478,144. MACHINE FOR NAPPING CLOTH. EDWARD W. THOMAS, Lowell, Mass. Filed Apr. 4, 1890. Serial No. 346,573. (No model.)

Claim.—1. The combination of the napping-cylinder consisting of heads or spiders and napping-rolls journaled in said heads, said napping-rolls being provided with fast pulleys, a belt extending around all said

478,144.

pulleys and in contact therewith and causing the same to be rotated by frictional contact therewith when said napping-cylinder is rotated, one end of said belt being fast, and a weight to draw the other end of said belt and to cause a uniform tension thereon, as and for the purpose specified.

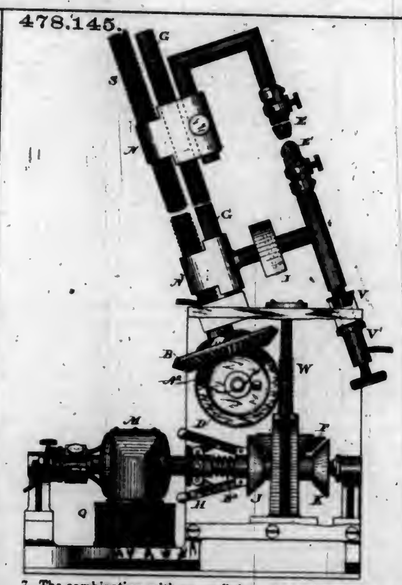
2. The combination of the napping-cylinder consisting of heads or spiders and napping-rolls journaled in said heads, said napping-rolls being provided with fast pulleys, a belt extending around all said pulleys and in contact therewith and causing the same to be rotated by frictional contact therewith when said napping-cylinder is rotated, one end of said belt being fast, a lever connected to the other end of said belt, and a weight supported on said lever to cause a uniform tension on said belt, as and for the purpose specified.

3. The combination of the napping-cylinder consisting of heads or spiders and napping-rolls journaled in said heads, said napping-rolls being provided with fast pulleys, a belt extending around all said pulleys and in contact therewith and causing the same to be rotated by frictional contact therewith when said napping-cylinder is rotated, one end of said belt being fast, a lever connected to the other end of said belt, and a weight adjustable on said lever to vary the tension of said belt, as and for the purpose specified.

478,145. ELECTRIC-ARC LAMP. ELIHU THOMSON, Lynn, Mass., assignor to the Thomson-Houston Electric Company, of Connecticut. Filed Mar. 22, 1890. Serial No. 344,936. (No model.)

Claim.—1. The combination, with an arc-lamp carbon, of a constantly-running motor controlled by and responsive to the current or electro-motive force between the terminals of the arc or lamp and a speed-responsive device connecting the carbon with the motor, so as to cause the motor to operate the carbon on a variation from normal speed.

2. The combination, with an arc-light carbon, of an electric motor constantly in operation and a speed-responsive device connecting said carbon with the motor, so as to be actuated thereby upon a variation from the normal speed of the motor.



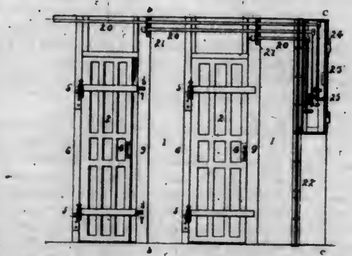
3. The combination, with an arc-light carbon, of an electric motor on the same circuit and depending upon the electrical conditions of the arc and a speed-responsive device actuated by the said motor and adapted to connect the carbon with the motor, so as to be actuated thereby upon a variation from the normal speed of the motor.

4. The combination, with an arc-light carbon, of operating mechanism therefor, an electric motor constantly in operation and depending upon the electrical condition of the arc, and a speed-responsive device driven by said motor and adapted to connect the said motor with the said mechanism upon a variation from the normal speed of the motor.

5. The combination, with two arc-light carbons, of a common actuating mechanism therefor, an electric motor actuated constantly and depending upon the condition of the arc, and a speed-responsive device adapted to connect the motor with the said mechanism on a variation from the normal speed of the motor.

6. The combination, with an arc-light carbon, of an electric motor constantly in operation, speed-reducing mechanism through which the motor may act upon said carbon, and a speed-responsive device for mechanically connecting the motor and the carbon through said mechanism upon a variation from the normal speed of the motor.

478,145.



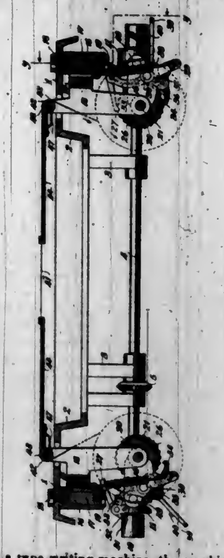
7. The combination, with an arc-light carbon, of actuating mechanism therefor having a friction-wheel for driving the same, an electric motor, two pinions driven by the motor, and a speed-responsive device adapted to bring one or the other of said pinions in contact with said friction-wheel upon a variation from the normal speed of the motor.

8. The combination, with two arc-light carbons, of a shaft having two screw-threads thereon of different pitch, a nut connecting each of the said carbons with the two screw-threads, respectively, an electric motor in continuous operation, and a speed-responsive device connecting the said motor with the said shaft upon a variation from its normal speed.

9. The combination, with a constant-potential circuit, of an arc lamp included therein, a constantly-running electric motor having driving connections with a carbon of said lamp and having its armature in circuit with the arc, and speed-responsive devices connected to such motor and changing or reversing its driving relation to said carbon.

10. The combination, with a constant-potential circuit, of an arc lamp included therein, an electric motor also included in said circuit, and a speed-responsive device connecting the said motor with the said carbons either to approach or to separate them upon a variation from the normal speed of the motor.

478,146. BOLT FOR PRISON-DOORS. FRANK O. WEARY and GEORGE W. KRAMER, Akron, Ohio. Filed Oct. 5, 1891. Serial No. 407,715. (No model.)



Claim.—1. In a prison-locking apparatus, the hinged cell-door having bolt-eyes and a hollow jamb-post having openings to receive said eyes, and vertically-moving bolts within said jamb-post, arranged to enter said eyes, combined with springs located in said jamb-post, arranged to be engaged and pressed inward by said eyes and provided with toes to rest under and sustain the bolts as the eyes are withdrawn, substantially as shown and described.

2. In a prison-locking apparatus, the hinged cell-door having bolt-eyes and a hollow jamb-post having openings to receive said eyes, and vertically-moving bolts within said jamb-post, arranged to enter said eyes, and springs located in said post, arranged to be engaged and pressed inward by said eyes, combined with an adjusting device, as a cam, by which the tension of the spring may be regulated.

3. The combination, with the rock-shaft arranged to operate the locking-bolts and the hand-lever arranged to rock said shaft, of the automatic latch attached to said hand-lever, and the notched segmental guide-bar arranged to be engaged by said latch, substantially as shown and described.

478,147. TYPE-WRITING MACHINE. GEORGE B. WEBB, New York, N. Y., assignor to the Remington Standard Type Writer Manufacturing Company, same place. Filed Jan. 21, 1892. Serial No. 418,784. (No model.)

Claim.—1. In a type-writing machine, the combination, with an inking-ribbon, of a ribbon-spool shaft, a ribbon-spool, a ratchet-wheel, a spring-actuated lever carrying a driving-pawl and provided with a laterally-extending arm, and an actuating-cam arranged to turn in a plane at right angles to the plane of vibration of the pawl-carrying lever.

2. In a type-writing machine, the combination, with an inking-ribbon, of a ribbon-spool shaft, a ribbon-spool, a ratchet-wheel, a spring-actuated lever carrying a driving-pawl and provided with an arm, a constantly-rotating shaft, and a cam on said shaft acting in opposition to the spring on the lever to retract the driving-pawl and constructed to release said arm after retraction of said pawl to enable the said spring to vibrate said lever and cause its pawl to turn the ratchet-wheel and wind the ribbon.

3. In a type-writing machine, the combination, with an inking-ribbon, a ribbon-spool shaft, a ribbon-spool, a ratchet-wheel, a spring-actuated lever carrying a driving-pawl and provided with an arm, a cam for actuating said lever in one direction, a detent engaging said ratchet-wheel, and a projection on said lever adapted to move said detent when said lever is vibrated to throw its driving-pawl out of operative relation to its ratchet-wheel.

4. In a type-writing machine, the combination, with an inking-ribbon, a ribbon-spool shaft, a ribbon-spool, a ratchet-wheel, a lever carrying a driving-pawl, means connected to the carriage-driving power for vibrating said lever and retracting said driving-pawl, and a spring for vibrating said lever in the opposite direction and advancing said pawl.

5. In a type-writing machine, the combination, with an inking-ribbon, a ribbon-spool shaft, a ribbon-spool, a ratchet-wheel, a lever carrying a driving-pawl, means for vibrating said lever and retracting said pawl, and a spring for vibrating said lever in the opposite direction and advancing said pawl and arranged so as to act on either side of the center of motion or pivot of the said lever, whereby when desired the said spring may operate to hold the driving-pawl out of operative relation with its ratchet-wheel.

6. In a type-writing machine, the combination, with an inking-ribbon, a ribbon-spool shaft, a ribbon-spool, a ratchet-wheel, a lever provided with an arm, a constantly-rotating cam for vibrating said lever in one direction, a spring for vibrating said lever in the opposite direction, adapted to act on both sides of the center of motion or pivot of said lever, and a detent for said ratchet-wheel, adapted to be disengaged by said lever when the latter is vibrated to throw its driving-pawl out of operative relation with its ratchet-wheel.

7. In a type-writing machine, the combination of a ribbon-spool, a ratchet-wheel, a cranked lever carrying a driving-pawl and provided with a laterally-extending arm, a cam operating upon said arm to move said lever in one direction, and a spring connected at one end to said lever and at its other end to the frame-work for moving said lever in the opposite direction and causing said driving-pawl to turn said ratchet-wheel.

8. In a type-writing machine, the combination of a ribbon-spool having a cut-away or recess between its ends, a ribbon-spool shaft having an annular groove arranged between the ends of said spools and communicating with said cut-away or recess, and an arm on said ribbon-spool having a bent or hook-shaped end engaging with said annular intermediately-arranged groove.

9. In a type-writing-machine, the combination, with an inking-ribbon, of a vertically-pivoted vibratory frame provided with a ribbon-spool and a ribbon-carrier.

10. In a type-writing machine, the combination, with an inking-ribbon, of a vertically-pivoted vibratory frame provided with a ribbon-spool and a ribbon-carrier and a cam for rocking said frame.

11. In a type-writing machine, the combination, with an inking-ribbon, of a vertically-pivoted vibratory frame provided with a ribbon-spool and a ribbon-carrier, and a constantly-rotating shaft provided with a cam adapted to rock said frame first in one direction and then in the opposite direction to cause the ribbon-carrier to move the ribbon widthwise both forwardly and rearwardly.

12. In a type-writing machine, the combination, with an inking-ribbon, of a vertically-pivoted vibratory frame, a spool-shaft journaled in said frame, a ribbon-spool on said shaft, a ribbon-carrier mounted on said frame, and means for rocking said frame.

13. In a type-writing machine, the combination, with an inking-ribbon, of a vertically-pivoted vibratory frame, a spool-shaft journaled in said frame, a ribbon-spool mounted on said shaft, a ribbon-carrier mounted on said frame, and means for rotating said spool and rocking said frame.

14. In a type-writing machine, the combination, with an inking-ribbon, of a vertically-pivoted vibratory frame, a ribbon-spool shaft journaled in said frame, a ribbon-spool on said shaft, a horizontally-arranged bar mounted on said frame, a ribbon-carrier supported upon said bar, a pin projecting laterally from said frame, and a constantly-rotating cam to co-operate with said pin.

15. In a type-writing machine, the combination, with an inking-ribbon, of a vibratory frame consisting of the vertical member 13, a horizontal arm 14, and the plate-like portion 15, a ribbon-spool shaft journaled in said frame, a ribbon-spool mounted on said shaft, a horizontal bar mounted on said frame, a ribbon-carrier mounted on said bar, a pin projecting laterally from said frame, a cam for actuating said pin, and a vertical pivot for said frame.

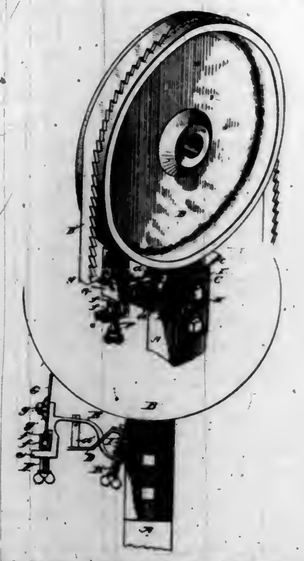
16. In a type-writing machine, the combination, with an inking-ribbon, of a pair of horizontally hinged or pivoted ribbon-carriers extending inwardly toward each other and in the direction of travel of the paper-carriage, and adapted to be turned up in opposite directions to lift the ribbon, so that the operator may conveniently clean the type.

17. In a type-writing machine, the combination, with an inking-ribbon, of a horizontally-arranged supporting-bar disposed at substantially right angles to the length of said ribbon, a ribbon-carrier pivoted or hinged at one end upon said bar and extending in the direction of the length of said ribbon, so that it may be turned to an upright position, and means, substantially as described, for maintaining said carrier in such upright position.

18. In a type-writing machine, the combination, with an inking-ribbon, of a horizontally-arranged supporting-bar formed with notches or depressions and a ribbon-carrier hinged or pivoted upon said bar and provided with a spring plate or finger.

19. In a type-writing machine, the combination, with an inking-ribbon, of a pair of vertically-pivoted vibratory frames, a pair of ribbon-carriers connected to said frames, and means, substantially as described, for rocking both said frames and moving said carriers simultaneously in the same direction.

20. In a type-writing machine, the combination, with an inking-ribbon, of a pair of independent vertically-pivoted vibratory frames, a ribbon-carrier connected to each of said frames and projecting inwardly toward each other, and a pair of constantly-rotating cams adapted to simultaneously rock both of said vibratory frames and cause the ribbon-carriers to simultaneously move laterally in the same direction.



21. In a type-writing machine, the combination, with an inking-ribbon, of a pair of independent vertically-pivoted vibratory frames

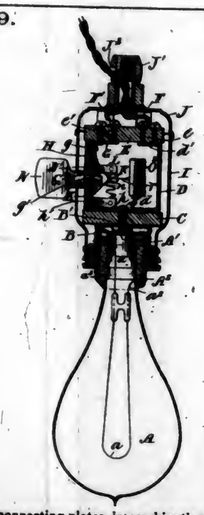
provided with ribbon-spools and ribbon-carriers, means for turning one of said spools at a time, and a pair of cams for rocking said frames first in one direction and then in the other and constructed to delay or momentarily stop said rocking action at the time the means for turning the ribbon-spool are acting or are in operation.

22. In a type-writing machine, the combination, with an inking-ribbon, of a pair of independent vertically-pivoted vibratory frames provided each with a ribbon-spool and a ribbon-carrier, a ratchet-wheel connected to each said spool, a spring-actuated lever connected to each said vibratory frame and carrying a driving-pawl, a cam for rocking each said vibratory frame, and a cam for actuating each said pawl-carrying lever in one direction.

23. In a type-writing machine, the combination, with an inking-ribbon, of a vertically-pivoted vibratory frame provided with a ribbon-spool and a ribbon-carrier, a ratchet-wheel connected to said spool, a driving-pawl for turning said ratchet-wheel pivotally connected to a lever, a cam for rocking said vibratory frame, a cam for actuating said pawl-carrying lever in one direction, and a spring for actuating said lever in the opposite direction.

478,148. SCRAPER FOR BAND-SAW PULLEYS. JOSEPH H. WHITE, Baraga, Mich. Filed Mar. 8, 1892. Serial No. 424,203. (No model.)

Claim.—1. In a scraper for band-saw pulleys, the combination, with the pulley and its support, of a shelf mounted on the support, a rock-arm mounted on the shelf, a scraper-plate yieldingly secured to one end of the arm, and a spring exerting its force on the opposite end of the arm to normally hold the scraper-plate in contact with the pulley, substantially as and for the purposes described.

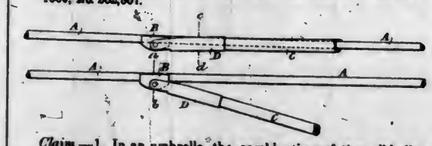


2. In a scraper for band-saw pulleys, the combination, with the pulley and its support, of a shelf attached to the support, a rock arm mounted on the shelf, a scraper-plate yieldingly secured to one end of the rock-arm, a roller mounted in the arm for holding the plate in even contact with the pulley, and a spring for normally holding the plate in contact with the pulley, substantially as and for the purposes described.

3. In a scraper for band-saw pulleys, the combination, with the pulley and its support, of a shelf attached to said support, pedestals on the shelf, a rock-arm mounted in the pedestals, a scraper-plate secured on one end of the arm, an adjustable roller normally contacting with the base of the scraper-plate, a spring for exerting force on the other arm, and means for regulating the tension of the spring, substantially as and for the purposes specified.

478,149. INCANDESCENT-ELECTRIC-LAMP SOCKET. HENRY R. WORTHINGTON, Lancaster, assignor, by direct and mesne assignments, to the Worthington Electrical Specialty Company, York, Pa. Filed Dec. 22, 1891. Serial No. 415,993. (No model.)

Claim.—1. A light-regulating device for electric lamps, consisting

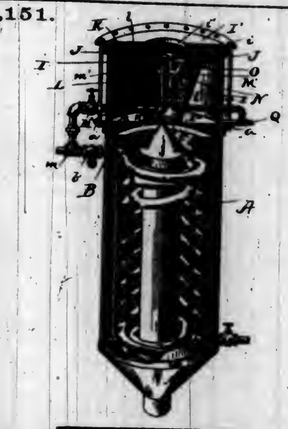


478,149.

of a switch and connecting-plates, in combination with a series of resistances which are connected together and severally connected to the said plates and a rigid supporting bar or brace H within the lamp-socket, through which the terminals of the said resistances pass, the said bar not forming part of any inclosure, but being a simple supporting and bracing device for the said resistances, substantially as set forth.

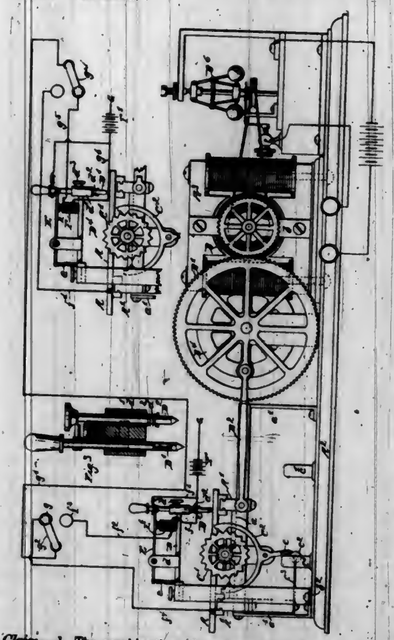
2. In an electric-lamp socket, a series of connected resistances composed of carbon filaments and connecting-springs, the latter serving to give stiffness, substantially as described.

478,150. FRAME FOR UMBRELLAS. JAMES WILLIS, Bournemouth, England. Filed Dec. 8, 1891. Serial No. 414,419. (No model.) Patented in England July 13, 1889, No. 11,295, and in France Dec. 26, 1889, No. 202,807.



Claim.—1. In an umbrella, the combination of the solid ribs A, the solid goats B, made to embrace the ribs, of a width approximately equal to the width of the ribs and of a depth approximately equal to the depth of the stretchers, trough-stretchers C, having forked inner ends embracing the goats, and joint-pins passing through the stretcher-forks and through holes in the goats drilled close up to the ribs, whereby a lock-rib frame is produced in which solid ribs lie within trough-stretchers, and goat-pieces are provided sufficiently small not to project beyond the stretchers and yet strong enough to make a sound hinge-joint.

2. In an umbrella, the combination of the solid ribs, solid goats secured thereto of a width approximately equal to the width of the ribs and of a depth approximately equal to the depth of the stretchers, the trough-stretchers, the sheet-metal end pieces D, secured thereto, and having forked ends inclined, as described, and joint-pins securing the forked ends of the stretchers to the goats, substantially as described.



478,151. STEAMING ATTACHMENT FOR WHEAT-HEATERS. SAMUEL M. BRADEN, Ligonier, Ind. Filed Dec. 26, 1891. Serial No. 416,117. (No model.)

Claim.—In a steaming attachment for wheat-heaters, the combination, with outer and inner chambers separated by a perforated inverted-frusto-conical wall, the inner chamber being in open relation with the induction and eduction openings at the steaming attachment, of a steaming-head located within the inner chamber, said steaming-head having a conical top and having an annular series of slits or perforations below such conical top, a steam-pipe for supplying steam to the steaming-head, a hood for preventing the ejection of condensed steam from the annular series of slits or perforations in the steaming-head aforesaid, and drain-pipes for conducting off the water resulting from condensation of steam or otherwise, substantially as and for the purpose set forth.

478,151.

478,152. DEVICE FOR REPRODUCING CHARACTERS. HENRY C. BRIDGER, Wood Ridge, N. J., assignor to the United States Autograph Telegraph Company, New York, N. Y. Filed Aug. 10, 1891. Serial No. 402,218. (No model.)

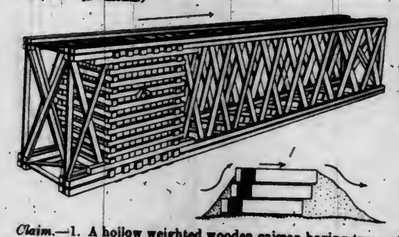
Claim.—1. The combination of an electric circuit, a movable table upon which a message is supported, a message of metallic ink on an insulating material, and a transmitting-point coacting with the message to close the circuit, the said table having a continuous to-and-fro motion and a step-by-step lateral motion, substantially as specified.

2. The combination, with the table having a to-and-fro and a lateral movement and independent mechanism, substantially such as described, for causing each of said movements, of a pen-supporting arm adjustably mounted over said table, substantially as specified.

3. The combination, with an electric circuit, of a pen and table having a to-and-fro and a lateral movement beneath the pen and independent mechanism, substantially such as described, for causing each of said movements, substantially as specified.

4. The combination, with the pen, of a table, a motor for imparting a to-and-fro movement to said table, and a screw for imparting a lateral movement to said table, substantially as specified.

5. In a device of the character designated, the combination of the pen, the table, a carriage upon which the table is movable laterally, a way upon which the carriage is movable to carry the table to and fro, a motor for causing such movement, and a screw operated at the ends of the to-and-fro motion to impart a lateral movement to the table, substantially as specified.



478,153. TOBACCO-HANGER. BENJAMIN R. BYRNSIDE, Clifty, W. Va. Filed Jan. 4, 1892. Serial No. 417,008. (No model.)

Claim.—1. A tobacco-hanger made of an integral piece and provided on its opposite edges with oblique slots, said slots being wider upon one face than upon the other and the slots from one edge terminating inwardly opposite the entrance of the slots in the opposite edge, substantially as described.

2. A tobacco-hanger formed of an integral piece and provided with oblique slots, said slots being wider upon one face than upon the other, substantially as described.

478,154. MOLE, DIKE, OR DAM FOR SILT-BEARING STREAMS. WILLIAM W. CARSON, Knoxville, Tenn. Filed July 24, 1891. Serial No. 400,655. (No model.)

Claim.—1. A hollow weighted wooden caisson having trusses for faces, as described, and for the purpose set forth.

2. A weighted wooden caisson built with one or more chambers to receive deposits of silt and with trusses for faces, as described, and for the purpose set forth.

3. A wooden caisson built with one or more chambers to contain material to sink it and with trusses for faces, as described, and for the purpose set forth.

4. A wooden caisson built with one or more chambers to contain material to sink it and one or more internal cavities to receive deposits of silt, as described, and for the purpose set forth.

5. A wooden caisson weighted at or near one end and of such shape that its smallest cross-section shall be approximately at right angles to the current when the weighted end of the caisson is placed upstream, as described, and for the purpose set forth.

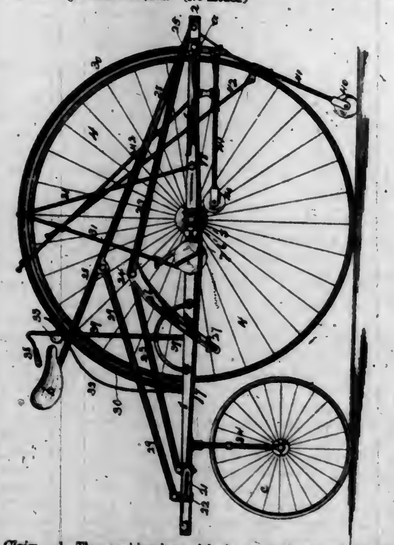
6. A wooden caisson consisting of one or more chambers to contain material to sink it and one or more projecting cores for silt to gather around and about, as described, and for the purpose set forth.

7. An elongated hollow wooden caisson of sawed lumber, constructed so as to embody these three features: (*a*) some or all of the pieces of lumber which compose two adjacent longitudinal faces of the caisson to project the pieces of one face beyond the plane of the other face, thus defining the dihedral angles of the intersecting planes, (*b*) a chord composed of three (3) or more parallel stringers placed, respectively, in the different dihedral angles mentioned above and alongside of each other to lie along and about the line of intersection of the aforesaid faces; (*c*) a wooden pin to connect together two of the chord-stringers with the face-piece which passes between them, all substantially as described, and for the purpose set forth.

478,155. ELECTRIC ALARM-CLOCK. GEORGE C. DARBEE, Chicago, Ill. Filed June 1, 1891. Serial No. 394,636. (No model.)

Claim.—1. In an electric alarm-clock, the battery and alarm, in combination with the spring L, the contact-wheel H, carrying the insulated terminal f^3, the shaft G, carrying the pin g', and gearing adapted

478,155.



to rotate said contact-wheel synchronously with the hour-hand, substantially as described.

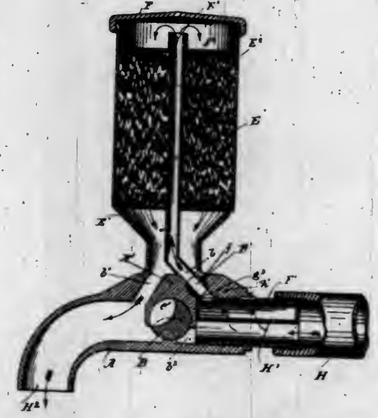
2. In an electric alarm clock, the shaft G, mounted loosely in its bearings and provided with a pin g' at one end, in combination with the contact-wheel H, mounted loosely on said shaft and carrying an insulated terminal j^3, adapted to make contact with said pin, which constitutes the other terminal of the circuit, gearing adapted to rotate said wheel synchronously with the hour-hand, and an indicator by which to adjust the shaft G to set the alarm, substantially as described.

3. In an electric alarm-clock, the shaft G, provided at one end with the pin g', forming one terminal of the circuit, in combination with a contact-wheel mounted loosely on the pin end of said shaft and consisting of a gear-wheel, the insulating-disks I and K and the metal disk J, provided with the other terminal j^3, and the spring L, arranged to bear upon the periphery of the disk J and connected at its other end with the circuit-wires, substantially as described.

478,156. BICYCLE. ANDREW W. DUNN, Pulaski, N. Y. Filed Sept. 14, 1891. Serial No. 405,661. (No model.)

Claim.—1. The combination, with the main frame and the propelling-wheel journaled therein, of the vertically-movable treadle-frame carrying the pedals and pivotally connected at one end to the frame and at the other to slides upon the side bars of the frame, and pitman-rods connecting said slides to the crank-pins of the wheel-propelling mechanism.

2. The combination, with the main frame, the propelling-wheel, and the saddle, of the vertically-movable treadle-frame carrying the pedals and pivotally connected at one end to the frame and at the other to slides upon the side bars of the frame, and pitman-rods connecting said slides to the driving-crank pins, and the saddle-frame comprising the saddle rails pivotally connected at one end to the main frame, the connecting-rods hinged at one end to the rails and at the other to slides upon the side bars, and the pitman-rod extensions connecting the latter slides to said crank-pins.



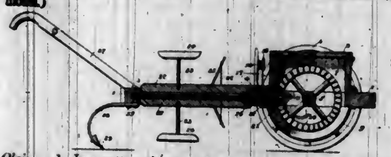
3. In a velocipede, a saddle mounted upon a vertically-movable frame, which is mounted upon the main frame, and a vertically-movable treadle-frame mounted upon the main frame, and pitman-rods connecting the treadle and saddle-frames to the drive-crank pin, in combination.

4. In a velocipede, a main frame, a caster-wheel journaled in a yoke, a pinion upon the top of said yoke, rack-bars in said frame engaging with the pinion, and crank-handle bars engaging with said rack-bars, in combination, as set forth.

5. In a velocipede, a drive-wheel provided with a groove across its face, a crank-pin mounted in said groove, a spring-bolt through the crank-pin engaging with the drive-wheel, and a crank-lever connected to the outer end of said bolt, in combination, as set forth.

6. In a velocipede, a main frame, a saddle-carrying frame mounted thereon, a treadle-frame also mounted upon the main frame, and a pitman-rod connecting the treadle-frame to the drive-crank pin and to the saddle-frame, whereby the free end of the saddle is moved vertically when said treadle-frame is operated, in combination, as set forth.

478,157. WATER-FILTER. OLAF EASTMAN, San Francisco, Cal. Filed Jan. 13, 1892. Serial No. 417,916. (No model.)

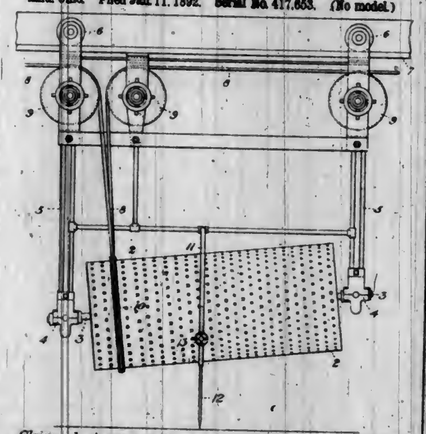


Claim.—1. The combination, with the faucet having one end forming an inlet and the other forming an outlet, the passage b, leading upward from the inlet, the passage b^3, leading directly from the inlet to the outlet, and the passage b', leading from the top of the faucet to the outlet, of valves mounted in the passages b b^3, and a filter secured on the faucet and communicating with the passages b b'.

2. The combination, with the supply-pipe, of a faucet having a plurality of water-passages, a filter secured on the faucet, a coupling connecting the faucet and the supply-pipe and provided with a longitudinal strainer, and valves mounted in the water-passages and adapted to force the water through the filter or directly through the faucet.

3. The combination of the faucet having passages b b' b^3, a supply-pipe, a coupling connecting the supply-pipe and the faucet and provided with a longitudinal strainer, valves mounted in the passages b b^3, and a filter secured on the faucet and having a central pipe forming a continuation of the passage b.

4. The combination, with the faucet provided with water-passages, filter secured thereto, removable cap secured to the filter, pipe passing through the filtering material and having its discharge in a chamber thereabove, said pipe forming a continuation of the filter-passage of the faucet, rotatable valves secured within the faucet and controlling the water-passages, said valves connected so that the opening of one closes the other, and a coupling forming connection between the faucet and supply-pipe and of the strainer located therein, as and for the purpose set forth.



478,158. COTTON-CHOPPER. ELISHA A. ELLIS and WILLIAM C. S. WOOD, Grassy Pond, S. C. Filed Nov. 17, 1891. Serial No. 412,172. (No model.)

Claim.—1. In a cotton-chopper, the combination, with the frame, the transverse axle, the ground-wheels, and the master-gear upon the axle, of the cross-bar of the frame-work having a longitudinal slot 11, the bottom of which has an opening 12, a sliding guiding-block mounted in the slot, a lever loosely connected with the bearing-block and fulcrumed loosely upon the bar, a curved toothed locking-bar mounted upon the cross-bar in front of the lever, the L-shaped bracket secured to the lever and loosely embracing the locking-bar, a transverse locking-pin extending from the bracket and engaging the teeth of the locking-bar, the chopper-shaft having its front end journaled in the bearing-block and extending through and beyond the same, and the gear-wheel mounted on the chopper-shaft and adapted to be thrown into engagement with the master-gear, substantially as specified.

2. In a cotton-chopper, the combination, with the frame-work, the chopping-shaft, and means for operating the same, of a hub mounted upon the shaft, hoes mounted on the hub, spokes radiating from the hub in front of the choppers, and a wire connecting the ends of the spokes, substantially as specified.

478,159. SEPARATING APPARATUS. EUGENE L. HOWE, Cleveland, Ohio. Filed Jan. 11, 1892. Serial No. 417,663. (No model.)

Claim.—1. A rotatory drum, in combination with a supporting-frame suspended from an elevated track, on which it is movable to change the position of the drum, as and for the purposes described.

2. A rotatory drum mounted on a movable support, in combination with a traveling power connection connected with the drum and adapted to rotate the same, substantially as and for the purposes described.

3. A rotatory drum, in combination with a supporting-frame movably suspended from an elevated track and a traveling power connection connected with the drum and adapted to rotate the same, substantially as and for the purposes described.

4. A rotatory drum, in combination with a supporting-frame movably suspended from an elevated track, a traveling power connection connected with the drum and adapted to rotate the same, and adjustable supporting-legs connected with the frame, substantially as and for the purposes described.

478,160. SASH-BALANCE. SAMUEL JENKINSON, Rochester, assignor, by mesne assignments, to the Vanderbilt Sash Balance Company, Canandaigua, N. Y. Filed Nov. 2, 1891. Serial No. 410,574. (No model.)

Claim.—1. The combination, with the front plate and the casing thereon, of the drum located entirely within the casing, the tape connected thereto, the cover-plate connected to the casing, having the arms projecting inside the drum, and the spring connected to said

478,160.

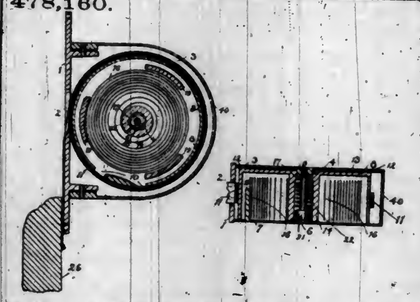


plate at its outer end and to the drum at its inner end, substantially as described.

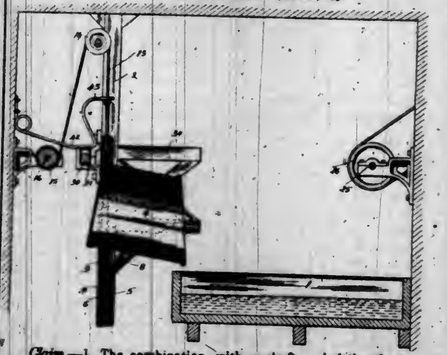
2. The combination, with the front plate and the rearwardly-projecting plate thereon, a second plate extending parallel with the latter, and a screw-pin connecting them and having a shoulder of the drum journaled on the pin and arranged with one of its sides in contact with one of the plates, of a spring for rotating it and a spring arranged between the shoulder on the pin and the drum, substantially as described.

3. The combination, with the front plate and the rearwardly-projecting plate thereon having the central boss, a second plate extending parallel with the other, and a screw-pin connecting the plates, having a shoulder, of the drum journaled on the pin and boss and arranged between the plates, a spring located between the shoulder on the pin and the drum, and a spring connected to one of the plates and to the drum for rotating the latter, substantially as described.



4. The combination, with the front plate, the rearwardly-projecting plate thereon having the central boss, and the screw-pin having the shoulder, of the drum journaled on said boss and pin, a spring arranged between the shoulder on the pin and the drum for pressing the side of the latter into engagement with the plate, and a spring for rotating the drum, substantially as described.

5. The combination, with the front plate, the rearwardly-projecting plate thereon, the screw-pin having the shoulder, the drum having the slotted sleeve or hub, and the collar in it, of the cover-plate having the arms, the spring connected thereto at one end and at the other to the drum, and the spring between the collar on the drum and the shoulder on the screw-pin, substantially as described.

6. The combination, with the front plate, the rearwardly-extending plate, and the drum having the peripheral flange and the central slotted hub, of the cover-plate having the arms projecting inside the drum, a spring connected to one of said arms at one end and to the hub of the drum at the other, and a tape adapted to be secured to the drum, substantially as described.

7. The combination, with the front plate, rearwardly-projecting plate, and cover-plate, of the drum arranged to engage one of the side plates, the spring for rotating it, and a spring arranged to press the drum into contact with the plate it engages, substantially as described.

478,161. MILK-ELEVATOR. CHRISTEN J. JEPPESEN, Hebron, Ind. Filed Feb. 18, 1892. Serial No. 422,157. (No model.)

Claim.—1. The combination, with a shaft, a hoisting-drum, a hoisting-rope, and a bucket, of fast and loose pulleys mounted upon said shaft, a belt for driving the fast pulley to rotate the shaft, and

mechanism thrown into action by a part of the bucket to shift the belt to the loose pulley when the bucket has been elevated, substantially as described.

2. The combination, with a shaft, a hoisting-drum, a hoisting-rope, and a bucket, of fast and loose pulleys mounted on the shaft, a belt for driving the fast pulleys to rotate said shaft, mechanism thrown into action by a part of the bucket to shift the belt to the loose pulley when the bucket has been elevated, and pawl-and-ratchet mechanism for controlling the descent of the bucket, substantially as described.

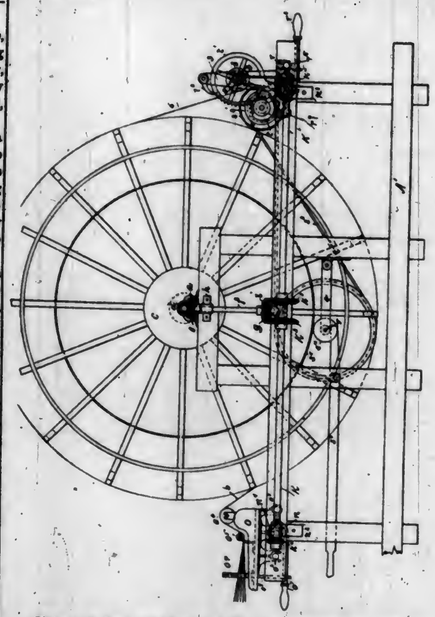
3. The combination, with a shaft, a hoisting-drum, a hoisting-rope, and a bucket, of fast and loose pulleys on the shaft, a belt for driving the fast pulley to rotate the shaft, a belt-shifting bar, a device located in the path of a part of the bucket for detaining said bar in position to hold the belt on the fast pulley, and means for automatically moving the belt-shifting bar when its detaining device is released by the action of a part of the bucket after the latter has been elevated, substantially as described.

4. The combination, with a shaft, a hoisting-drum, a hoisting-rope, and a bucket, of fast and loose pulleys on the shaft, a belt for driving the fast pulley to rotate the shaft, a spring-pressed belt-shifting bar, and a stop engaging the belt-shifting bar and released therefrom by the action of a part of the bucket when the latter has been elevated, substantially as described.

5. The combination, with a bucket, lateral guides therefor, and a shaft 16, of a hoisting-drum mounted upon said shaft, a hoisting-rope wound around said drum and connected to said bucket, loose pulleys 19 20 and fast pulley 21, mounted upon said shaft, means for locking said shaft to the pulley 19 when it rotates in one direction, belts 28 29, gearing said pulleys to suitable driving mechanism, and means for shifting the belt 29 to the loose pulley 20, substantially as and for the purpose specified.

6. The combination, with a bucket, lateral guides therefor, shaft 16, hoisting-drum mounted thereupon, and a hoisting-rope connected to said drum and to the bucket, of loose pulleys 19 and 20 and fast pulley 21, mounted upon said shaft, ratchet-wheel 22, rigidly connected to said shaft, pawl 23, mounted upon said pulley 19 and adapted to engage the teeth of said wheel 22, shaft 25, having pulley 27, belts 28 and 29, and means for shifting the belt 29 laterally, substantially as and for the purpose specified.

7. The combination, with a bucket, lateral guides therefor, shaft 16, hoisting-drum mounted thereupon, and a hoisting-rope connected to said drum and to the bucket, of loose pulleys 19 and 20 and fast pulley 21, mounted upon said shaft, ratchet-wheel 22, rigidly connected to said shaft, pawl 23, mounted upon said pulley 19 and adapted to engage the teeth of said wheel 22, shaft 25, having pulley 27, belts 28 and 29, and means for automatically shifting the belt 29 laterally when the bucket shall have reached its uppermost point, substantially as and for the purpose specified.



8. The combination, with a bucket, lateral guides therefor, shaft 16, a hoisting-drum mounted thereupon, and a hoisting-rope connected to said drum and to said bucket, of pulleys 19, 20, and 21, mounted upon said shaft, belts 28 and 29 for driving said pulleys, cross-bar 30, adapted to shift the belt 29 laterally, a stop adapted to hold said bar in a fixed position, and means for releasing said stop and causing said bar to move transversely to shift the belt 29, substantially as and for the purpose specified.

9. The combination, with a bucket, lateral guides therefor, shaft 16, drum mounted upon said shaft, hoisting-rope connected to said drum and to the bucket, and pulleys 19, 20, and 21, mounted upon said shaft, of belts 28 and 29, cross-bar 30, adapted when moved transversely to shift the belt 29, a spring adapted to move said bar transversely to hold the belt 29 upon the pulley 20, means for moving the cross-bar 30 transversely to shift the belt 29 to the pulley 21, a stop for holding said cross-bar in such position that the belt 29 will operate upon the pulley 21, and means for automatically releasing said bar to permit of its being operated by said spring when the bucket reaches its uppermost position, substantially as described.

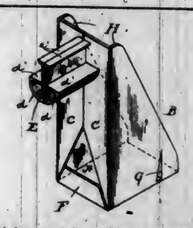
10. The combination, with a bucket, lateral guides therefor, a bail carried by said bucket, shaft 16, hoisting-drum mounted thereupon, hoisting-rope connected to said drum and to the bail of the bucket, and pulleys 19, 20, and 21, mounted upon said shaft, of a wheel 22, pawl 23, belts 28 and 29, cross-bar 30, having a slot 41, spring-stop 42, having an upwardly-projecting end 43, spring 33, acting upon said cross-bar 30 to move it transversely, and means for moving said cross-bar in a direction opposite to that in which it is moved by the spring 33, the arrangement of the spring 42 and bucket-bail being such that when the bucket reaches its uppermost position the bail will move the spring 42 upward, substantially as and for the purpose specified.

11. The combination, with a bucket having pins 11 and 12 and bail 10, lateral guides 8 and 9 for said pins and bail, shaft 16, drum carried thereby, and a hoisting-rope connected to said drum and to the bail 10, of pulleys 19, 20, and 21, mounted upon said shaft, ratchet-wheel 22, mounted upon said shaft, pawl 23, mounted upon said pulley 19 and adapted to engage the teeth of said wheel 22, belts 28 and 29, cross-bar 30, adapted to be moved transversely to shift the belt 29 from the pulley 21 to the pulley 20, spring 33, operating upon said cross-bar to move it transversely, slot 41 in said bar, spring 42, adapted to fit into said slot, said spring 42 having an upwardly-projecting portion 43, said portion 43 being so placed that when the bucket reaches its uppermost position the bail 10 will engage said projecting portion and lift the spring 42 from the slot 41, levers 37 and 44, and rod 40 for moving the cross-bar transversely against the action of the spring 33, substantially as described.

478,162. **WARPING-MACHINE.** GEORGE F. KUNTZ and CHARLES SLINGLAND, Paterson, N. J. Filed Sept. 18, 1890. Serial No. 365,291. (No model.)

Claim.—1. In a warping-machine, the combination, with the frame A', of the reel *c*, journaled in the said frame A' and having the rim c^3, a gear *d* on the shaft of said reel, the vertical shaft *f*, having a gear *e* engaging gear *d* and a gear *i* on its lower end, the shaft *k*, having a gear k^2 engaging gear *i* and a gear k^4 on its outer end, the screw *n*, carrying a gear n^4, engaging gear k^2, rods o^2 o^3, frame *o*, sliding on said rods and carrying a lever o^7, designed to engage said screw *n*, and thus propel frame *o*, the arm 4, and a wheel c^4 on said arm, adapted to frictionally engage the rim c^3, the lever c^4, pivoted to frame A' and adapted to engage arm 4, and means to rotate wheel c^4, substantially as described.

2. In a warping-machine, the combination, with the frame A', of the reel *c*, journaled in the said frame A', a gear *d* on the shaft of said reel, the vertical shaft *f*, having a gear *e* engaging gear *d* and a gear *i* on its lower end, the shaft *k'*, having a gear k^2 engaging gear *i* and a gear k^3 on its outer end, the screw *n'*, carrying a gear n^5, engaging gear k^3, rods r^1 r^2, frames *r r'*, sliding on said rods and carrying levers r^3 r^4, respectively, designed to engage screw *n'*, and thus propel frames *r r'*, the mandrel r^5, having a feather r^6 and clutch r^7, the gear-wheel *f'*, rotating said clutch, safety-pawl r^8, and means for actuating said gear-wheel *f'*, substantially as described.



478,168. **WROUGHT-METAL HANGER FOR JOISTS.** ISRAEL J. LEHMAN, Cleveland, Ohio. Filed Aug. 23, 1891. Serial No. 403,460. (No model.)

Claim.—1. A hanger for joists, constructed of sheet metal and having a socket for receiving the joist and having a supporting-lug at the rear, the parts being integral, and the side walls of the socket being flanged inward to form ribs for engaging the joist laterally, substantially as set forth.

2. A hanger for joists, constructed of sheet metal, the same having a socket for receiving the joist and having a supporting-nail at the rear adapted to be driven into the wood, substantially as set forth.

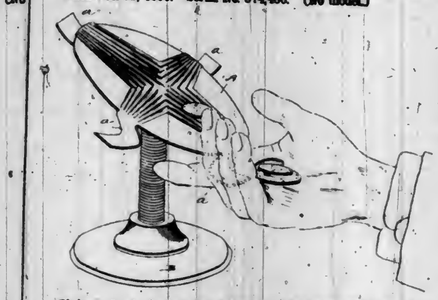
3. A hanger for joists, constructed of sheet metal bent substantially as shown, with the parts integral, the hanger having a socket for receiving the joist and having a lug at the rear for attaching the hanger, and a hole in the walls of the lug for anchoring the hanger, substantially as set forth.

478,168.

478,164. **CASH REGISTER AND INDICATOR.** CHARLES S. LEWIS, Waterbury, Conn. Filed Jan. 31, 1890. Serial No. 338,722. (No model.)

Claim.—1. In a cash-indicator, the combination of a stationary disk having numbers thereon denoting different denominations of money, a pointer adapted to be moved over the face of said disk, a revoluble disk having numbers corresponding with the numbers on the stationary disk and ratchet-teeth on the periphery of the revoluble disk, a dog to engage said teeth, a spring-actuated lever to make contact with said dog to maintain it normally out of contact with the revoluble disk when the lid of the cash-box is closed, and a rod connected to said lever and adapted to make contact with the lid of the cash-box, whereby the revoluble disk will be engaged by the dog when the lid is raised, substantially as set forth.

2. In a cash-indicator, the combination, with a hinged spring-actuated cover, of a stationary disk having numbers thereon denoting different denominations of money, a pointer adapted to be moved over the face of said disk, a revoluble disk having numbers thereon corresponding with the numbers on the stationary disk, means for maintaining the revoluble disk at any desired position, a catch on the lid of the cash-box, a shaft carrying a hook to engage said catch, an arm on the shaft, and means to engage said arm and automatically release the hook from the catch when the device is operated, substantially as set forth.

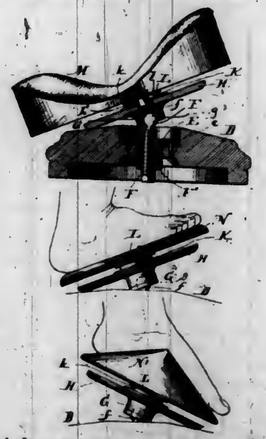


3. In a cash-indicator, the combination, with an upright carrying a disk having numbers thereon, of a shaft, an operating-lever secured to said shaft and carrying a pointer to be moved over the face of said disk, a disk loosely mounted on the shaft and having numbers thereon corresponding with the numbers on the first-mentioned disk, an arm secured to rotate with the loosely-mounted disk and having a projection thereon, an arm secured to the shaft and having a projection adapted to engage the projection on the first-mentioned arm to rotate it, and means for causing the loosely-mounted disk to be automatically released, substantially as set forth.

4. In a cash-indicator, the combination, with an upright carrying a stationary disk having numbers thereon, of a shaft, an operating-lever secured to said shaft and carrying a pointer to be moved over said disk, a disk loosely mounted on the shaft and having numbers thereon corresponding with the numbers on the first-mentioned disk, an arm secured to rotate with the loosely-mounted disk and having a projection thereon, an arm secured to the shaft and having a projection adapted to engage the projection on the first-mentioned arm to rotate it, a spring for rotating the loosely-mounted disk in one direction, and means for causing said loosely-mounted disk to be automatically released, substantially as set forth.

5. In a cash-indicator, the combination, with a cash-box and an alarm-bell, of a stationary disk having numbers thereon, a pointer adapted to be moved over the face of said disk, a revoluble disk having numbers thereon corresponding with the numbers on the stationary disk, an arm adapted to rotate with the revoluble disk, a shaft in the cash-box, an arm projecting therefrom adapted to be engaged by the arm which moves with the revoluble shaft, and an arm secured to the upwardly-extending arm carrying a hammer to strike the bell when the device is operated, substantially as set forth.

6. The combination, with a stationary disk having numbers thereon, a pointer adapted to be moved over the face of said disk, and a revoluble disk having numbers thereon corresponding with the numbers on the stationary disk, of a dial having two sets of numbers thereon, a short shaft carrying a pointer and gear-wheel, a sleeve carrying a ratchet-wheel and a pointer, a spring-dog carried by said gear-wheel and adapted to intermittingly engage the ratchet-wheel and move it one tooth at a time, a gear-wheel on the main shaft, and ratchet mechanism connecting the gear-wheels on the main shaft with the indicator-disk, substantially as set forth.



478,165. **COIN-TABLE.** FREDERICK C. LIDER, New York, N. Y. Filed Dec. 12, 1890. Serial No. 374,480. (No model.)

Claim.—1. A device for facilitating the handling of coin, consisting of a table, a base, and a spring directly connecting them, the said table and base being otherwise unconnected, substantially as described.

2. A device for facilitating the handling of coin, consisting of a table, a base, and a spring directly connecting them, the said table having hooks integral with and depending from the edge thereof, substantially as described.

478,166. **EXERCISING APPARATUS.** WILLIAM MADSEN, Chicago, Ill. Filed Feb. 10, 1892. Serial No. 420,938. (No model.)

Claim.—1. In an exercising apparatus, the combination, with a suitable rest, of a universal joint for supporting said rest and a bearing-base whereon said part may roll, substantially as described.

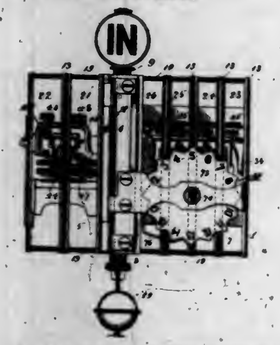
2. In an exercising apparatus, the combination, with a suitable rest, of a ball-and-socket support for said rest and a bearing-base

whereby said rest may be sustained as a rolling movement is given thereto, substantially as described.

3. In an exercising apparatus, the combination, with a suitable rest, of a bearing-base and a universal joint for supporting said rest and means for vertically adjusting said universal joint, substantially as described.

4. In an exercising apparatus, the combination, with a suitable rest, of a bearing-base whereby said rest is sustained as a rolling movement is imparted thereto, a screw-spindle F, provided with a ball, and a socket suitably connected with the rest for receiving said ball of the spindle, substantially as described.

5. In an exercising apparatus, the combination, with a rest, of a rolling plate to which said rest is loosely connected, a bearing-base whereon said rolling plate may travel, and a universal joint for sustaining said rolling plate, substantially as described.



6. In an exercising apparatus, the combination, with a rest, of a rolling plate to which said rest is loosely connected, a bearing-base whereon said rolling plate may travel, and a universal joint for sustaining said rolling plate, and suitable devices adapted to be grasped by the user, substantially as described.

7. The combination, with a foot-plate having a tapering upper surface, of a universal joint for sustaining said foot-plate, substantially as described.

8. The combination of a foot-plate having a tapering upper surface, a bearing-base for supporting the foot-plate during the rolling movement, and a universal joint for sustaining said foot-plate, substantially as described.

9. In an exercising apparatus, the combination, with a pedestal A, of a rest, a universal joint for supporting said rest, and an adjustable spindle or support whereby said rest can be adjusted at any desired angle, substantially as described.

478,167. FARE-REGISTER. JOHN W. MEAKER, Chicago, Ill., assignor to the Meaker Manufacturing Company, same place. Filed July 23, 1891. Serial No. 400,522. (No model.)

Claim.—1. In a fare-register, a units-chain composed of a series of links elliptical in shape, each tenth link having a depression extended across its surface and each of the other links having a recess at one side of its under surface, in combination with other register chains and actuating mechanism, substantially as and for the purpose specified.

2. In a fare-register, the combination of register-chains for registering tens, hundreds, and thousands, each chain composed of a series of elliptical-shaped links, nine of said links being provided at one side of their under surface with a recess and the tenth link being provided with a recess extended entirely across its under surface, a central rod 29, extended lengthwise of each tenth link on its lower surface, and actuating mechanism for said chains, substantially as and for the purpose specified.

3. In a fare-register, a units-register chain composed of nine elliptical-shaped links, each provided with a depression 27 at one side of its under surface, and a tenth link having a recess 28, substantially as and for the purpose specified.

4. The combination, with a register-frame composed of sections having their inner portions cut out and interior flanges in said frame to form tracks to carry register-chains, of the register-chains adapted to move upon said tracks and lugs 20, secured in said frame and adapted to guide the chains around the corners of the register-frame, substantially as specified.

5. The combination, with a register-frame composed of sections, rods 19, uniting the several sections of the frame, and register-chains adapted to move around said frame, of pawls 16, mounted at and in the top of the frame and adapted to prevent backward motion of the chains, each of said pawls having an extension 18 projecting under the rods 19 and adapted to limit the upward motion of the pawls, substantially as specified.

6. In a fare-register, the combination, with a frame for supporting the chains of a trip-register and a frame for supporting the chains of a total-register, of a detachable plate interposed between said frames to unite the frames, substantially as specified.

7. The combination, with a detachable plate adapted to support a main pull-bar and a resetting pull-bar, of chain-carrying frames secured at opposite sides to said plate, pull-bars supported in said plate, and register-chains adapted to move in said frame, substantially as and for the purpose specified.

8. The combination, with a plate 6, having lateral flanges 10 and lugs 11, of pull-bars 8 and 9, adapted to be held by said plate, and chain-carrying frames 5 and 7, adapted to be secured at opposite sides of said plate, substantially as and for the purpose specified.

9. The combination of the plate 6, a pull bar 8, adapted to move upon said plate, the notched block 53, secured upon said pull-bar near its upper end, the dog 54, pivotally mounted upon said plate and adapted to engage the notches upon the block 53 when the pull-bar is operated, and the spring 56, having one end attached to said plate 6 and its other end directly engaged with and acting upon said dog between the pivot of the dog and the notched bar and adapted to hold the dog at right angles to the line of motion of the pull-bar, substantially as described, for the purpose specified.

10. The combination, with a hollow pull-bar 8, having a cap 50 resting upon its upper end and a spring 52, fitted in said pull-bar and secured at its lower end to the bottom of the pull-bar and at its upper end to said cap, of a plate 6, adapted to support said pull-bar and provided with recesses 51 to receive projections on the pull-bar cap for securing said cap in position upon the plate, substantially as and for the purpose specified.

11. The combination, with a hollow pull-bar 8, having a cap 50 at its upper end, said cap projecting from the sides of the pull-bar, and a spring 52, secured to the lower portion of the pull bar and to the cap 50, of a plate 6, adapted to support the pull-bar, said plate having a recess 51, adapted to receive the projecting portion of the cap 50, substantially as and for the purpose specified.

12. The combination, with a chain-carrying frame and register-chains carried thereby, of a pull-bar having a plate 32, and the bifurcated and webbed pawls 35 36 37, carried by said plate and actuated from the pull-bar for operating the register-chains, one of the arms of each of said pawls being provided at its outer end with an enlarged and rounded portion to bear on said chains, the said pawl 35 having at its rear end a lip 40 to engage the plate 32 and hold the pawls at the desired angle, and the pawls 36 and 37 being provided with lips 38 and 39 to engage adjoining pawls, substantially as and for the purpose specified.

13. The combination, with a chain-carrying frame and register-chains carried thereby, of a pull-bar 8, provided with a plate 32, and the pawls 34, 35, 36, and 37, mounted on said plate and actuated by the pull-bar to operate the register-chains, said pawl 35 having a downwardly-projecting lip 40 and the pawls 35, 36, and 37 being bifurcated and webbed and each having an enlarged rounded portion at the outer end of one arm, substantially as and for the purpose specified.

14. The combination, with a chain-carrying frame and register-chains mounted in said frame, of a pull-bar, pawls mounted upon said pull-bar for operating the chains of the register, and stops 46 upon the lower edge of the pull-bar, substantially as and for the purpose specified.

15. The combination, with a chain-carrying frame and register-chains mounted upon said frame, of a pull-bar, pawls mounted upon said pull-bar and adapted to operate the chains of the register, and stops 45 upon the upper edge of the pull-bar, substantially as and for the purpose specified.

16. The combination, with a chain-carrying frame, register-chains carried thereby, and devices for returning the chains to zero, of a bifurcated pawl for operating the register-chains, a plate for supporting the pawl, and spring-stops 48, secured to said plate and projecting beyond its upper edge, substantially as and for the purpose specified.

17. The combination, with a chain carrying frame 5 and register-chains carried thereby, of a pull-bar adapted to move in said frame, a bifurcated pawl mounted upon said pull-bar, a web 44 upon one arm of said pawl, and a stop 99 in said frame 5, adapted to be engaged by the web 44 when the pull-bar is at its lowermost position, substantially as and for the purpose specified.

18. The combination, with a chain-carrying frame and register-chains carried thereby, of a canceler mounted upon said frame and adapted to cancel the reading of said chains, and a spring-stop adapted to limit the motion of the canceler, substantially as and for the purpose specified.

19. The combination, with a chain-carrying frame and chains carried thereby, of cancelers 93, mounted upon said frame, springs 97, secured to said cancelers, the upper ends of the springs projecting beyond the ends of the cancelers, and a stop 98, adapted to engage the ends of the springs 97, substantially as and for the purpose specified.

20. The combination, with a chain-carrying frame and chains carried thereby, of cancelers mounted upon said frame and springs secured to said cancelers, said springs having downwardly-projecting ends adapted to strike the side of the frame when the cancelers are drawn to their lowermost point, substantially as and for the purpose specified.

21. The combination, with a chain-carrying frame, chains carried thereby, mechanism for operating said chains, and canceling devices mounted upon said frame, of a resetting pull-bar, a plate carried by said pull-bar, and pawls 81 and 82, carried by said plate and adapted to operate the register-chains and the canceling devices, substantially as and for the purpose specified.

22. The combination, with a chain-carrying frame, register-chains carried thereby, mechanism for operating said chains, and a stop 87 in said frame, of a resetting pull-bar, pawls carried by said pull-bar, and teeth upon said pawls adapted to engage the register-chains, said teeth being adapted to engage the stop 87 when the pull-bar reaches its uppermost point, substantially as and for the purpose specified.

23. The combination, with a chain-carrying frame, register-chains carried thereby, a cam 86 on one of the links of each of said chains, canceling devices mounted upon said frame, and levers 96, connected to said canceling devices, of a resetting pull-bar, pawls 81 and 82, carried by said pull-bar, said pawls having teeth 85, and pawls 91 and 92, said pawls 91 and 92 being adapted to operate the canceling devices, substantially as and for the purpose specified.

24. The combination, with a chain-carrying frame and register-chains carried thereby, each of said chains having a cam 86 upon one of its links, of a resetting pull-bar, pawls carried by said pull-bar, and canceling devices adapted to close the sight-openings of the register when the resetting pull-bar is operated, said pawls being operated by said cams to operate the canceling devices, substantially as described.

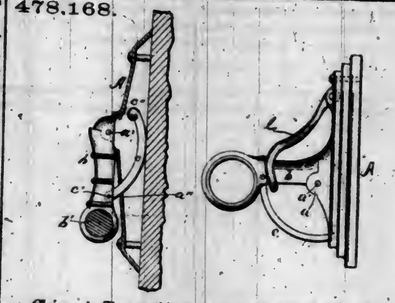
25. The combination, with a chain-carrying frame, register-chains carried thereby, and stops 91 upon one of the links of each of said chains, of springs 89 upon said frame and mechanism for operating said chains, substantially as and for the purpose specified.

26. In a fare-register, the combination, with a chain-carrying frame, of a units-chain consisting of ten elliptical-shaped links, each having a recess or notch upon one side of its under surface and one of said links having a deeper recess than the others, a tens-chain also consisting of ten elliptical-shaped links, each of said links having a recess or notch, the notches in the units and tens chains being adjacent to each other, and mechanism for operating said chains, substantially as and for the purpose specified.

27. In a fare-register, the combination, with a bell, a striker 62, mounted therein, said striker having a notch 66 at its outer end, devices for supporting said striker, and a spring adapted to cause the striker to strike the bell, of a lever pivotally mounted in said bell, a pin 69, carried by said lever and adapted to engage the notch 66, and devices for operating said lever by the operation of the register, substantially as and for the purpose specified.

28. The combination, with a bell 59, a bracket 61, secured at the inside of said bell, and a striker 62, carried by said bracket, said striker having a notch 66 at its outer end, of springs 63 and 65, mounted upon said striker, and a lever 67, pivotally mounted in said bell, said lever having a notch 71 and pins 69 and 70, substantially as and for the purpose specified.

29. In a register, the combination, with a bell and a striker 62, mounted therein, said striker being adapted to be operated to ring the bell at each operation of the register, of a lever having a pin 70 for holding the end of the striker normally in close proximity to the bell, substantially as and for the purpose specified.



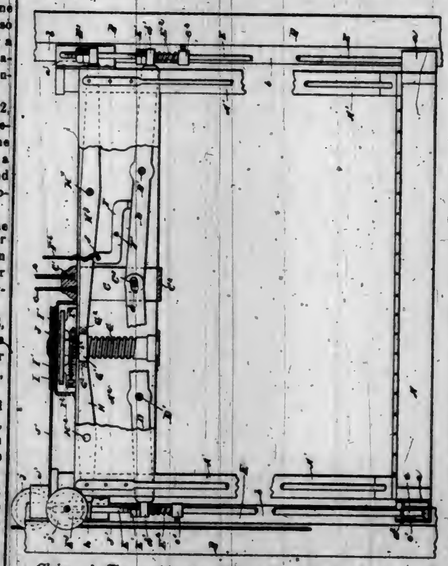
30. The combination, with a bell, a striker 62, mounted in said bell, and the spring 63, adapted to cause the striker to strike the bell, of a lever 67, pivotally mounted in said bell, said lever having a pin 70, adapted to engage the outer end of the striker, substantially as and for the purpose specified.

31. The combination, with a register-frame and a chain adapted to move around said frame, of tracks in said frame for supporting the chain and outer guides located at diagonally-opposite corners of the frame and adapted to direct the chain as it moves around the frame, substantially as and for the purpose specified.

32. The combination, with a chain-carrying frame and chains carried thereby, of a pull-bar, pawls mounted thereupon for operating the chains, and devices for locking the chains when the pull-bar is at rest, substantially as and for the purpose specified.

33. The combination, with a chain-carrying frame and register-chains carried thereby, of cancelers 93, mounted upon said frame, and a yielding stop upon each of said cancelers adapted to limit their upward motion, substantially as and for the purpose specified.

478,168. CASKET-HANDLE. JOHN MCCARTHY, Syracuse, N. Y. Filed Feb. 29, 1892. Serial No. 423,169. (No model.)

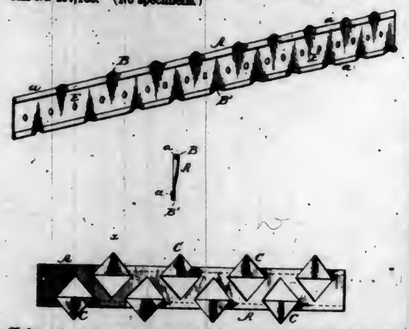


Claim.—1. The combination, with the handle, the arm carrying it, and the body-plate to which said arm is hinged, of a relief-bar connected to said arm and passing through a slot in said plate and provided on its inner end with a head.

2. The combination, with the handle, the arm carrying it, and the body-plate to which said arm is hinged, of a relief-bar pivotally connected to said arm and passing through a slot in said plate and provided on its inner end with a head.

3. The combination, with a handle, the arm carrying it, and the body-plate to which said arm is hinged, of a relief-bar connected to said arm on its lower side and passing through a slot in said plate, having a head on its inner end, and a relief bar loosely secured to the handle-bar and extending upward and engaging with the plate and adapted to travel therein, as set forth.

478,169. SAFETY ATTACHMENT FOR ELEVATORS. MARTIN J. O'DONNELL, WILLIAM C. SMITH, and HENRY BOURD, Cleveland, Ohio. Filed May 10, 1890. Renewed May 6, 1892. Serial No. 432,061. (No model.)

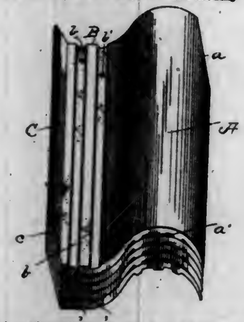


Claim.—1. The combination, with an elevator-car, ways between which the car travels, operating-rods, and dogs actuated by the operating-rods, of a screw, a nut thereon, levers engaging the nut and connected to the operating-rods, a pulley loose on the screw, dogs for locking the pulley to the screw when an abnormal speed of the car is attained, and means for rotating the pulley while the car is in motion, substantially as set forth.

2. The combination, with an elevator-car, ways, operating-rods, dogs, and two sets of levers fulcrumed on the car and connected with the rods, of an operating-lever adapted to engage one set of levers in case the hoisting-cable is broken to apply the dogs, a screw operatively connected with the other set of levers, a governor on said screw,

adapted to rotate the latter when an abnormal descent is attained, and a stationary cable or rope connected with the car and adapted to keep the governor in motion, substantially as set forth.

478,170. FENCE. RICHARD B. PERKINS, Hornellsville, assignor of one-half to Charles A. Ball, Wellsville, N. Y. Filed Sept. 29, 1891. Serial No. 407,183. (No specimens.)

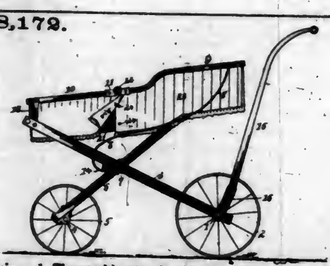


Claim.—1. As an article of manufacture, the metallic fence ribbon or strip having the longitudinal strengthening-ribs on one side and the smooth surface on the other side thereof and the barbs stamped from the body of the ribbon and bent at right angles to the length of the ribbon to lie against the flat smooth side thereof, substantially as described.

2. As an article of manufacture, the metallic fence ribbon or strip having the integral longitudinal ribs on one side, the integral barbs on its other side, and the crimps or indentations formed alternately on its edges and extending through the ribs and barbs on lines at right angles to the longitudinal axis of the ribbon, substantially as described.

3. As an article of manufacture, the metallic fence ribbon or strip provided with the longitudinal reinforcing-ribs and the alternate crimps on its edges, extending at right angles to the longitudinal axis of the ribbon, substantially as described.

478,171. ROOFING-TILE. JOSEPH RAFF, New Philadelphia, Ohio. Filed Oct. 23, 1891. Serial No. 409,607. (No model.)



Claim.—1. A roofing-tile consisting of a rounded or curved section having longitudinal grooves on one of its faces, both surfaces of this section being of such relative contour that it will overlap and snugly fit a like tile, and a flat section integral with one edge of the curved section, the said flat section having holes for fastening devices, substantially as set forth.

2. A roofing-tile consisting of a rounded or curved section, the upper and under sides of said section being of such relative contour that it will overlap and snugly fit a like tile, the under side of said section having longitudinal grooves therein, and a flat section integral with one edge of the curved section, substantially as set forth.

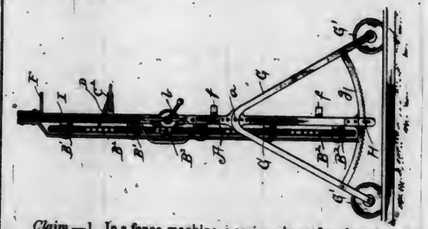
3. A roofing-tile consisting of a rounded or curved section grooved on its under side, and a flat section integral with said rounded or curved section and grooved on its upper side and having a section C at an angle to the flat section, substantially as set forth.

478,172. BABY-CARRIAGE. ABBOTT M. REEVES, Decatur, Ill. Filed Mar. 14, 1892. Serial No. 424,905. (No model.)

478,172.

Claim.—1. The combination, in a baby-carriage composed of cross-frames pivotally connected and provided each with wheels, of a rigid rear-wheel frame, a front-wheel frame elastic at its upper end, and a bed connected at its front end with the rear-wheel frame and at its rear end with the front-wheel frame.

2. The combination, in a baby-carriage composed of cross-frames pivotally connected and provided each with wheels, of a rigid rear-wheel frame, a front-wheel frame elastic at its upper end, and a bed connected directly with one frame and connected with the other frame by means of approximately vertical links.



3. The combination, in a baby-carriage composed of cross-frames pivotally connected and provided each with wheels, of a rigid rear-wheel frame having links at its upper end, a front-wheel frame having springs at its upper end, and a bed supported at its forward end on the links and at its rear end on the springs.

4. In a folding baby-carriage, the combination of axle 1, bars 3, mounted on the axle, handles 15, handle-brackets 16, having arms 17, provided with slotted heads, bolts 20, adapted to extend through the bars and the slots of the heads, and the nuts 19, to hold the heads in rigid contact with the bars.

5. In a folding baby-carriage, the combination, with the frame and the rear axle thereof, of handles connected pivotally with the axle and having extensions detachably secured to the frame.

6. In folding baby-carriages, the combination, with a jointed frame and a flexible bed, of comparatively stiff hangings parted at the joints of the frame and detachably connected.

478,173. WIRE-AND-PICKET-FENCE MACHINE. AGUSTUS H. ROGERS, North Amherst, Ohio. Filed Sept. 18, 1891. Serial No. 406,074. (No model.)

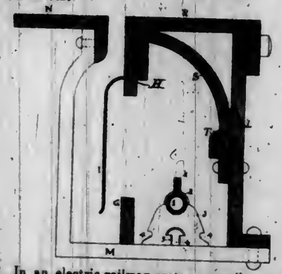
Claim.—1. In a fence-machine, a spring-clamp for clamping pickets and a latch adapted to hold the clamp open, substantially as set forth.

2. In a fence-machine of the variety indicated, a spring-clamp comprising a movable spring-actuated jaw and a stationary jaw, a handle for opening the clamp, and a gravity-latch for locking the clamp in its open position, substantially as set forth.

3. In a fence-machine, the combination, with a spring-clamp, substantially as indicated, of an adjustable stop located above the clamp for engaging the top of the picket in placing the latter in the clamp, substantially as set forth.

4. In a fence-machine, the combination, with the body of the machine, of a pair of diverging legs pivotally connected with the body portion, said legs having rollers at their outer ends, a toothed sector connecting the legs, and a latch connected with the body and adapted to operate in connection with the sector, whereby to lock the body in different positions, substantially as set forth.

478,174. SEPARABLE BUTTON. CHARLES M. SHERER, Lawrence, Kans. Filed May 11, 1891. Serial No. 392,334. (No model.)



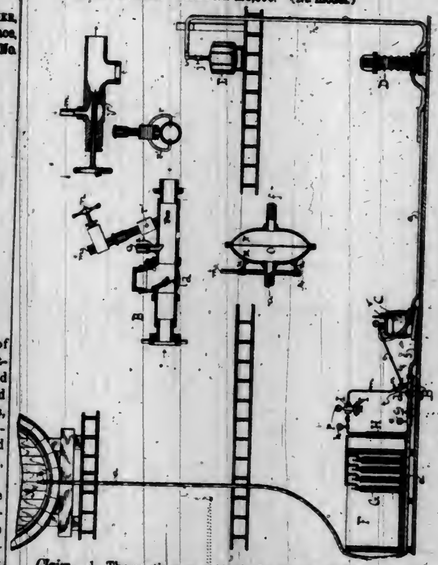
Claim.—In a separable button, the combination of a head part provided with a shank and cross-bar and a foot-piece made of one piece of metal, having the two ends bent inward and upward, so as to form from the same piece of metal the upper and under parts of the foot-

478,174.

piece, and a spring connection between the two, said lower portion of said foot-piece being formed with a holding-seat lying across the opening between the upturned ends, substantially as and for the purpose described.

478,175. ELECTRIC-RAILWAY CONDUIT. MILTON SHOEMAKER, Sioux City, Iowa, assignor of two-thirds to James W. Martin, same place, and Jason Passmore, Duncannon, Pa. Filed May 26, 1891. Serial No. 393,976. (No model.)

Claim.—1. In an electric-railway system, a trolley-rail made of metal tubing, suitably set in glass insulators, which are located at suitable distances from each other, said metal tubing being rigidly held in place on said insulators by means of a suitable wire passing around said tubing and downward diagonally through each of said insulators, said wire having its ends coiled to form a head on each side of the insulator, a conductor, and a suitable clip adapted to pass around said conductor and the metal tubing to hold said conductor in place thereon, all substantially as set forth, as and for the purpose specified.



2. In an electric-railway system, in combination, a trolley-rail made of suitable metal tubing set on glass insulators which are placed at suitable distances apart for this purpose, said metal tubing being set in the groove provided on the upper surface of each insulator and there rigidly held in place by a suitable wire passing around said metal tubing and thence downward diagonally through each of said insulators, suitable openings being provided in the insulators for this purpose, the ends of said wire being coiled or turned up to form a head on each side of the insulators, each of said insulators being rigidly held in place by means of a broad-headed bolt, the head of which fits into an opening provided on the under side of each insulator to receive it, the screw end of said bolt being rigidly secured to an angle-bar of the metal case, a conductor, and a suitable clip adapted to pass around said conductor, and the metal tubing to hold said conductor in place thereon, grooves being provided on the under surface of said metal tubing to receive the ends of said clip and to hold it securely in place, all substantially as set forth.

3. In an electric railway system, the combination of the following parts, viz: the metal tube 1, provided with the grooves 8 8, the glass insulator 3, grooved at its upper surface to receive said metal tube, said insulator being provided with openings 4 4, running diagonally through the body of the insulator, and an opening 5, provided on its under surface, as shown, the wire 2, the conductor K, the clip 7, and a metal case provided with angle-bars M M, all arranged as set forth.

4. In an electric-railway system, the combination, with a slotted continuous underground metal case, of a metal tube, as 1, glass insulators, as 3, placed at suitable distances from each other in said underground case, said metal tube adapted to lie longitudinally in the grooves provided in the upper surface of each insulator for this purpose, said metal tube being rigidly held in place by a suitable wire passing around said tube and downward diagonally through each of said insulators, a head being formed on the ends of said wire at the points where they enter the sides of the glass insulator to keep said wire rigidly in place, each of said insulators being provided with suitable openings to receive said wire, and an opening to receive a broad-headed bolt, the bottom part of said bolt being firmly secured to an angle-bar, as M, similar angle-bars being placed at suitable distances from each other in the case, a conductor K, and a suitable clip, as 7, adapted to pass around said conductor, and the metal tube 1 to hold said conductor in place thereon, all as set forth.

5. In an electric-railway system, a trolley-rail consisting of a metal tube extending longitudinally inside of an underground metal case, said metal tube being set in glass insulators, and means for rigidly holding it in place therein, a suitable conductor, and suitable means for holding it in place on said metal tube, said metal tube being provided with glass connections at all points of connection between it and a service-pipe for forcing hot air from a hot-air furnace into and through said metal tube, all substantially as set forth, as and for the purpose specified.

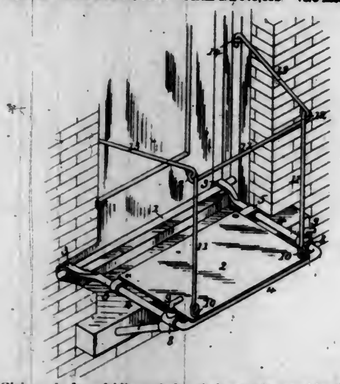
478,176. METHOD OF AND APPARATUS FOR CARBONATING BEER. JOHN B. STORRUS and FREDERICK C. WACKENHUTH, Newark, N. J., assignors to the Universal Carbonating Company, same place. Filed Mar. 25, 1892. Serial No. 426,390. (No model.)

Claim.—1. The continuous method of preparing beer for the market, consisting in supplying ruh-beer from a vessel to a carbonic-acid charger under a substantially constant head, causing a current to flow from the vessel to the charger by allowing the beer to be discharged through a pipe against a fluid-resistance smaller than the pressure due to the constant head, injecting carbonic acid into the current thus produced in the charger, and passing the mixed beer and carbonic acid through a separator and through a filter and discharging the same, substantially as specified.

2. The continuous method of preparing beer for the market, consisting in supplying ruh-beer from a vessel to a carbonic-acid charger under a substantially constant head, causing a current to flow from the vessel to the charger by allowing the beer to be discharged through a pipe against a fluid-resistance smaller than the pressure due to the constant head, injecting into the current thus produced in the charger carbonic-acid gas under constant pressure so regulated as to prevent complete saturation under the conditions of pressure and temperature of the charger, and passing the mixed beer and carbonic acid on its way to the place of discharge through a separator, substantially as specified.

3. The continuous method of preparing beer for the market, consisting in supplying ruh-beer from a vessel to a carbonic-acid charger under a substantially constant head, causing a current to flow from the vessel to the charger by allowing the beer to be discharged through a pipe against a fluid-resistance smaller than the pressure due to the constant head, injecting into the current thus produced in the charger carbonic-acid gas under constant pressure so regulated as to prevent complete saturation under the conditions of pressure and temperature at the charger, and passing the mixed beer and carbonic acid through a pipe and discharging the same, substantially as specified.

4. The continuous method of preparing beer for the market, consisting in passing ruh-beer from a vessel through a pipe under substantially constant head, injecting carbonic-acid gas into the beer in the pipe, passing the mixed beer and carbonic acid through a pipe against a resistance less than the pressure of the mixed beer and carbonic acid, and discharging it, substantially as specified.



5. In an apparatus for impregnating beer with carbonic acid, a

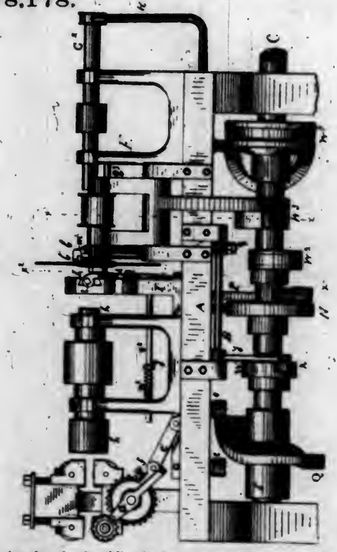
vessel containing beer, a carbonic-acid charger, a pipe or hose connecting the vessel with the charger, means, substantially as described, for producing a substantially constant pressure at the charger, one or more nozzles for injecting carbonic acid into the current passing through the charger, a separator, a pipe or hose leading from the charger to the top of the separator, and an outlet at or near the bottom of the separator connected with a pipe or hose for carrying off the charged beer, substantially as shown and described.

6. In an apparatus for impregnating beer with carbonic acid, a vessel containing beer, a carbonic-acid charger, a pipe or hose connecting the vessel with the charger, means, substantially as described, for producing a substantially constant pressure at the charger, a check-valve at or near the charger, one or more nozzles for injecting carbonic acid into the current passing through the charger, a separating-vessel, a pipe or hose leading from the charger to the top of the separator, a pipe or hose leading from near the bottom of the separator to a filter, and a pipe or hose leading from the filter to the place of discharge, substantially as shown and described.

7. In an apparatus for impregnating beer with carbonic acid, a vessel containing beer, a carbonic-acid charger a pipe or hose connecting the vessel with the charger, means, substantially as described, for producing a substantially constant fluid-pressure at the charger, a check-valve at or near the charger, one or more nozzles for injecting carbonic acid into the current passing through the charger, a separating-vessel, a pipe or hose leading from the charger to the top of the separator, a pipe leading from the top of the separator back into the charger between the check-valve and the injecting-nozzles, and an outlet at or near the bottom of the separator for carrying off the charged beer, substantially as shown and described.

478,177. FOLDING WINDOW-BALCONY. CLAUDE THOMSON, Chicago, Ill. Filed Dec. 17, 1890. Serial No. 375,082. (No model.)

Claim.—1. In a folding window-balcony, the combination of the platform or rest 2 and its marginal bow 4, having hooks 3 formed on its inner ends to engage the window rod 1, with the obliquely-arranged brace-feet 7, slidable on the side members of the bow 4 and provided with clamping-screws 9, said feet projecting downwardly and inwardly to rest against the wall and support the outer portion of the platform in proper position, as set forth.



2. In a folding window-balcony, the combination, with the platform and means for attaching its inner edge to the window-frame, of the obliquely-arranged brace-feet 7, slidable on the side rods of the platform and provided with clamping-screws 9, the eyes 10, vertically-arranged bow 11, having corner eyes 12, hook-rods 13, and eyes 14 on the window frame, substantially as set forth.

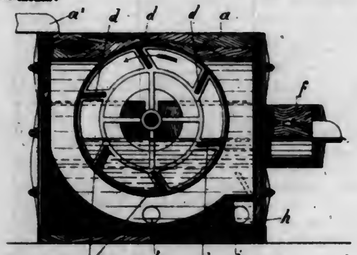
3. In a folding window-balcony, the combination of the platform 2, metal bow 4, having hooked inner ends to engage a fixed rod on the window-frame, the eyes 10, vertically-arranged bow 11, having corner-eyes 12, hook-rods 13, and eyes 14 on the window-frame, substantially as set forth.

478,178. GAGE-LATHE. LOCIUS C. TRASK, Greenwood, Me., assignor to Eugene L. Tebbets, same place. Filed Feb 9, 1889. Serial No. 299,339. (No model.)

Claim.—1. In an automatic spool-lathe, gripping-jaws for the rough-turned stick, which are mounted upon a sliding plate, and a roller by which motion is transmitted to the sliding plate from the actuating-cam, in combination with a projection upon the back of the actuating-cam and a spring reacting against the projection when the said projection is placed at such a point upon the cam that it acts to

478,178.

move the plate back while the jaws are gripped upon the stick and after the saw has cut off the block, all as and for the purpose set forth.

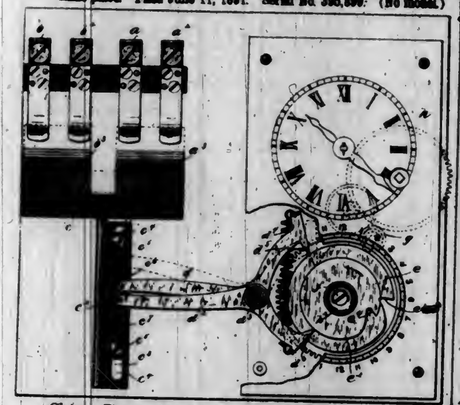


2. The combination of the sliding plate G, connecting-rod d', arm a, and feed-rolls actuated thereby, with a slotted connecting-piece mounted upon the back of arm a for the purpose of varying its working length.

3. The combination of a vertically-clamping jaw b, having a projecting part b', with a supporting-piece m, having a similar projection m', all as and for the purpose set forth.

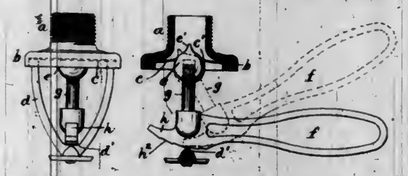
4. The combination of the finger-motion arm P, cam N, intermediate arm S, and adjustable connection V, all as and for the purpose set forth.

5. In an automatic spool-lathe in which spool-blanks are severed from the end of a turned stick, a clamping-jaw which holds the severed blank in place while being bored, a rock-shaft, jointed connections between the jaw and the rock-shaft, and a cam upon the principal cam-shaft, which imparts motion to the rock-shaft, all in combination with each other and with a boring-tool which bores an axial hole in the block and a cutting-off saw which moves at right angles thereto, substantially as specified.



478,179. STRAINER FOR CHEMICAL WOOD PULP. CHRISTIAN WAENDEL, Reutlingen, Germany. Filed July 26, 1889. Serial No. 318,796. (No model.)

Claim.—1. In an apparatus for straining chemical wood pulp, the combination of the trough a, having mounted therein a rotary drum b, perforated with slots c and provided with interior wings d d, said drum having centrally-arranged outlets in its ends leading out of the trough a, stuffing-boxes and glands g g for preventing communication between the drum-outlets and the interior of the trough a, and suitable means for rotating the drum b, substantially as described.



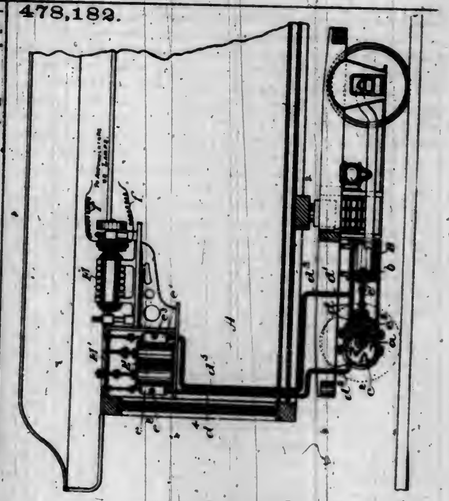
2. In an apparatus for straining chemical wood pulp, the combination of the trough a, having outlet-passages e e' f and having the gutter h and cover i, arranged as described, and clearing-hole k with a rotary drum b, having perforations c and interior wings d d and having its centrally-arranged end outlets x x communicating with the outlet-passages e e' of the said trough a, the stuffing-boxes and glands g g, and suitable means for rotating the said drum, substantially as described.

478,180. TIME-SWITCH FOR ELECTRIC CIRCUITS. BENJAMIN F. WATERS, Brockton, Mass., assignor to the Waters Electric Company, same place. Filed June 11, 1891. Serial No. 395,890. (No model.)

Claim.—The combination, with the stationary contacts, of the movable contact-maker and its supporting and guiding slide bar provided with engaging projections or shoulders, and pivoted spring-actuated levers each having one arm arranged to co-operate with one of said shoulders of the slide-bar, and a time-motor and cams operated thereby controlling the other arms of said actuating-levers, substantially as and for the purpose described.

478,181. DEVICE FOR PLUGGING SPRINKLER-HEADS. GEORGE E. WRIGHT, Newark, N. J., assignor of one-half to Dennis Houlihan, same place. Filed Apr. 22, 1892. Serial No. 430,197. (No model.)

Claim.—1. As a new article of manufacture, a device for plugging sprinkler-heads, consisting in a handle having a plug attached to one side of the same and an abutment attached to the opposite side of the handle, substantially as set forth.



2. As a new article of manufacture, a device for plugging sprinkler-heads, consisting in a handle having a plug attached adjustably to one side of the same and an abutment attached to the opposite side of the handle, substantially as set forth.

3. The attachment for plugging sprinkler-heads, consisting in the handle f, the screw-shank g, the plug c, screwed thereon, and the eccentric abutment h, provided with the series of steps h^2, arranged substantially as herein set forth.

478,182. ELECTRICAL DISTRIBUTION FOR CARS. SAMUEL YOUNG, MORRIS MOSKOWITZ, LEON D. ADLER, and JOSEPH LOEWENBERG, Newark, N. J. Filed Oct. 15, 1891. Serial No. 408,767. (No model.)

Claim.—In a system for electrically lighting cars, in combination with the pivoted truck of a car, a pair of air-compressing cylinders arranged directly upon said truck, said cylinders being provided with valves on their opposite sides, eccentrics arranged on and moving with said car-wheel axle of the truck and said eccentrics being directly connected with the piston-rods in said cylinders, pipes d and d', leading from said cylinders, flexible tube connections d^3 and d^3, pipes d^5 and d^5, extending into the car-body, an air-engine provided with valve-chests with which said pipes d^5 and d^5 communicate, and a dynamo connected with said engine, all arranged substantially as and for the purposes set forth.

478,182.

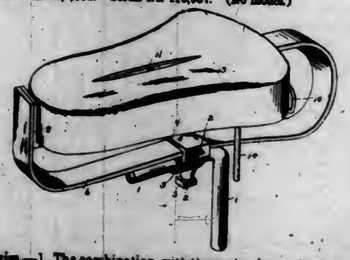
478,183. ELECTRIC CAR-LIGHTING SYSTEM. SAMUEL YOUNG and MORRIS MOSKOWITZ, Newark, N. J., assignors of one-fourth to Leon D. Adler and Joseph Loewenberg, same place. Filed Jan. 13, 1892. Serial No. 417,932. (No model.)

Claim.—1. The herein-described system for electrically lighting cars, consisting, essentially, of the combination, with a pivoted truck, of an air-compressor on said truck, means for driving said air-compressor from the axle, consisting, essentially, of eccentrics rotating with and arranged on the axle and connected with the air-compressor, an air-engine and dynamo connected therewith, an air receiver or storage-tank intermediately arranged between said compressor and air-engine, and a pressure-regulator arranged in the piping between said compressor and air-receiver, acting automatically to shut off the air from the compressor into said air-tank and cause the compressor to exhaust outside of the tank, and a flexible tube connection in the piping between said air-compressor and the regulator, substantially as and for the purposes set forth.

2. The herein-described system for electrically lighting cars, consisting, essentially, of an air-compressor, means for driving said air-compressor from the car-axle, an air-engine and dynamo connected

therewith, an air receiver or storage tank intermediately arranged between said compressor and air-engine, and a pressure-regulator arranged in the piping between said compressor and air-receiver, acting automatically to shut off the air from the compressor into said air-tank and cause the compressor to exhaust outside of the tank, said regulator consisting, substantially, of a cylinder *f*, provided with a slide-valve having ducts f^2 and f^3, an air-chamber, a pipe connecting said chamber with the air or storage tank, and an exhaust-pipe leading from said cylinder *f*, substantially as and for the purposes set forth.

3. The herein-described system for electrically lighting cars, consisting, essentially, of air compressors or pumps arranged on the car-wheel truck, eccentrics on one of the axles of the truck for driving said compressors or pumps from the car-axle, pipes *c* and *c'*, extending from said compressors, pipes c^4 and c^5, and flexible connections between said pipes, air receiving or storage tanks C and C', a cock or valve c^{13} in each tank for filling the same when the car is not in motion, and an air-engine and dynamo connected with said tanks C and C', substantially as and for the purposes set forth.



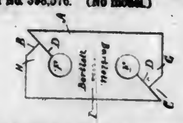
4. The herein-described system for electrically lighting cars, consisting, essentially, of air compressors or pumps arranged on the car-wheel truck, eccentrics on one of the axles of the truck for driving said compressors or pumps from the car-axle, pipes *c* and *c'*, extending from said compressors, pipes c^4 and c^5, and flexible connections between said pipes, air receiving or storage tanks C and C', a cock or valve c^{13} in each tank for filling the same when the car is not in motion, and an air-engine and dynamo connected with said tanks C and C', and a pressure-regulator in each of said pipes c^4 and c^5, acting to automatically shut off the air from the compressors into said receivers C and C', substantially as and for the purposes set forth.

5. In a system for electrically lighting cars, in combination, air-compressors arranged on the car-truck, means for driving the same from the car-axle, an air-engine and dynamo, air receivers or storage tanks C and C' beneath the car, and air receivers or storage tanks on the roof of the car, all communicating with each other, and regulating devices arranged in the connections between said air compressors and tanks C and C', adapted to automatically cut off the supply of air to said tanks, substantially as and for the purposes set forth.

6. In a system for electrically lighting cars, in combination, an air-compressor on the truck of the car, an eccentric for driving the same, an air-receiving tank, an air-engine and dynamo, pipes connecting the same, and an automatic regulating device to decrease the pressure of air in the receiving-tank, consisting, essentially, of a cylinder provided with a slide-valve having ducts f^2 and f^3, an air-chamber, a pipe connecting said chamber with the air or storage tank, and an exhaust-pipe leading from said cylinder *f*, substantially as and for the purposes set forth.

7. The herein-described system for electrically lighting cars, consisting of an air-compressor, eccentrics driving said air-compressor directly from the car-wheel axle, an air-engine and dynamo connected therewith, an air receiver or storage tank intermediately arranged between said compressor and air-engine, and a pressure-regulator arranged in the piping between said compressor and air-receiver, acting automatically to shut off the air from the compressor into said air-tank and cause the compressor to exhaust outside of the tank, said regulator consisting, substantially, of a cylinder *f*, provided with a slide-valve, an air-chamber connected with said cylinder, a pipe connecting said chamber with the air or storage tank, and an exhaust-pipe leading from said cylinder *f*, substantially as and for the purposes set forth.

478,184. BICYCLE-SADDLE. CYRUS W. ZIMMER, Logansport, Ind. Filed Jan. 22, 1892. Serial No. 418,937. (No model.)

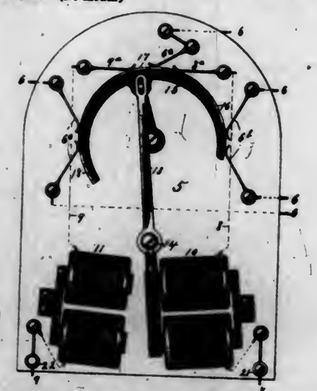


Claim.—1. The combination, with the suspension-spring and means for securing the same to the seat-standard, of a metal saddle secured between the opposite terminals of and supported by the spring, the air-cushion, and the leather covering for the same mounted upon said saddle, substantially as specified.

2. In a saddle, the combination, with the suspension-spring having the upturned ends, the L-shaped bracket secured to the ends of the spring, and the perforated saddle-plate secured to the brackets, of the air-cushion having the vent and the leather covering secured to the plate and brackets and having an opening in line with the vent of the cushion and opening of the saddle-plate, substantially as specified.

3. The combination, with the inverted-L-shaped standard, the sleeve or collar having the lower cylindrical bore receiving the standard and the upper rectangular bore, and the screws terminating in the bore, of the suspension-spring loosely fitting the rectangular bore and having its front end upturned and its rear end upturned or curved and terminating in a downwardly-disposed securing-plate, the front and rear L-shaped brackets, the metal saddle-plate riveted to the lower edges of the brackets, the saddle-shaped cushion, and the leather covering for the same, the latter being riveted to the saddle-plate, substantially as specified.

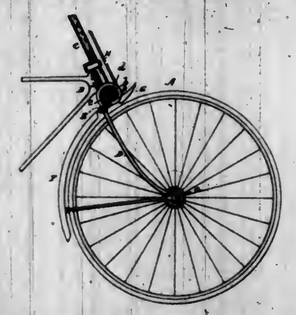
4. The combination, with the suspension-spring having front and rear upturned ends, of a metal saddle-plate secured at its ends to the ends of the spring and a saddle mounted on the plate, substantially as specified.



478,185. TAG. THOMAS C. BARNUM, Indianapolis, Ind. Filed July 6, 1891. Serial No. 398,576. (No model.)

Claim.—1. The above-described tag, consisting of an oblong strip of sheet material having near each end a perforation F, notches B and C, cut in the ends near diagonally-opposite corners, and slits D D, connecting said notches respectively with said perforations, said strip being folded upon itself and its opposed parts secured together, except between said notches, whereby a single structure is formed having a single central opening, and the free overlapping parts C and H, substantially as set forth.

2. In a tag, the combination, with the folded strip having a pair of registering perforations, notches B and C, slits D D, connecting said perforations and notches, respectively, and the transverse slot I at the fold, of the auxiliary strip J, projecting through the slot and secured in the fold of the strip, for the purpose set forth.



478,186. ELECTRIC-LIGHTING SYSTEM. EDWARD T. COOKE and WILLIAM H. MACKAY, St. Louis, Mo. Filed July 17, 1891. Serial No. 399,796. (No model.)

Claim.—1. A system of lighting and extinguishing electric lamps from one or more points, the same consisting of a circuit, a switch carrying two suitable contact-plates for making and breaking said circuit, two magnets governing said switch, one of which operates the said switch to make the circuit and light the lamps and the other of which operates said switch to break the circuit and extinguish the lamps, a circuit in which each of said magnets is arranged, a third contact-plate carried by said switch, adapted to break the circuit of the actuating-magnet and establish the circuit of the other magnet, the said third contact-plate being connected to one terminal of the circuit containing the lamps, and manually-operated devices controlling at will the circuits of said magnets to light and extinguish the lamps.

2. A system of lighting and extinguishing electric lamps from one or more points, the same consisting of a circuit, a rotary switch carrying suitable contact-plates for making and breaking said circuit, two oppositely-arranged magnets for governing said switch, one of which operates the switch to make the circuit and light the lamps and the other of which operates said switch to break the circuit and extinguish the lamps, a circuit in which each of said magnets is arranged, a contact-plate carried by said switch to break its own circuit and establish the circuit of the other magnet, the said contact being connected to one terminal of the circuit containing the lamps, and push-buttons controlling the circuits of said magnets to light and extinguish the lamps and adapted to be placed in electrical communication with the other terminal of the circuit containing the lamps.

478,187. BICYCLE. WHITNEY C. DAVIS, Waterloo, N. Y. Filed Aug. 28, 1891. Serial No. 403,906. (No model.)

Claim.—1. The combination, with the frame and wheels of a bicycle, of the separate or twin spring-rods D D, convoluted at one end and there secured to the frame adjustably on the axes of the said convolutions and also fastened at their other ends to one of the wheel-axles, substantially as and for the purposes specified.

2. The combination, in a bicycle, of the two separate independent or twin spring-rods D D, secured at their lower ends to the steering-wheel axle and having volute upper ends clamped adjustably on the axes of the said volutes to the steering-head, substantially as and for the purposes specified.

3. In a bicycle, the springs D D, having volute ends clamped adjustably to lateral extensions on the head, and said springs being also secured to the axle, substantially as and for the purposes specified.

4. The combination, in a bicycle, of a head having lateral extensions *b b*, the volute spring rods D D, having their volutes clamped adjustably to said extensions, the yoke E, connecting said rods near their upper ends, and the wheel-axle connecting the lower ends of the said rods, substantially as shown and described, and for the purposes specified.

5. The combination, in a bicycle, of a head having lateral extensions on its lower end, the volute springs attached to said head and to the axle, a yoke connecting said springs, the brake-rod or plunger, and the brake-shoe jointed or hinged to said rod and to the said yoke, substantially as and for the purposes specified.

478,188. PROCESS OF BREWING BEER. CHARLES H. PRIEST and BERTHA O. PRIEST, New York, N. Y., assignors to the Brewing Improvement Company, Maywood, N. J. Filed Oct. 28, 1891. Serial No. 410,112. (No specimens.)

Claim.—The method of hopping wort, which consists in subjecting the hops to a dry heat beyond drying until at least parched, extracting the hops thus treated with water at a temperature above 50° Fahrenheit, and adding the extract to the wort, substantially as and for the purpose specified.

478,189. METHOD OF HOPPING MALT LIQUORS. CHARLES H. PRIEST and BERTHA O. PRIEST, New York, N. Y., assignors to the Brewing Improvement Company, Maywood, N. J. Filed Mar. 3, 1892. Serial No. 423,655. (No specimens.)

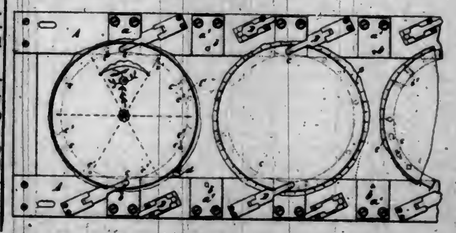
Claim.—1. The herein-described method of preparing hops for brewing, which consists in subjecting the hops to the action of dry heat until heated beyond drying or at least parched, substantially as and for the purpose specified.

2. The within-described method of hopping beer, which consists in subjecting the hops to the action of a dry heat until heated beyond drying or at least parched and then adding the hops thus prepared to the wort, in the manner specified.

478,190. TROUSERS, &c., AND PATTERN THEREFOR. RICHARD HAMILTON and JOHN G. LEWIS, Jefferson City, Mo.; said Hamilton assignor to said Lewis. Filed Sept. 29, 1891. Serial No. 407,173. (No model.)

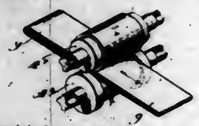
Claim.—1. A pattern for garments of the class described without inseam, having bottom and top lines and side lines adapted to determine the outseam of the leg and body and having an intermediate slit from the top line down to and below the center or lowest point of the crotch, substantially as specified.

2. A garment of the class described having legs without inseam, an integral fly-piece, and a continuous seam extending from points on both legs in the rear of the garment above the knee-line to the bottom of the fly, and a crotch-piece joined in part along said seams and on opposite edges of the seat portion of the garment, as set forth.



478,191. WHEEL FOR VELOCIPEDES. ARTHUR C. HIDE, London, England, assignor to the Disc Wheel Company, Limited, same place. Filed Dec. 7, 1891. Serial No. 414,244. (No model.) Patented in England May 15, 1891, No. 8,395.

Claim.—1. In a wheel, the combination, with a hub, of two dished plates inclosing the hub, the metal of each plate being of greater thickness around the hub and at the periphery than at the intermediate parts of the plate, and the two said plates having their thickened edges secured together and adapted to support an elastic tire, substantially as set forth.



2. In a wheel, the combination, with a hub, of two dished plates inclosing the hub, the metal of each plate being of greater thickness around the hub and at the periphery than at the intermediate parts of the plate, and the said two plates being secured together and flared outwardly at their edges, and a ring secured to the thickened edges of the two said plates and adapted to support an elastic tire, substantially as set forth.

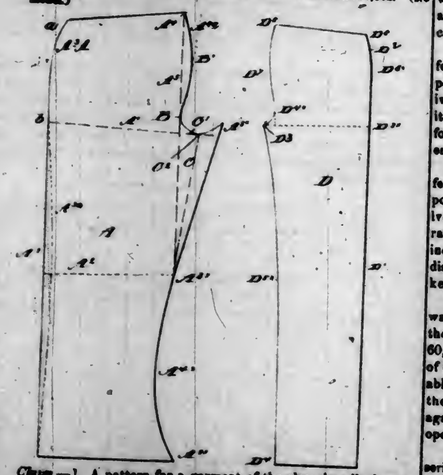
478,192. FABRIC-HOLDING FRAME FOR EMBROIDERING-MACHINES. FRIEDRICH HÜRSELER, St. Gall, Switzerland. Filed Feb. 1, 1892. Serial No. 419,868. (No model.)

Claim.—In combination with the frame proper of an embroidering-machine, a round removable fabric-holding frame provided with a series of holes placed at equal distances around its periphery, pins mounted on said frame proper to engage said holes, and clamps to preserve said engagement, substantially as set forth.

478,193. PROCESS OF ROLLING THIN SHEET STEEL OR IRON. BERNARD G. LAUTH, Philadelphia, Pa. Filed Apr. 6, 1891. Serial No. 387,728. (No specimens.)

Claim.—The hereinbefore-described process, which consists in rolling the metal into long strips, then reeling the strips into flat coils, and passing the coils thus formed through rolls.

478,194. BRAKE FOR BICYCLES. WILLIAM T. LEWIS, Peoria, Ill. Filed Sept. 16, 1891. Serial No. 405,823. (No model.)

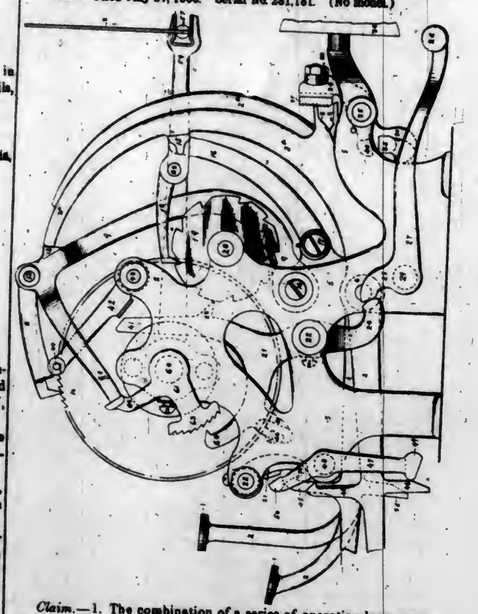


Claim.—1. In a brake for bicycles, the ball A, provided on its interior with a metal tube D, with washers E on either end thereof, and mounted on an axle C, in combination with the yoke B, projection J, screw I, and button H, as herein set forth and described.

2. In a brake for bicycles, the ball A, in combination with the yoke B, provided with the projection J, screw I, and button H, substantially as set forth and described.

3. In a brake for bicycles, the yoke B, with the projection J, through which passes the screw I, with its button H, in combination with the ball A, substantially as herein set forth and described.

4. In a brake for bicycles, one or more balls A, provided on their interiors with the metal tube or tubes D, with washers E, in combination with the yoke B, with its projection J, through which passes the screw I, with its button H, substantially as set forth.



478,195. TROUSERS, &c., AND PATTERN THEREFOR. JOHN G. LEWIS and RICHARD HAMILTON, Jefferson City, Mo.; said Hamilton assignor to said Lewis. Filed Sept. 29, 1891. Serial No. 407,172. (No model.)

Claim.—1. A pattern for a garment of the class described, comprising front and back parts, each having curved inseams, each extending outwardly from a line perpendicular to the knee-line, said extensions projecting above the hip-line and terminating at the top in concave lines, the extension on the back being greater than that on the front, substantially as specified.

2. A garment having extensions in the back of each leg and seat portion, projected outside of a line perpendicular to the knee-line and having the lower half of the back of the body portion extended toward said perpendicular line, the extension on the back being greater than that on the front, as set forth.

478,196. CASH REGISTER AND INDICATOR. CHARLES E. LORD, Boston, Mass., assignor to the National Cash Register Company, Dayton, Ohio. Filed July 27, 1888. Serial No. 281,181. (No model.)

Claim.—1. The combination of a series of operating-keys representing different values, an indicator actuated thereby and moved to different positions by the operations of different keys to indicate their respective values, a latch for holding the indicator in the position to which it is moved by an operated key, and a trip for said latch operated at the beginning of the next operation of a key to release the indicator.

2. The combination of a series of operating-keys representing different values, an indicator actuated thereby and moved to different positions by the operations of different keys to indicate their respective values, a ratchet and pawl co-operating with the indicator to hold it in the position to which it is moved by an operated key, and a trip for disengaging the ratchet and pawl at the beginning of the next operation of a key to release the indicator.

3. The combination of a series of operating-keys representing different values, an indicator actuated thereby and moved to different positions by the operations of different keys to indicate their respective values, a ratchet movable with the indicator, a pawl engaging said ratchet at the completion of the stroke of an operated key to hold the indicator in the position to which it has been moved by such key and disengaged from the ratchet at the beginning of the next operation of a key to release the indicator.

4. The combination of the key-levers 2, having upwardly and forwardly curved extensions 2^a, the bar 12, co-operating with the latter, the indicator-shaft 60, a connection between the bar 12 and the shaft 60, by which the latter is moved different distances upon the operation of different keys, an indicator moved by said shaft, a ratchet 63, movable with the shaft, the revoluble notched cam-disk 19, actuated by the key-levers, and the lever 21, provided with a tooth 23, bearing against the periphery of the cam-disk, and with a pawl-tooth 66, co-operating with the ratchet 63, substantially as described.

5. In a registering and indicating machine, the combination of a series of operating-keys of different values, a revoluble notched cam-disk, as 19, actuated by the operating-keys and moved the same distance by each of them, and a movable part, as 21, provided with a tooth 23, spring-pressed against the periphery of the cam-disk and co-operating with the notches therein in the manner described to cause a quick movement of such part 21 at the completion of the stroke of an operated key.

6. The combination of the key-levers 2, movable bar 15, common to all of them and moved the same distance by each of them, pawl 18, revoluble notched cam-disk 19, and the lever 21, provided with a tooth 23, bearing against the periphery of the cam-disk 19 and co-operating with the notches therein, for the purpose described.

7. The combination of a series of operating-keys representing different values, a registering-wheel, a pawl actuated by the operating-keys to turn the registering-wheel different distances, according to the key which is operated, and a trip for disengaging the pawl from the registering-wheel at the completion of the stroke of an operated key.

8. The combination of the key-levers 2, having the upwardly and forwardly curved rear extensions 2^a, a registering-bar 12, the pawl 11, the registering-wheel 14, the trip-arm 42, revoluble cam-disk 19, actuated by the key-levers 2, and the movable part 41, co-operating with the trip-arm 42 and provided with a tooth 23, bearing upon the periphery of the cam-disk 19, substantially as described.

9. The combination of the key-levers 2, having upwardly and forwardly curved rear extensions 2^a, the bar 12, co-operating with the latter, the pawl 11, and registering-wheel 14, the arm 65, movable with the bar 12, the indicator shaft 60, the arms 61 and 64, fast on said shaft, the former engaged by the arm 65 and the latter supporting the ratchet 63, the cam-disk 19, actuated by the key-levers 2, and the movable part 21, provided with a tooth 23, bearing against the periphery of the cam-disk 19, and with a tooth 66, co-operating with the ratchet 63, substantially as described.

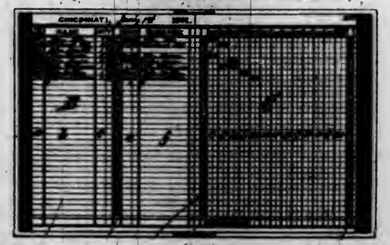
10. In a registering-machine, the combination of a registering-wheel provided with two ratchets having oppositely-facing teeth, a combined actuating and locking pawl, one of whose teeth engages one of said ratchets to actuate the wheel and the other of whose teeth engages the other of said ratchets to lock the wheel against excess of movement, and a trip for disengaging the pawl from the ratchets at the completion of the stroke of an operated key.

11. In a registering-machine, the combination of a series of operating-keys, a registering-bar, as 12, moved different distances by the operation of different keys, a registering-wheel 14, provided with two ratchets having oppositely-facing teeth, a pawl 11, carried by the bar 12 and provided with an actuating-tooth engaging one of the ratchets of the registering-wheel and with a locking-tooth 79, engaging the other ratchet of said wheel, and a trip for lifting the pawl at the completion of a stroke of an operated key.

12. In a registering-machine, the combination of a series of operating-keys representing different values, a registering-wheel provided with a ratchet and moved different distances by the operation of different keys, a revoluble cam-disk 19, actuated by the operating-keys, and a movable part 21, provided with a tooth 23, co operating with the notches in the cam-disk 19, and with a locking-tooth 68, which is thrown into engagement with the ratchet of the registering-wheel at the completion of the stroke of the operated key, for the purpose described.

13. The combination of the key-levers 2, provided with teeth 8 at their rear ends, the bar 37, spring-pressed toward said teeth, means for maintaining said bar out of engagement with said teeth when the key-levers 2 are all in their normal position of rest, the revoluble cam-disk 19, actuated by the keys-levers 2, and a movable part 21, provided with a tooth 23, co-operating with the cam-disk 19 to cause the part 21 to release the bar 37 upon the operation of any key and permit said bar to be moved by its spring into position to co-operate with the teeth of the keys.

14. The combination of the key-levers 2, provided with the teeth 8 at their rear ends, the ratchet-bar 37, pivotally supported on the shaft 35 and having rigid with it an arm 40, a spring applied to the ratchet-bar to press it forward, a lever 25 to 27, provided with an arm 33, arranged to engage the arm 40 and maintain the ratchet-bar 37 in its rearmost position when all of the key-levers are at rest, a spring applied to the lever 25 to 27 to normally hold the arm 33 in engagement with the arm 40, a revoluble notched cam-disk 19, actuated by the key-levers 2, and a lever 21, provided with a tooth 23, bearing against the periphery of the cam-disk 19 and having a pendent arm 24, co-operating with the arm 25 of the lever 25 to 27 to withdraw the arm 33 from engagement with the arm 40 upon the operation of any key-lever and permit the ratchet-bar 37 to be moved by its spring into engagement with the tooth 8 of such lever, substantially as described.



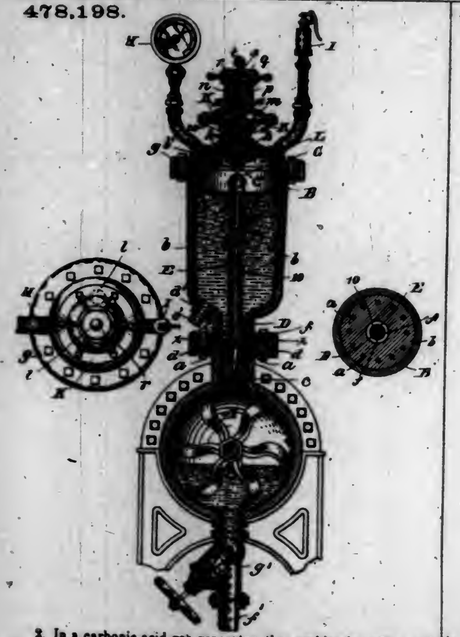
15. The combination of a series of operating-keys, each provided with an upwardly-projecting hook, a locking-bar normally tending to move beneath said hooks to lock the keys, and means for normally holding the locking-bar out of engagement with said hooks and for releasing said bar upon the operation of any key to permit it to move beneath said hooks and lock the unoperated keys.

16. The combination of the key-levers 2, each provided near its front end with an upwardly-projecting hook 45 and a downwardly-projecting lug 46, a locking-bar 54, normally tending to move beneath the hooks 45 to lock the keys, and a detaining-frame for normally holding the locking-bar 54 out of engagement with the hooks 45, and co-operating with the lugs 46 to release the locking-bar 54 when any key is operated and permit said bar to move beneath the hooks of the operated keys.

17. The combination of the key-levers 2, each provided with an upwardly-projecting hook 45 and with a downwardly-projecting lug 46, a locking-bar 54, pivotally supported at 52 and normally tending to swing under the hooks 45, a detaining-frame composed of the lever 47 and cross-bar 49, and a spring yieldingly holding the lever 47 in position to maintain the locking-bar 54 out of engagement with the hooks 45 and the cross-bar 49 in position to be engaged by the lug 46 of an operated key, substantially as described.

18. In a registering-machine, the combination of the independently-revoluble registering-wheels 4 and 14, mounted side by side upon a suitable support, the fixed collar 71 between them, the washers 73, bearing against their outer sides, and the spiral springs confined in housings in the frame-work and bearing against said washers, for the purpose described.

478,197. ACCOUNT-BOOK. WILLIAM LUBBY, Cincinnati, Ohio. Filed May 11, 1891. Serial No. 392,400. (No model.)



Claim.—1. A court witness-book having its pages divided into a debit and a credit side, each of which is provided with successively-arranged vertical columns and with parallel transverse lines, the columns on the debit side being provided with suitable captions and adapted to receive the numbers of the cases, the names of the witnesses entitled to fees in such cases, the amount due said witnesses, the numbers of the several transverse lines, the dates on which the witnesses are paid their fees, and the signatures of the witnesses, and the columns on the credit side being provided at their upper ends with the names of the calendar months of the year arranged consecutively, and each column being adapted to receive the amount of fees paid out during each month, and each of the columns being provided at its lower end with a space to receive the total amount of fees paid out during that entire month, substantially as set forth.

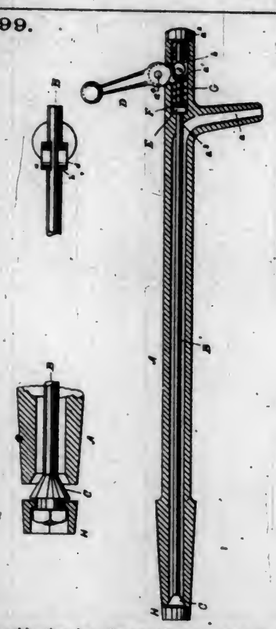
2. A set of books for court fees, consisting of two books, one of which has its pages divided into a debit and a credit side, each side of which is provided with vertical columns and transverse parallel lines, the columns on the debit side being provided with suitable captions and adapted to receive the number of the cases, the names of the witnesses, the amounts due said witnesses, the dates on which the witnesses are paid their fees, the signatures of the witnesses, and the number of the lines of the page, and the columns on the credit side being provided with captions for the calendar months of the year and adapted to receive the amounts for each of said months, and the lower end of each column being also provided with a space for the total amounts paid out during that entire month, and a cash-book having its pages provided with vertical columns and transverse lines, a portion of which columns being adapted to receive a record of the same transactions as appear in the witness-book, and another portion of said columns, as *w*, *y*, and *z*, being adapted to receive, respectively, the corresponding number of the page and the line thereof of the witness-book, the amount paid each witness, and suitable check-marks on both books to indicate that the proper posting has been done from time to time, substantially as described.

478,198. CARBONIC-ACID-GAS GENERATOR. PATRICK J. MAGUIRE, Salem, assignor to the American Soda Fountain Company, Boston, Mass. Filed Mar. 29, 1892. Serial No. 426,961. (No model.)

Claim.—1. In a carbonic-acid-gas generator, the combination, with the acid-chamber having within it a siphon communicating with the alkali-chamber and provided with a back-pressure or check valve, substantially as described, of a pressure-regulating governor connected with said check-valve and adapted to hold the latter open whenever the pressure in the acid-chamber rises to or above a point at which said governor has been set to act, substantially as set forth.

478,198.

2. In a carbonic-acid-gas generator, the combination of an acid-chamber, a siphon placed within said chamber and communicating with the alkali-chamber, said siphon being provided with a back-pressure or check valve, which when open will equalize the pressure in the acid and alkali chambers and prevent the flow of the acid, and an adjustable pressure-regulating governor having a spring and diaphragm, the latter connected with said check-valve in such manner as to permit the latter to operate independently of the governor, said governor being adapted to hold the check-valve open whenever the pressure in the acid-chamber is at or above the desired limit, substantially as set forth.



3. In a carbonic-acid-gas generator, the combination, with the acid-chamber, of a vertical pipe rising within said acid-chamber and communicating with the alkali-chamber, an outer casing or jacket surrounding said vertical pipe and provided at its bottom with an inlet for the passage of the acid to the space between said vertical pipe and its outer casing or jacket, a back-pressure or check valve applied to the upper end of the jacket above the end of the vertical pipe inclosed thereby and opening into the acid-chamber, and an adjustable pressure-regulating governor loosely connected with the check-valve and adapted to open the same and hold it open whenever the pressure in the acid-chamber rises to or above a point at which said governor has been set to act, substantially as set forth.

4. In a carbonic-acid-gas generator, the combination of the alkali-chamber A, the acid-chamber B, provided with a pressure-gage H, the vertical pipe D, rising within said acid-chamber and communicating with the alkali-chamber, the outer casing or jacket E, surrounding the pipe D and provided at its bottom with an inlet for the passage of the acid to the space between the pipe D and its jacket E, the back-pressure or check valve G at the upper end of the jacket E, said valve opening into the acid chamber, the adjustable pressure-regulating governor K, having the spring *q*, screw-cap *r*, and diaphragm *m*, the latter connected by means of the coupling L with the stem *b'* of the valve G in such manner as to permit said valve to operate independently of the governor, said governor being adapted to hold the valve G open whenever the pressure in the acid-chamber is at or above the desired limit, all operating substantially in the manner and for the purpose described.

478,199. SELF-CLOSING FAUCET. ANTON MAYER, Cincinnati, Ohio, assignor to Rudolph J. Mayer, same place. Filed Aug. 28, 1891. Serial No. 403,980. (No model.)

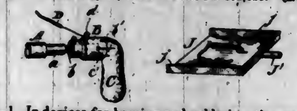
Claim.—1. The combination, in a faucet, of a valve-stem, a valve seated in the inner end of the faucet-casing, and a guard-cap for the valve-stem, carried by the stem and seating against the inner end of the faucet-casing, substantially as and for the purpose specified.

478,199.

2. The combination, in a faucet, of a valve-stem, a valve seated in the inner end of the faucet-casing, a spring adapted to press against the valve-stem outwardly, a lever adapted to actuate the valve-stem, and a guard-cap taking over the inner end of the valve-stem and carried thereby, substantially as and for the purpose specified.

3. The combination, in a faucet, of the valve-stem B, the valve C, the chamber *a'*, the spring G, the lever D, the screw-cap a^3, and the guard-cap H, taking over the inner end of the valve-stem and carried thereby, substantially as and for the purpose specified.

478,200. BREAD-RAISER AND CABINET. JOHN MILTONBERGER, Warsaw, Ind. Filed Sept. 26, 1891. Serial No. 406,895. (No model.)



Claim.—1. In a bread raiser and cabinet, the combination of the casing or housing having the lower chamber and the chamber above the same, the lamp in the lower chamber, the hood or concentrator above the lamp, the pipes leading from the hood through the chamber above, the dampers for controlling the heat-supply, and the cold-air duct and dampers for controlling said cold-air supply, whereby the supply of hot and cold air may be directed to one or both sides of casing.

2. In a bread raiser and cabinet, the combination of the casing having the three compartments in the lower portion thereof, the lamp or heater in the lower compartment, the hood or concentrator above said heater, the pipes leading from each side of said concentrator through the compartment above and communicating with the outer air, dampers for controlling said pipes, and air-ducts having dampers for regulating the supply of cold air to the casing.

3. In a bread raiser and cabinet, the combination of the casing having the lower compartment, the compartment above said lower compartment, and the upper compartment receiving the dough-pan, the lamp or heater in the lower compartment, the hood or concentrator above the lamp, the pipes leading from each side of the hood through the compartment above to the open air, dampers for controlling the passage of heat through said pipes to cause the heat to be supplied to one or both sides of the compartment, and cold-air ducts having dampers for controlling the passage of cold air to one or both sides of the compartment, substantially as and for the purpose described.

478,201. ELECTRICAL BRAZING DEVICE. WILLIS MITCHELL, Malden, assignor to the Butterfield-Mitchell Electric Heating Company, Boston, Mass. Filed Aug. 17, 1891. Serial No. 402,836. (No model.)

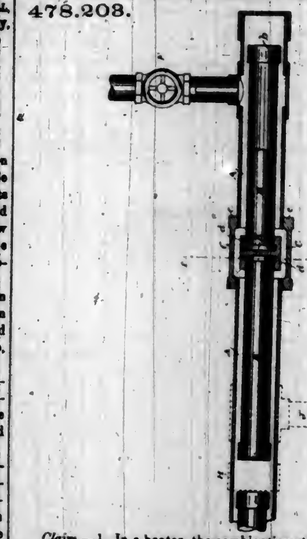
Claim.—1. In devices for brazing and soldering, the combination of a holder for the article or articles to be soldered with a movable pencil or pointer which is adapted to be presented to different points of the said holder opposite the parts in need of soldering, the said holder being of carbon or equivalent material and thin enough to allow an arc to heat through it from the pencil to the article or articles, the pencil and holder constituting the electrodes of an electric circuit, substantially as set forth.

2. In combination with a carbon cup forming one electrode of an electric circuit and adapted to receive and support a ring or rings upon it, a movable carbon pencil forming the other electrode of the said circuit and adapted to be introduced into the cavity of the said cup, substantially as and for the purpose set forth.

3. In combination with a holder for articles to be brazed or soldered, a socket into which the said holder is fitted, an electric conductor attached to the said socket, making the said holder one of the electrodes of an electric circuit, and a handle attached to the said socket for moving the latter about at will, substantially as set forth.

4. In combination with a holder of infusible electrically-conducting material for supporting articles to be brazed or soldered and connections making it one of the electrodes of an electric circuit, a pencil constituting the other electrode thereof, electrical connections with said pencil completing the circuit, and a socket and handle for the said pencil, whereby it may be presented to any point of the said holder, as desired, substantially as set forth.

478,202. VAGINAL SYRINGE. JOHN H. MORRISON, Salida, Colo. Filed Jan. 20, 1892. Serial No. 418,695. (No model.)



Claim.—1. In a vaginal syringe, a nozzle-tube provided with a rounded perforated nozzle-cap, a series of laterally elongated discharge-slots and an enlarged back receiving-reservoir at its lower end, an inclosing plug inclosing said back reservoir, a supply-pipe passing through said tube and connected with said nozzle-cap, a discharge-tube, and a vertically-adjustable shield-tampon working upon said tube over said reservoir, substantially as set forth.

2. In a vaginal syringe, the combination of a nozzle-tube provided with a series of laterally-elongated discharge-slots and terminating at its lower end in an enlarged back reservoir, an inclosing plug inclosing said back reservoir, a rounded perforated nozzle-cap fitted detachably in the upper end of said tube, a supply-pipe passing through said reservoir and tube and connected with said nozzle-cap, and a vertically-adjustable conical shield-tampon working upon said tube over said reservoir, substantially as set forth.

478,203. HEATING APPARATUS. JAMES F. MCELROY, Albany, N. Y., assignor to the Consolidated Car Heating Company, same place. Filed Feb. 26, 1892. Serial No. 422,670. (No model.)

478,203.

Claim.—1. In a heater, the combination of two pipes differing in diameter, the smaller pipe placed within the larger, and a steam-space surrounding the smaller pipe, the smaller pipe charged with a heat-absorbing substance, one end of said smaller pipe secured in and supported by a suitable coupling, the larger pipe adapted to receive steam or other heating fluid, substantially as described, and for the purpose set forth.

2. In a heater, a coupling-head, two pipes differing in diameter attached to said coupling-head, the smaller pipe extending from the coupling-head within the larger pipe, the end of the smaller pipe farthest from the coupling-head provided with a cap, and a steam-space surrounding said smaller pipe, said smaller pipe charged with a heat-absorbing substance, said larger pipe adapted to receive steam or other heating fluid, substantially as described, and for the purpose set forth.

3. In a storage-heater, the combination of a composite coupling, two storage-cylinders rigidly attached to said coupling, an envelop-ing-pipe surrounding said storage-cylinders, said storage-cylinders containing a heat-retaining substance, and a means for maintaining a steam-and-water connection from one end of the heater to the other, substantially as described, and for the purpose set forth.

4. In a heater, a coupling-head provided on each end near the outer edge with a projecting flange, screw-threads cut on the interior surface of said flange, said coupling-head provided at each end with a projecting flange nearer the center thereof than the aforesaid flange and suitably threaded upon the interior surface, and spaces through the coupling-head, with a pipe provided with screw-threads on its exterior surface, meshing with threads on the outer flange of the coupling-head, with a smaller pipe having screw-threads on its exterior surface, meshing with threads on the inner flange of the coupling-head, the smaller pipe charged with a suitable heat-absorbing substance, the larger pipe adapted to receive steam or other heating-fluid, substantially as described, and for the purpose set forth.

478,204. ILLUMINATED ADVERTISING-SIGN. CHARLES R. MCGINLEY, New York, N. Y. Filed June 2, 1891. Serial No. 394,830. (No model.)

Claim.—1. An advertising-sign comprising an inclosing frame or case having an advertising device in one end, an electric lamp in the case and provided with a key, and a motor inclosed within the case or frame and connected with the key to make and break the circuit, substantially as set forth.

2. An advertising sign comprising the casing having an advertising device in one end, a reflector 16, closing the case in rear of the sign, an electric lamp 18, extending through the reflector, with its key 20 behind said reflector, and a motor also in the casing, concealed behind the reflector and having a link connection 23 with the lamp-key, substantially as set forth.

478,205. HARNESS-SADDLE. STEPHEN A. HOLEN, McCrory, Ark. Filed Apr. 19, 1892. Serial No. 429,722. (No model.)

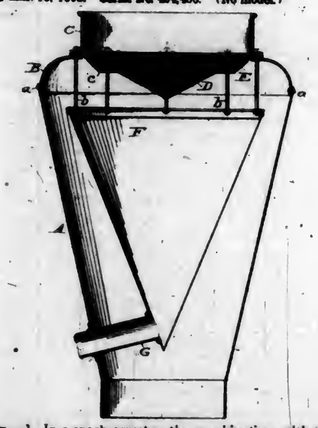
Claim.—1. In a harness saddle, the combination of the jockey-plates, each having a metal plate D resting thereon, a plate C, resting on the plate D and having an upwardly-turned loop *c* and a horizontal slot, a terret having its ends passing through said slot and bent under the plate C, with a wire link B, having its front and rear portions arched upward, and a metal strap G, folded around said arched portions and having its ends in the form of a hook, substantially as described.

2. In a harness-saddle, the combination of the jockey-plates, each having superposed metal plates, the upper plate having a horizontal slot and the lower ends of a rigid terret passing through said slot and resting upon the lower plate, with a wire link B, uniting together the metal plates and the jockey-plates, said link having its front and rear portions arched upward, substantially as described.

478,206. BRAKE FOR BICYCLES. FREDERICK D. OWEN, Washington, D. C. Filed Nov. 30, 1891. Serial No. 413,931. (No model.)

Claim.—1. In a bicycle, each wheel, in combination with a brake-shoe attached to the frame of the wheel, respectively, and to operate on each wheel independently at the will of the rider by a governing brake-lever located on the handle-bar connecting one (compression) plunger or (tension) pull-brake connection with an adjustable attachment coupling the two brake connections, all as shown and described.

2. In a bicycle, the combination of two independent brakes, one brake located on the frame so as to engage the front wheel and one brake located on the frame so as to engage the rear wheel and governed separately or simultaneously, as desired, with one brake-lever attached to and pivoted on the handle-bar and engaging one (compression) plunger or (tension) pull-brake connection with an adjustable coupling device, substantially as shown and described.



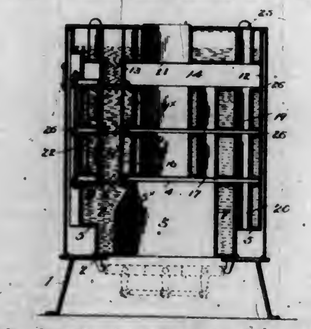
3. The combination, with the wheels of a bicycle, of brakes arranged to engage the wheels, a brake-lever located on the handle-bar with one (compression) plunger or (tension) pull connection between the hand-lever and brake-shoes, and connecting and adjusting devices, whereby either one only of the brakes may be made to operate or by which both brakes may be made to operate simultaneously.

4. The combination of the wheels of a bicycle with two brakes attached to the frame so as to engage the wheels, respectively, and operate with one hand brake-lever connecting with one adjustable plunger brake-rod or an adjustable pull-brake connection, applying the force at the will of the rider, whereby one brake will be engaged previous to and stronger than the other brake, substantially as herein shown and described.

5. In a bicycle or like vehicle having two brakes located on the frame of the cycle so that each brake will engage the wheels, respectively, the combination of one hand brake-lever located on the handle-bar and connecting one adjustable plunger brake-rod or an adjustable pull-brake member with an adjustable coupling device, all governed at the will of the rider, whereby either brake may be made to operate or both brakes may be made to operate, all as shown and described.

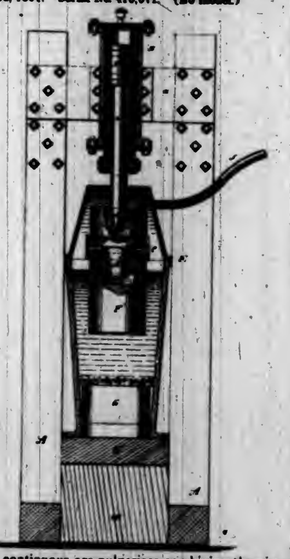
6. The combination of two brakes of a bicycle operating one on the frame of each wheel so as to engage the wheels, respectively, at the will of the rider with two separate hand-levers attached to and pivoted on the steering-frame of the bicycle, said hand-levers engaging one and the same brake-rod, substantially as described.

478,207. SPARK-ARRESTER. HENRY C. SMITH, Roanoke, Va. Filed Mar. 10, 1892. Serial No. 424,406. (No model.)



Claim.—1. In a spark-arrester, the combination, with the stack A, of a receptacle F, open at its upper end and located within the stack, a screen D, extending across the top of the stack immediately above the mouth of the receptacle, so as to direct the sparks thereinto, and a deflecting-screen E, surrounding that portion of the screen D above the annular space between the parts A and F, all substantially as shown and described.

2. In a spark-arrester, the combination, with a stack A, of a receptacle mounted therein, but set away from the sides thereof, so as to form an annular draft-space, a conical screen D, extending across the outlet of the stack and projecting down toward the mouth of the receptacle F, and a second screen E, made in the form of a ring or band and adapted to receive the initial impact of the draft, &c.



3. In combination with stack A, having curved upper wall or casting B, receptacle F, mounted therein and having its upper end of the same size as the opening in the top of the stack, the conical screen D, filling the opening in the stack-opening and extending down toward the mouth of the receptacle, and a second screen E, made in the form of a band and surrounding the screen D near its junction with the stack.

478,208. SECTIONAL STEAM-BOILER. GEORGE F. STEEL, Philadelphia, Pa. Filed Mar. 2, 1892. Serial No. 423,462. (No model.)

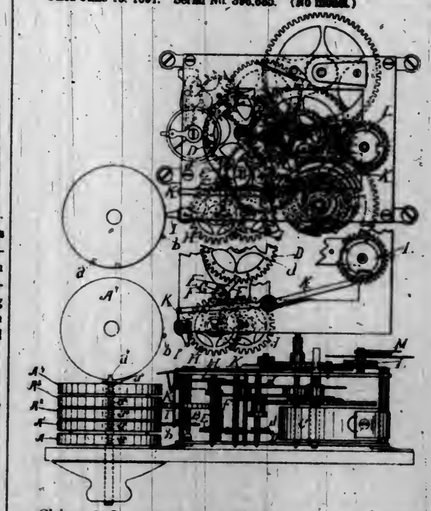
Claim.—In combination, the base-section formed with a seat, the combustion-chamber section fitting therein having an overhanging portion provided with flues and water-spaces, the interchangeable sections above the combustion-chamber sections, each having a portion extending inwardly and overhanging the inner wall of the lower section, said overhanging portion being formed with uptake-flues and having also a return-flue communicating with the flues through the overhanging part of the combustion-section, the sockets and nipples with the interposed gaskets held by the said sockets forming the connection between the sections, the said sockets in the combustion-chamber section being formed in enlargements thereon, the upper section having the long depending flange-nipple to form an upper combustion-space, the means for securing the sections together, and the flanges and sockets around the outer edge of the sections, and the outer shell supported on the base-section, substantially as described.

478,209. ORE-PULVERIZER. JOHN J. STUART, New York, N. Y. Filed Oct. 26, 1891. Serial No. 410,071. (No model.)

Claim.—A continuous ore-pulverizer combining therein a stamping mechanism consisting of the piston, piston-rod, and removable shoes adapted to be dislodged therefrom by wedges introduced into transverse openings, a closed receptacle adapted to be partially filled with water, an ore-introducing chute above the surface of the water, an induction water-pipe leading into the top of and continuously flowing into the closed receptacle, and an outlet-pipe arranged on a level with and adapted to receive the water, together with the particles carried thereby, all arranged and operated substantially as described.

478,210. BOILER-FURNACE. JOSEPH W. WILKINSON, Des Moines, Iowa. Filed Mar. 8, 1892. Serial No. 424,121. (No model.)

Claim.—1. In a boiler-furnace, the combination of hollow furnace-walls on either side of a fire-grate, a hollow bridge-wall, the cavity in which communicates with the cavities in the hollow side walls, and a superheating-pipe located in a hot-air chamber, one end of which pipe opens within the combustion-chamber below the fire-grate, the other end of said pipe discharging into the cavity in the bridge-wall, together with perforations in the side walls on either side of the combustion-chamber and above the grate, as set forth.



2. In a boiler-furnace, a bridge-wall having an air-chamber and perforations at its top to discharge air from said chamber, parallel side walls having air-chambers communicating with the air-chamber in the bridge-wall and provided with perforations to discharge air into the combustion-chamber in front of the bridge-wall, an open-ended air-conveying tube adapted to convey air into the air-chamber in the bridge-wall, and a perforated air superheater and distributer connected with said tube to discharge hot air above and in rear of the bridge-wall, arranged and combined to operate in the manner set forth, and for the purposes stated.

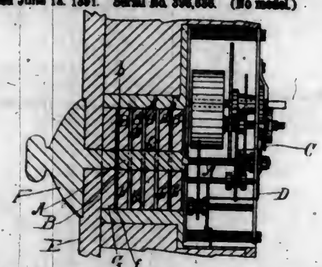
478,211. OVEN FOR OIL, GAS, OR GASOLINE STOVES. HENRY F. HASTLETT, Springfield, Mo., assignor of one-third to S. A. Hastletine, S. C. Hastletine, and John F. Carson, same place. Filed Apr. 28, 1887. Serial No. 236,502. (No model.)

Claim.—In an oven for oil-stoves, the combination, with the outer casing having an inlet-opening in its bottom, of a perforated plate above said opening and an interior casing provided with a solid bottom, perforated sides and top, and a door provided with perforations near its upper edge for the escape of the air, substantially as and for the purposes described.

478,212. TIME-LOCK. LYMAN H. BEDFORD, San Bernardino, Cal. Filed June 18, 1891. Serial No. 396,685. (No model.)

Claim.—1. In a lock, the combination, with one of the rotating tumblers, of an operating device arranged to intermittently engage such tumbler to displace it, substantially as described.

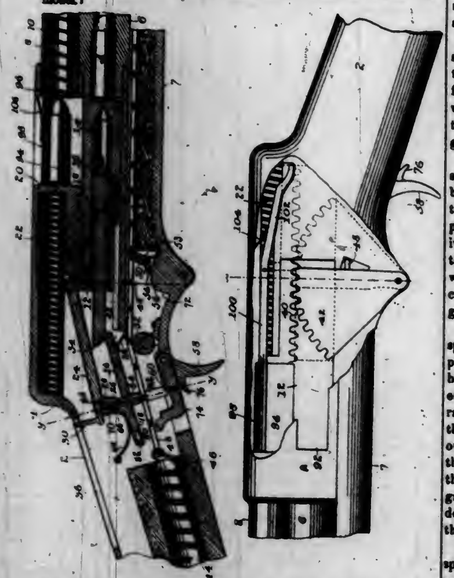
2. In a lock, the combination of the tumbler-operating device arranged to intermittently engage the rotating tumbler to displace it, and a stop device arranged to stop such operating device, substantially as described.



3. In a lock, the combination of the tumbler provided with the projection, the intermittently-operating spur arranged to engage such projection when the tumbler is in the unlocking position to partially rotate the tumbler and throw it out of such unlocking position, and means for operating the spur, substantially as described.

4. In a lock, the combination of the tumbler provided with the projection, the intermittently-operating spur arranged to engage such projection when the tumbler is in its unlocking position to partially rotate the tumbler and throw it out of such unlocking position, means for operating the spur, and a stop device arranged to stop such spur, substantially as described.

5. The combination of the tumbler, the tumbler-displacing spur arranged to intermittently displace the tumbler, the spur-driving train, the time mechanism, the stop and releasing wheel D, provided with



the pins and connected with such time mechanism, the stop-spar connected with the tumbler-displacing spar-operating mechanism, and a stop device connected with the time mechanism and arranged to periodically stop the tumbler-displacing spar-operating mechanism, substantially as described.

478,213. TIME-LOCK. LYMAN H. BEDFORD, San Bernardino, Cal. Filed June 18, 1891. Serial No. 396,636. (No model.)

Claim.—The combination of the rotating arbor, time mechanism arranged to rotate the arbor, and a series of tumblers journaled upon such arbor and adapted to rotate therewith and to be rotated thereupon, substantially as described.

478,214. RECOIL-OPERATED MAGAZINE-GUN. OLIVER H. BENNETT, Jamestown, N. D. Filed Apr. 1, 1891. Serial No. 387,233. (No model.)

Claim.—1. In an automatic magazine-gun, the combination of the breech-block, the spring actuating the breech-block to throw it forward to load the gun, and the retracting-spring to move the breech-block backward to withdraw an exploded shell, substantially as described.

2. In an automatic magazine-gun, the combination of the breech-block, the spring actuating the breech-block to press it forward, the retracting-spring, and the intermediate mechanism connecting the retracting-spring and the breech-block, substantially as described.

3. In an automatic magazine-gun, the combination of the breech-block, the spring actuating the breech-block to press it forward, the retracting-spring, and the gear-and-rack mechanism connected with the breech-block, and the retracting-spring to convey the energy of the latter to the former, substantially as described.

4. In an automatic magazine-gun, the combination of the breech-block, the spring actuating the breech-block to press it forward, the retracting-spring, the chain connected with the said spring, the rack attached to the breech-block, the segmental gear engaging with the said rack, and the means for successively connecting and disconnecting the chain with the segmental gear, substantially as described.

5. In an automatic magazine-gun, the combination of the breech-block, the spring actuating the breech-block to press it forward, the retracting-spring, the rack secured to the breech-block, the segmental gear engaging with the said rack, the chain connected with the retracting-spring, and the dog pivoted to the segmental gear, adapted to engage with the successive links of the free end of said chain, substantially as described.

6. In a magazine-gun, the combination of the casing, the spring-actuated breech-block carried therein, the retracting-spring, the rack attached to the breech-block, the segmental gear engaging with the said rack, and the chain connecting the retracting-spring with the segmental gear, substantially as described.

7. In a magazine-gun, the combination of the breech-block, the spring operating to press the breech-block forward, the retracting-spring, the rack attached to the breech-block, the segmental gear engaging with the said rack, the chain successively connecting and disconnecting the retracting-spring with the segmental gear, and the locking mechanism consisting of the stop secured within the casing, the dog pivoted to the breech-block and adapted to engage with the said stop, the plunger adapted to disengage the said dog, and the trigger for operating the plunger, substantially as described.

8. In a magazine-gun, the combination of the spring-actuated breech-block, the rack attached to the breech-block, the segmental gear engaging with the said rack, the retracting-spring, the mechanism for successively connecting and disconnecting the said spring with the segmental gear, consisting of the chain attached to the retracting-spring, the dog pivoted to the segmental gear, adapted to engage with the said chain and after moving with the said gear a short distance to release the chain, the stop adapted to engage with the chain as it is released by the dog, and the trigger for operating the said stop, substantially as described.

9. In a magazine-gun, the combination of the breech-block, the spring operating to press the breech-block forward, the dog adapted to hold the breech-block in its forward position, the spring-actuated firing-pin carried by the breech-block, the dog adapted to engage with the firing-pin, the plunger adapted to release the firing-pin and the breech-block successively from their respective dogs, and the trigger operating the plunger, substantially as described.

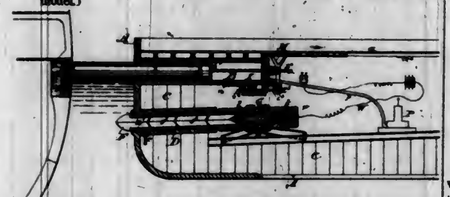
10. In a magazine-gun, the combination of the breech-block, the spring operating to press it forward, a dog adapted to hold the breech-block in its forward position, the spring-actuated firing-pin carried by the breech-block, the dog adapted to engage with the firing-pin, the plunger adapted to release the firing-pin and the breech-block successively from their respective dogs, the trigger operating the plunger, the rack attached to the breech block, the segmental gear engaging with the said rack, the retracting-spring, and the chain successively connecting and disconnecting the retracting-spring with the segmental gear, substantially as described.

11. In a magazine-gun, the combination of the breech-block, the spring operating to force the same forward, the spring-actuated firing-pin, the top fixed within the casing, the dog pivoted to the breech-block and adapted to engage with the said stop, the dog adapted to engage with the rear end of the firing-pin, the retracting-spring, the rack attached to the breech-block, the segmental gear engaging with the said rack, the chain attached to the retracting-spring, the dog pivoted to the segmental gear and adapted to engage successively with the links of the said chain, the stop adapted to hold the chain against the action of the spring while the dog is releasing a preceding and engaging with a succeeding link, the plunger operating to disengage the dogs of the breech-block and firing-pin, and the trigger for operating the plunger and stop, substantially as described.

12. In a magazine-gun, the combination of the breech-block, the spring-actuated firing-pin carried by the breech-block, the spring operating to press the breech-block forward, the spring operating to withdraw the breech-block against the action of the first-mentioned spring, the rack attached to the breech-block, the segmental gear engaging with the said rack, the chain successively connecting and disconnecting the retracting-spring with the segmental gear, the stop secured within the casing, the dog pivoted to the breech-block and adapted to engage with the said stop, the dog adapted to engage with the firing-pin, a plunger adapted to successively release the said dogs from their engagements, and the trigger operating the said plunger, substantially as described.

13. In a magazine-gun, the combination, with the reciprocating breech-block, of a cartridge-carrier adapted to receive cartridges from the magazine and convey them to the breech-block, having an elastic operating-lever located to be actuated by the breech-block, substantially as described.

14. In a magazine-gun, the combination of the breech-block, the spring operating to press the same forward, the spring-extractor secured to the forward end of the breech-block, adapted with a shoulder



of the latter to grasp the shell of a cartridge, and the mechanism for withdrawing the exploded shell from the barrel by moving the breech-block backward against the action of the first-mentioned spring, consisting of the retracting-spring, the rack attached to the breech-block, the segmental gear engaging the said rack, and the chain connecting the retracting-spring with the segmental gear, substantially as described.

15. In a magazine-gun, the combination of the casing, the breech-block carried therein, the spring operating to press the breech-block forward, the magazine, the cartridge-carrier operated by the breech-block, and the spring-stop secured to the top of the carrier, substantially as described.

16. In a magazine-gun, the combination, with the breech-block, of a spring tending to throw the same forward to load the gun, a dog automatically locking the block in the forward position, mechanism operated by the trigger for tripping said dog, a rack upon said block, a segmental gear engaging said rack and adapted to throw said breech-block, a retracting-spring, means for applying tension thereto, means for connecting it to said segmental gear, whereby when the breech-block is released it expends its force to throw the same back, and means through which may be restored the tension of said retracting-spring, substantially as described.

17. In a magazine-gun, the combination, with its reciprocating breech-block, of an actuating-spring tending to throw it forward, mechanism for automatically locking it in its forward position, means for tripping said locking mechanism, a rack upon said block, a segmental gear engaging with said rack, means for applying stored energy to said gear to retract said block when the locking mechanism is released, and means through which may be restored said energy, substantially as described.

478,215. OPERATING SUBMARINE GUNS. HIRAM BERDAN, Washington, D. C. Filed Mar. 22, 1892. Serial No. 425,967. (No model.)

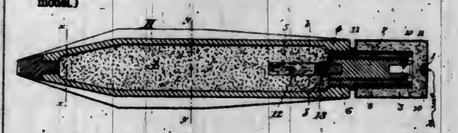
Claim.—1. As a means for firing projectiles under water and also for checking the momentum of a vessel, a gun located in said vessel at the bows and under the buffer and a chamber at or near the water-line, provided with a buffer sliding therein, said chamber being filled with oil or other suitable fluid at the rear of the buffer to absorb the momentum of the vessel when impacted against an external object, and suitable electric connections between the chamber and the breech of the gun, whereby while the buffer is being pushed in the gun is fired by means of said connections, substantially as and for the purpose described.

2. As a means for firing projectiles under water, a vessel provided with a gun located therein at its bows and under the buffer, in combination with an open chamber at or near the water-line and having therein and projecting therefrom a sliding buffer, and suitable electric connections between the said buffer and said gun, whereby while the buffer is being moved by external impact the gun is fired by means of said connections, substantially as and for the purpose set forth.

3. As a means for firing projectiles under water, a vessel provided with a submarine gun and a buffer-chamber located above the gun, said chamber being provided with a buffer sliding therein and oil or other suitable fluid, and a valve mechanism connected with the chamber and with suitable electrical connections between said mechanism and the gun, whereby while the buffer is being moved by external impact the oil or other fluid is compressed to operate the valve mechanism and electrical connections whereby the gun is fired, substantially as and for the purpose set forth.

4. As a means for firing projectiles under water, a vessel provided with a gun located therein at its bows and under the buffer and a chamber located above the gun and having extending therefrom and sliding therein a buffer provided with a suitable rear extension, in combination with electrical devices connected with the gun, whereby said buffer while being moved rearward is brought in contact with said devices to complete the circuit and fire the gun, substantially as described.

5. As a means for firing projectiles under water, a vessel provided with a gun located under the buffer at the bows of said vessel in a tube that is connected with the frame-work of the vessel, in combination with an open chamber at or near the water-line and having therein and projecting therefrom a sliding buffer and suitable electric connections between the said buffer and said gun, whereby while the buffer is being moved by external impact the gun is fired by means of said connections, substantially as and for the purpose set forth.



6. The combination, with a vessel, of a collision-buffer sliding in a suitable chamber, said chamber being provided with the valve I, which is operated by the movement of the piston *b*, operatively connected with the rack *n*, the pinion *o* on the shaft *o'*, the bevel-wheel i^2 thereon, the bevel-wheel i^3, meshing with i^2 and carrying the screw i^4 to operate the valve, substantially as and for the purpose herein set forth.

7. The combination, with a war-vessel, of a hydraulic collision-buffer provided with suitable pressure-regulating devices, said devices consisting of a sliding valve provided with a small projection s^3, operating against the spring *r* to adjust itself to the desired pressure, substantially as and for the purpose herein described.

8. As a means for firing a projectile under water, a vessel provided with a hydraulic cylinder having a piston moving therein, a sliding bracket connected with said piston, a rack attached to said bracket, a transverse shaft connected with the cylinder and carrying a pinion and a bevel-wheel, the former of which meshes with the rack and the latter with a bevel-wheel, operating a screw-threaded shaft to operate a valve, whereby the pressure of the fluid in the cylinder is equalized during the entire stroke of the piston, as set forth.

9. As a means for firing projectiles, a vessel provided with a hydraulic cylinder having an opening therein and a valve attached thereto, said valve having also an opening therein and a small ledge against which the fluid acts, a spring counteracting the pressure of the fluid against said ledge, all operatively connected and combined substantially as set forth.

478,216. AMMUNITION FOR SUBMARINE GUNS. HIRAM BERDAN, Washington, D. C. Filed Mar. 22, 1892. Serial No. 425,968. (No model.)

Claim.—1. The combination of a shell, substantially as described, with air-cylinders in front thereof, all in operative relation, substantially as and for the purpose herein set forth.

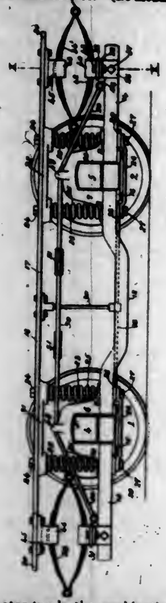
2. A shell, substantially as described, having a time-fuse attached to its rear end, a spindle around which the time-fuse is coiled, and a sleeve for protecting the fuse, substantially as and for the purpose herein set forth.

3. A shell, substantially as described, having a metal case attached to its rear part carrying the propelling charge and a time-fuse, all in operative relation, substantially as set forth.

4. A shell, substantially as described, having a fuse-spindle and sleeve, the fuse encircling said spindle, and a metal case for carrying the propelling charge surrounding said sleeve, said parts being attached to the rear of the shell, and all in operative relation therewith and with each other, as set forth.

5. A shell, substantially as described, having a fuse-spindle, the fuse encircling said spindle, and a metal case carrying the propelling charge surrounding the fuse, said parts being attached to the rear of the shell and separable therefrom and from each other, as set forth.

6. A shell, substantially as described, charged with wet gun-cotton and a case of dry gun-cotton, a tube of fulminate of mercury, and a time-fuse, substantially as described, all combined and in operative relation, as set forth.



7. A shell constructed with longitudinal corrugations corresponding internally and externally thereof, whereby the gas freely passes the shell, as and for the purpose specified.

478,217. DENTAL FORCEPS. CHARLES E. BLAKE, Sr., San Francisco, Cal. Filed Oct. 22, 1891. Serial No. 409,539. (No model.)

Claim.—A dental forceps having one of its jaws made shorter than the other and formed into two or more points or prongs, while its opposite jaw is a tapering, curved, and pointed beak, substantially as described.

478,218. CAR-TRUCK. George M. Bell, Philadelphia, Pa. Filed June 26, 1891. Serial No. 397,068. (No model.)

Claim.—1. In a motor-truck, the combination, with a stationary frame supported upon the running-gear, said frame having sections extending outwardly from the axle, of a movable frame supported upon said truck, spiral springs located between the movable and stationary frames, and elliptical springs located between the extended sections of the said rigid frame and the movable frame, substantially as described.

2. In a truck, a spring-supporting frame supported upon the running-gear by saddles and having sections extending outwardly from the axles, a movable frame having like extensions, spiral springs located between the saddles and movable frame, and elliptical springs located between the spring-supporting frame and the movable frame, substantially as described.

3. In a truck, a stationary frame supported upon the running-gear of said truck having sections extending outwardly from the axles, a movable frame carried by said truck, springs located between the stationary and movable frames and between the extended sections of both frames, and a brace for said extended sections of the stationary frame, secured to said extended sections and supported upon the running-gear of the truck, substantially as described.

4. In a truck, a stationary frame supported on its running-gear by saddles and having sections extending outwardly from the axles, a movable frame with extending sections, springs located between the stationary and movable frames and between their extended sections, and a brace for said extended sections of the stationary frame, secured to such sections and supported upon the said saddles, substantially as described.

5. In a truck, a stationary frame having sections extending outwardly from the axles, saddles secured to stationary frame and supported on the axle-boxes, a movable frame having outwardly-extending sections, spiral springs located between the saddles and the movable frame, elliptical springs located between the movable frame and the extended sections of the stationary frame, and a brace for said extended sections, supported upon the saddles, the ends of which are secured to said extended sections, substantially as described.

6. A spring-supporting frame for a truck, comprising the saddles adapted to straddle the axle-boxes, longitudinally-extending beams extending between and secured to said saddles, additional beams secured to and extending outwardly from said saddles, and a brace supported upon said saddles and secured at its outer ends to the outwardly-extending beams, substantially as described.

7. A spring-supporting frame for a truck, comprising the saddles 6 and 7, having projections for supporting the truck-springs, outwardly-extending lugs 49 on the saddles, central sections 12 of the side beams, secured to the saddles, outwardly-extending sections 13 14 of the side beams, secured to the said saddles, cross bars 15 16, uniting the ends of the side-beam sections, lugs 48 on the sections 13 14 of the side beams, a brace 50, secured to said lugs 48 and extending over the lugs 49 on the saddles, and a turnbuckle 51 for tightening said brace, substantially as described.

8. In a truck, a spring-supporting frame supported upon the running-gear by saddles and having sections extending outwardly from the axles, a movable frame having like extensions, spiral springs located between the saddles and movable frame, and elliptical springs located between the spring-supporting frame and the movable frame, and braces for the extended ends of the spring-supporting frame, secured thereto and resting on the saddles, substantially as described.

9. In a truck, the combination of two frames, one stationary and supported upon the running-gear, the other movable, and a plurality of springs located between the stationary and movable frames, some of said series being adapted to be compressed by the downward movement of said movable frame subsequent to the compression of other of the series, substantially as described

10. In a truck, the combination of two frames, one stationary and supported upon the running-gear of the truck, the other adapted to be moved toward said stationary frame, springs located between the ends of both frames, and springs otherwise disposed between the two frames, the end springs being adapted to be compressed subsequent to the compression of the other springs, substantially as described.

11. In a truck, a stationary spring-supporting frame having at its ends elliptical springs rigidly secured thereto, in combination with a movable frame supported by springs other than said elliptical springs, said movable frame being provided with devices for engaging said elliptical springs, the elliptical springs being adapted to be brought into action subsequent to the springs supporting the movable frame, substantially as described.

12. In a truck, a spring-supporting stationary frame mounted on the running-gear of said truck, said frame being composed of a plurality of bars contiguously disposed, a saddle secured to the outer sections of said bars, an elliptical spring the lower section of which rests upon said saddle, and a second saddle disposed over the first and the spring and secured to the first saddle, a movable frame, and a spring supported upon the stationary frame and having devices for guiding the upper section of the elliptical spring, substantially as described.

13. In a truck, the combination of two frames, the one stationary and supported upon the running-gear, the other movable, said stationary frame having the contiguously-disposed beams 14, a saddle 35, closed at the top and having legs 36 secured to the beams 14 and projections 38, a second saddle closed at the top and secured to the projections 38, an elliptical spring 34', held between the two saddles, and a cap 45, having downwardly-extending legs 46 secured to the movable frame, the ends of which engage the upper section of said elliptical spring, substantially as described.

14. A truck having running-gear and a frame, and spiral springs for supporting the car-body, supplemented by elliptical springs adapted to coact therewith, the spirals being adapted to be compressed prior to the ellipticals, substantially as described.

15. A truck having side beams disposed about the axle-boxes and a brace extending between the axle-boxes and secured to the side beams, substantially as described.

16. A truck having side beams disposed about the axle-boxes and a brace supported upon or above the axle-boxes and secured to the side beams, substantially as described.

17. The upper chord having the depending cap 45, with downwardly-extending legs 46, and elliptical springs held on the side beams, adapted to move in said cap, substantially as described.

18. The saddle 35, having the legs 36 secured to the side beams and projections 38, and the saddle 34, provided with projections 42, secured to like parts on the saddle 35, substantially as described.

19. The side beams on the axle-boxes, axle-box saddles 6 7, having the lugs or projections 49 above the axle-boxes, and a brace supported thereon and secured to the side beams, substantially as described.

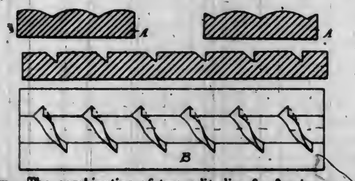
20. A truck having side beams disposed about the axle-boxes, a brace supported upon or above the axle-boxes, extending between them and secured thereto, and means for tightening the said brace, substantially as described.

21. The side beams intermitted about the axle-boxes, saddles for supporting the side beams on the axle-boxes, and a brace supported on the saddles above the side beams and secured to the side beams, substantially as described.

22. The saddles 6 7, supported on the axle-boxes, lugs 49 on the saddles, side-beam sections 12 13 14, secured to the saddles, and a brace 50, supported on the lugs 49 and secured to the sections 13 14 of the side beams, substantially as described.

23. A frame for a truck, comprising the saddles 6 7, having projections for supporting the truck-springs, lugs 49 on the saddle, central side-beam sections 12, secured to the saddles, outwardly-extending side-beam sections 13 14, secured to the saddles, and a brace 50, secured to the sections 13 14 and supported on the lugs 49 of the saddles, substantially as described.

24. A frame for a truck, comprising the saddles 6 7, having projections for supporting the truck-springs, lugs 49 on the saddles, central side-beam sections 12, secured to the saddles, outwardly-extending side-beam sections 13 14, secured to the saddles, a brace 50, secured to the side-beam sections 13 14 and supported on the lugs 49, and a turnbuckle 51 for tightening said brace, substantially as described.



25. The saddles 6 7, straddling the axle-boxes and open below the same, lugs 49 on the saddles, side-beam sections 12 13 14, secured to the saddles, and a brace 50, secured to the side-beam sections 13 14 and supported on the lugs 49, substantially as described.

26. The saddle 35, secured to the side beams, the saddle 40, secured to the saddle 35, and an upwardly-extending elliptical spring held between the two saddles, substantially as described.

27. In a truck, a stationary spring-supporting frame mounted on the running-gear of said truck, having outwardly-extending sections and elliptical springs secured to the stationary frame, and a movable-frame spring supported upon the said stationary frame, having a device for guiding the upper portion of the elliptical springs, substantially as described.

28. Side beams supported upon the running-gear and extending past the same and a brace detachably supported upon the running-gear or a portion thereof and secured to the extended ends to the side beams, substantially as described.

478,219. DIE FOR SWAGING SCREWS. Henry P. Boyd, Southampton, England. Filed Mar. 7, 1889. Renewed Dec. 29, 1891. Serial No. 416,475. (No model.) Patented in England Apr. 23, 1885, No. 5,029.

Claim.—The combination of two split dies for forging a screw-thread, consisting of a primary split die internally threaded parallel throughout with a slightly indented and rounded primary leading-thread of a shorter pitch than that to be eventually forged on the screw and a parallel internally-threaded secondary split die with a fully-formed rectilinear thread of a longer pitch than that of the primary die to admit of elongation of the barrel of the screw during forging and corresponding to the thread finally to be forged upon the finished screw, substantially as specified.

478,220. MAGAZINE-FIREARM. Andrew Burgess, Owego, N. Y. Filed Oct. 21, 1886. Serial No. 216,874. (No model.)

Claim.—1. In a breech-loading gun, a frame provided with two abutments on different sides of the bolt-receiver, a bolt moving between said abutments, two locking-braces hung in said bolt to swing outward and lock against said abutments, and an operating-handle connected to said braces by which the braces and bolt may be moved, in combination, substantially as described.

2. In a breech loading gun, the frame having abutments at opposite sides of the bolt, a reciprocating bolt provided with a plurality of braces hung therein to swing outward against said abutments, one of said braces having a bearing against the other, and a handle connected to said braces, the parts in combination, substantially as described.

3. In the frame of a breech-loading firearm, a reciprocating bolt, a movable piece to serve as a fulcrum arranged in said bolt to be projected forward of its face against an abutment in the frame, in combination with an operating-handle therefor and a lever arranged in connection therewith, substantially as described, to start back the bolt.

4. In a breech-loading gun, the reciprocating bolt, an extractor therein, and a lever pivoted to and moving with the bolt and in position to engage said extractor, said lever bearing on parts of the gun to operate automatically to turn the extractor during the bolt movement, substantially as described.

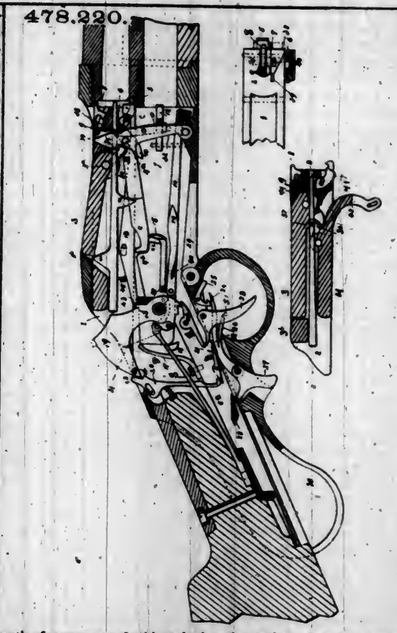
5. In the frame of a magazine-firearm with an opening at its top, a reciprocating bolt and an ejector arranged at the bottom of the face of the bolt with movement upward from the bottom of the face of the bolt, in combination with a carrier which, rising from below the bolt by impulse of its spring or the breech mechanism, strikes the ejector to throw it violently upward against the flange of the cartridge to expel the shell sidewise upward through the opening in the top of the frame.

6. In a magazine-gun, a reciprocating bolt, a carrier-operating stud hung in the bolt in position to swing downward therefrom, a carrier hung below the bolt, having a shoulder projecting up into the path of movement of said stud when the stud is swung downward, and means for moving said stud into or out of engaging position, in combination, substantially as described.

7. In a breech-loading gun, a reciprocating bolt having an extractor therein, a cross-lever in said bolt, and a recoil-piece having engagement with said lever to press it against the extractor when the gun is fired, in combination, substantially as described.

8. In a magazine-firearm, a reciprocating bolt, a magazine, a carrier whose forward end moves upward from the mouth of the magazine, vertical side grooves situated in the frame, a cartridge-length to rearward of the magazine-mouth to receive, and their walls to guide the flange and control the cartridge when the carrier rises, all in combination, substantially as described.

9. In a firearm, a breech-piece locking in the frame to resist the discharge, a relatively-movable piece projecting forward from the face of said breech-piece to bear against the cartridge and press it home in the chamber, and a hammer having an abutment in the line of movement of this movable piece, whereby the backward movement of the cartridge on firing throws back the movable piece and hammer, but is itself stopped by the locked breech-piece, all in combination, substantially as described.



10. In a breech-loading firearm, a longitudinally-reciprocating breech-bolt and a sliding sleeve on the small of the stock connected to said bolt, said sleeve having a forward extension 31, which moves close to the bolt and closes the opening in the frame when the breech is closed, in combination, substantially as described.

11. In a magazine-firearm, a vibrating carrier which raises the cartridge-point higher than its rear, in combination with a lever pivoted at the rear of the carrier, so as to rise therewith, and a projection on the reciprocating breech mechanism to engage the said lever in the first part of the breech-closing movement, and thereby raise the rear of the cartridge above the floor of the carrier, substantially as specified.

12. In a breech-loading firearm, mechanism to open and close the breech, a sliding handle connected to said breech mechanism, and a locking-dog to lock the sliding handle on the gun in position to hold the breech closed, in combination with a finger-piece connecting with the locking-dog by which the handle may be unlocked, and a catch to be turned at will to confine the finger-piece, and thereby hold the locking-dog out of locking position, substantially as set forth.

13. In a breech-loading firearm, mechanism to open and close the breech, a sliding handle connected to said breech mechanism to operate it, a locking-dog to lock the sliding handle on the gun in position to hold the breech closed, and a spring connection between the locking-dog and trigger, in combination with a trigger which compresses said spring when pulled back to press the locking-dog and unlock the sliding handle.

478,220.

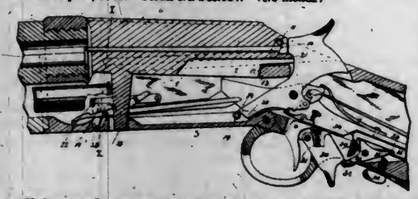
14. In a breech-loading gun, the reciprocating breech and shifting handle connected thereto, a dog engaging said handle, and a rod movable into position to engage and unlock said dog, in combination, substantially as described.

15. In a magazine-gun, the cartridge-stop at the mouth of the magazine, the movable breech-piece and a lever connected thereto in position to engage said cartridge-stop, and automatic means operated by the firing of the gun to trip said lever and stop, in combination, substantially as described.

16. In a magazine-gun, a frame having an opening at the bottom wide enough to receive a cartridge, a magazine under the barrel in front of the opening, a sliding handle, and a forward extension connected to the handle and to the breech-piece, said extension forming a cover to close the opening in the frame and magazine when the breech is closed, but which is retired in its movement of opening the breech to expose the orifice of the magazine, all in combination, substantially as described.

17. In a magazine-gun, a frame having an opening at the bottom wide enough to receive a cartridge, a magazine under the barrel in front of the opening and having a cartridge-stop, a sliding handle traversing the small of the stock, and a link pivoted to said handle and connected to the breech mechanism to operate the same, said link serving as a cover to close the opening in the frame when the breech is closed, all in combination, substantially as described.

18. In a magazine-firearm, a recoil-piece connected to the breech-piece, said piece having a limited recoil independent of the breech-piece, adjunctive locking devices, substantially as described, by which the breech-operating handle is held locked, and connections from the recoil-piece to said handle-lock by which the same is unlocked on the firing of the gun, in combination, substantially as described.



19. In a breech-loading gun, the reciprocating bolt and sliding handle connected thereto, the locking-dog engaging said handle, a rod movable to position to trip said dog, and the hammer operating on said rod when moved to cocked position, in combination, substantially as described.

20. In a breech-loading gun, the reciprocating breech-piece and sliding handle connected thereto, a locking-dog engaging the handle, and automatic mechanism operated by the recoil to unlock said handle, substantially as described.

21. In a breech-loading gun, a reciprocating bolt, an extractor carried thereby, a cross-lever in the bolt, and a firing-pin having a projection to engage said cross-lever and hold the extractor when the gun is fired, substantially as described.

22. In a magazine-firearm, a reciprocating bolt and a carrier-operating stud hung in the bolt to swing downward, in combination with a carrier hung below the bolt, with a shoulder below the line of movement of said stud when in its operative position, and a firing-pin arranged to strike said stud down into position to engage and raise the carrier.

478,221. MAGAZINE-FIREARM. ANDREW BURGESS, Owego, N. Y. Filed Sept. 6, 1887. Serial No. 248,987. (No model.)

Claim.—1. In a breech-loading firearm, a reciprocating breech having a locking-shoulder thereon, a lateral projection near the front end of said breech-piece, and a groove from its rear end forward, said groove being offset at its rear, substantially as described, in combination with a frame provided with a longitudinal groove to guide the front of the breech-piece, and a lateral projection extending into the groove in the breech-piece to guide the rear of said breech-piece, and an abutment in the frame against which the breech-piece locks.

2. In a breech-loading gun, the frame having the longitudinal groove 9, a breech-piece carrying the projection 8 to move in said groove and thereby guide the front end of the breech-piece, the projection 11 in the frame to guide the rear of the breech-piece by bearing in a longitudinal groove in said breech-piece, and an operating-handle connected to the breech-piece, all in combination.

3. In a breech-loading gun, a frame open at the top, in combination with a breech-piece having a substantially longitudinal movement in said frame and a swinging movement to lock the same, said breech-piece having side extensions at its upper part which overhang the frame.

4. In a breech-loading firearm, a frame open at the top, a breech-piece guided to move longitudinally therein, a locking-shoulder at the rear of the breech-piece, and an abutment for its engagement in the frame, a projection extending downward from the front of the breech-piece and below it, and a slide-piece which connects with the operating-handle and engages said projection, all in combination.

5. In a breech-loading firearm, a breech-piece whose rear end swings vertically in one direction to lock it and in the reverse direction to unlock, and a firing-pin housed in said breech-piece having a projection on its rear with an inclined front face, in combination with a fixed projection in the frame, arranged to engage the incline on the firing-pin through an opening in the breech-piece, substantially as described, to start back the firing-pin in the unlocking movement of the breech-piece.

6. In a magazine-gun, the combination of the magazine having a spring-stop at its mouth, a reciprocating breech-operating handle and slide, and a raised ear connected to the slide and engaging the magazine-stop to operate the same as the slide reciprocates, substantially as described.

7. In a firearm, the frame, a breech-piece moving therein and swinging to locked position, a vibrating hammer in position to engage the breech-piece and lock the same, a breech-operating lever, and slot and abutment connections from the lever to the breech-piece, whereby a lost motion is permitted, all combined substantially as described.

8. In a breech-loading firearm, a frame, a sliding handle, a catch to lock said handle in the frame in its breech-closing position, and a light spring engaging said catch to throw the catch out of its locking engagement, in combination with a stronger spring arranged to throw the catch into locking engagement by overpowering the light spring and outside connection with the stronger spring, by which it may be compressed to allow the light spring to release the catch.

9. A reciprocating rod connected at its rear with the movable butt-plate to operate it, a reciprocating handle operatively connected to the breech-piece, and a spring-catch to lock said handle into breech closing position, the rod engaging the catch to release it and engaging the operating-handle to start open the breech by movement of the butt-plate, the specified elements in combination in a breech-loading firearm, substantially as described.

10. In a breech-loading firearm, a movable butt-plate, a spring interposed between the butt plate and stock, a lever hung to the stock and having an arm in position to be actuated by the butt-plate, a rod engaging the other arm of said lever, and the breech-operating handle having operative engagement with said rod, the parts in combination, substantially as described.

11. In a breech-loading firearm, a butt-plate pressed back by a spring from the butt stock, a lever pivoted in the butt-stock, having one arm in contact with the butt-plate, a reciprocating rod engaged by the other end of said lever, a reciprocating operating-handle, and its locking-catch in position to be engaged by said rod, all combined, substantially as described, so that the recoil of the gun backward against the resistance of the butt-plate moves the rod rearward, and thereby unlocks the catch and handle and moves the handle to start open the breech.

12. In the butt of a gun, a socket-piece inclosing the rear of the stock and having the inner socket 37, the spring 33 to press back the butt-plate, a reversing-lever pivoted in the socket-piece, a telescoping butt-plate having the projection 38 to enter the socket 37 and guide the butt-plate, and rod 5, engaged by said lever, all in combination, substantially as described

13. In the butt of a gun, a socket-piece inclosing the rear of the stock and having the inner socket 37, the spring 33 to press back the butt-plate, a reversing-lever pivoted in the socket-piece, and a telescoping butt-plate having the projection 38 to enter the socket 37 and guide the butt plate, and a movable stop for said butt-plate, all in combination with the rod 5, for operation substantially as described.

478,222. MAGAZINE-FIREARM. ANDREW BURGESS, Owego, N. Y. Filed May 13, 1889. Serial No. 310,660. (No model.)

Claim.—1. In a double-barreled breech-loading gun, two breech-pieces, an operating-handle connected to one of said breech-pieces to operate it, and an abutment on said breech-piece to engage and lock the other breech-piece, in combination, substantially as described.

2. In a double-barreled breech-loading gun, two breech-pieces, an operating-handle connected to one of said breech-pieces to operate it, and an abutment on said breech-piece to engage and lock the other breech-piece, in combination with a movable dog to couple the two breech-pieces together.

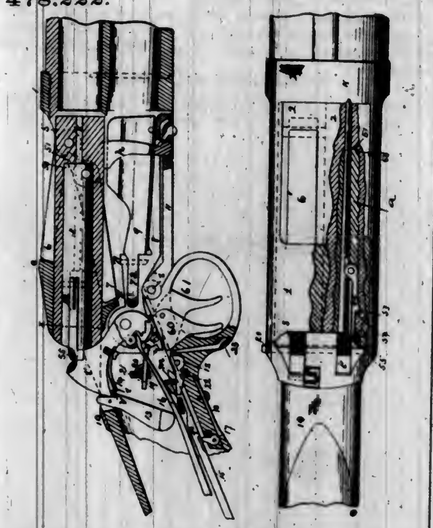
3. In a double-barreled breech-loading gun, two breech pieces, an operating-handle connected to one of said breech-pieces to operate it, and an abutment on one breech-piece to engage and lock the other breech-piece, in combination with a coupling-dog having a projection by which it may be operated, substantially as set forth.

4. In a double-barreled breech-loading gun, two breech-pieces, an operating-handle connected to one of said breech-pieces to operate it, and an abutment on said breech-piece to engage and lock the other breech-piece, in combination with a coupling-dog having a projection by which it may be operated by a connection with the operating-handle and a hammer arranged to operate said coupling, substantially as described.

5. In a breech-loading firearm, two hammers in combination with a breech-piece, with connections to operate it back and forward, and two shoulders moved by said breech-piece to first cock one hammer and then the other by the continued movement of the breech-piece, substantially as specified.

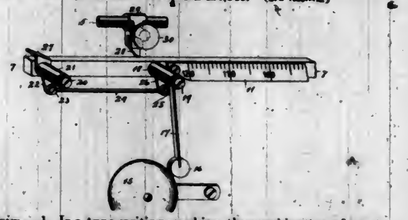
6. In a magazine-firearm, a vibrating carrier hung in the frame, arranged to raise a cartridge to the axis of the barrel, and a lever hung at the side of the carrier, the forward part of said lever constituting a raised ear guided to swing laterally inward above the floor of the carrier and an arm of the lever rearward of its pivot, by which it is engaged by a connection of the breech-piece, all in combination, to turn the forward part of the lever to hold the rising cartridge and serve to eject the extracted shell, substantially as described.

7. In a breech-loading firearm, a sliding handle connected to the breech mechanism to operate it, a locking-dog forming engagement between the handle and the frame of the gun to lock the handle, and a foil-piece arranged in the frame of the gun and having a path of movement to the locking-dog, in combination with a hammer and a spring operated by the hammer to engage the foil-piece in the striking movement of the hammer and throw said foil-piece against the dog to unlock the sliding handle, substantially as set forth.



8. In a breech-loading firearm, a starting-rod having reciprocating movement in the butt-stock of the gun, and means for engaging said rod to the breech mechanism and means for engagement of said rod to the frame of the gun to lock it in operative position, and a foil-piece arranged in the frame and having a path of movement to the starting-rod, in combination with a spring operated by the hammer to engage the foil-piece in the striking movement of the hammer, and thereby release the starting rod from its inoperative engagement with the frame and to throw it into operative engagement with the breech mechanism, substantially as specified.

9. In a breech-loading firearm, a hammer and usual operating mechanism therefor, a foil or striker adjacent to the hammer, and a spring connected to the hammer in position to engage and actuate the foil, and thus communicate an impulse to adjunctive mechanism by the striker, the parts combined substantially as described.



10. In a double gun, two hammers and usual operative connections, a foil-piece or striker in proximity to one hammer, a connecting-piece by which the hammer may be made to actuate the foil, and operative connections between the foil and the detent of the second hammer, all substantially as described.

11. In a double gun, two hammers and usual operative connections, a foil near one hammer and in position to be actuated thereby, and a pin movable by the gunner into position to be struck by the foil and when so struck to release the sear of the other hammer, all combined substantially as described.

478,222.

478,223. TYPE-WRITING MACHINE. HENRY D. CLEMONS, Hartford, Conn., assignor to the American Writing Machine Company, same place. Filed Apr. 1, 1892. Serial No. 427,315. (No model.)

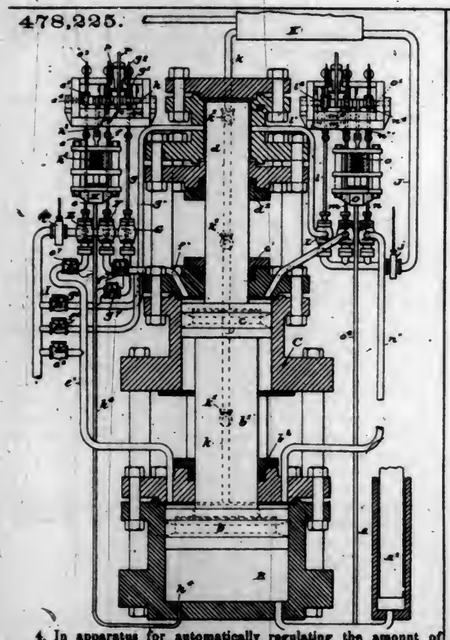
Claim.—1. In a type-writing machine, the combination of a gong or bell, a pivoted bell-hammer arm, an actuating-plate pivoted to a stationary part of the machine and removed from the bell-hammer arm, a connecting-rod joining the said plate and the said bell-hammer arm, and a bell-trip upon the paper-carriage.

2. In a type-writing machine, the combination, with a gong or bell, of a bell-hammer arm attached to a pivoted sleeve having a crank or projection, an inclined plate attached to another pivoted sleeve, also having a crank or projection, a connecting-rod uniting said pivoted sleeves through said cranks or projections, and an adjustable bell-trip upon the paper-carriage.

478,224. OIL-CUP. FRANCIS J. COLE and GEORGE B. HAHLEHURST Baltimore, Md. Filed Mar. 5, 1892. Serial No. 423,945. (No model.)

Claim.—1. The combination of an oil-cup with an independent central stem passing through the oil-cup and whereby it is secured to the machine to be lubricated, having a hole through its center, within which is a vibrating valve for controlling the flow of oil to the bearing, an adjustable cap consisting of a cylindrical portion which is screwed upon the top of the central stem, and a yoke passing from one side to the other across the top of the valve-stem, whereby the throw of said stem is limited.

2. The combination of an oil-cup with an independent central stem passing through the oil-cup and whereby it is secured to the machine to be lubricated, having a hole through its center, within which is a vibrating valve for controlling the flow of oil to the bearing, an adjustable cap consisting of a cylindrical portion which is split at one point, so as to be tightened or expanded by pressure, and a yoke passing across the top from side to side, the under side of the interior of which is in proximity to the top of the valve-stem, whereby the throw of the valve-stem is limited.



478,225. HYDRAULIC MACHINERY. GEORGE S. DUNCAN, Melbourne, Victoria. Filed Feb. 4, 1891. Serial No. 380,154. (No model.)

Claim.—1. The combination, with the main operating-cylinder of a hydraulic machine, of a plurality of governing-cylinders, such as B C, whose pistons are of different areas, connected one with said main cylinder and the rest with valves, such as E F G, and means for automatically opening and closing the same according to the pressure in said main operating-cylinder, substantially as and for the purposes herein described and explained, and as illustrated in my drawings.

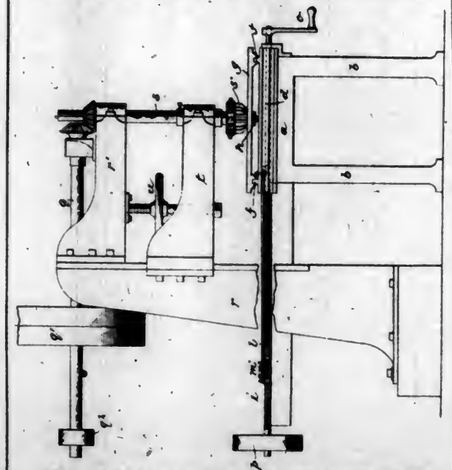
2. In a hydraulic machine, the combination, with the main operating-cylinder, of a plurality of governing-cylinders having pistons of different areas, a corresponding number of valves connected with said governing-cylinders, and means for automatically operating the said valves, substantially as set forth.

3. The combination, with the main cylinder, a plurality of governing-cylinders provided with pistons of different areas, one of said cylinders being connected to said main cylinder and valves connected therewith, of a rock-shaft, pawls, or analogous devices fitted thereon, each adapted to open one of said valves, and a piston or plunger connected to said rock-shaft, substantially as and for the purpose set forth.

478,225.

4. In apparatus for automatically regulating the amount of power-water used in hydraulic machinery according to the weight to be raised or work done, the combination, with the main cylinder and a plurality of governing-cylinders fitted with pistons of different areas and connected each with a separate valve, one of said governing-cylinders being connected directly to the main cylinder, of a rock-shaft, such as A, and pawls or catches, such as c^4 f^4 g^4, fitted thereon and adapted to engage with trip-levers, such as c^3 f^3 g^3, connected with the spindles of said valves, said pawls, catches, or cams being arranged in different relative positions around said shaft, so as to operate upon the spindles of and so open said valves in rotation, and means for returning said shaft to its normal position, substantially as and for the purposes herein described.

5. In an apparatus for automatically regulating the amount of power-water used in hydraulic machinery according to the weight to be raised or work done, the combination, with the spindles, such as f g, of a pair of valves, such as F G, an arm or lever, such as P, mounted upon a rock-shaft, such as A, carrying pawls, catches, or cams, whereby said spindles may be raised to open said valves, together with a vertically-sliding frame, such as p', engaging with said spindles and fitted with a pair of pawls, such as p, wherewith said arm can engage, substantially as and for the purposes herein described and explained, and as illustrated in my drawings.



6. In apparatus for use in hydraulic machinery for automatically returning a certain proportion of water to the water-supply, the combination, with a plurality of cylinders containing pistons or rams of varying areas and connected to said water-supply by pipes fitted with back-pressure or retention valves, of a corresponding number of stop-valves, and means whereby one of said valves will be automatically closed according to the pressure in the main operating-cylinder, substantially as set forth.

7. In an apparatus for regulating the amount of water used in hydraulic machinery, the combination of a main operating-cylinder, a pressure-main, a cylinder communicating therewith and with the main operating-cylinder, a piston in said cylinder, a spring acting on said piston, a valve R, a spindle on said piston, a shaft connected thereto, and spring q^3 on said spindle adapted to actuate said shaft, and valves E F G, substantially as and for the purposes specified.

8. In apparatus of the class herein described, the combination, with a power-main, of a main cylinder and a series of governing cylinders, one of said cylinders connected to said main cylinder, and a series of valves serving to open communication between said power-main and governing-cylinders, and a piston controlled by water-pressure and connected by suitable means to the said valves, substantially as set forth and described.

9. In an apparatus for automatically regulating the amount of power-water used in hydraulic machinery according to the weight to be raised, the combination, with valves E F G, a rock-shaft, and devices thereon for the purpose specified, of an arm p', having pawls p, said arm engaging by means of a cross-head on spindles one or more of said valves, the arm P upon said rock-shaft adapted to engage said pawls upon said arm to open one or more of said valves, substantially as described.

478,226. STONE-MOLDING MACHINE. WILLIAM H EVANS, Baltimore, Md. Filed Jan. 16, 1892. Serial No. 418,301. (No model.)

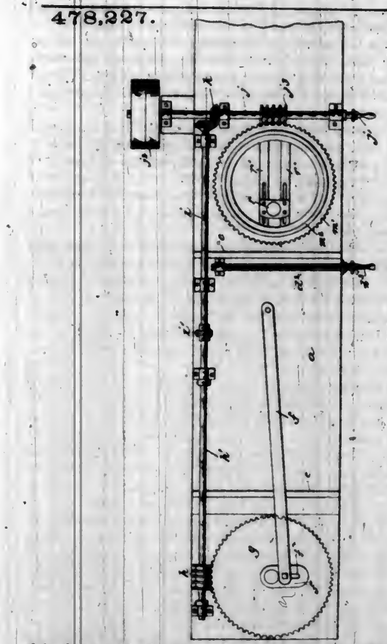
Claim.—1. In a machine for molding stone, the combination of a cutter-head revolving in a fixed vertical plane with two work tables or carriages independent of and disconnected from the cutter-head, one mounted upon the other and moving with it and also having a motion of its own at right angles to the other, the motor mechanisms of the two carriages being synchronized at variable rates of motion, thereby to compound the rectilinear movements of the carriages into a resultant curvilinear motion, substantially as and for the purpose described.

2. The combination, with a longitudinally-movable carriage and a carriage mounted thereon and movable therewith and also independently movable transversely thereof, of synchronized reciprocators connected with said carriages, adjustable connections between such reciprocators and carriages, a common prime motor, and a rotary cutter-head mounted in bearings wholly independent of the two carriages, substantially as and for the purpose described.

478,227. MACHINE FOR MOLDING STONE SLABS. WILLIAM H. EVANS, Baltimore, Md. Filed Jan. 16, 1892. Serial No. 418,302. (No model.)

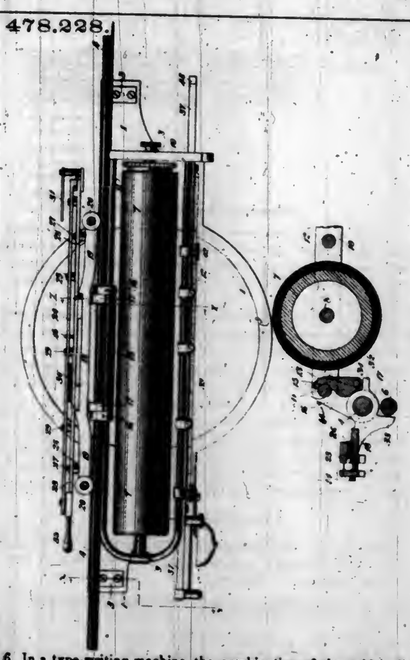
Claim.—1. In a machine for molding stone slabs, the combination, with the frame-work, its bed, and work-table, of a cutter-spindle and a skeleton carrier therefor, comprising a base, opposite uprights secured thereto, an annular worm-gear having a depending flange to which the uprights are fastened, a ring or bushing in the bed in which the flange is fitted to rotate, and a bearing for the spindle in said gear, substantially as described.

2. In a machine for molding stone slabs, the frame-work and tables having openings for the passage of the cutter-head, in combination with a cutter-spindle and cutter-head thereon and a carrier for such spindle, said carrier comprising a body portion, an annular worm-gear having a depending flange by which the body portion and worm-gear are connected, and a bushing in the frame-work in which said flange has a bearing, substantially as described.



3. In a machine for molding stone slabs, the combination, with the frame-work and the work-table having openings for the passage of the cutter-head and escape of the dust, of a cutter-spindle and head thereon, a rotary carrier for such spindle, having its top made as an annular worm-gear, which is provided with the upper annular flange m^2, and a subjacent dust-deflector, substantially as described.

4. In a machine for molding stone slabs, the frame-work and work-tables having openings for the passage of the cutter-head and escape of the dust, combined with a cutter-spindle and head, a cutter-carrier having its top made as an annular gear-wheel supported in the opening in the frame-work and thereby permitting the escape of the dust through it, and a subjacent dust-deflector, substantially as described.



5. In a machine for molding stone slabs, the frame-work and work-tables having openings for the passage of the cutter-head and escape of the dust, combined with a cutter-carrier having its top made as an annular gear-wheel supported in the opening in the frame-work, and a dust-deflector supported by such carrier, substantially as described.

6. In a machine for molding stone slabs, the combination, with a frame-work, work-tables, a cutter-carrier, its worm-gear, and a driving-shaft for such worm-gear, of a reciprocator, a rod connecting it and the work-tables to move them longitudinally of the frame-work and in a right line, a worm-shaft synchronously connecting such reciprocator with the driving-shaft of the worm-gear of the carrier, and a separable or disconnecting coupling device in said shaft, whereby the reciprocator may be thrown into and out of operation to enable the machine to be used, respectively, for oval and for circular work, substantially as described.

478,227.

478,228.

478,228. TYPE-WRITING MACHINE. JOHN M. FAIRFIELD, Hartford, Conn., assignor to the American Writing Machine Company, same place. Filed Mar. 23, 1892. Serial No. 426,078. (No model.)

Claim.—1. In a type-writing machine, the combination, with the guide-rail and the paper-carriage, of a yoke-piece connected to said paper-carriage and arranged to slide on said guide-rail and a rack-bar frame having at each end an arm extending in the direction of travel of the paper-carriage and provided with a bearer for contact with the said guide-rail.

2. In a type-writing machine, the combination, with a guide-rail and a paper-carriage, of a yoke-piece secured to said carriage and hinged upon said rail and a rack-bar frame also hinged upon said rail and provided at each end with an arm having a bearer for contact with said rail.

3. In a type-writing machine, the combination of the top plate, the standards, the guide-rail secured to said standards and projecting beyond the same, the yoke-piece hinged to said guide-rail, the paper-carriage secured to said yoke-piece, the rack-bar frame hinged to said guide-rail, and the arms 19, extending on each side from said rack-bar frame and provided each with a bearer for contact with said guide-rail.

4. In a type-writing machine, the combination of the guide-rail, the stop-rod arranged beneath and parallel therewith, the yoke-piece hinged upon said guide-rail and provided with vertical contact pins or screws, and the rack-bar frame hinged upon the said guide-rail and provided with forwardly-extending projections adapted to be acted upon by said pins or screws to slightly elevate the said feed-racks when the carriage is down in working position.

5. In a type-writing machine, the combination of the guide-rail, the stop-rod arranged beneath and parallel therewith, the yoke-piece hinged upon said guide-rail, the paper-carriage rigidly connected to said yoke-piece, and the rack-bar frame provided with downward projections adapted to contact with said stop-rod when the carriage is turned up and back and rests upon the rack-bar frame.

6. In a type-writing machine, the combination of the guide-rail seated in grooves in the upper ends of standards and prolonged to extend beyond said standards, the yoke-piece hinged upon said guide-rail, the paper-carriage rigidly connected to said yoke-piece, the rack-bar frame connected to said guide-rail, and the arms 19, extending outwardly in opposite directions from said rack-bar frame and provided each with a bearer adapted to travel in contact with said guide-rail past the standard to or near the free unsupported end of the guide-rail.

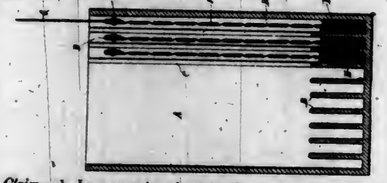
7. In a type-writing machine, the combination of the guide-rail, the yoke-piece hinged thereto, the paper-carriage rigidly connected to the yoke-piece, the rack-bar frame connected to the guide-rail, and the arms 19, made integral with the rack-bar frame and provided each with grooved anti-friction rollers adapted to ride in contact with said guide-rail.

8. In a type-writing machine, the combination of the guide-rail, the yoke-piece, the platen, and the rack-bar frame provided with the arms 19, bearing each an anti-friction roller, and means for adjusting said roller to said guide-rail.

9. In a type-writing machine, the combination, with the guide-rail, the yoke-piece, the platen, the rack-bar frame, and the arms 19, of the anti-friction rollers, the adjusting-eccentrics, and the retaining-screws.

10. In a type-writing machine, the combination of a paper-carriage, a guide-rail, a yoke-piece connected to said paper-carriage and arranged to slide on said guide-rail, and a pair of longitudinally-disposed arms connected to the paper-carriage and provided each with a bearer for contact with the said guide-rail.

478,229. ADHESIVE. JEROME W. FRANK, New York, assignor of three-fifths to Louis S. Langville, Troy, N. Y. Filed Sept. 1, 1891. Serial No. 404,479. (No specimens.)



Claim.—1. The process of forming an adhesive composition, consisting in adding hydrate of ammonia to the liquor of bisulphite fiber or wood pulp and heating the same until an excess of ammonia is driven off, substantially as specified.

2. An adhesive composition consisting of the liquor of bisulphite fiber or wood pulp and an alkali, substantially as specified.

3. An adhesive composition consisting of the liquor of bisulphite fiber or wood pulp and hydrate of ammonia, substantially as specified.

478,230. SECONDARY BATTERY. JAMES H. GERRY, Brooklyn, and CHARLES B. LOOS, New York, N. Y., assignors to the Gerry-Long Manufacturing Company, Jersey City, N. J. Filed Aug. 1, 1891. Serial No. 401,367. (No model.)

478,230.

Claim.—1. In a secondary battery, the combination, with a cell containing shallow compartments or troughs formed by insulating-partitions and containing active material, of lead plates arranged in said cell with their lower edges extending down into the active material, as set forth.

2. In a secondary battery, the combination, with a cell formed or provided with narrow insulating-partitions across the bottom and up the sides, dividing said cell into a number of shallow troughs at the bottom and grooves up the sides, of active material contained in the troughs, and lead plates, the lower edges of which extend down into the active material in the said troughs, as herein set forth.

3. The combination, with a cell the bottom of which is divided by low insulating-partitions into a series of vertical troughs, an active material contained in said troughs, and positive and negative plates composed of woven strips or ribbons of metallic lead with their lower edges extending down into the active material in said troughs, as herein set forth.

478,231. MECHANISM FOR DELIVERING AND CUTTING ROLL PAPER. DARIUS L. GOFF, Pawtucket, R. I. Filed Sept. 25, 1890. Serial No. 366,075. (No model.)

Claim.—1. In a machine for delivering paper in lengths from a roll-package, the combination, substantially as hereinbefore described, of a support for the package, a roll which is revolved by the contact therewith of drawn-off paper, stopping mechanism operated and controlled by the measuring roll for restricting the said roll to one revolution, and a rotatively-mounted cutter for severing the drawn-off length of paper.

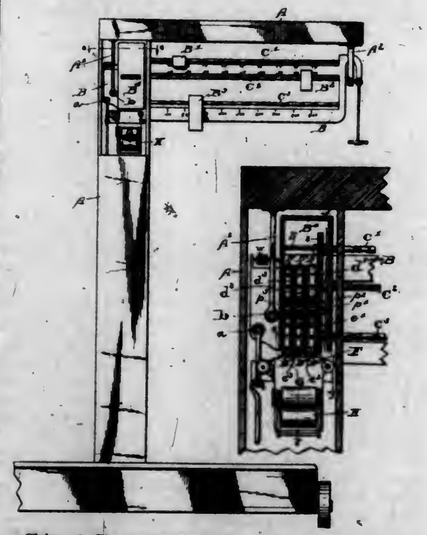
2. In a machine for delivering paper in lengths from a roll package, the combination, substantially as hereinbefore described, of a support for the roll-package, a roll which is revolved by the contact of drawn-off paper, stopping mechanism which is operated by the measuring-roll and restricts said roll to one revolution, a rotatively-mounted cutter for severing the drawn-off length of paper, and mechanism for releasing said roll from the stopping mechanism.

3. In a machine for delivering paper in lengths from a roll-package, the combination, substantially as hereinbefore described, of a support for the roll-package, a pair of operatively-connected rolls which are revolved by the contact therewith of drawn-off paper, stopping mechanism which restricts said rolls to one complete revolution, and a cutter for severing a drawn-off length of paper.

4. In a machine for delivering paper in lengths from paper in roll form, the combination, substantially as hereinbefore described, of two rolls rotative by the contact therewith of drawn-off paper, stopping mechanism for restricting said rolls to one revolution, a cutter for severing the lengths of drawn-off paper, means for releasing said rolls from the stopping mechanism, and means for automatically causing said rolls to partially rotate for projecting the free end of paper from said rolls.

5. In a machine for delivering paper in lengths from a roll-package, the combination, substantially as hereinbefore described, of a support for the roll-package, a pair of operatively-connected corrugated rolls, which are revolved by the contact of the drawn-off paper and serve as means for predetermining the lengths of paper to be drawn from said package, stopping mechanism which stops said rolls at the limit of each predetermined length of paper, and a cutter for severing said length from the roll-package.

6. In a machine for delivering paper in lengths from a roll-package, the combination, substantially as hereinbefore described, of a support for the roll-package, a roll which is revolved by the contact of drawn-off paper, stopping mechanism for restricting said roll to one revolution, a cutter for severing the drawn-off length of paper, and automatic releasing mechanism which permits said roll to again make one revolution.



7. In a machine for delivering paper in lengths from packages of paper in roll form, the combination, substantially as hereinbefore described, of independent supports for two roll-packages of paper, two rolls rotative by the contact of paper drawn from said packages, stopping mechanism for restricting both rolls to one complete revolution, and mechanism operated by each roll for releasing the other from the stopping mechanism.

8. In a machine for delivering paper in lengths from a roll-package, the combination, substantially as hereinbefore described, of a support for the roll-package, a cutter for severing drawn-off lengths of paper, a roll which is revolved by the contact of drawn-off paper, stopping mechanism for restricting the said roll to complete revolutions, and means for controlling the stopping mechanism for enabling said roll to revolve any number of times until a required length of paper has been drawn off.

9. In a machine adapted to deliver paper from two roll-packages, the combination, substantially as hereinbefore described, of a pair of rolls for each package, and each pair rotative by contact with paper drawn from their appropriate package, a cutter for each pair of rolls, and stopping mechanism for restricting each pair of rolls to one complete revolution, the upper roll of each pair serving to release the rolls of the other pair form the stopping mechanism and also for imparting thereto a partial forward rotation after each stop.

10. In a machine for delivering paper in lengths from roll-packages, the combination, with a roll-package having an axial opening, of a detachable axial rod within said package and a frame provided with brackets having on their inner sides slotted and downwardly-curved bearings for the ends of said rod, and also having a hole in one of said plates for longitudinally applying said rod to the roll-package, and still further having gatings or openings at the upper side of the inner or lower ends of said slotted bearings, substantially as described, whereby the axial rod of a roll-package may be inserted endwise at the hole in the bracket, secured against displacement until after the paper has been exhausted, and then readily lifted sidewise and outwardly through the gatings.

478,232. INDICATING AND RECORDING BALANCE. JASON H. GREENSTREET, Indianapolis, Ind., assignor to Charles J. Greenstreet and Flora V. Greenstreet, both of same place. Filed Mar. 10, 1892. Serial No. 424,362. (No model.)

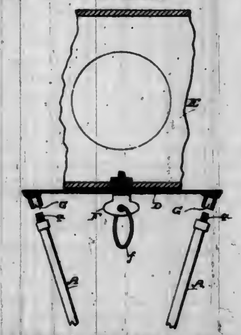
Claim.—1. The combination, in a scale, of several poises, corresponding disks bearing numbers, and connections between the several poises and the disks, whereby the numbers on said disks are made to display the sum represented by the several poises on the scale beam.

2. The combination, in a scale, of a scale-beam having several sliding poises representing, respectively, units, tens, hundreds, and so on, number-bearing disks corresponding thereto, and connections between said poises and said disks, whereby in weighing an article the figures caused to be displayed at the observation-point on the face of the disks will represent the combined weights as represented by the poises on the scale-beam.

3. The combination, in a scale, of a scale-beam having several poises, a corresponding number of disks, screw-threaded rods passing through the poises and geared to the disks, whereby as the poises are moved along the scale-beam the rods are revolved and through the gearing move the disks, substantially as and for the purposes set forth.

4. The combination, in a scale, of the scale-beam B, the screw-rods C', C², and C³, mounted thereon and parallel therewith, the poises B', B², and B³, mounted on said scale-beam and adapted to revolve said screw-rods as they are moved longitudinally thereof and the several gear-wheels and pinions driven thereby, and the number-bearing disks D', D², and D³ and E', E², and E³, said several parts being arranged and operating substantially as and for the purposes set forth.

5. The combination, in a scale, with the scale-beam, of disks carrying printing-numbers, a number of poises on the scale-beam corresponding to the number of disks, connections between the same, and a printing attachment adapted to be brought into contact with said printing numbers or type and print the number represented by the weights on the scale-beam on impression-receiving material carried thereby.



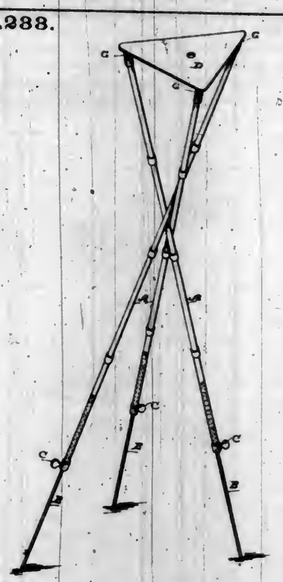
6. The combination, with a scale or weighing mechanism and a series of type-bearing disks connected therewith, of a printing device consisting of a ribbon running over spools adjacent to said disks, a roller mounted in a swinging frame and carrying paper, a friction-roll for holding and drawing said paper forward, a ratchet-wheel on the end of the printing-roll shaft, and a pawl pivoted to the frame-work near the terminal point of the movement of said roll on said swinging frame which is adapted to come in contact with said ratchet-wheel and impart a rotary motion to said printing-roll.

7. The combination, with a scale having type-bearing disks connected to and driven by the weighing mechanism, of a printing apparatus consisting of a type-ribbon mounted on spools at a point adjacent to said disks, a ratchet-wheel connected to said spool, a printing-roll mounted in a swinging frame, and a pawl pivoted to the frame-work near said ratchet-wheel and adapted to be raised by said roller when it is lifted and engage with said ratchet-wheel, thereby revolving the spool and pulling the ribbon, substantially as set forth.

8. The combination, in a scale, of a mechanism carried by the scale-beam consisting of two or more poises, a corresponding number of disks, and connections between said poises and said disks, respectively, whereby said disks are caused to display figures indicating the weight also represented by the sum of weights indicated by the poises.

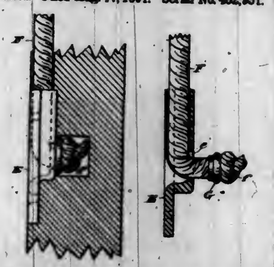
9. The combination, in a scale, of several poises mounted on a single scale-beam and corresponding disks connected with each poise, respectively, said disks bearing figures indicating numbers corresponding with the positions of the poises and the whole being arranged upon and carried by said scale-beam, substantially as set forth.

478,233. TRIPOD. JAMES HEWITT, Berkeley, Cal. Filed Aug. 1, 1891. Serial No. 401,418. (No model.)



Claim.—1. A tripod having means for securing a camera and provided with legs of tubular springy metal, said legs crossing each other, but being unconnected and having extension feet or rods fitted telescopically to their lower ends, substantially as herein described.

2. A tripod comprising a head provided with means for securing a camera and tubular legs of springy metal removably fitted to the head and converging downwardly to the point of crossing and thence diverging to their lower ends, said legs being unconnected with each other at their points of crossing and removably fitted to the head, substantially as herein described.

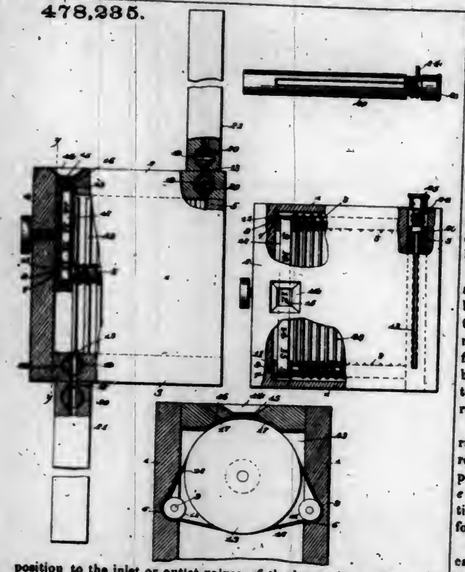


3. A tripod consisting of a head-plate having the inwardly-inclined threaded sockets and tubular metal legs adapted to be removably fitted to said sockets and crossing each other, but unconnected at the points of crossing, whereby the legs are readily removed, substantially as herein described.

4. A tripod consisting of a head-plate having means for securing the instrument and provided with inwardly-inclined threaded sockets, and tubular metal legs fitted to said sockets and crossing each other, but being unconnected at the point of crossing, whereby the legs are readily removed, said legs diverging from the point of crossing and having extension feet or rods fitted telescopically in the lower ends, substantially as herein described.

478,233.

478,234. SASH-CORD FASTENER. WILLIAM HUTCHINS, Melbourne, Victoria. Filed Aug. 17, 1891. Serial No. 402,951. (No model.)

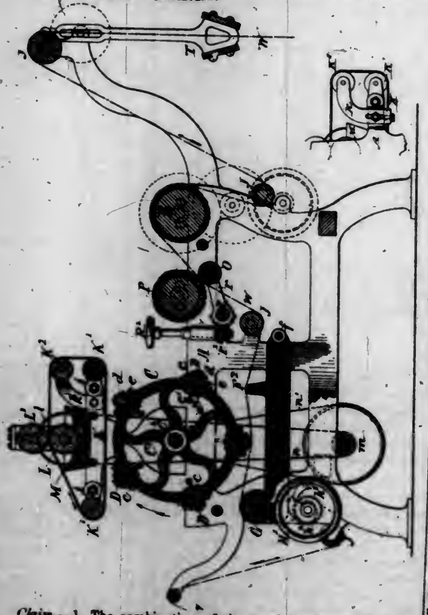


Claim.—1. The combination, with the sash and cord, of the plate E, having hole and groove for the cord, and the ring on said cord, substantially as and for the purposes set forth.

2. The combination, with the sash and cord, of the plate E, having hole and groove for the cord, and the ring on said cord and having a shoulder, substantially as and for the purpose set forth.

478,235. PHOTOGRAPHIC-PLATE CARRIER. CHARLES H. LONGMAN, Chicago, Ill. Filed Dec. 24, 1891. Serial No. 416,101. (No model.)

Claim.—1. In a magazine carrier for photographic plates, the combination of a box having an inlet and an outlet cylindrical valve kept normally closed and light-tight, a conveying-screw housed in each side of the box, means to rotate said screws and at the same time indicate the number of plates moved thereby, and an ordinary plate-holder having a light-tight cylindrical valve adapted to be alternately put in op-



478,285.

position to the inlet or outlet valves of the box, substantially as and for the purpose set forth.

2. In a magazine-carrier for plates, screw conveyers adapted to separate, guide, and move the same from one end of the box to the other opposite the outlet-valve thereof, in combination with a belt adapted to drive the screws in one or the other direction and carrying figures arranged thereon, so as to indicate the number of plates brought opposite the outlet-valve, as set forth.

478,286. MACHINE FOR WAXING VELVETS, &c. EDWIN T. MARBLE and EDWIN H. MARBLE, Worcester, Mass. Filed Jan. 25, 1892. Serial No. 419,126. (No model.)

Claim.—1. The combination of the revoluble wax-carrier composed of a series of separate bars rigidly supported by wheels or spiders on a central rotatable axis and each adapted for holding a bar of wax and a fabric-supporter provided with two rolls or supports whereon the fabric is flexibly sustained by being drawn tightly across an unobstructed space between said two supports and there presented to the action of said revoluble wax-carrier, for the purpose set forth.

2. The combination, substantially as described, of the rigid cylindrically-revoluble wax-carrier having the recessed bars or peripheral pockets with facilities for holding bars of wax therein, an adjustable fabric-support having thereon the holdback-roll and a guide-roll respectively disposed at its front and rear with an intervening space and adapted for extending and presenting the fabric flexibly sustained across said space to the face of said wax-carrier, means, substantially as described, for adjusting said fabric-support toward or from the wax-carrier, and an adjustable brake for varying the tension of said holdback-roll, for the purpose set forth.

3. The combination of the revoluble carrier C, having rigidly-attached wax-supporting bars and means for securing and adjusting bars of wax supported thereon, the swinging fabric-carrier F, having the guide-roll F^3, and the holdback-roll G, mounted thereon, and guide-rolls J J at front and rear thereof, said rolls arranged for straining the fabric across the face of the carrier, and the shaft H, with cams h beneath the free end of said supporter, the hand-wheel H′ for moving the same to swing the supporter toward and from said carrier, and the ratchet h^3 and pawl h^3, for the purpose set forth.

4. In a fabric-waxing machine, the wax-carrier, bars or wax-boxes rigidly fixed to the periphery of spiders or end wheels, mounted on the rotatable shaft, said boxes having the radially-disposed longitudinal pockets or recesses therein provided with plates d and d', and screws e and e' for binding and radially adjusting the bars of wax, substantially as described, in combination with the fabric-supporter and means for advancing the fabric across the same, for the purpose set forth.

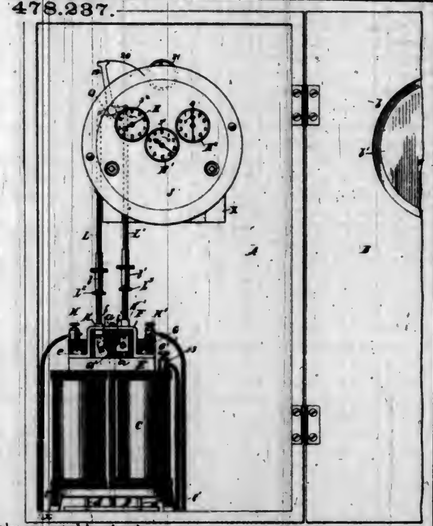
5. The combination, substantially as described, of the revoluble carrier having recessed bars or peripheral pockets with facilities for holding bars of wax therein, the adjustable fabric-supporter having thereon a holdback-roll and a guide-roll for extending and flexibly presenting the fabric to the action of said wax-carrier, the revolving endless cooling-apron, the apron-guiding rolls at front and rear of said wax-carrier, the dampening-rolls, and means for advancing the apron, for the purposes set forth.

6. The combination of the revoluble bar-wax carrier, the cooling-apron K, the guide-rolls K′, whereby said apron is extended and supported over the wax-carrier, and the roll-supporting bearings i, attached to and adjustable on the frame for raising and lowering said guide-rolls and apron in relation to the wax-carrier, substantially as and for the purpose set forth.

7. The combination, substantially as hereinbefore described, of the revoluble bar-wax carrier C, having the pulley m^3 on its shaft, the endless apron K, its guide-rolls K′, the dampening and drive roll L, having the pulley l fixed on its axle, intermediate pulleys or change-wheels m, and belts n and n' for transmitting relative motion from the carrier-axis to said apron, for the purpose set forth.

8. The tension-regulating roll K^3 and its adjustable bearing-supports k and the endless apron K, its adjustably-supported guiding-rolls K′, in combination with the revoluble bar-wax carrier C, fabric-supporter, and feeding mechanism, substantially as and for the purpose set forth.

9. The combination, substantially as described, of the revoluble bar-wax carrier C, the endless traveling apron K, its guide-rolls K′, and dampening-rolls L, the adjustable fabric-supporter F, with fabric-guide F^3 and holdback-roll G, the adjustable friction-brake for said holdback-roll, the rotatable brush P, its adjustable bed-roll O, the feed-roll B, and guide-rolls J, relatively disposed for operation in the manner shown, and for the purposes set forth.



10. The revolving brush P, the fabric-supporting roll O, the adjustable arms r, having said roll mounted thereon, the rocker-shaft R, connecting said bearing-arms, the toothed segment and worm-screw r', and the operating hand-wheel R^2, in combination with a wax-carrier and fabric supporting and feeding mechanism, substantially as set forth.

478,287. TIME-REGISTERING APPARATUS FOR ELECTRICITY. HENRY H. PATTEE, Monmouth, Ill. Filed Dec. 11, 1891. Serial No. 414,760. (No model.)

Claim.—1. The combination, with a main circuit from a source of electricity, of one or more translating devices arranged therein, a switch to control said circuit, an electro-magnet arranged in a shunt-circuit from the main circuit, a switch to control the shunt-circuit adapted to be operated by the electro-magnet, and time-registering mechanism adapted to be stopped or started by said electro-magnet.

2. The combination, with a source of electricity, of one or more translating devices arranged in a circuit therefrom, an electro-magnet, also arranged in said circuit, a switch to control the circuit, time-registering mechanism, and means operated by said electro-magnet to automatically stop or start said time-registering mechanism, and means,

478,287.

also operated by the electro-magnet, to automatically cut the electro-magnet out of circuit.

3. The combination, with a source of electricity, of one or more translating devices arranged in a circuit therefrom, an electro-magnet also arranged in said circuit, a switch to control the circuit, and a separate switch adapted to be operated by the electro-magnet to cut the electro-magnet out of circuit.

4. The combination, with a source of electricity, of one or more translating devices arranged in a circuit therefrom, an electro-magnet also arranged in said circuit, a switch to control the circuit, time-registering mechanism adapted to be started or stopped by said electro-magnet, and a separate switch adapted to be operated by the electro-magnet to cut the electro-magnet out of circuit.

5. The combination, with a source of electricity, of one or more translating devices arranged in a circuit therefrom, an electro-magnet also arranged in said circuit, a switch to control the circuit, time-registering mechanism adapted to be stopped and started by said electro-magnet, and means operated by said electro-magnet to automatically cut said electro-magnet out of circuit.

6. The combination, with a source of electricity, of one or more translating devices arranged in a circuit therefrom, an electro-magnet also arranged in said circuit, an armature adapted to be actuated by the electro-magnet, a switch to control the circuit, time-registering mechanism adapted to be stopped or started by the movement of said armature, and means operated by said armature to automatically cut the electro-magnet out of circuit.

7. The combination, with a source of electricity, of one or more translating devices arranged in a circuit therefrom, a switch to control said circuit, an electro-magnet also arranged in said circuit, an armature adapted to be actuated by said electro-magnet, time-registering mechanism, and means adapted to be operated by said armature to start or stop said time-registering mechanism and at the same time cut the electro-magnet out of circuit.

8. The combination, with a main circuit from a source of electricity, of one or more translating devices arranged therein, a switch to control the main circuit, an electro-magnet arranged in a shunt-circuit from the main circuit, time-registering mechanism adapted to be started or stopped by said electro-magnet, and means also operated by said electro-magnet to automatically cut the electro-magnet out of circuit.

9. The combination, with a source of electricity, of one or more translated devices arranged in a circuit therefrom, a switch to control said circuit, an electro-magnet also arranged in said circuit, an armature adapted to be actuated by said electro-magnet, time-registering mechanism, means adapted to be operated by said armature to start or stop said time-registering mechanism, and a switch also adapted to be operated by the movement of said armature to automatically cut the electro-magnet out of circuit.

10. The combination, with a source of electricity, of one or more translating devices arranged in a circuit therefrom, a switch to control said circuit, time-registering mechanism adapted to be started or stopped by said electro-magnet, an armature adapted to be actuated by said magnet, and a switch adapted to be operated by the movement of the armature to automatically cut the electro-magnet out of circuit.

11. The combination, with an electro-magnet and its armature, of the rod J, connected therewith, pawl a, connected with said rod, rods L L′ and heads K K′, connected with said rods, walking-beams Q, to which the rods L L′ are attached, and sleeve t, all arranged and adapted to be operated by the movement of said armature when the electro-magnet is energized, substantially as set forth.

12. The combination, with an electro-magnet and its armature, of the rod J, connected therewith, pawl a, connected with said rod, rods L L′, couplings l l', heads K K′, connected with said rods, walking-beam Q, and sleeve t, all arranged and adapted to be operated by the movement of said armature when the electro-magnet is energized, substantially as set forth.

13. The combination, with an electro-magnet and its armature, of the rod J, connected therewith, pawl a, rods L L′, connected with the walking-beam Q, sleeve t, heads K K′, connected with said rods, and pins m m', which pass through said heads K K′, lever M on the shaft n, and switch I, all arranged and adapted to be operated by the movement of said armature when said electro-magnet is energized, substantially as set forth.

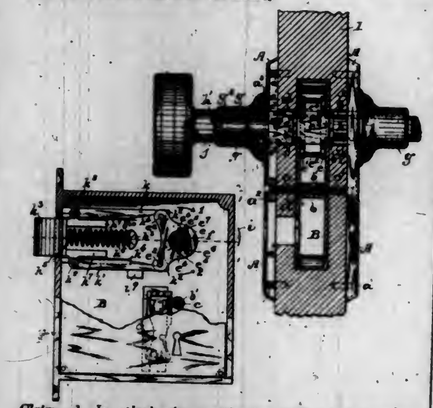
14. The combination, with a source of electricity, of a switch to control the circuit leading therefrom, an electro-magnet in said circuit, an armature adapted to be operated by said electro-magnet, a rod J, connected with said armature, a pawl a, connected with said rod, rods L L′, connected to the walking-beam Q, which turns the sleeve t, heads K K′, connected with said rods L L′, pins m m', which pass through said heads K K′, a lever M adapted to be moved by said pins, a switch I on the same shaft with the lever M, an electrode P, with which said switch I makes contact, and electrodes g g', all arranged and adapted to be operated by the movement of said armature when the electro-magnet is energized, substantially as set forth.

15. The combination, with a time-registering mechanism, of means to start or stop said mechanism, consisting of the arm 19 on the sleeve t, a spring 20, connected with said arm, lever 17, having the spring 18 attached at one end and the trundle 16 pivoted to the other end, wheel 15 on said sleeve t, provided with recesses N N′ in its periphery, into which the trundle 16 is adapted to fall and to be held therein by the spring 18, and walking-beam Q on the sleeve t, said mechanism adapted to be actuated by an electro-magnet, substantially as set forth.

16. The combination, with a time registering mechanism having as its pulsative device a balance-wheel, of means to start or stop said mechanism, consisting of the arm 19 on the sleeve t, a spring 20, connected with said arm, lever 17, having the spring 18 connected at one end and the trundle 16 pivoted to the other end, wheel 15 on said sleeve t, provided with recesses N N′ in its periphery, into which the trundle 16 is adapted to fall and to be held therein by the spring 18, and walking-beam Q on the sleeve t, said mechanism being adapted to be started or stopped by an electro-magnet, substantially as set forth.

17. The combination, with a time-registering mechanism, of a graduated dial-plate, pointers in gear with said time-registering mechanism, an escapement device forming part of said time-registering mechanism, and means adapted to start or stop the said time-registering mechanism, consisting of an arm 19 on the sleeve t, spring 20, connected with said arm, adapted to engage with said escapement device, walking-beam Q, also connected with the sleeve t, and rods L L′, connected with the said walking-beam, said rods being adapted to be moved up or down to start or stop the time-registering mechanism by the action of an electro-magnet, substantially as set forth.

18. The combination, with a time-registering mechanism, of an escapement device forming part thereof and means adapted to start or stop said time-registering mechanism, consisting of an arm adapted to engage with said escapement device, a walking-beam connected with said arm, and means to move said walking-beam adapted to be operated by an electro magnet, substantially as and for the purpose set forth.



19. The combination, with a source of electricity, of one or more translating devices arranged in a circuit therefrom, an electro-magnet also arranged in said circuit, a switch to control the circuit, time-registering mechanism, and an escapement device forming part thereof, and means adapted to start or stop said time-registering mechanism, consisting of an arm adapted to engage with said escapement device, a walking-beam connected with said arm, and means to move said walking-beam adapted to be operated by said electro-magnet, substantially as and for the purpose set forth.

478,288. SOLDER FOR ALUMINIUM. JOSEPH W. RICHARDS, Philadelphia, Pa. Filed Oct. 5, 1891. Serial No. 407,789. (No specimens.)

Claim.—1. As a solder for aluminium, an alloy of aluminium and zinc, having incorporated therein a reducing reagent whose affinity for oxygen is greater than that of aluminium or zinc under the conditions of use and whose oxide is substantially non-film forming.

2. As a solder for aluminium, an alloy of aluminium, zinc, and phosphor-tin, substantially as set forth.

478,239. LOCK. CHARLES RICHTMANN, Newark, N. J. Filed Mar. 5, 1892. Serial No. 423,574. (No model.)

Claim.—1. In a lock, the combination, with a bolt-operating mechanism, of a cylindrical spindle having slots in its end and a flat plate in said slots arranged to prevent the withdrawal of the spindle from the lock-casing, and devices in the lock-casing with which said plate in the slotted end of the spindle is in engagement, substantially as and for the purposes set forth.

2. In a door-lock, the combination, with a cylindrical spindle provided with a slotted end and a plate secured therein, of a bolt-operating mechanism consisting, essentially, of plates *e* and *e'* and a flat plate e^3, arranged therebetween, and blocks *f*, all arranged substantially as and for the purposes set forth.

3. In a door-lock, the combination, with a cylindrical spindle provided with a slotted end and a plate secured therein, of a bolt-operating mechanism consisting, essentially, of plates *e* and *e'* and a flat plate e^3, arranged therebetween, blocks *f*, said plates *e* and *e'* being connected by pins e^5, hook-shaped links engaging with said pins, and a spring-actuated bolt to which said links are pivotally connected, all arranged substantially as and for the purposes set forth.

4. In a lock, the combination, with mechanism adapted to operate the bolt-operating mechanism, of a cylindrical spindle provided with a knob, a face-plate A, and a cup *g*, of sheet metal, provided with a bearing g^3 for said spindle and said free end of the cup being in close engagement with a sleeve or collar on the knob, and a flat plate in the opposite end of the spindle adapted to engage with the inner surface of said face-plate and also with the mechanism for operating the bolt-operating mechanism, consisting, essentially, of plates *e* and *e'* and a flat plate e^3, arranged therebetween, and blocks *f*, between which said flat plate on the spindle projects, all arranged substantially as and for the purposes set forth.

5. The combination of the face-plate A, a cylindrical spindle, a flat plate *i* on said spindle, a cup *g*, secured to said face-plate and arranged on said spindle between said plate and the knob on the spindle, a bolt-operating mechanism, and means connected with said bolt-operating mechanism and the plate on the spindle, all arranged substantially as and for the purposes set forth.

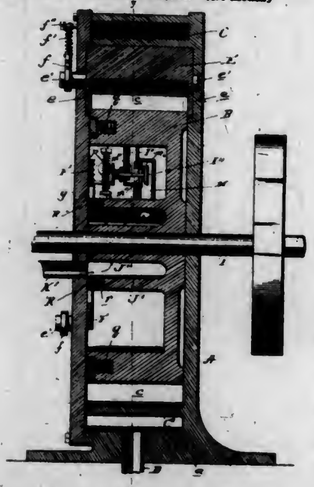
6. In a lock, the combination of a face-plate, a cup *g*, of sheet metal, on said plate, provided with a bearing g^3, and a cylindrical spindle arranged in said bearing g^3 and projecting into the face-plate, and means connected with said spindle for operating the bolt-operating mechanism of the lock, substantially as and for the purposes set forth.

7. In a lock, the herein-described plates *e* and *e'*, provided with a plate e^3, having tongues e^4 for arranging them in bearings or openings in the sides of the lock-case, pins e^5, connecting said plates *e* and *e'* for operating the bolt-operating mechanism, a spindle, and means for operating said plates *e* and *e'* and e^3 when the spindle is turned, substantially as and for the purposes set forth.

8. In a lock, the combination, with the lock case B, having openings or bearings b^3, of the plates *e* and *e'*, and a plate e^3, arranged between said plates *e* and *e'*, tongues e^4 on said plate e^3, projecting into said openings or bearings b^3, in which they rotate and hold the parts in position in the lock-case, blocks *f*, arranged on the sides of said plate e^3 and projecting from said hole b^3, thereby forming a space *f'* between them, and a spindle engaging with the ends of said blocks, substantially as and for the purposes set forth.

9. In a lock, the combination, with the lock-case B, having openings or bearings b^3, of the plates *e* and *e'*, and a plate e^3, arranged between said plates *e* and *e'*, tongues e^4 on said plate e^3, projecting into said openings or bearings b^3, in which they rotate and hold the parts in position in the lock-case, blocks *f*, arranged at the sides of said plate e^3 and projecting from said opening b^3, thereby forming a space *f'* between them, and a tubular spindle adapted to be passed over said projecting ends of the blocks *f* and having a plate *i*, adapted to be passed between said blocks into the space *f'* for operating said parts, substantially as and for the purposes set forth.

10. In a door-lock, the combination, with means for operating the bolt-operating mechanism, of blocks *f*, projecting from the lock-case, and a tubular spindle provided with a plate adapted to engage with said blocks, substantially as and for the purposes set forth.



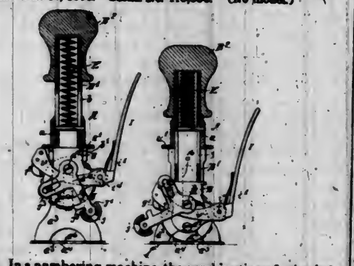
11. In a lock, the combination, with a cylindrical spindle, of a sleeve or collar arranged on the free end of said spindle and a knob secured to said collar, a face-plate A, having an opening into which said spindle projects, and a cap of sheet metal arranged on said spindle between the face-plate and the collar or sleeve of the knob, substantially as and for the purposes set forth.

12. In a lock, a face-plate A, of sheet metal, having a bead a^3 therein, a sheet-metal cup arranged in said bead and provided with an inwardly-turned edge g^3, a cylindrical spindle provided with a collar, said collar projecting against said turned-over edge on said cap, and the inwardly-turned portion thereof serving as a bearing to said spindle, substantially as and for the purposes set forth.

13. In a lock, the combination, with a bolt-operating mechanism consisting, essentially, of a spring-actuated bolt and links *k* and *k'*, pivotally connected with said bolt, provided with hook ends k^2, of a cylindrical spindle having slots in its end and a flat plate in said slots, arranged to prevent the withdrawal of the spindle from the lock-casing, and devices in the lock-casing with which said plate in the slotted end of the spindle and said hook ends k^2 are in engagement, substantially as and for the purposes set forth.

14. In a lock, the combination, with a bolt-operating mechanism consisting, essentially, of a spring-actuated bolt and links *k* and *k'*, pivotally connected with said bolt, provided with hook ends k^2, of a cylindrical spindle having slots in its end and a flat plate in said slots, arranged to prevent the withdrawal of the spindle from the lock-casing, and devices in the lock-casing consisting of plates *e* and *e'*, connecting-pins e^5, a plate e^3, and blocks *f*, with which said plate in the slotted end of the spindle and said hook ends k^2 are in engagement, substantially as and for the purposes set forth.

478,240. ROTARY STEAM-ENGINE. JOHN L. ROWAN, Joplin, Mo. Filed Oct. 7, 1891. Serial No. 408,018. (No model.)



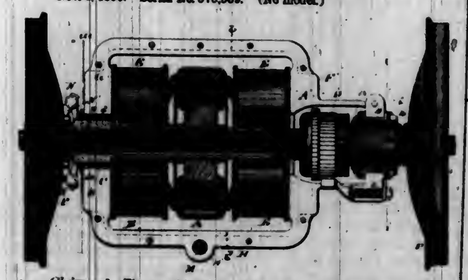
Claim.—1. In a rotary engine, the combination, with the exhaust-passages and the rocking abutments, of the piston having the offsets, the central steam-chamber, and the valved controlling-chambers, the face-plate having the series of ways of different lengths, and the weighted spring-controlled pins adapted to open the valves and to ride upon the ways, substantially as described.

2. In a rotary engine, the combination, with the exhaust-passages and the rocking abutments, of the set of concentric variable ways in juxtaposition to each abutment, the piston having the central steam-chamber and the valved controlling-chambers, and the centrifugal regulator carried by the piston and arranged to ride upon the ways and open the valve for a period of time in accordance to the rate of speed of the piston, substantially as described.

3. In a rotary engine, the combination, with the exhaust-passages and the rocking abutments, of the concentric variable ways arranged in series at each abutment, the piston having the central steam-chamber and the valved controlling-chambers connected thereto, the sliding cross-heads carried by the piston and each having a centrifugal ball or weight acting against tension-springs, and the movable pins in the cross-heads arranged to ride on the ways and open the valves in the controlling-chambers, substantially as described.

4. In a rotary engine, the casing having the exhaust-passages, combined with the pivoted abutments, each having a spring-controlled tappet, the rotary piston packed within the cylinder and having the offsets and the valved controlling-chambers situated between a central steam-supply and the discharge-port at the offsets, the variable concentric ways rigid with the cylinder at each abutment, the radial guide stems or rods, the springs, the sliding cross-heads having the centrifugal balls, and the movable valve-pins carried by the cross-heads, substantially as described.

478,241. NUMBERING-MACHINE. CHARLES H. SHAW, Brooklyn, N. Y. Filed Dec. 17, 1891. Serial No. 415,263. (No model.)



Claim.—1. In a numbering-machine, the combination of wheels for printing having printing-pieces of soft material applied to their peripheries, ratchet-wheels arranged intermediately of the wheels for printing and attached each to one wheel for printing, pawls extending from a support which is located beyond the peripheries of the wheels for printing and extending between the wheels for printing to the ratchet-wheels, and side supports for the printing-pieces, located at the sides of the said printing-pieces and preventing the latter from spreading out so as to lap over the ratchet-wheels or interfere with the pawls, substantially as specified.

2. In a numbering-machine, the combination of a main frame, a support for wheels for printing, wheels for printing, a pawl-lever, and an inking-lever provided with stops coacting with the pawl-lever for preventing the wheels for printing from operating before the ink-distributer carried by the inking-lever resumes its normal position, substantially as specified.

3. In a numbering-machine, the combination of a support for wheels for printing, pins or projections extending therefrom, an inking-lever fulcrumed to said pins or projections, and a pawl-lever which is arrested in its return movement by said pins or projections, substantially as specified.

478,242. ELECTRIC LOCOMOTIVE. SIDNEY H. SHORT, Cleveland, Ohio, assignor to the Short Electric Railway Company, same place. Filed Nov. 6, 1890. Serial No. 370,539. (No model.)

Claim.—1. The combination, with a car, of an electric propelling-motor comprising an axially-mounted armature and non-rotative field-magnets, and a self-adjusting coupling connecting the said armature directly with a driving-axle and comprising the arms, the forks, and the spring-pads, substantially as described.

2. The combination, with the driving-axle of an electric-motor car, of an armature mounted upon a driving-shaft encircling the axle, field-magnets journaled upon and supported by said hollow driving-shaft, a yielding support interposed between the driving-axle and the hollow driving-shaft, and an elastic self-adjustable driving connection interposed between the driving-shaft and driving-axle, whereby power is transmitted from the armature to the driving-axle, substantially as set forth.

3. The combination, with a car, of an electric propelling-motor comprising a spring-mounted armature placed axially with reference to the driving-axle and non-rotative field-magnets, and a coupling connecting the said armature directly with the driving-axle and comprising the arms, the forks, and the spring-pads, substantially as described.

4. The combination, with a car, of an electric propelling-motor comprising an armature with a hollow shaft, springs interposed between and turning with said shaft and a driving-axle, and a coupling connecting the said armature directly with the driving-axle and comprising the arms, the forks, and the spring-pads, substantially as described.

5. The combination, with a car, of an electric propelling-motor comprising an armature with a hollow shaft, and non-rotative field-magnets mounted by journal-bearings on said shaft, springs interposed between the said shaft and the driving-axle, and a coupling connecting the armature directly with the driving-axle and comprising the forks, the arms, and the spring-pads, substantially as described.

6. The hollow shaft provided with sockets or enlargements at the ends, and the springs in the said sockets or enlargements, in combination with the driving-axle in said shaft, and the armature thereon, substantially as described.

7. The combination, with an electric car, of a propelling-motor with an axially-mounted armature insulated from the wheel-base of the car by way of the mounting and provided, also, with a direct insulating driving connection between the armature and driving-axle, substantially as described.

8. The combination, with an armature having a hollow shaft and the field-magnets mounted thereon by means of journal-bearings, of an insulating-mounting for said shaft, an insulating connection adapted to prevent the rotation of the field-magnets, and an insulating direct driving connection between said armature and a driving-axle of the vehicle, substantially as described.

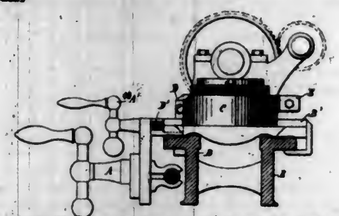
9. The combination, with a car, of an electric propelling-motor comprising an axially-mounted armature and non-rotative field-magnets, insulating spring-mountings for the armature and field-magnets, and an insulating self-adjusting coupling or driving connection between the armature and a driving-axle, substantially as described.

10. The combination, with a car, of an electric propelling-motor comprising an armature with hollow shaft and field-magnets mounted by means of journal-bearings on said shaft, insulating spring-bearings interposed between the armature and a driving-axle, an insulating self-adjusting coupling connecting the armature directly with a driving-axle, and an insulating spring connection adapted to hold the said field-magnets from rotation, substantially as described.

11. The combination, with a hollow shaft, an armature, and a driving-axle, of the coupling comprising the forks, the arms, and the insulating spring-pads, substantially as described.

12. The combination, with a driving-axle, a hollow shaft encircling the axle, an armature rigidly secured to said hollow shaft, and field-magnet yokes journaled upon and supported by the hollow shaft, of a yielding support interposed between the axle and hollow shaft, and a self-adjustable coupling for transmitting power from the hollow armature-shaft to the driving-axle, substantially as set forth.

13. The combination, with the driving-axle of an electric-motor car, of an armature mounted upon a driving-shaft, non-rotative field-magnets located on opposite sides of the armature and mounted upon the armature-shaft, and means for adjusting the field-magnets longitudinally on the armature-shaft and with reference to the armature, substantially as set forth.



478,243. COOKING UTENSIL. THOMAS A. SIMONS, Columbus, Ohio. Filed Aug. 28, 1891. Serial No. 403,978. (No model.)

Claim.—In a cooking utensil, the combination, with the pan or

body *a* and the longitudinal supporting-ribs projecting from the bottom thereof and formed therewith, of the cover-sections *c*, hinged, as described, on opposite sides of said pan-body and adapted to be made to meet centrally above the latter, a rounded edge on one of said cover-sections and a projecting lip on the other, said lip adapted to form a seat for said rounded edge, and handles *g*, projecting, as described, from the closed ends of said cover-sections, substantially as and for the purpose specified.

478,244. MILLING ATTACHMENT FOR LATHES. FRANK D. SKEEL, New York, N. Y. Filed Nov. 25, 1891. Serial No. 413,069. (No model.)

Claim.—1. The combination, with the cross-slide and cross-feed mechanism of a lathe, of a base engaged by the feed mechanism and running on the slide and formed or provided with a split socket and means for contracting or tightening the same, a threaded ring engaging with the socket, a face-plate seated in or on said ring, and means for securing the face-plate to said ring, substantially as herein described.

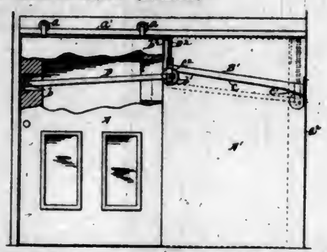
2. In a milling attachment for lathes, the combination, with the socket-base engaged or adapted for engagement with the cross-feed mechanism, of the threaded ring within the socket, which socket is split and provided with a clamping-screw, a face-plate for which the ring forms a seat, a bridge-piece across the under side of the ring engaging a nut on a stem extending downward from the under side of the face-plate, and a screw for depressing the bridge-piece and clamping or binding the face-plate in its seat.

3. In a milling attachment for lathes, the combination of a base having a feed movement transverse to the line of centers, a socket-ring engaging with the base by screw-threads, whereby it may be adjusted angularly and vertically with respect thereto, a face-plate carried by said ring and capable of rotation therein, a detent for preventing the rotation of the face-plate with respect to the base, and means for binding or clamping together the face-plate and ring and the ring and base, as herein set forth.

4. In a milling attachment for lathes, the combination, with a base having a feed movement transverse to the line of centers, the threaded ring set therein, the face plate, and means for clamping or binding it to the ring, of the split or clamping ring surrounding the face-plate and a pin or stud thereon entering a vertical hole in the base, as and for the purpose set forth.

5. In a milling attachment for lathes, the combination, with a base having a feed movement transverse to the line of centers, of a threaded ring set therein, a face-plate seated on the ring and formed with a stem extending downward from its under side, a bridge across the under side of the ring through an opening in which the stem passes, a nut under the bridge and secured to the stem, and a screw passing down through the ring and adapted to depress one end of said bridge and clamp or bind the face plate and ring together, as set forth.

478,245. MAGNETIC LOCK. HENRY V. SMITH, South Yarra, near Melbourne, Victoria. Filed Dec. 14, 1891. Serial No. 415,480. (No model.)



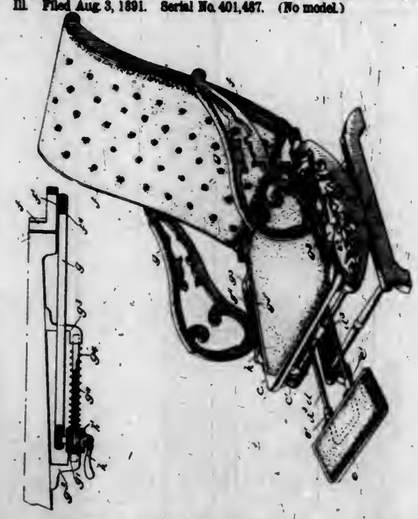
Claim.—1. In a magnetic lock, the combination, with the permanent magnet, of the pivoted latch and means on said latch whereby it may be actuated by a key, substantially as set forth.

2. In a magnetic lock, the combination of a permanent magnet, the pivoted latch adapted to be drawn into recess by action of said magnet, and means on said catch whereby the same may be disengaged from said magnet and recess, substantially as set forth.

3. In a magnetic lock, the combination of the latch and a notch in the upper end of said latch, adapted to prevent the insertion of a knife or analogous device between the latch and magnet to disengage the said latch from the magnet, substantially as set forth.

4. In a magnetic lock, the combination, with the permanent magnet, of the pivoted latch having a loop, means operating within said loop to move the pivoted latch away from the magnet, and a cam adapted to be operated by a key to secure the latch in a locked position, substantially as set forth.

478,246. AUTOMATIC DOOR-CLOSER. JOHN R. STOKER, New York, N. Y., assignor to Leonie Fordham, Long Branch, N. J. Filed Jan. 21, 1892. Serial No. 418,866. (No model.)



Claim.—1. The combination, with a sliding door, of an arm pivoted at one end to said door, a roller at the opposite end of the arm, a spring secured at one end to the door and at the other end to the pivoted arm, and a fixed cam-arm, against which the roller bears, substantially as specified.

2. The combination, with a sliding door, of a closer consisting of the pivoted arm having a roller and a spring carried by the door and the fixed arm having the inclined surface provided with an increased pitch at its rear end, substantially as specified.

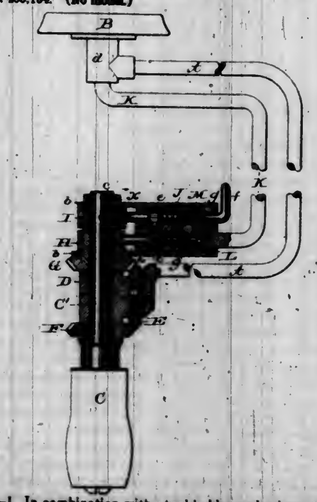
3. The combination, with a sliding door, of a closer consisting of the pivoted arm having a roller at its free end and a spring carried by the door, and the fixed arm having the inclined or cam surface provided with an increased pitch at its forward end, substantially as specified.

4. The combination, with a sliding door, of a closer consisting of a pivoted arm having a roller at its free end and a spring carried by said door, and a fixed arm having an inclined or cam surface provided with an increased pitch at each end, substantially as specified.

478,247. RECLINING-CHAIR. GORDON B. VALENTINE, Chicago, Ill. Filed Aug. 3, 1891. Serial No. 401,487. (No model.)

Claim.—1. The combination of a chair, hangers *c' c'*, depending from the under side of the chair-bottom near its front edge, one at each side of the chair, a transverse rod *d*, connecting the lower ends of these hangers, a hanger c^3, depending from the bottom of the chair-seat at or near its rear edge, a central longitudinal rod *d'*, connecting the rear hanger to the front transverse rod, a loop sliding on the rod *d'* between the rear hanger and front rod, and a frame connected to said loop and carrying a foot-rest at its forward end, this frame resting on the front transverse rod *d*, whereby the foot-rest and frame may be slid in and out and adjusted laterally, substantially as described.

2. The combination of a chair, a longitudinal rod suspended under the seat thereof, a sliding frame d^3, connected thereto and consisting of a pair of parallel rods connected together, longitudinally-adjustable clamps on the rods provided with upwardly-projecting ears, and a foot-rest *e*, provided with eyes on its rear edge, said eyes being pivotally connected to the upwardly-projecting ears on the adjustable clamps, whereby the foot-rest may be adjusted longitudinally on the rods and folded over on the same when slid in under the chair, as and for the purposes described.



3. The combination of a chair, a transverse rod *d*, suspended under the front edge of the seat thereof, a longitudinal central rod *d'*, suspended under the seat and connected at its forward end to the rod *d*, a sliding laterally-elongated loop d^4 on said rod *d'*, a forwardly-extending frame d^3, connected at its rear end to said loop d^4, said frame consisting of a pair of parallel rods connected together at their ends, sliding clamps on the forward part of said frame d^3, and a foot-rest *e*, pivotally connected at its rear edge to said clamps, as and for the purpose described.

4. The combination of a chair provided with a hinged back, horizontal rectangular rods secured at the respective edges of the chair-seat, rigid supporting-brackets at the ends of these bars, rectangular boxes sliding on these bars and provided each with a lateral pivot, a spring surrounding each of the rods and normally pressing the boxes forward on the rods, a friction-shoe embracing each of the rods within the respective boxes, a pivoted cam working through a slot in each of the boxes and bearing on the shoes, and arms pivotally connecting the lateral pivots on the boxes to the chair-back, as and for the purpose described.

5. The combination of a chair provided with a hinged back, stationary horizontal rods *g''*, secured on the opposite edges of the chair-seat, boxes *g'*, embracing and sliding on the rods, a spring surrounding each of the rods and normally keeping the boxes pressed forward, a cam-lever *h*, pivoted in a longitudinal slot in the box, and shoes *h'*, embracing the rods within the boxes and adapted to receive the thrust of the cam, and arms pivotally connecting the sliding boxes to the hinged back, substantially as described.

6. The combination of a chair, rods *g''*, secured on the side edges of its seat, sliding boxes *g'* thereon, carrying laterally-extending grooved pins, means for actuating and securing said boxes on the rods, a hinged chair-back provided with oppositely-projecting grooved pins *f''* upon its side edges, chair-arms *g*, connecting the hinged back to the boxes *g'*, the ends of these arms being provided with recesses for the reception and retention of the pins *f''*, and the lateral pins carried by the boxes, and locking-pins secured in the arms and engaging the grooved pins, substantially as described.

478,248. BIT-STOCK. OLIVER R. ALDEN, Nicholson, assignor of one-half to Humphrey W. Lord, Lathrop, Pa. Filed Aug. 20, 1891. Serial No. 403,184. (No model.)

Claim.—1. In combination with a tool-holder and a bow, the reversible and reversely-acting pawls and intermediate connections, substantially such as shown, between the pawls and the tool-holder, whereby a continuous motion in either direction may be imparted to the holder by the oscillation of the bow.

2. In combination with the handle and with the bow of a bit-stock, a tool-holder adapted to turn therein and provided with fast and loose ratchets and gear-wheels, the idler, and the reversible pawls.

3. In combination with the handle, bow, tool-holder, and fast and loose ratchets, the fast and loose gears, the idler, and the pawls or dogs geared together.

4. In combination with the handle, bow, tool-holder, and fast and loose ratchets, the fast and loose gears upon the tool-holder, the idler, the pawl or dogs for engagement with the ratchets, and the stop-gears thereon.

5. In combination with the handle, bow, tool-holder, and fast and loose ratchets, the fast and loose gears and idler, the pawls or dogs provided with meshing gears, and the coiled springs.

6. In combination with the handle, bow, tool-holder, and fast and loose ratchets, the fast and loose gears and idler, the pawl L, provided with gear *e*, and the pawl M, provided with a similar gear *e* and with a tail or handle *f*.

478,249. FIRE-KINDLER. JOHN W. B. COOK, Camden, Ark. Filed Sept. 25, 1891. Serial No. 406,512. (No specimens.)

Claim.—A composition of matter adapted to be applied to paper for use as a fire-kindler, consisting of sodic nitrate, resin, turpentine, and sawdust.

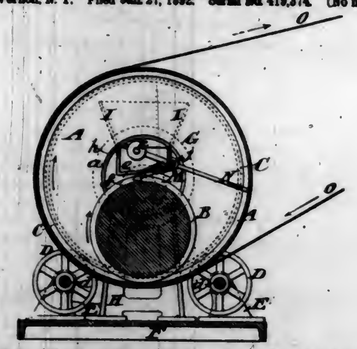
478,250. UMBRELLA-RUNNER. LOUIS B. COOPER, Nyack, N. Y. Filed Apr. 18, 1891. Serial No. 389,473. (No model.)

Claim.—1. The umbrella-runner consisting of the single sleeve having exterior projections, the single exterior ring H, loosely confined on said sleeve by said projections, means to limit the turning of the sleeve independently of the ring, the curved pin-holding socket opening through the lower end of the sleeve having the pin-recess, and the pin-holding socket at the opposite end of the sleeve having a curved edge E on one side terminating at the lower end of straight edge G, and the hook D, projecting from the opposite side of the socket over the meeting-point between edges E and G, for the purpose as set forth.

2. The runner-sleeve, the ring H loosely confined thereon by exterior projections, so that the sleeve has a limited turning movement independent of the ring, the curved pin-receiving socket at one end of the sleeve with a pin-holding recess and the pin-receiving recess at the opposite end of the sleeve tapering inwardly and having the long curved edge E on one side terminating with the straight edge G, the hook D, having an inclined outer edge projecting over the junction between edges E and G, and the pin-holding recess F under said hook and above edge G, as set forth.

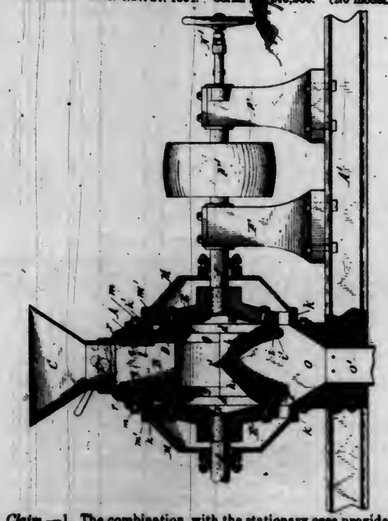
3. The runner-sleeve carrying a loose ring, and the pin-receiving sockets at the ends of the sleeve, having inclined curved edges and pin-holding recesses and covered by exterior hoods formed by pressing out the metal to form the sockets, as set forth and shown.

478,251. OIL-FILTER. JAMES B. CRANE, Newnan, Ga., assignor of one-half to J. L. Barrett, same place. Filed Dec. 24, 1891. Serial No. 416,070. (No model.)



Claim.—1. In an oil-filter, the combination of a cylindrical body, a cover comprising a stationary and a hinged half, cocks in said body, a water-supply tube secured through said stationary half and leading nearly to the bottom of the body, its upper end being funnel-shaped, a cap for closing said end, a filter-box within the body below the wa-

ter-level, a tube leading from the bottom of the filter-box up through the cover of the body and having an enlarged cylindrical upper end, a rod having a handle at its upper end and an enlarged head at its lower end, perforated disks mounted on said rod and of a size to move within said cylindrical upper end, and filtering material between said disks and within said upper end, substantially as described.

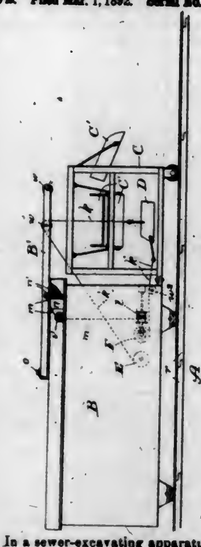


2. In an oil-filter, the combination, with the body and means for partially filling it with water, of a filter-box within the body below the water-level, a tube leading from the bottom of the filter-box up through the cover of the body and having an enlarged cylindrical upper end, a rod having a handle at its upper end and an enlarged head at its lower end, perforated disks mounted on said rod and of a size to move within said cylindrical upper end, and filtering material between said disks and within said upper end, as and for the purpose hereinbefore set forth.

478,252. GRINDING-MILL. GEORGE R. COLLINGWORTH, Mount Vernon, N. Y. Filed Jan. 27, 1892. Serial No. 419,374. (No model.)

Claim.—The combination, in a grinding-mill, of a rotary drum having on one side a stationary head, a crushing-roller in said drum, a scraper for the said drum, and a counter-balance for said scraper, a scraper for said roller, and a pivot attached to said stationary head and having both the said scrapers and the counter-balance mounted upon it, substantially as herein set forth.

478,253. PULVERIZING-MACHINE. URIAH CUMMINGS, New Haven, Conn. Filed Nov. 27, 1891. Serial No. 413,209. (No model.)



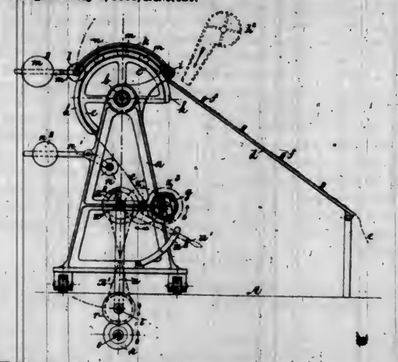
Claim.—1. The combination, with the stationary case provided in its upper portion with a vertical throat or passage and in its end with an opening communicating with said throat, of a stationary grinding disk or ring secured to the case around said opening, a rotary grinding-disk facing the stationary grinding-disk, a curb or casing inclosing said disks, and a removable wear-ring surrounding the disks and arranged on the inner side of the curb for receiving the impact of the pulverized material escaping at the peripheries of the disks, substantially as set forth.

2. The combination, with the case, of a removable grinding-disk applied to the end of the case, a curb removably secured to the end of the case and surrounding the grinding-disk, and a clamping-ring interposed between said grinding-disk and the curb, whereby the disk is removably held in place on the case, substantially as set forth.

3. The combination, with the case having a groove in its end, of a removable grinding-disk applied to the end of said case and provided on its rear side with a rib or tenon entering said groove and at its marginal edge with lugs, a curb inclosing said disk and secured to the case, and a clamping-ring interposed between said curb and the lugs of the grinding-disk, substantially as set forth.

4. The combination, with the casing constructed with circular openings in its sides, a central feed-throat communicating freely with said openings, a transverse saddle having its inclined sides exteading to the lower edges of said circular openings, stationary grinding-disks surrounding said openings, and a discharge-passage underneath said saddle, of separate shafts arranged on opposite sides of the case, rotary grinding-disks secured to the inner ends of said shafts, and curbs inclosing the grinding-disks, substantially as set forth.

478,254. SEWER-EXCAVATING APPARATUS. WILLIAM DAVY, Kenosha, Wis. Filed Mar. 1, 1892. Serial No. 423,352. (No model.)



Claim.—1. In a sewer-excavating apparatus, the combination of a car-track to be laid along the line of excavation and formed in separable rail-sections braced at intervals with adjustable and removable tie-bars, a car carrying a boom extending from its rear end, and winding mechanism, a trailer car or frame behind the said car and over which the said boom extends, and a shovel suspended from the boom in the trailer-car by a cable connected with the winding mechanism, said shovel being also connected from its forward end by a cable with the said winding mechanism, the whole being constructed and arranged to operate substantially as described.

2. In a sewer-excavating apparatus, the combination of a car-track A to be laid along the line of excavation and formed in separable rail-sections *r*, braced at intervals with adjustable and removable tie-bars *p*, a car B, carrying winding mechanism and a boom extending from its rear end and supported to be swung laterally on the car, a trailer car or frame C behind the car B and over which the said boom extends, one or more chutes C' on the trailer-car, a shovel D, suspended from the boom in the trailer-car by a cable *k*, connected with the winding mechanism, and a cable *k'*, connecting the shovel from its forward end with the winding mechanism, the whole being constructed and arranged to operate substantially as described.

3. A sewer-excavating apparatus comprising, in combination, a car-track A to be laid along the line of excavation and formed in separable rail-sections *r*, braced at intervals with adjustable and removable tie-bars *p*, a car B, carrying winding mechanism and a rotary drum *l* and a boom extending from the rear end and supported to be swung laterally on the car, a cable *m*, connecting the boom with the drum *l*, a trailer-car C behind the car B and over which the said boom extends, one or more chutes C' for a side and the rear end of the trailer-car, a shovel D, suspended from the boom in the trailer-car by a cable *k*, connected with the winding mechanism, and a cable *k'*, connecting the shovel from its forward end with the winding mechanism, the whole being constructed and arranged to operate substantially as described.

478,255. MACHINE FOR STRAIGHTENING AND WINDING CLOTH, &c. ARCHER EDWARDS and RICHARD J. EDWARDS, London, England. Filed July 6, 1891. Serial No. 398,540. (No model.) Patented in England July 4, 1885, No. 8,129.

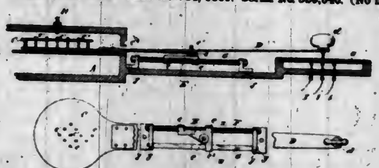
Claim.—1. In a machine of the class herein described, the combination of the drum *c*, having a curved upper surface, and the flanges *h h* upon the ends of the said drum, with the frame *k* hinged above the drum *c*, the roller *l*, mounted in the said frame *k* in position to bear upon the said drum *c*, and means for moving the fabric between the drum *c* and the roller *l*, substantially as described.

2. In a machine of the class herein described, the combination of the drum *c*, having a curved upper surface, and the flanges *h h* upon the ends of the said drum, with the frame *k*, hinged above the drum *c*, the roller *l*, mounted in the said frame in position to bear upon the surface of the drum *c*, the transverse bars *m* on the under side of the frame *k*, and means for moving the fabric between the drum *c* and the frame *k*, substantially as described.

3. In a machine of the class herein described, the combination of the frame *a*, the drum *c*, rigidly fixed in the said frame, the flanges *h h* upon the drum *c*, the frame *k*, hinged above the said drum, and the roller *l*, mounted in the said frame *k* with the winding-reel *g*, and means for moving the fabric between the drum *c* and the frame *k* and winding it upon the reel *g*, substantially as set forth.

4. In straightening and winding apparatus, the combination of the frame *a*, the drum *c*, rigidly fixed in the said frame, the flanges *h h* upon the drum *c*, the frame *k*, having the roller *l* hinged above the drum *c*, the board *d*, hinged to the frame *a*, the pins *f* upon the board *d*, and means for moving the fabric over the board *d* between the pins thereon and between the drum *c* and the frame *k*, substantially as described.

5. In a machine of the class herein described, the combination of a movable frame *a*, the drum *c*, rigidly fixed thereon, flanges *h h* upon the drum *c*, the frame *k*, having the roller *l* hinged above the drum *c*, and the winding-reel *g* with the shaft *w*, the pulley x^6, mounted upon the shaft *w* and geared to the winding-reel, the lever *u*, also mounted upon the shaft *w*, the pulley *x*, mounted upon the lever *u* and geared to the pulley x^6, the disks *r* and *s*, secured to the pulley *x*, the disk *p* upon a driving-shaft, and means for moving the disks *r* and *s* into contact with the disk *p*, substantially as described, for the purpose specified.



6. In a machine of the class herein described, the combination of a frame *a*, the drum *c*, rigidly mounted thereon, the frame *k*, hinged above the drum *c*, the winding-reel *g* and means for operating the same with the bearings for the winding-reel, consisting of the body of the bearing C, the slotted cover D, hinge E, hinged bolt F, and spring G, substantially as described.

478,256. TRAVELER FOR RING-SPINNING FRAMES. SAMUEL S. FOWLER, Elizabeth City, N. C. Filed Mar. 7, 1892. Serial No. 424,006. (No model.)

Claim.—As a new article of manufacture, a ring-traveler for spinning and twisting frames constructed substantially as described—that is, consisting of a flat strip of metal having its ends bent down and in to hold it on the ring and a recess made in one edge on its upper side to allow the thread to draw from near the middle of the top of the traveler, as herein set forth.

478,257. MATRIX-MAKING MACHINE. GEORGE A. GOODSON, Minneapolis, Minn. Filed Nov. 11, 1889. Serial No. 329,846. (No model.)

Claim.—1. The combination, with a die-carriage having a sliding and a swinging motion, of a lever independently connected to said carriage and adapted to move in a plane at right angles to the plane of the swinging motion thereof, said lever being provided with a key, substantially as and for the purpose specified.

2. The combination, with a die-carriage and a character-board, of a movable cross-head between the two, on which said carriage is pivoted, and a key-lever independently connected to said carriage between said cross-head and the dies, substantially as and for the purpose specified.

3. The combination, with a movable cross-head and a character-board, of a die-carriage provided with an extension pivoted on said cross-head, a swinging key-lever independently connected to said carriage between the cross-head and the dies, and a retaining device for holding said key-lever in line with the extension of the die-carriage.

4. The combination, with a cross-head, of a character-board, a die-carriage provided with an extension pivotally secured to the cross-head, and a key-lever attached to the carriage and perforated to fit upon the pivot of the cross-head, said key-lever having a reduced portion substantially as and for the purpose specified.

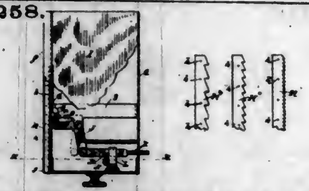
5. A cross-head guide consisting of two parallel bars, one of which is fixed and the other movable, substantially as and for the purpose specified.

6. A cross-head guide consisting of a fixed cylindrical bar and a rectangular bar having journals at its ends, substantially as set forth.

7. The combination, with the guide consisting of parallel rods, of a cross-head pivotally mounted on one rod and guided by the other, substantially as set forth.

8. The combination, with a guide consisting of parallel rods, one of which is fixed and the other adapted to rock in its bearings, of a cross-head mounted to have rectilinear movement on the fixed rod and limited in pivotal motion only by the other rod, substantially as and for the purpose set forth.

9. The combination of the die-carriage having a projecting arm perforated at its forward end and the key-lever connected to said carriage to permit of its movement in the arc of a circle, of a cross-head, guide-rods, one fixed and the other movable, upon which the cross-head may be reciprocated, and a device on the cross-head for keeping the key-lever in alignment with the die-carriage, substantially as and for the purpose specified.



10. In a matrix-making machine, the combination, with the cross-head guides consisting of parallel rods, of the cross-head pivotally mounted on one of said rods and guided by the other, and a combined die-alignment bar and key-lever pivotally mounted on said cross-head, substantially as and for the purpose set forth.

478,258. MATRIX-MAKING MACHINE. GEORGE A. GOODSON, Minneapolis, Minn. Filed Nov. 25, 1889. Serial No. 331,445. (No model.)

Claim.—1. In a matrix-making or similar machine, the combination, with an impression-material carriage movable to effect the letter-feed, of a series of interchangeable racks applicable to said carriage and movable transversely to the travel of the same for holding the impression material and effecting the spacing between the lines.

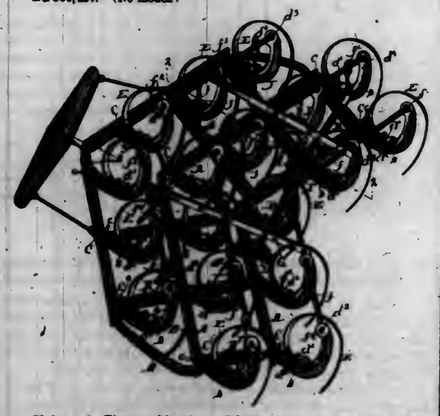
2. In a matrix-making or similar machine, the combination, with an impression-material carriage movable to effect the letter-feed, of a series of interchangeable racks having differently-spaced teeth appli-

478,258.

cable to said carriage and movable transversely to the travel of the same for holding the impression material and effecting any desired spacing between the lines, substantially as described.

3. In a matrix-making or similar machine, the combination, with an impression-material carriage movable to effect the letter-feed, of a series of interchangeable racks for holding the impression material, having teeth differently spaced in accordance with the multiple-point system of type-bodies, any one of said racks being applicable to said carriage and movable transversely to the travel of the same to effect such spacing as may be required, as set forth.

4. In a matrix-making or similar machine, the combination, with an impression-material carriage movable to effect the letter-feed, of a removable rack mounted on said carriage and movable transversely to the travel of the same to effect the spacing between the lines, having a series of studs on its face in line with each other for locating and holding the impression material in a true line, substantially as described.



5. In a matrix-making or similar machine, the combination, with an impression-material carriage movable to effect the letter-feed, of a rack mounted on said carriage for holding the impression material and movable transversely to the travel of the carriage to effect the spacing between the lines and devices for giving an exact feed to said rack, consisting of a feed-pawl for driving the rack, a stop-surface for said pawl, and a locking-pawl for engaging and securing the rack at the end of each throw of the driving-pawl, the said stop-surface and the said locking-pawl being arranged in a true transverse line or common plane with each other for preventing either the backlashing or throwing by of the feed-rack.

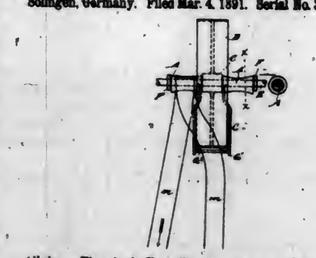
6. The combination, with the impression-material carriage movable to effect the letter-feed, of the interchangeable racks applicable to the carriage for holding the impression material and affording any desired spacing between the lines, the feed-pawl for moving the rack, the stop surface, and the locking-pawl arranged in a common transverse plane for giving an exact feed regardless of the particular rack in use, substantially as described.

7. The carriage having a rack-seat, in combination with the rack, a pivoted lever having a pawl, a hand-lever, a stop on said lever, a slotted banking-post, and a movable piece secured to said post, substantially as and for the purpose set forth.

8. The carriage having a rack-seat and a rack movable in said seat, in combination with the pivoted lever, the feed-pawl carried by said lever, and the stop-pawl secured to the carriage in line with the feed-pawl, substantially as and for the purpose specified.

478,259. HARROW. WILLIAM W. GREEN, Chicago, Ill., assignor of one-half to Alice V. Terry, Brockport, N. Y. Filed Apr. 18, 1891. Serial No. 389,427. (No model.)

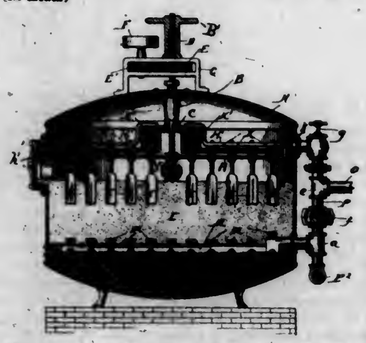
Claim.—1. The combination, with the frame of a harrow, of the blocks C, arms D, teeth E, rods F, bars G, handle H, and segment I, substantially as described.



2. The combination, with the frame of a harrow, of blocks C, arms D, standards J, and rods F, having sleeves f and nuts f^3, by means of which the rods, the standards, and the arms may be tightly clamped together, substantially as described.

3. The combination, with the frame of a harrow containing the angle-iron pieces A, of blocks C, fitted into the angle of said iron and having ears, swinging arms D, pivoted to said blocks, teeth E, mounted upon said arms, connecting devices adapted to unite two or more of such teeth, and adjustable supports for the connecting devices, substantially as described.

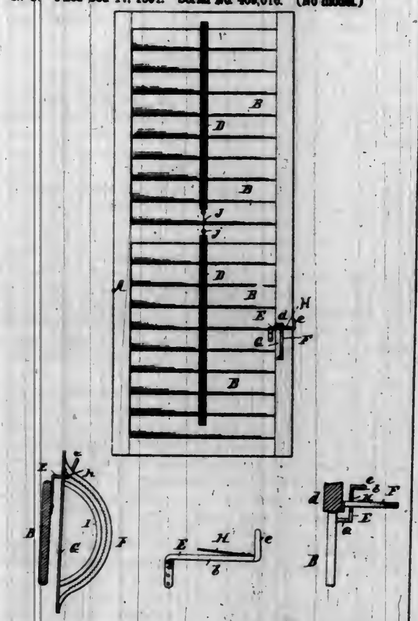
4. The combination, with the frame of a harrow, of swinging arms D, pivoted thereto, spring-teeth E, secured to the arms, standards J, secured to the frame, rods F, passing through holes in the arms and slots in the standards, encircling tubes f, spacing the arms and standards apart, and nuts f^3, threaded to the ends of the rods, by means of which the tubes, arms, and standards may all be tightly clamped together, substantially as described.



5. The combination of a suitable frame, a series of arms D, pivoted thereto, a series of teeth E, mounted upon the arms, a series of standards J, mounted upon the frame, connecting-rods F, passing through holes in the arms and slots in the standards, encircling tubes f and cup-shaped washers f' between the standards and the arms, and nuts f^3, threaded to the ends of the rods and adapted to clamp the arms, standards, tubes, and washers tightly together, substantially as described.

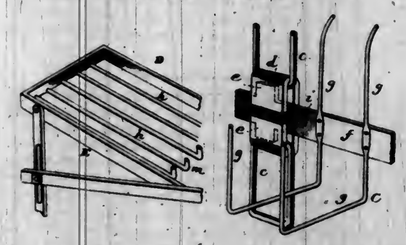
478,260. BELT-SUSPENDING DEVICE. ERNST HANNEWAHR, Solingen, Germany. Filed Mar. 4, 1891. Serial No. 383,674. (No model.)

Claim.—The shaft E, pulley D, and two loose sleeves concaved, as shown, in combination with each other and with two arms G, connected to the sleeves and across the outer face of the pulley and provided with two horns G', all arranged for operation relatively to each other and to a belt m, as herein specified.



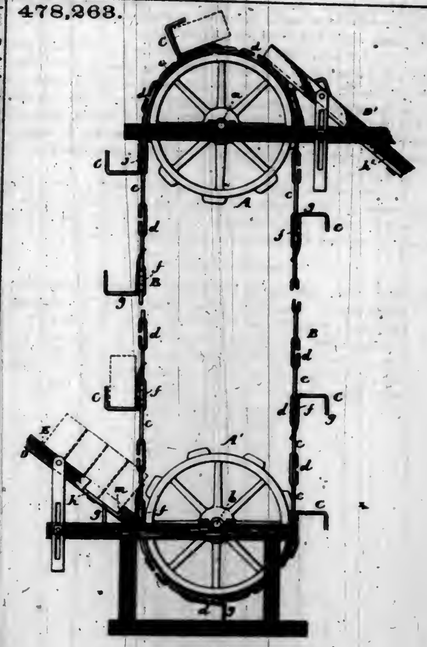
478,261. FILTER. OMAR H. JEWELL, WILLIAM M. JEWELL, and IRA H. JEWELL, Chicago, Ill. Filed Nov. 17, 1891. Serial No. 412,241. (No model.)

Claim.—1. The combination, with a filtering-tank A, of a pendent sleeve B, having a fixed gear-wheel C at its lower end, a frame G above the tank, a vertically-movable shaft D, extending through the sleeve and having a screw-threaded upper end, a horizontal cross-bar H, secured to the shaft below the sleeve and having gear-wheels K', which remain in mesh with the fixed gear-wheel as the shaft and cross-bar are raised and lowered, the agitator-arms I, journaled to the cross-bar and geared to the gear-wheels carried by the latter, means for rotating the shaft, and a hand-wheel B', engaging the screw-threaded portion of the shaft to raise and lower the same, substantially as described.



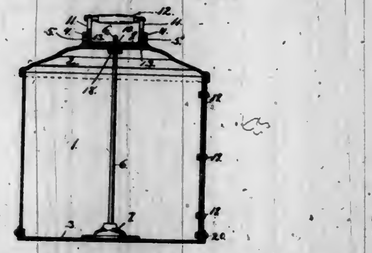
2. The combination, with a filtering-tank A, of a pendent sleeve B, suspended from the top wall of the tank and having a fixed gear-wheel C at its lower end, a frame G, arranged above the tank, a vertically-movable shaft D, extending through the sleeve and frame and having a screw-threaded upper end, a horizontal cross-bar H, secured to the shaft below the sleeve and having gear-wheels which remain in mesh with the fixed gear-wheel as the shaft and cross-bar are raised and lowered, the agitator-arms I, journaled in the cross-bar and geared to the gear-wheels carried by the latter, a gear-wheel E, mounted on the shaft within the frame above the tank and through which wheel the shaft is adapted to move lengthwise, a gear-wheel E', carried by the frame, a drive-pulley F, and a hand-wheel B', engaging the screw-threaded portion of the shaft above the frame, substantially as described.

478,262. BLIND-STOP. WILLIAM E. MACLACHLAN, New York N. Y. Filed Oct. 17, 1891. Serial No. 409,016. (No model.)



Claim.—The combination of a handle to be attached to a blind-slat, said handle having a horizontal arm carrying a spring-catch, with a segmental rack-bar adapted to be affixed to the blind-frame in the plane of rotation of the slat, having an internal segmental rack adapted to engage said spring-catch, substantially as described.

478,263. ELEVATOR. JOHN R. MOSS, Webster, Pa. Filed Nov. 4, 1891. Serial No. 410,890. (No model.)



Claim.—An elevator having a double chain with connecting cross-bars f and oblong links at right angles to each other, the said cross-bars f being provided with hook-rods and end studs, substantially as shown, and for the purpose specified.

478,268.

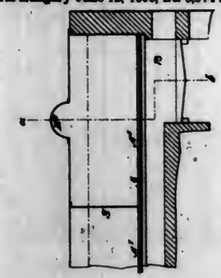
478,264. BALLOT-BOX. FREDERIC K. PLUMELY, Buffalo, N. Y. Filed Apr. 28, 1892. Serial No. 430,970. (No model.)

Claim.—1. In a ballot-box, the combination, with its top or cover provided with a ballot-slot, of a locking-plate open or slotted on one side only, said plate being adapted to be turned or reversed in position to open or close the ballot-slot and to be locked in either of its positions at one or more points, as and for the purpose stated.

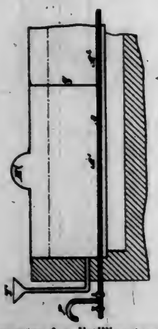
2. In a ballot-box, the combination, with its top or cover provided with a ballot-slot, of a locking-plate open or slotted on one side only, said plate being adapted to be turned or reversed in position to open or close the ballot-slot and to be secured in either of its positions at more than one point by separate and independent locks, as and for the purpose stated.

3. In a ballot-box, the combination, with its top or cover provided with a ballot-slot, of a locking-plate open or slotted on one side only, said plate being adapted to be turned or reversed in position to open or close the ballot-slot and to be secured in either of its positions at more than one point by separate and independent locks of different constructions, as and for the purpose stated.

4. In a ballot-box, the combination, with its top or cover provided with a ballot-slot and means for securing said cover to the box, of a locking-plate open or slotted on one side only, said plate being adapted to be turned or reversed in position to open or close the ballot-slot and to be secured in either of these positions at more than one point by separate and independent locks and to simultaneously secure the cover to the box, as and for the purpose stated.



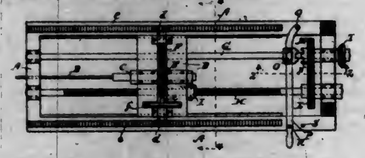
5. In a ballot-box, the combination, with the top or cover 2, provided with the ballot-slot 15 and posts 4 4, with apertures 5 5, of the plate 9, with open side 14 and having apertured posts 11 13 and han-



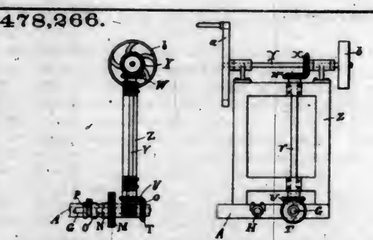
die 12, the whole adapted to be locked through the apertures in the posts, substantially as and for the purpose stated.

6. In a ballot-box, the combination, with the top or cover 2, provided with ballot-slot 15, central aperture 8, and posts 4 4, with apertures 5 5, and the securing-rod 6, screw-threaded at its upper end and secured to the bottom 3 at its lower end, of the plate 9, with open side 14 and centrally screw-threaded aperture 10 and having apertured posts 11 13 and handle 12, the box, its cover, and the plate, all adapted to be locked through the apertures in the posts, substantially as and for the purpose stated.

7. A knockdown ballot-box consisting of the body 1, of one piece of sheet metal, bolted together along the side, the bottom 3, bolted to the body 1, and the removable top or cover 2, secured in place by the screw-threaded rod 6 and any suitable locking mechanism.



478,265. DISTILLING APPARATUS. HEINRICH PROPFE, Mannheim, Germany. Filed May 22, 1890. Serial No. 352,776. (No model.) Patented in Germany Jan. 30, 1890, No. 55,025; in France Feb. 19, 1890, No. 208,865; in Switzerland Feb. 19, 1890, No. 1,956; in England Feb. 24, 1890, No. 2,955; in Belgium Feb. 27, 1890, No. 89,650; in Italy Apr. 21, 1890, XXIV, 27,849, LIV, 88; in Spain May 24, 1890, No. 10,689, and in Austria-Hungary June 12, 1890, No. 8,574 and No. 22,624.



Claim.—In an apparatus for distilling tars and mineral oils, the combination, with a train of stills, the adjacent ones of which have intercommunication between their lower parts, of a furnace at one end of the train and a flue running therefrom to the other end of the train, a feed-pipe for feeding the still at the end of the train farthest from the furnace, and an exit-pipe communicating only with the still nearest the furnace and running through the several stills of the train, substantially as and for the purpose herein set forth.

478,266. BORING-MACHINE. JOHN H. STEDE, Chicago, Ill. Filed June 26, 1891. Serial No. 397,497. (No model.)

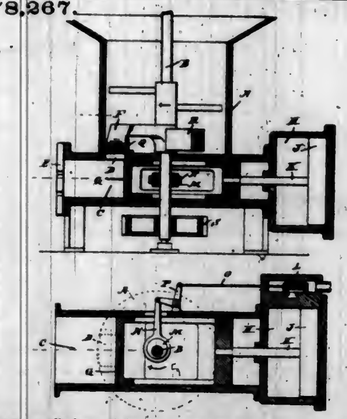
Claim.—1. In a boring-machine, the combination, with the frame, a power-shaft journaled therein, a screw-threaded shaft also journaled in said frame parallel with the power-shaft, and a gear connection between said shafts, of a carriage mounted upon and having a sliding connection with said frame, a rotary drill journaled in said carriage, a gear connection between said drill and the power-shaft, and a detachable screw-threaded connection between the carriage and the screw-threaded shaft, substantially as described.

2. In a boring-machine, the combination, with the frame, a power-shaft journaled therein, a screw-threaded shaft also journaled in said frame parallel with the power-shaft, a gear-wheel keyed upon said screw-threaded shaft, another gear-wheel meshing therewith and loosely mounted upon the power-shaft, and a clutch-coupling between said wheel and the power-shaft, of a carriage mounted upon and having a sliding connection with said frame, a screw-thread connection between said carriage and the screw-threaded shaft, a rotary drill journaled in said carriage, a gear-wheel for operating the same, and another gear-wheel meshing therewith and splined upon the power-shaft, substantially as described.

3. In a boring-machine, the combination, with the frame, a power-shaft journaled therein, a screw-threaded shaft also journaled in said frame parallel with the power-shaft, and a gear connection between said shafts, of a carriage mounted upon and having a sliding connection with said frame, a rotary drill journaled in said carriage, a gear connection between said drill and the power-shaft, a detachable connection between said carriage and the screw-threaded shaft, and a rack-and-pinion connection between said carriage and the frame, substantially as described.

4. In a boring-machine, the combination, with the frame, a power-shaft journaled therein, a screw-threaded shaft also journaled in said frame parallel with the power-shaft, a gear-wheel keyed upon said screw-threaded shaft, a second gear-wheel meshing with the first gear-wheel and being loosely mounted upon the power-shaft, and a clutch-coupling between said second gear-wheel and the power-shaft, of a carriage mounted upon and having a sliding connection with said frame, a detachable screw-thread connection between said carriage and the screw-threaded shaft, a rotary drill journaled in said carriage, a gear-wheel for operating said drill, and another gear-wheel meshing with the latter gear-wheel splined on the power-shaft, substantially as described.

5. In a boring-machine, the combination, with the frame, a power-shaft journaled therein, a screw-threaded shaft also journaled in said frame parallel with the power-shaft, and a gear connection between said shafts, of a carriage mounted upon and having a sliding connection with said frame, a rotary drill journaled in said carriage, a permanent sliding gear connection between said drill and the power-shaft, and a detachable connection between said carriage and the screw-threaded shaft, substantially as described.



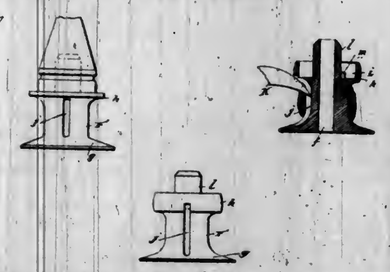
6. In a boring machine, the combination, with the main frame, of a carriage mounted to slide thereon, a rotary drill-chuck having a driving-gear E, journaled in and supported by said carriage, the driving-shaft, a gear F, meshing with the gear E and being splined on said driving-shaft and adapted to be slid along the driving-shaft by the movement of the carriage, and means for advancing and withdrawing said carriage, substantially as described.

478,267. BRICK OR TILE MACHINE. JOHN C. TITUS, New Bremen, Ohio, assignor of one-half to The New Bremen Machine Company, same place. Filed June 11, 1891. Serial No. 395,893. (No model.)

Claim.—1. In a brick or tile machine, the combination, substantially as set forth, of a pug-mill having a discharge-opening in its floor, a fence projecting upwardly from said floor near the inner margin of the discharge-opening, an upwardly and forwardly sloping feed-wing carried by the pug-shaft in a path over the discharge-opening, and a volute or eccentric arm carried by the pug-shaft at the level of the feed-wing.

2. In a brick or tile machine, the combination, substantially as set forth, of a plunger-chamber, a die, a plunger working in the plunger-chamber, a pressure-cylinder having a piston connected with said plunger, a valve for said cylinder, a pug-mill arranged to discharge into said pressure-cylinder and having a pug-shaft, and valve-gearing disconnected from said plunger and connecting said pug-shaft and valve, whereby the valve is positively moved in unison with the revolutions of the pug-shaft.

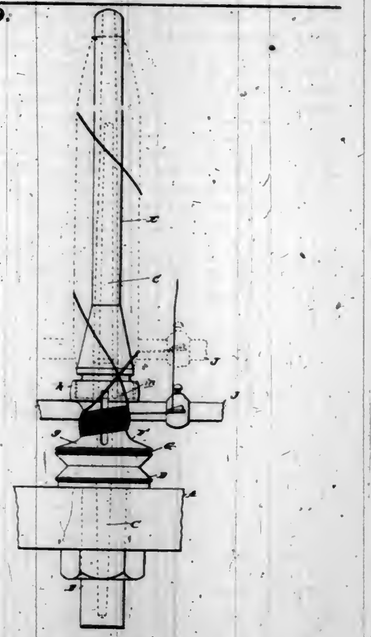
478,267.



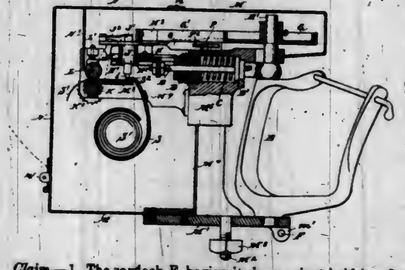
478,268. PROCESS OF MAKING LAMP-BLACK. SWAN P. WESTRAU and ERASTUS R. BLOOD, Ludlow, Pa., assignors to Martha P. Blood, same place. Filed Dec. 4, 1888. Serial No. 292,673. (No specimens.)

Claim.—The process of making lamp-black by depositing the particles of carbon from a flame, which consists in conducting away the gases contained in the inner dark cone of the flame and permitting the outer part of the flame, including the carbon-bearing or middle envelope thereof, to impinge against a depositing-surface.

478,269. FRICTION-COLLAR FOR SPINDLES ON LONG-CHAIN QUILLING-FRAMES. WILLIAM F. WEST, Slatersville, R. I. Filed Mar. 14, 1892. Serial No. 424,857. (No model.)



Claim.—1. A friction-collar for quilling-machines, provided with the longitudinal recess or groove in its exposed face, substantially as and for the purpose described.



2. A friction-collar for quilling-machines, having the flared base and the enlarged flanged upper part forming the socket, and the longitudinal recess or groove in the outer face of said collar, which is extended into the flared and flanged ends of the collar, substantially as and for the purpose described.

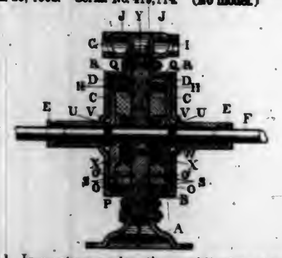
3. The combination, with a spindle, the whirl thereof, and a bobbin, of the friction-collar having the enlarged upper end provided with a socket receiving the lower end of the bobbin and the pin or stud which connects said bobbin and the collar, and a yielding pad interposed between the collar and the whirl, substantially as and for the purpose described.

478,269.

478,270. OARSMAN'S RECORDER. JOHN BAKER, JOSEPH H. BAKER and WALTER B. PEET, New York, N. Y. Filed May 2, 1891. Serial No. 391,333. (No model.)

Claim.—1. The rowlock E, having its lower pivot held in a fixed bearing and its upper pivot free to move forward and backward, in combination with the slide B, housing M, spring C, and pencil-holder J, and with connected mechanism for indicating by the motion of the pencil the extent of each stroke, the position of each stroke—that is to say, whether the man sits too far forward or too far backward in the boat—and the force of the pull at each point in the stroke, all substantially as herein specified.

2. In an oarsman's recorder, the carriage H, having transverse guideways $H' H^4$ and adapted to move forward and backward by the conflicting forces of the pull of the oarsman, and a spring, as C, in combination with such spring, and means for communicating the force of the pull on the oar thereto, and the wheel G, pulleys H^3 H^4, and transversely-moving carriage J, and pencil *i*, carried therein, all arranged for joint operation relatively to each other and to provisions for moving a recording-surface, as herein specified.

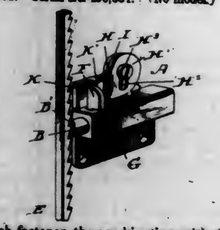


3. In an oarsman's recorder, the wheel G, two pulleys H^3 H^4, and a belt $G' G^2$, running around such pulleys, in combination with each other and with a slide B, spring C, rowlock E, carriage H, and transversely-moving carriage J, carrying a recording-pencil, all arranged to serve relatively to each other and to a suitable recording-surface, as herein specified.

4. In an oarsman's recorder, the rowlock E, capable of partially revolving, as usual, the lever F', links O Q, and carriage J, carrying transverse ways $H' H^4$, and the lever R, pawl R^2, ratchet-wheel K', and feed-rollers K and L, combined and arranged for joint operation substantially as herein specified.

5. In an oarsman's recorder having a rowlock E, capable of both rocking horizontally and moving forward and backward under the force of the pull, the slide B, actuated by such rowlock and carrying a transverse carriage H, the spring C, adapted to act longitudinally against the slide B, and the adjusting means D, arranged to allow the tension of the spring to be varied at will, as herein specified.

6. In an oarsman's recorder, the feed-rollers K L and means for operating them to carry forward a strip of paper and provisions for marking on such paper, and the approximately volute paper-guide S, having the bent upper edges S^2, in combination with each other and with the door M^{12} opposite the end of such volute guide, all arranged to serve substantially as herein specified.

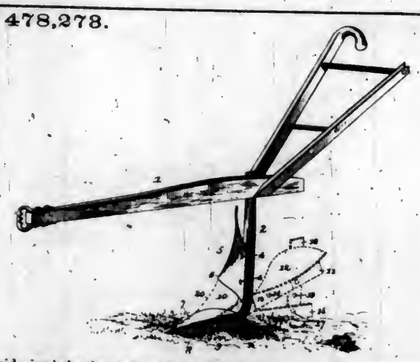


478,271. ROTARY ENGINE. ANDREW BEARD, Woodlawn, Ala. Filed Jan. 25, 1892. Serial No. 419,114. (No model.)

Claim.—1. In a rotary engine, the combination of the base with a central partition and heads on both sides, having casings on the outside recessed to inclose the heads and secured together by bolts passing through flanges on their outer edges and the central partition, said heads having pistons with cam-loops on their inner ends working over rollers on the ends of shafts or studs secured in the central partition to reciprocate the said pistons in grooves in the heads, substantially as described.

2. In a rotary engine, the combination of the base with a central partition and heads on both sides having casings on the outside recessed to inclose the heads and secured together by bolts passing through flanges on their outer edges and the central partition, and heads having pistons with cam-loops on their inner ends working over rollers on the ends of shafts or studs secured in the central partition to reciprocate the said pistons in grooves in the heads and having a steam-chest with reversing-lever and valves secured to the said central partition, with two steam-passages extending downwardly from the steam-chest through the central partition and opening on both sides and having abutments secured to both sides of the central partition between the ports, the said abutments filling the annular spaces in the piston-heads, substantially as described.

478,272. SASH-FASTENER. THOMAS B. BOMAR, Wolfe City, Tex. Filed Apr. 27, 1892. Serial No. 430,831. (No model.)

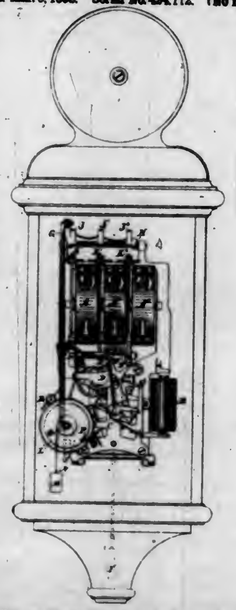


Claim.—In a sash-fastener, the combination, with the sliding latch provided with a handle, of a pivoted stop having a portion to engage said handle and a cam portion at its pivot end and an elongated hole in which the pivot works, substantially as shown and described.

478,273. PLOW. BENJAMIN F. CADENHEAD and MOSES E. BUTT, Blountville, Ala. Filed Feb. 26, 1892. Serial No. 422,894. (No model.)

Claim.—1. In a subsoil-plow, the combination, with the beam and the standard depending therefrom having its lower end forwardly bent to form a foot and above the same provided with an inclined face or beveled portion forming a front cutting-edge, of the point 7, having a convexed upper side and provided at its landside with a depending foot-embracing flange 8, a bolt passed through the flange and foot, and a main wing or mold-board bolted to the standard at its inclined face and having its outer lower corner forwardly curved,

478,278.



said wing being located some distance above the point and combining with the latter to form a passage or space for the subsoil as it leaves the point, substantially as specified.

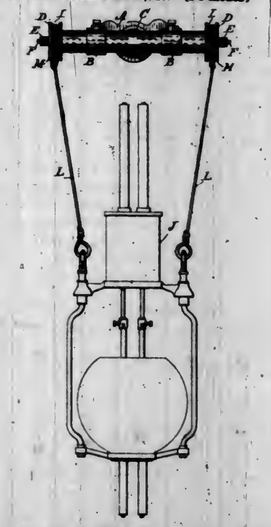
2. The combination, with the beam, the standard, the mold-board, and point, of a pivoted landside secured to the point, a secondary mold-board thereon, and means for adjusting said landside, substantially as specified.

3. The combination, with the beam, the standard, the mold-board, and the point, said mold-board being above the point and combining therewith to form an intermediate space or passage, of a supplemental mold-board pivotally supported at the landside of the plow above the point and opposite the first-mentioned mold-board, and means for adjusting the same with relation to the main mold-board, substantially as specified.

4. The combination, with the beam, a depending standard, a point, and mold-board, of a rearwardly-extending stationary landside-bar, a standard rising vertically from the rear end of the bar and provided with perforations, and a landside-bar pivoted to the plow and having a rear perforated end, a bolt for adjusting the landside-bar being passed through the perforation thereof and any of those of the standard, and the secondary mold-board bolted to the pivoted landside-bar, substantially as specified.

478,274. ELECTRIC INDICATOR. WILLIAM R. DECROW, Boston, Mass. Filed Mar. 8, 1892. Serial No. 424,112. (No model.)

Claim.—1. The combination, with an indicator having a series of numbered parts, of electrically-controlled means for moving said parts so as to give a desired indication and a resetting device controlled by



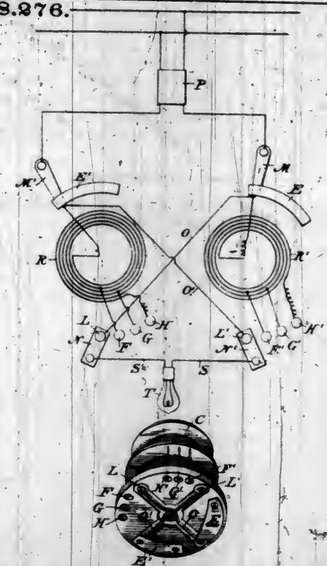
said means and timed to reset the indicator after a definite lapse of time.

2. The combination, with an indicator consisting of a number of wheels having figures on their peripheries and means for rotating the wheels such a distance, respectively, as will bring into visible position the figures corresponding to the number of breaks in an electric circuit, of a resetting device for such indicator, consisting of means for rotating the said wheels to their "0" position by means of a weight or other suitable motive force, a controlling device for the same dependent upon the operating of the indicator, and means for timing the said resetting device so as to operate after a definite lapse of time.

3. The combination, with an indicator consisting of a number of wheels adapted to be rotated a certain distance, respectively, to bring into visible position corresponding figures on their peripheries, of means for rotating these wheels in succession controlled by the breaks in an electric circuit and a resetting device for bringing the wheels to their "0" position and timed to actuate them at definite intervals after the registration has been completed.

4. The combination, with the numbered wheels A A' A^2, of an electro-magnet B, controlling the rotation of said wheels, a resetting device consisting of a rod G, adapted to actuate ratchet-rods K K' K^2, engaging with the said wheels, respectively, and means for automatically operating said rod G, consisting of the cam N, motive weight M, wheel L, a stop P for said wheel, controlled by the mechanism of the register, and a retarding-fan R, substantially as described.

478,275. SUSPENSION-BAR FOR ELECTRIC LAMPS. THOMAS DILLON, Indianapolis, Ind., assignor of one-half to John Caven, same place. Filed Apr. 28, 1892. Serial No. 430,949. (No model.)



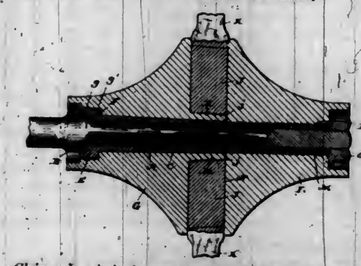
Claim.—1. The above-described suspension-bar for electric lamps, consisting of a bar of wood or other non-conducting material and a pair of metallic disks mounted upon the opposite ends of said bar, and each provided with a peripheral groove and a binding-post adapted to receive an electric conductor, substantially as set forth.

2. The combination of the wooden bar, the arm arranged to support said bar, the pair of peripherally-grooved disks secured to the opposite ends of the bar and each provided with a binding-post and forming a part of an electric circuit, the pair of suspending-rods, each having a loop embracing one of said disks, and the lamp suspended from said rods, so as to form an electric circuit therewith, all substantially as and for the purpose set forth.

478,276. RHEOSTAT. WINSLOW P. EATON, Nashua, N. H., assignor of one-half to Frank A. McKean, same place. Filed Aug. 3, 1891. Serial No. 401,454. (No model.)

Claim.—1. In a device for regulating electric lights, two resistances and contacts therefor, two sets thereof being connected, respectively, with said resistances, corresponding contacts in each set being connected, with their respective resistances at similar points, said resistances being respectively always in contact with the legs of a main circuit and said corresponding contacts being movable and adapted to

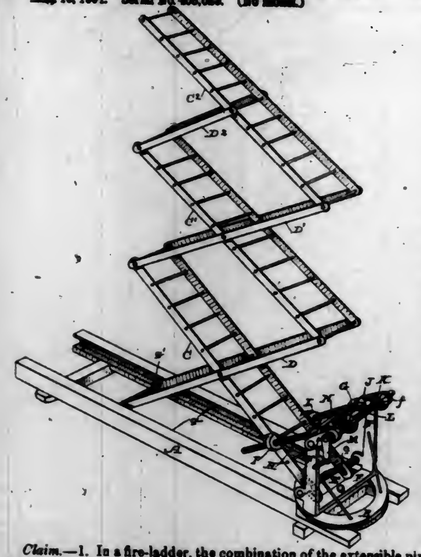
478,276.



be brought in pairs successively in contact with the legs of a local circuit, substantially as shown and described.

2. In a device for regulating electric lights, the combination of a base carrying contact-pieces connected, respectively, with the legs of a main and a local circuit, a support movable upon said base, two resistances carried by said support, two sets of contact-points also carried by said support, each set being connected with one of said resistances, each contact-point therein with a different point in the resistance and corresponding points in each set with similar points in each resistance, and contact-strips upon said support adapted to keep said resistances respectively always in contact through contact-pieces on the base with the legs of one of said circuits, said contact-points being adapted to be brought by moving the support upon the base successively and in pairs respectively in contact through contact-pieces on the base with the legs of the other of said circuits, substantially as shown and described.

3. In a device for regulating electric lights, the combination of a base carrying contact-pieces connected, respectively, with the legs of a main and a local circuit, a turret rotatable upon said disk, two resistances carried by said turret, each set being connected with one of said resistances, each contact-point therein with a different point in the resistance and corresponding points in each set with similar points in each resistance, and contact-strips upon said turret adapted to keep said resistances respectively always in contact through contact-pieces on the base with the legs of one of said circuits, said contact-points being adapted to be brought by the rotation of said turret successively and in pairs respectively in contact through contact-pieces on the base with the legs of the other of said circuits, substantially as shown and described.



478,277. VEHICLE-HUB. FREDERICK W. FIEDLER, Scranton, Pa. Filed Feb. 29, 1892. Serial No. 423,179. (No model.)

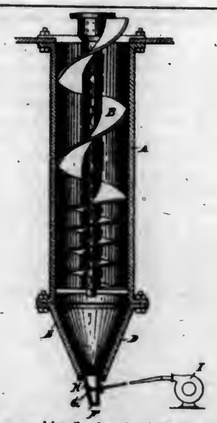
Claim.—In a hub, the combination, with the axle, of the axle-box having its rear half exteriorly tapered and its outer half exteriorly screw-threaded, the rear hub-section having an exteriorly-tapered

bore fitting the rear half of said axle-box and provided with a projecting exteriorly tapered or inclined flange, and a radial series of mortises arranged over said flange, which forms the base for said mortises, the solid front hub-section having an exteriorly-threaded bore engaging the threaded half of said axle-box and a flat inner face working over the open edges of the mortises, and a securing-nut engaging the outer threaded end of the axle-spindle and bearing directly against the outer end of the axle-box and the outer face of the front hub-section, substantially as set forth.

478,278. FIRE-LADDER. LEWIS H. FOWLER, Vallejo, Cal. Filed Aug. 18, 1891. Serial No. 403,089. (No model.)

Claim.—1. In a fire-ladder, the combination of the extensible pivotally-connected sections constituting the ladder, the nuts on one of said sections, the screws operating in and through the nuts, and the rock-shaft carrying the screws, substantially as herein described.

2. In a fire-ladder, the combination of the extensible pivotally-connected sections constituting the ladder, the nuts on one of said sections, the screws operating in and through the nuts, and the rock-shaft carrying the screws and gearing between said shaft and screws, substantially as herein described.



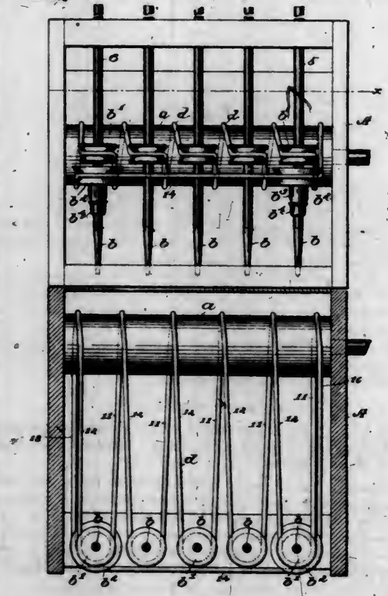
3. In a fire-ladder, the combination of the pivotally-connected ladder and link sections, the lowermost ladder-section having a pivotal connection and the lowermost link-section having a sliding connection, the nuts on the lowermost ladder-section, the rock-shaft, the screws seated in said rock-shaft and operating in and through the nuts, and the power-shaft and gears for operating the screws, substantially as herein described.

4. In a fire-ladder, the combination of the truck-frame having the side guides, the turn-table mounted upon said frame, the pivotally-connected ladder and link sections, the lower end of the lowermost link-section being adapted to travel in the side guides of the truck-frame to and upon the turn-table, a pivotal connection of the lower end of the lowermost ladder-section with the turn-table, the standards of the turn-table, the rock-shaft in said standards, the operating-screws carried by the rock-shaft, the nuts on the lowermost ladder-section in and through which the screws operate, and a power-shaft and gearing by which the screws are operated, substantially as herein described.

5. In a fire-ladder, the combination of the frame with side guides, the turn-table, the ladder and link sections, the lower link-section sliding in the side guides of the frame to and upon the turn table, the standards on the turn-table, the cross-shaft E of standards upon which the lower link-section is pivotally slotted, the rock-shaft in the standards, the screws carried by the rock-shaft, the swinging nuts on the lower ladder-section receiving the screws, the power-shaft supported from the rock-shaft, and gearing between said power-shaft and screws, substantially as herein described.

478,279. APPARATUS FOR THE MANUFACTURE OF TUBULAR ARTICLES OF CONFECTIONERY. CLEMENT R. GARDINER, Hempstead, N. Y. Filed Jan. 30, 1892. Serial No. 418,672. (No model.)

478,279.

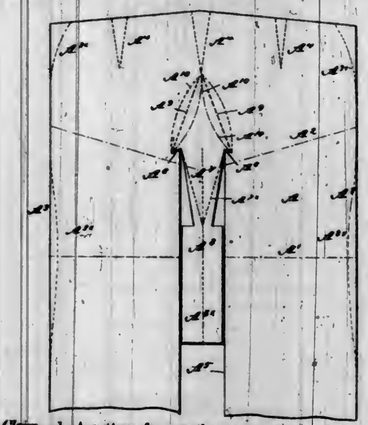


Claim.—1. In a machine for forming hollow articles from plastic materials, the combination of the cylinder or receptacle for the plastic mass, provided with a die-orifice and with means for forcing the material through said orifice, and an air-tube, one end of which occupies the center of the die-orifice and the other extends beyond the wall of the cylinder, substantially as described.

2. The combination of the cylinder having a contracted mouthpiece forming its lower end, a die-plate with an orifice or orifices on one side of said mouthpiece, and air-tubes, one extending from the center of each orifice through the opposite side of the mouthpiece, substantially as and for the purpose set forth.

3. The combination of the cylinder provided with a die-orifice, an air-tube having its end in the center of said die-orifice, and means, such as an air-pump, for supplying air under pressure through said tube, substantially as described.

4. A machine for forming hollow articles from plastic materials, said machine comprising, in combination, the cylinder or receptacle, the feed-screw, the tapering extension beneath the feed-screw, the diaphragm between the cylinder and extension, the mouthpiece having a die-plate, and the air-tubes extending through the mouthpiece and terminating one in each die-orifice, substantially as described.

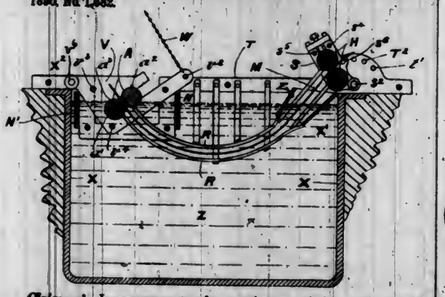


478,280. MEANS FOR DRIVING SPINDLES. HENRY GREENWOOD, Gilbertville, Mass. Filed Nov. 27, 1891. Serial No. 413,194. (No model.)

Brief.—Each end spindle is provided with an additional whirl, loose to revolve on the spindle, around which whirls the band passes in its return.

Claim.—A frame and a driving-cylinder journaled therein, combined with a series of spindles each provided with a driving-whirl, the end spindles of the series having in addition loose guide-whirls larger in diameter than the said driving-whirls, and the endless band *d*, extended around the driving-cylinder and each of said driving-whirls, and returned around the guide-whirls of the end spindles, substantially as described.

478,281. TROUSERS, &c., AND PATTERN THEREFOR. RICHARD HAMILTON and JOHN G. LEWIS, Jefferson City, Mo.; said Hamilton assignor to said Lewis. Filed Sept. 22, 1891. Serial No. 406,443. (No model.)



Claim.—1. A pattern for a nether garment, comprising a back and seat portion, a back for each leg and a central longitudinal fly-piece, and an intermediate crotch-piece integral with the back and seat portion and fly-piece, as set forth.

2. A pattern for a nether garment, comprising a back and seat portion, a back for each leg, a central longitudinal fly-piece, and an intermediate crotch-piece integral with the back and seat portion and separated from the same at its junction therewith by inclined slits.

3. A nether garment comprising seat, body, and leg back portions, a crotch-piece integral with the seat portion, and a fly-piece forming a continuation of the crotch-piece, said seat portion being folded and stitched to form a double-ply reinforce.

478,282. APPARATUS FOR COATING METAL SHEETS. RICHARD HEATHFIELD, Darlaston, England. Filed July 17, 1890. Serial No. 359,015. (No model.) Patented in England May 2, 1889, No. 7,311, and Jan. 31, 1890, No. 1,632.

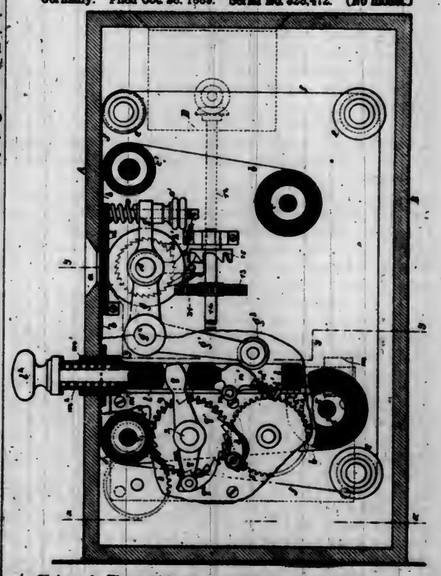
Claim.—1. In an apparatus for coating metal sheets, the combination, with the pot X, adapted to contain molten coating metal, and the feed-rolls H, of the exit-rolls A, adjustably supported within the pot below the upper edge thereof, whereby the nip of said rolls may be brought close to the surface of the molten metal, but with the lower roll not completely submerged and the upper roll not wholly out of the metal, substantially as described.

2. In an apparatus for coating metal sheets, the combination of the pot X, adapted to contain molten coating metal, the feed-rolls H, a separate pivoted frame in which said feed-rolls are mounted, the exit-rolls A, located below the edge of the pot, and a separate pivoted frame in which said exit-rolls are supported, whereby the nip of the exit-rolls may be brought close to the surface of the coating metal, but with the lower exit-roll not completely submerged and the upper exit-roll not wholly out of the metal, substantially as described.

3. In an apparatus for coating metal sheets, the combination, with the pot X, adapted to contain molten metal, of the adjustable frame B, arranged on the outside of the pot and provided with the pivot a^3 and eye a^4, the feed-rolls H, supported in said frame, the quadrant T^2, having eyes t', and a pin for locking the roll-supporting frame at any required inclination, substantially as described.

4. In an apparatus for coating metal sheets, the combination, with the pot X, adapted to contain molten coating metal, of the feed-rolls H, a separated pivoted and adjustable frame in which said rolls are mounted on the outside of the pot, means for locking said frame in its adjusted position, the exit-rolls A, and an adjustable frame in which said rolls are mounted below the edge of the pot, substantially as described.

5. In an apparatus for coating metal sheets, the combination of the pot X, adapted to contain molten metal, the feed-rolls H, a pivoted and adjustable frame in which said feed-rolls are supported on the outside of the pot, the exit-rolls A, and a removable and adjustable frame in which said exit-rolls are supported below the edge of the pot, substantially as described.



478,283. BALLOT-BOX. CHARLES F. HODGDON, New York, N. Y. Filed Jan. 18, 1892. Serial No. 418,366. (No model.)

Claim.—1. The combination, with a ballot-box having a slot therein, of a removable cap adapted to cover the slot and having a finger near one end to project down through the slot and hook beneath the cover and a spring-latch near the other end of the cover to pass down into the slot and hold the cover, substantially as set forth.

2. The combination, with a ballot-box having a slot therein, of a cover of a size to cover the slot in the ballot-box and provided with a rim fitting into the slot and preventing lateral motion of the cover and a spring locking device upon the cover to pass through the slot and engage the inner surface of the ballot-box, substantially as set forth.

478,284. WORKMAN'S TIME-RECORDER. JOHN C. KOCH, Berlin, Germany. Filed Oct. 28, 1889. Serial No. 328,472. (No model.)

Claim.—1. The combination, with the case having an opening and a table behind the opening, of rolls for supplying and guiding a web

of paper, a wind-up roll, a push-button which extends outside the case, a lever, pawl, and ratchet-wheel receiving motion from the push-button and gearing therewith connected for moving the wind-up roller, a range of character-wheels, and connection for a clock mechanism for rotating such character-wheels, a lever for supporting the character-wheels, and a cam on the inner portion of the push-button for moving the lever and type-wheels and impressing the characters on the same, substantially as specified.

2. The combination, with the containing-case having an opening therein and the supporting table and rollers for supplying, guiding, and winding up the paper, of a push-button and slide, a ratchet-wheel and pawl and the gearing moved thereby, and a frictional connection between the gearing and the winding-up roller, and a letter or character wheel, and a lever carrying the letter-wheel, and a connection from the same to the push-button for impressing the character on the paper, substantially as set forth.

3. The combination, with the containing-case and the roll e for supplying a web of paper, of the guide-rolls d c^3 and winding-up roll c^4, the gearing connecting the rolls c^3 c^4, the ratchet-wheel for giving motion to the gearing, a frictioo device between the roll c^3 and the gearing, a push-button, lever, and pawl for acting upon the gearing to move the paper, the type or character wheels, a lever for supporting and moving the same, and a cam acted upon by a slide for giving motion to the lever and character-wheels, substantially as set forth.

4. The combination, with a containing-case having an opening in the same and a table behind the opening, of a roll for supplying the web of paper, the guide-rolls d c^3, the wind-up roll and mechanism for actuating the same, substantially as specified, a ribbon containing coloring-matter adjacent to the web of paper near one edge, type or character wheels and a connection for moving the same by clock-work, and a lever and cam for supporting the character-wheels and a push-button and cam for impressing the character-wheels, substantially as set forth.

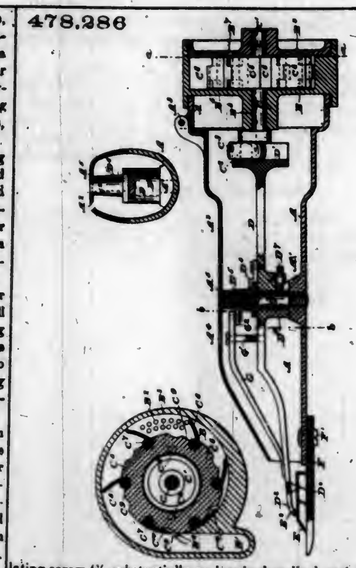
478,285. BUCKLE. FRANK H. LA PIERRE, East Orange, N. J. Filed Apr. 6, 1892. Serial No. 428,060. (No model.)

Claim.—1. The herein-described buckle, consisting of a frame A, having a central opening, with an offset bar or lip along one side of said opening, with a plate B, hinged to the frame at the opposite side of said opening and having a bar or slot at both its front and rear edges for attaching the belt or ribbon, substantially as shown and described.

2. As an improved article of manufacture, a buckle consisting of a frame A, having a central opening, with an offset along one side of said opening, and a plate B, hinged to the rear side of the frame at one side of the opening and provided at its edges with a slot or opening for the reception of the belt or ribbon, substantially as shown and described.

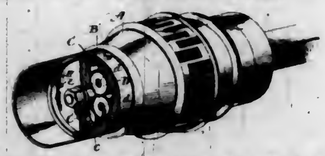
478,286. SHEEP-SHEARING MACHINE. ALFRED MELCHIOR, Sydney, New South Wales. Filed Dec. 3, 1891. Serial No. 413,958. (No model.)

Claim.—1. In a sheep-shearing machine, the combination, with the shaft C, of the lever D and cutters E, cylinder B, having inlet and outlet ports, said cylinder having a frusto-spherical inner periphery, and the annulus C^9 in said cylinder and having wings C^8 pivoted thereon, the holes or basins C^{10} in said annulus adapted to be engaged by and partly covered by wings C^8, substantially as set forth.



2. In a sheep-shearing machine, the combination, with the boss D^2 on lever D, of the pin D^4, engaging boss A′ and passing through said boss D^2, and screw-threaded flanged cap D^5, engaging said pin D^4 and engaged by arm D^6 on lever D, substantially as set forth.

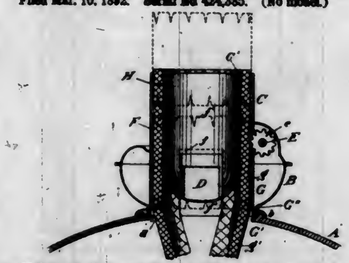
3. In a sheep-shearing machine, the combination, with the boss D^2 on lever D, of the anti-friction roller D^7 on said boss and bearing on pin D^4, said pin passing through boss D^2, the partly cone-shaped interiorly-screw-threaded cap D^5, adapted to engage the upper screw-threaded end of pin D^4, the pin G′, engaging lever D and having thereon spring G, and rollers G^2 on the inner end of said spring, said rollers bearing on said cap D^5, substantially as set forth.



4. In sheep-shearing machines of the class set forth, the combination and arrangement, with a vibrating lever D, of a pivotal stud or pin D^4, a cap D^5, catch or connection D^6, and orifices A^4 and A^5, substantially as herein described and explained, and as illustrated in the drawings.

5. In sheep-shearing machines of the class set forth, the combination and arrangement, with a lever D, having pivotal screw or stud D^4, of a cap D^5 and a tension spring G, having end rollers G^2 and regulating-screw G′, substantially as herein described and explained, and as illustrated in the drawings.

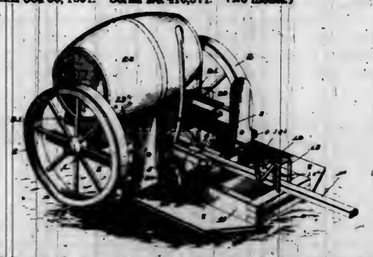
478,286



478,287. VEHICLE-HUB. ALFRED A. MINOR, Egg Harbor, Wis. Filed Nov. 16, 1891. Serial No. 412,078. (No model.)

Claim.—In a vehicle-hub, the combination, with the body of the hub provided on its interior with an annular chamber enlarged at the ends to form two shoulders f and h, of plates having projecting pins on their inner surfaces adapted to form bearings for rollers, rods connecting the said plates, longitudinal rollers pivoted on said projecting pins, the plates H H, bearing against the shoulders h h and the outer surface of the plates C, and rods connecting said outer plates, all substantially as shown and described.

478,288. WICK-ADJUSTING DEVICE. FRANK REHM, Meriden, Conn., assignor of one-half to the Edward Miller & Company, same place. Filed Mar. 10, 1892. Serial No. 424,385. (No model.)



Claim.—1. In a wick-adjusting device, the combination of a wick-carrier, a rack on said carrier, and a supplemental rack hinged to said carrier and forming a continuation of said first-named rack, substantially as described.

2. In a wick-adjusting device, the combination of a wick-carrying sleeve, a rack on said sleeve, and a supplemental rack hinged to said sleeve and forming a continuation of first-named rack, substantially as described.

3. In a wick-adjusting device, the combination of a wick-carrying sleeve, means, as teeth, for attaching said sleeve to the wick, a rack in said sleeve, a supplemental rack below said first-named rack, and a hinge connecting said supplemental rack and said sleeve, substantially as described.

478,289. TOBACCO-PLANTER. ELMER A. ROLLMAN, Eaton, Ohio. Filed Oct. 30, 1891. Serial No. 410,371. (No model.)

Claim.—1. In a machine of the class described, the combination, with the opposite side bars 6, of the axle 1, mounted thereon, the wheels mounted on the axle, the transverse bars 4, connected to the front ends of the side bars, the standards 5, depending from the inner ends of the transverse bars, the axle journaled in the standards, the peripherally grooved and concaved covering-wheel mounted on the axle, the frame 10, secured to the front ends of the bars 6 and carrying the roller 12, the platforms 8, supported by the frame and transverse rods 4, the boot 16, depending from between the bars 6 and between the platforms, the shoe at the lower end of the same, the barrel supported upon the side bars, the discharge-pipe leading from the barrel and terminating in rear of the shoe, the spring-actuated cut-off mounted in the discharge-spout, the loosely-journaled trip-shaft bent at its ends and secured to the axle, the pins on the wheel for engaging the outer end of the trip-shaft, and the lever pivoted to the bar 6 and at its ends to the inner end of the trip-shaft, substantially as specified.

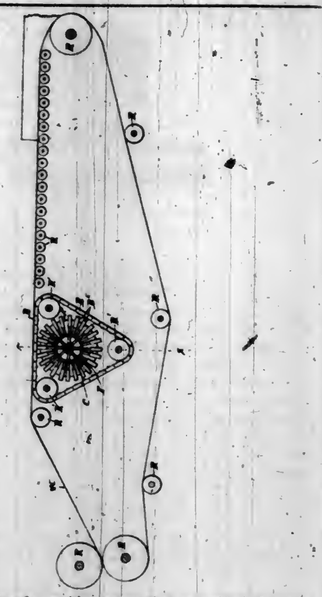
2. In a machine of the class described, the combination, with the frame-work, the axle, and the wheels, of the depending boot, the shoe located in the lower end of the same, the water-reservoir supported upon the frame-work, the discharge-pipe leading therefrom and terminating in rear of the shoe, the cut-off mounted in the discharge-pipe, a spring for normally closing the same, a trip-shaft journaled on the axle and having its outer end bent and extending parallel to the wheel, pins mounted on the wheel for tripping the shaft, and a lever pivoted to the frame-work at its lower end pivoted to the inner end of the trip-shaft and at its front lower end pivoted to the cut-off, and a foot-lever loosely connected to the inner end of the trip shaft and adapted to reciprocate the same into and out of the path of the pins, substantially as specified.

478,290. SUCTION APPARATUS FOR PAPER-MILLS. EPHRAIM SANDERSON and FRANK C. BASS, Cleveland, Ohio. Filed Dec. 19, 1891. Serial No. 415,579. (No model.)

Claim.—1. In a machine of the character described, a suction-regulator consisting of a rotating circular shell having radial openings through it for tube connections, and a stationary circular block within said shell and having a vertical opening in its upper side and adapted to close all the radial openings in the circular shell except those opposite said vertical opening, substantially as shown and described.

2. In a machine of the character described, the combination of a suction-regulator consisting of a rotating circular shell having radial openings through it for tube connections and a circular stationary block within said shell and having a vertical opening in its upper side, said stationary block being adapted to close all the radial openings of the shell except those opposite the vertical opening in the block, with a suction-pipe opening into the vertical opening in said stationary block, substantially as shown and described.

3. The combination, in a machine of the character described, of a suction-regulator consisting of a rotating circular shell having radial openings through it for tube connections and a circular stationary block within said shell, said block having a vertical opening in its upper side and being adapted to close all the radial openings of the shell except those opposite said vertical opening, a suction-pipe opening into the said vertical opening in said block, and an expansible device interposed between the under side of said suction-pipe and said stationary block, substantially as shown and described.



4. The combination, in a machine of the character described, of a suction-regulator with an endless series of suction-boxes, substantially as shown and described.

5. The combination, in a machine of the character described, of an endless series of traveling suction-boxes, a rotating shell having radial openings, means for making connection successively between the radial openings of the rotating shell and the traveling suction-boxes of the endless series, a suction-pipe to enter the rotating shell, and a block within the shell, said block being adapted to close connection between the suction-pipe and all the radial openings of the rotating shell except such as are in connection with the endless series of traveling suction-boxes, substantially as shown and described.

6. The combination, in a machine of the character described, of a suction-regulator, an endless series of suction-boxes, yielding pipes attached to the suction-regulator and adapted to make and break connection with the suction-boxes, a wire, a suction-pump, and pipe connection between said suction-regulator and pump, substantially as shown and described.

7. The combination, in a machine of the character described, of an endless series of suction-boxes having an opening in the bottoms, a suction-regulator consisting of a rotating circular shell having radial openings through it for tube connections, and a circular stationary block within said shell and having a vertical opening in its upper side, said stationary block being adapted to close all the radial openings of the shell except those opposite the vertical opening in the block, a suction-pipe opening into the vertical opening in the stationary block, and tubes attached over the openings in the rotating shell and adapted to make and break connection with the endless series of boxes, substantially as shown and described.

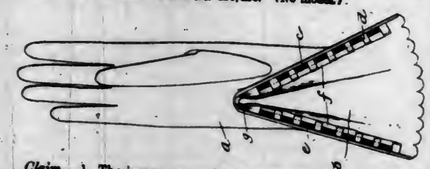
478,290.

478,291. HAT-GAGE. ISAAC SHRIER, Wilmington, N. C. Filed Oct. 23, 1891. Serial No. 409,600. (No model.)

Claim.—1. The herein-described gage for hats, consisting of a strip or web of material in the form of a ring of frusto-conical shape with the widest portion thereof at the base, the lowermost edge forming said base being beveled or reduced in thickness from opposite sides to prevent bulging of the sweat-band at the lower portion thereof, as set forth.

2. The herein-described gage for hats, consisting of a ring or circular band of material of frusto-conical shape having its lower edge or base beveled from opposite sides to reduce the same, and mucilage or other adhesive material applied thereto for the purpose of securing the gage in position behind the sweat-band, substantially as set forth.

478,292. LOOSE OR IDLE PULLEY. THOMAS W. SIBCOX, Fostoria, Ohio. Filed Nov. 2, 1891. Serial No. 410,662. (No model.)

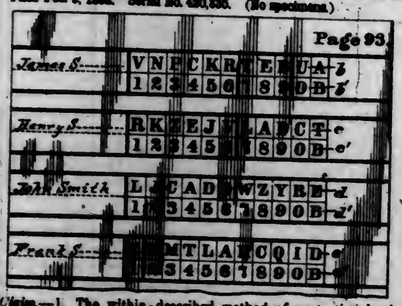


Claim.—In an idler-pulley, the combination, with a revolving

478,292.

shaft, of a double-cone sleeve or collar secured upon said shaft, a pulley provided with a conical half-hub adapted to fit upon one-half of said sleeve or collar and with a squared annular recess or groove formed in the inner face of said half-hub, a detachable half-hub corresponding to the shape of the cone-sleeve and adapted to fit upon the opposite half thereof, the same being provided with a series of radially-extending arms corresponding to the spokes of the wheel and with an inwardly-projecting annular flange adapted to project within said annular recess or groove, packing interposed between said arms and the spokes of the wheel, and means for adjustably clamping said arms to said spokes, substantially as set forth.

478,293. VOLTAIC GLOVE. FREDERICK SIMPSON, Boston, Mass. Filed Mar. 25, 1892. Serial No. 426,496. (No model.)

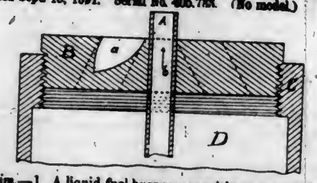


Claim.—1. The improvement in gloves or other hand-wear, consisting of two dissimilar metals, such as copper and zinc, secured to the inner surface of the wrist portion and a connection between the same, whereby when the glove or like article is upon the hand the metals will be in contact with the flesh of the wearer and electric action established, substantially as described.

2. In a glove or like article of hand-wear, wire-gauze strips or plates of copper and zinc secured therein near the edges of the slit or opening for the hand, a connection of some electric conducting material, a suitable binding for the said metals, and suitable openings in said binding to permit contact of the metals with the flesh, substantially as described.

3. The combination, in gloves or other hand-wear, of copper and zinc elements *c d* and connections *g* whereby the contact of the said elements with the flesh will produce currents of electricity, substantially as described.

478,294. METHOD OF PROTECTING BANK-CHECKS AND THE LIKE FROM BEING RAISED. THOMAS S. SEVEY, Cincinnati, Ohio. Filed Feb. 9, 1892. Serial No. 420,836. (No specimens.)



Claim.—1. The within-described method of protecting bank-checks and the like from being raised, which method comprises a secret detector inscribed with the names of the depositors and having for each depositor a series of consecutive numbers and a separate letter or symbol to indicate each number and a check or draft which is properly filled up and has applied to it a combination of letters or symbols which when compared with the letters or symbols associated on the secret detector with the name of the drawer of the check designates the exact amount to be paid in dollars, substantially as set forth.

2. A bank check or draft protector consisting of a sheet or book having spaces for the names of the depositors, a series of consecutive numerals for each name, and a separate character or symbol for each numeral, substantially as herein described.

3. A bank check or draft protector consisting of a sheet or book having spaces for the names of the depositors, a series of consecutive numerals for each name, a separate letter over each numeral, and a special initial to indicate "bearer," substantially as herein described.

478,295. LIQUID-FUEL BURNER. EDWIN SQUIER, Montclair, N. J., GEORGE H. COSS, Elmira, and FORREST M. TOWL, Brooklyn, N. Y. Filed Sept. 15, 1891. Serial No. 405,783. (No model.)

Claim.—1. A liquid-fuel burner comprising a central fuel-passage and a series of separate and distinct rectilinear air-passages arranged around it, each of which is inclined inwardly from its rear end toward the front and has its axis arranged tangentially to a circle drawn from the axis of the fuel-passage as a center and lying in a plane transverse to said axis.

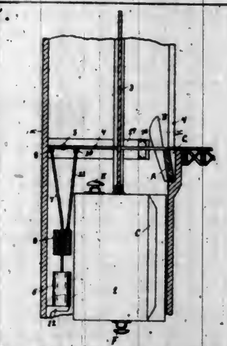
2. A liquid-fuel burner having a central fuel-passage, around which are arranged separate and distinct passages for the discharge of the atomizing medium, the axis of discharge of each of said latter passages being inclined inwardly toward the axis of the fuel-passage and tangential to a circle of which the axis of the fuel-passage is the center and lying in a plane transverse to said axis, substantially as set forth.

478,296. SPARK AND CINDER ATTACHMENT FOR SMOKE-STACKS. BENJAMIN W. SWEET, Portsmouth, Ohio. Filed Oct. 30, 1891. Serial No. 410,354. (No model.)

Claim.—1. In a spark and cinder attachment, the combination, with curved, rearwardly-diverging, and oppositely-faced semi-open deflectors, of means for securing together their inner or intermediate surfaces, substantially as described.

2. In a spark and cinder attachment, the combination, with curved rearwardly-diverging semi-open deflectors, of an intermediate hood and means for securing said hood and deflectors together, substantially as described.

3. A spark and cinder attachment provided with curved rearwardly-diverging semi-open deflectors and an intermediate directing-valve, in combination with a smoke-stack and means for securing said attachment to the upper end of said smoke-stack, substantially as described.

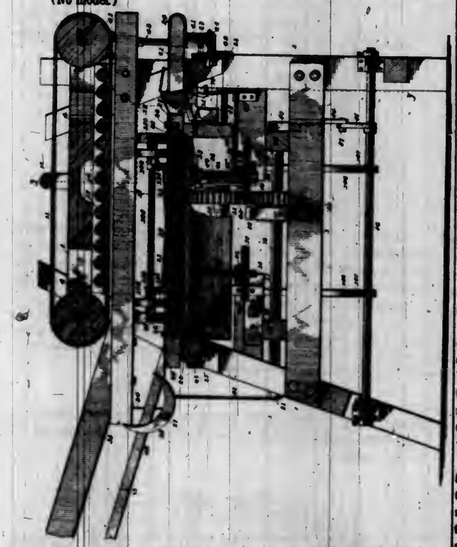


4. A spark and cinder attachment provided with spoon-shaped, upwardly-inclined, and rearwardly-diverging deflectors with a downwardly-projecting directing valve or damper and means for adjusting said valve or damper at any desired angle, substantially as described.

5. A spark and cinder attachment provided with two spoon-shaped, upwardly inclined, and rearwardly-diverging deflectors, with an intermediate hood, with a downwardly-projecting directing valve or damper, and means for adjusting said valve or damper at any desired angle, substantially as described.

6. A spark and cinder attachment provided with curved, rearwardly-diverging, and semi-open deflectors, substantially as described.

478,297. DEVICE FOR OPERATING HATCHWAY-DOORS. SETH G. TUPPS, Mainville, Ohio. Filed Aug. 20, 1891. Serial No. 402,221. (No model.)



478,297.

Claim.—1. In combination with the door 4, hinged to the shaft 5 within the hatchway of an elevator-shaft, the weights 6 and 9, connected by cords 11 and 7 to the door on each side of its shaft, the cord on one weight passing through the other, and the rest 12 to sustain the weight when the door is in the horizontal position, substantially as described.

2. The combination, with an elevator-shaft and a cab, of a swinging door hinged by a shaft or rod in the elevator-shaft and having the slots *a b* and side notch 15, the slides 13 for covering the slots when the door is horizontal, the springs 14 for pressing the slides outwardly, and the inclines 16, secured in the elevator-shaft and adapted to enter the side notches of the door for moving the slides to close the slots when the door is horizontal, substantially as described.

478,298. MACHINE FOR APPLYING LABELS TO CANS. JOHN F. WILLIAMS, Roanoke, Va. Filed July 22, 1890. Serial No. 359,537. (No model.)

Claim.—1. In a machine of the class described, the combination, with the frame-work, the feedway, and a label-holding table, of a pair of rolls journaled above the table, an endless apron mounted on the rolls, and a series of loose rollers journaled between the rolls and bearing upon the lower portion of the apron, substantially as specified.

2. In a machine of the class described, the combination, with a way having a slot, of a rock-shaft journaled under the way, means for intermittingly operating the same, and a substantially crescent-shaped separator mounted on the shaft and adapted to have its opposite ends alternately projected above the surface of the way, substantially as specified.

3. In a machine of the class described, the combination, with the table or way, the movable follower supported therein, and a train of gearing for operating the machine, of a device, substantially as described, adapted to be operated by and located in the path of a can upon the table, and means, substantially as described, for operating the follower and adapted to be thrown into operative engagement with the train of gearing by the can-operated device, substantially as specified.

4. In a machine of the class described, the combination, with a table having an opening therein and a follower mounted for movement in the opening, of means, substantially as described, for raising the follower, a train of power-gearing for operating the machine, a trip yieldingly supported in a slot in the table in rear of the follower-opening and adapted to be depressed by a can moving thereover, and devices, substantially as described, connected with and actuated by the trip and adapted for throwing the follower-operating mechanism into operative engagement with the power-gearing of the machine, substantially as specified.

5. In a machine of the class described, the combination, with the table having an opening therein and a follower mounted for movement in the opening, of means, substantially as described, for raising the follower, a train of power-gearing for operating the machine, a trip yieldingly supported in a slot in the table in rear of the follower-opening and adapted to be depressed by a can moving thereover, and devices, substantially as described, connected with and actuated by the trip and adapted for throwing the follower-operating mechanism into operative engagement with the power-gearing of the machine, and a spring for returning the trip after each depression and disengaging the follower-operating mechanism from said power-gearing, substantially as specified.

6. In a machine of the class described, the combination, with the table, of a paste-applying disk having a curved lower portion, a pivotal support for the same, and means, substantially as described, for reciprocating the disk, said disk being adapted to partially rotate and drag from the center of its curved portion to one end of its curved portion when moved in one direction and to partially rotate and drag from its center to its opposite end when moved in an opposite direction, substantially as specified.

7. The combination, with the label-supporting table, of a reciprocating block, a pin 114 passing therethrough, a roller, and a paste-distributer mounted on the pin side by side, substantially as specified.

8. In a machine of the class described, the combination, with the label-supporting table, of a curved rock-arm, means, substantially as described, for rocking the same intermittingly, a block pivoted at the upper end of the rock-arm, a spring for normally depressing the same, a pin arranged in the opposite end of the block, a roller, and a paste-distributer mounted side by side upon the pin, substantially as specified.

9. In a machine of the class described, the combination, with a table having an opening, a depending box surrounding the opening, and a follower mounted in said box, of a pair of ratchet-wheels revolubly supported under the follower, threaded shafts passing through and engaging the hubs of the ratchets, reciprocating bars supported at the sides of the ratchets and terminating at their corresponding ends in depending beat portions, in which are journaled rollers, a pawl mounted on each shaft and engaging the teeth of the ratchet, a spring for moving the shafts in one direction and stops for limiting the movement of the rods in the opposite direction, and a shaft having cams for operating against the rollers, and means, substantially as described, for rotating said shaft, substantially as specified.

10. The combination, with the label-carrying table having the pair of laterally-disposed curved tracks, of the pair of rock-arms, means, substantially as described, for operating said rock-arms, spring-pressed blocks pivoted in the rock-arms, paste-receptacles mounted below the blocks and tracks, bearing-pins mounted in the free ends of the blocks, rollers mounted upon the tracks and upon the pins, and paste-distributers mounted upon the pins at the sides of the rollers and in contact with the paste-rollers, substantially as specified.

11. In a machine of the class described, the combination, with the feed-table having an opening, the follower mounted below the table, the threaded shaft depending from the lower side of the follower, the rotatable centrally perforated and threaded ratchet-disk for the reception of the shaft, the reciprocating bar located at one side of the disk and provided with a series of adjusting perforations, of a pin passed through the bar and adapted to limit the movement of the same, a spring for throwing the shaft in one direction, a roller mounted in the opposite bent end of the bar, a shaft having a cam for operating the roller, and means, substantially as described, for operating the shaft, substantially as specified.

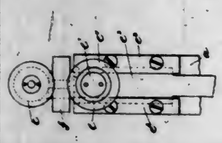
12. In a machine of the class described, the combination, with a table having a pivoted trip, a crank-shaft terminating in a crank-arm connected with the trip and at its opposite end provided with a cross-arm, a longitudinal shaft having a yoke provided with lugs arranged at one side of said cross-arm, a gear loosely mounted on the shaft, a pivoted bell-crank latch-spring pressed upon the gear and normally engaged by the cross-arm and adapted to be disengaged by each depression of the latch, a rock-shaft located below the first-mentioned shaft and carrying-arms having paste-distributers, and connections.

substantially as described, between the rock-shaft and said loose gear, whereby the rock-arms are operated by the gear, substantially as specified.

13. In a machine of the class described, the combination, with the feed-table having a pivoted trip arranged at the rear end of the same, a pair of vertically-opposite longitudinal shafts having gears engaging with each other and that of the upper shaft being loose thereon, a follower and its mechanism connected to and adapted to be operated by the lower shaft, a yoke mounted on the upper shaft, and devices, substantially as described, between the trip and loose gear, whereby a depression of the former locks the yoke with the loose gear, substantially as specified.

14. In a machine of the class described, the combination, with a longitudinal shaft having a crank-arm, a rock-shaft having a rock-arm, a rod having a series of perforations connecting the two arms, of a table, and a rock-arm mounted on the rock-shaft and provided at its free end with a paster adapted to move over the table, substantially as specified.

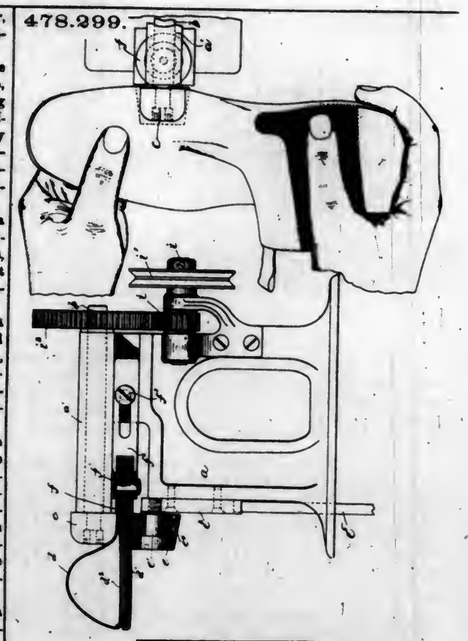
15. In a machine of the class described, the combination, with a table adapted for lateral contraction and expansion, of a shaft mounted for rotation in bearings and terminating at one end in a crank-arm, means, substantially as described, for operating said shaft, a rock-shaft mounted below the same and having a rock-arm, and a connecting-rod adjustably connecting the rock-arm with the crank-arm, substantially as specified.



16. In a machine of the class described, the combination, with the frame-work, of an upper frame adjustably mounted therein, opposite shafts having rolls mounted in the upper frame, an endless belt connecting the two rolls, one end of one shaft being provided with a pinion and the opposite end with a pulley or master-gear, pasting mechanism located below the belt and comprising a shaft having a pinion arranged below the pinion of the shaft in the upper frame, and a telescopic vertical shaft terminating in pinions engaging the pinion of the upper frame and that of the lower mechanism, substantially as specified.

17. In a machine of the class described, the combination, with a frame-work, an inclined way leading thereto, a table having an opening, and a follower mounted in said opening, and in rear of said opening a trip, of a separator located in the way, pasting mechanism, substantially as described, located at one side of the table, and means, substantially as described, for operating the separator, then the trip, and then the pasting mechanism in the order named, substantially as specified.

18. In a machine of the class described, the combination, with the frame-work, a table, and an inclined way leading thereto, of a separator-shaft located under the way and having a crescent-shaped separator and a rock-arm, a crank-shaft arranged at a right angle thereto and terminating in crank-arms, mechanism, substantially as described, for operating said shaft in an intermittent manner, a rod connecting one of the crank-arms with the rock-arm of the separator-shaft, a rock-shaft journaled below the crank-shaft and provided with rock-arms, each of which carries pasters, and at one side of the same a smaller rock-arm, and an adjustable rod connecting the last-mentioned rock-arm with one of the arms of the crank-shaft, substantially as specified.

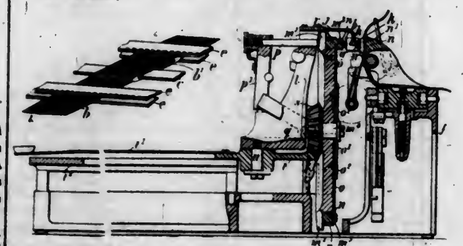


19. In a machine of the class described, the combination, with the frame-work and the superimposed can-feeding device, of the intermediate table yieldingly mounted on the frame-work and provided with an opening, and a label-supporting follower mounted therein, substantially as specified.

478,299. MACHINE FOR LAYING SOLE-EDGES. EDWARD C. WOODARD, Brockton, Mass. Filed Nov. 16, 1891. Serial No. 411,997. (No model.)

Claim.—1. The combination of a smooth-surfaced roll of rigid material, a yielding-surfaced pressure-roll movable toward and from the rigid roll and adapted to bear on the bottom of the outer sole of a boot or shoe interposed between the rolls, the axes of the said rolls being parallel, and a yielding-surfaced gage-roll adapted to bear on the edge of the outer sole, as set forth.

2. The combination of a smooth-surfaced roll of rigid material, a yielding-surfaced pressure-roll movable toward and from the rigid roll and having its axis parallel with that of the first-mentioned roll, a yielding-surfaced gage-roll adjustable toward and from the inner ends of said rolls, and means for securing the gage-roll at any position to which it may be adjusted, as set forth.



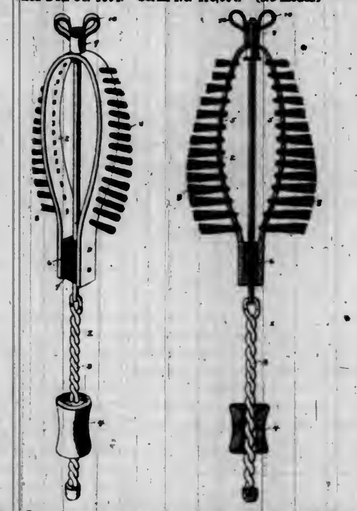
478,300. NUT-LOCK. LEVI H. YOUNG, St. John, Canada. Filed Dec. 2, 1890. Serial No. 373,342. (No model.) Patented in Canada July 12, 1890, No. 34,694.

Claim.—1. A nut-lock consisting of two nuts, each weighted at one edge, so that when seated one against the other the weighted portions of the nuts are on opposite sides of the bolt, the bolt being in a horizontal position, whereby they tend to turn toward each other and are adapted to lock a main nut in any required position.

2. In combination with a bolt and a main nut thereon and two lock-nuts seated on the bolt, one against the other, their edges weighted on one side and such weighted edges being oppositely arranged to cause the nuts to turn toward each other.

478,301. APPARATUS FOR MAKING STENCILS. EUGENIO DE ZUCCATO, London, England. Filed July 20, 1891. Serial No. 400,114. (No model.)

Claim.—1. In a device for making stencils, the combination of a box, frame, or holder, pointed wires or needles having elongated slots or eyes, and supporting-wires extending through such slots or eyes, each needle being capable of endwise movement on the supporting-wires independently of the other needles, substantially as and for the purpose above specified.



2. In a device for making stencils, the combination of a box, frame, or holder, pointed wires or needles having elongated slots or eyes, and supporting-wires extending through such slots or eyes, each needle being capable of endwise movement on the supporting-wires independently of the other needles, with wires or bands placed between the said wires or needles to maintain them in separate rows and to maintain the said rows parallel to each other, substantially as and for the purpose above specified.

3. In a machine for making stencils, the combination, with a typewriting machine, of a box, frame, or holder in which are held parallel to each other pointed wires or needles capable of endwise movement through a short distance independently of each other, said needles being arranged between the impression-surface and the type of the said type-writing machine, substantially as described.

4. In a machine for making stencils, the combination of a box, frame, or holder arranged between the impression-surface and the type, a spring whereby the said box, frame, or holder is normally held away from the said impression-surface, and pointed wires or needles which are held parallel to each other in the said box, frame, or holder and are capable of endwise movement through a short distance independently of each other, substantially as and for the purposes above specified.

5. In a machine for making stencils, the combination, with a bracket secured to the frame of the machine and provided with guides, of a box, frame, or holder in which are held parallel to each other pointed wires or needles capable of endwise movement through a short distance independently of each other and in the outer walls of which box, frame, or holder slots are formed to receive the said guides and to enable the said frame or holder to slide upon the said guides, and a spring whereby the said box, frame, or holder is normally held at one extreme of its travel, substantially as and for the purpose specified.

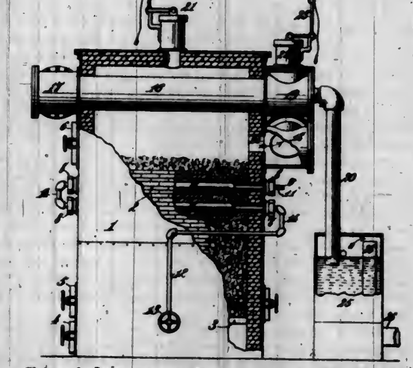
478,302. CHIMNEY-CLEANER. DAVID AIKEN, Winnsborough, S. C. Filed Dec. 31, 1891. Serial No. 416,697. (No model.)

Claim.—In a chimney-cleaner, the combination of a shaft, the two wires spirally twisted on each other and secured to and forming a continuation of the shaft, a sliding sleeve arranged on the wires and adapted to rotate the shaft, a brush composed of flexible sides having their outer ends rigidly connected to the shaft, and an adjustable sleeve mounted on the shaft and provided with a set-screw and having the other ends of the sides attached to it, and a swiveled handle arranged at the upper end of the shaft, substantially as described.

478,303. DRIPPER FOR BARRELS. CHARLES B. ALLCOOD, Petersburg, Va. Filed Mar. 24, 1892. Serial No. 426,280. (No model.)

Claim.—1. In a drainer for liquid-measures, the combination of a body having a door and a lower hopper-shaped extension with a funnel connected to the lower end thereof, a sieve or reticulated partition in the lower portion of said extension over the funnel, a basin surrounding said extension adjacent to the upper termination of said funnel, and a rack removably fitted in said body above the said sieve or reticulated partition, substantially as described.

2. In a drainer for liquid-measures, the combination of a body having a lower extension and a funnel connected thereto and a basin surrounding said extension adjacent to the upper termination of said funnel, substantially as described.

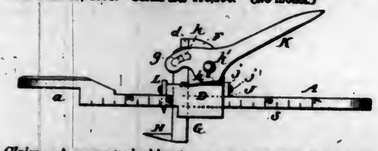


3. In a drainer for liquid-measures, the combination of a body and a rack removably supported therein and having cross-bars with rings between said cross-bars and connected to portions of the same and tubular side bars to which said cross-bars are secured, substantially as described.

478,304. COMMERCIAL COIN. IRVIN T. ALVORD, North Ogden, Utah. Filed Apr. 7, 1891. Serial No. 387,916. (No specimens.)

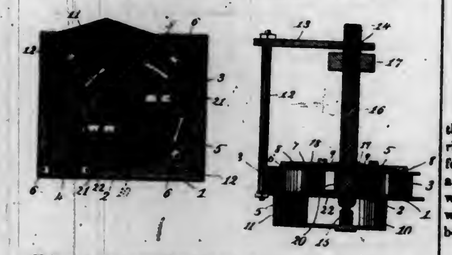
Claim.—The improved commercial coin or merchandise-check described, comprising a sheet or disk bearing the name of the party issuing said coin, together with its denomination or matter of similar import, and transparent disks protecting said inscribed disk and secured thereto by transparent adhesive substance, the respective disks being brought flush upon each other, so as to prevent breakage.

478,305. APPARATUS FOR THE MANUFACTURE OF WATER-GAS. JOSEPH ASKINS, Lima, Ohio. Filed Jan. 9, 1892. Serial No. 417,880. (No model.)



Claim.—1. In an apparatus for the manufacture of water-gas, the combination of a gas-generator having a purge-valve in its upper part, horizontal parallel gas-superheating retorts located in the generator and communicating with each other and with the interior of the generator above the bed of fuel, a purge-valve connected with one of said retorts, a gas-exit pipe leading from said gas-superheating retorts, and steam-pipes communicating with the lower part of the generator below its grate, substantially as described.

2. In an apparatus for the manufacture of water-gas, the combination of a generator having a purge-valve in its upper part and provided with a grate and with self-sealing doors located above and below the grate, horizontal parallel gas-superheating retorts located in the generator above the bed of fuel and communicating with each other



and with the interior of the generator, a purge-valve connected with one of said retorts, a gas-exit pipe leading from the retorts, and steam-pipes communicating with the lower part of the generator below its grate, substantially as described.

478,306. SHINGLE-GAGE. JOHN W. BACON, Enderley, Canada. Filed Dec. 28, 1891. Serial No. 416,296. (No model.)

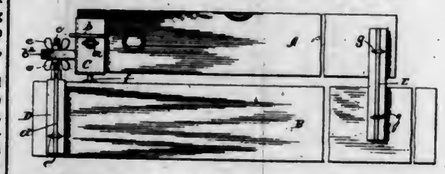
Claim.—A carpenter's shingling-gage consisting of the slotted and rabbeted rule A, scaled on one side, the slide-block D, adjustable thereon, the vertical slide-bar G, having a pin *g* near the upper end and the dog H at the lower end, the lever K, having curved slot for the pin *g* and a downward projection k^2, the bridge-spring I, and the spike-pin L, substantially as shown and described.

478,307. CENTRIFUGAL PUMP. BENJAMIN F. BEE, Harwich, Mass. Filed Aug. 22, 1891. Serial No. 403,366. (No model.)

Claim.—1. In a centrifugal pump, the combination, with the case having the vertical inlet-opening eccentrically related with the wall of the case, of the shaft passing through the case and opening, a disk on the shaft, and blades depending from the disk over the opening and having laterally-bent flanges at their lower edges overlapping the edge of said vertical opening and traveling horizontally thereover, substantially as specified.

2. In a centrifugal pump, the combination, with the scroll or spiral case having the vertical inlet-opening eccentrically related with the wall of the case, of the shaft passing through the case and opening, a flat disk on the shaft above said opening, and straight blades depending from the disk over the opening and having laterally-bent flanges at their lower edges, said flanges overlapping and extending beyond the edge of the opening and traveling horizontally thereover and having those portions above the opening downwardly inclined or bent, substantially as specified.

3. In a centrifugal pump, the combination, with the casing comprising the base, having the circular inlet-opening, and the spiral vertical wall eccentrically disposed with relation to the opening and terminating at one side in a discharge-spout, and a cover for the case, having an opening, of vertical curved deflecting-plates secured to the base within the casing near to and concentric with the edges of the opening, a shaft passing through the case and opening, and a disk mounted on the shaft and provided with depending blades traveling within said plate and over the edges of said inlet-opening, substantially as specified.



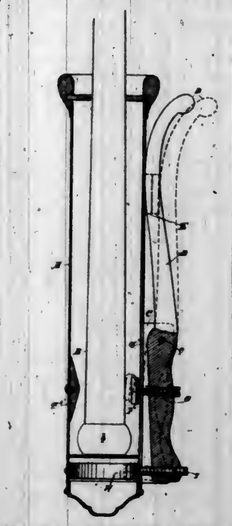
4. In a pump of the class described, the combination, with the casing comprising the base having the inlet-opening, the vertical spiral wall located adjacent to and eccentric with relation to the opening and having the discharge, the cover having the countersunk recess above the opening and provided with an opening, the receiving-box having the inlet located below the opening in the base, and the series of vertical transversely-curved deflecting-plates mounted on the base adjacent to and concentric with the opening and within the casing, of the opposite standards extending from the base, the transverse connecting-bar having a bearing vertically opposite the openings in the base and cover, and a bearing formed in the bottom of the discharge-box, the vertical shaft mounted in the bearings, the pulley on the shaft above the case, the disk upon the shaft within the base, and the depending L-shaped blades secured to the disk and having their horizontal wing portions traveling over and overlapping the edge of the opening in the base and having the said horizontal portions thereof immediately above the opening downwardly bent, substantially as specified.

478,308. DRESS-WAIST FORM. HAROLD A. BROWN, Lawrence, Kans. Filed Sept. 25, 1891. Serial No. 406,835. (No model.)

Claim.—The combination, with an upright standard, a collar C thereon, a set-screw Q through said collar, and rods R, pivoted to and rising from the collar and having hooked outer ends, of a hollow rigid form having an open lower end provided with perforations or eyes and a plate P within the form at the waist-line, having a hole through which the standard moves, the collar and its adjusting-rods being wholly below the lower end of the form, as and for the purpose hereinbefore set forth.

478,309. SPIRIT-LEVEL. THOMAS L. BURCHINAL, Morgantown, W. Va. Filed May 5, 1892. Serial No. 431,867. (No model.)

Claim.—1. The combination of a level, a clamp embracing its end, a straight-edge, a clamp secured thereto and connected to the clamp on the level, and a double clamp secured to the free ends of the level and straight-edge, substantially as described.



2. The combination of a level, a clamp secured to one end, a downward extension formed on the clamp, a straight-edge, a second clamp secured thereto and connected directly to the clamp on the level, a double clamp connecting the opposite ends of the level and straight-edge, and a cross-piece on the double clamp of a size similar to the extension on the level-clamp, substantially as described.

3. The combination of a level, a clamp secured to one end, an arm projecting out from the same, a straight-edge, a clamp secured thereto, a shank formed on the straight-edge clamp, means for connecting the arm and shank, and a double clamp secured to the opposite ends of the level and straight-edge, substantially as described.

4. The combination of a level, a clamp secured to one end, an arm projecting out from the clamp, an eye formed in the end of the arm, a straight-edge, a clamp secured thereto, a threaded shank formed on the straight-edge clamp and adapted to pass through the eye in the arm on the level-clamps, thumb-nuts for adjusting and holding the shank in place, and a double clamp secured to the opposite ends of the level and straight-edge, substantially as described.

5. The combination of a level, a clamp secured to its end, a downward extension formed on the same, an arm projecting out from the clamp, a straight-edge, a clamp secured thereto, a threaded shank formed on the straight-edge clamp, means for connecting the shank and arm, a double clamp connected to the straight-edge and level, and a cross-piece on the double clamp of a size similar to the extension on the level-clamp, substantially as described.

478,310. WHIP-SOCKET AND REIN-HOLDER. THEODORE F. BURKHARD, San Francisco, Cal. Filed Sept. 21, 1891. Serial No. 406,403. (No model.)

Claim.—1. The combined whip-socket and rein-holder consisting of the socket, the lever-arm pivoted to its side, the spring in the lower end of the socket under the supporting-base of the whip-butt operating on the lower end of the lever-arm, and the adjustable lock-plate on the lever-arm operating in the socket to confine and to relieve the whip-butt, substantially as herein described.

2. The combined whip-socket and rein-holder consisting of the socket, the spring-controlled lever-arm pivoted to its side, the lock-plate on the lever-arm operating within the socket to confine the whip-butt, and the fixed abutment-plate in the socket opposite the lock-plate, substantially as herein described.

3. The combined whip-socket and rein-holder consisting of the socket, the spring-controlled lever-arm, the lock-plate of said arm, and the adjusting-screw for regulating the position of the lock-plate, substantially as herein described.

4. The combined whip-socket and rein-holder consisting of the socket, the lever-arm pivoted thereto and having the lock-plate, the spring in the socket, and the adjusting-screw in the lever-arm bearing on the spring and adapted to regulate its tension, substantially as herein described.

5. The combined whip-socket and rein-holder consisting of the socket A, having the abutment-plate a^2 within it, the slot and the flanges, and the spring H in its lower portion, the lever-arm pivoted to said flanges and playing between them and through the slot, the adjustable lock-plate on the lever-arm operating within the socket, and the adjusting-screw in the lower end of the lever-arm bearing on the spring, substantially as herein described.

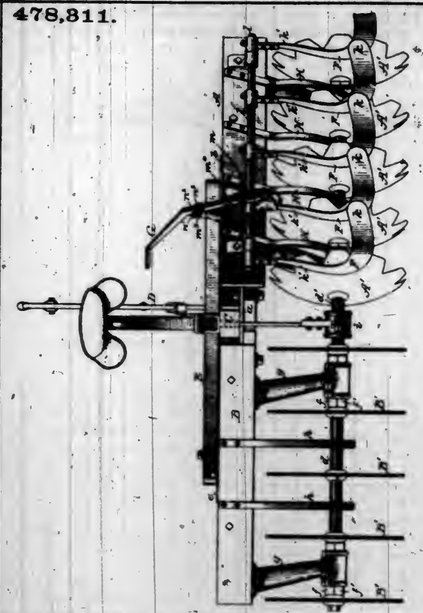
478,311. LAND-PLOWING MACHINE. GEORGE M. CLARK, Haddam, Conn., assignor to Clement S. Hubbard, same place. Filed Apr. 5, 1892. Serial No. 427,868. (No model.)

Claim.—1. The combination, substantially as hereinbefore described, of a rotary plowshare, a hinged mold-board having its blade at the rear of and extending laterally from the rear edge of the share, and a lever connected with said mold-board for vertically controlling its blade or working face.

2. The combination, substantially as hereinbefore described, of a gang of rotary plowshares, a corresponding number of connected hinged mold-boards, and a lever coupled therewith for vertically varying the position of all of the mold-boards.

3. The combination, substantially as hereinbefore described, of a rotary plowshare, a hinged mold-board, and a controlling-lever coupled to the mold-board by a link connection, which upon a release of the lever automatically locks the mold-board in its normal working position.

4. The combination of a rotary plowshare, a hinged mold-board, and a mold-board-controlling lever provided at its fulcrum with a variable bolt-and-slot connection, substantially as described, for enabling the adjustment of said lever in either rigidly confining the mold-board in its working position or permitting a limited upward and rearward movement of said board.



5. The combination, with a rotary plowshare, of a hinged or swinging mold-board held in its normal working position under yielding pressure, substantially as described.

6. The combination, with a gang of rotary plowshares, of a gang of rotary bladed or toothed landside-disks, and clearers located between the landside-disks and in contact with their axle, substantially as described, for freeing the landsides from roots and weeds and preventing them from being wound upon the axle.

7. The combination, in a plowing-machine, of a gang of rotary plowshares and a gang-frame, appropriate landside devices, and a landside-frame, a pole to which the inner ends of both of said frames are flexibly connected, draft links or bars, also coupling said frames to the pole, and a lateral spring-bar centrally bearing on the pole and pivoted at its ends to the two draft-bars, substantially as described.

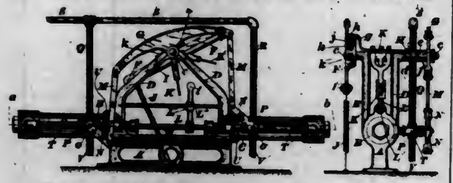
8. The combination, in a disk-gang frame and with its axle, of wooden journal-boxes occupying the space between two adjacent disks, and hangers secured at their upper ends to the frame, and at the lower ends having box-clamps provided with integral spurs for puncturing the wooden boxes and securely locking the latter against endwise movement in the clamps, substantially as described.

478,311.

478,312. CLAMP FOR DENTAL FLASKS. MORGAN R. B. CRESSY, Ebensburg, Pa. Filed Dec. 5, 1891. Serial No. 414,133. (No model.)

Claim.—1. In a clamp for dental flasks, the combination, with the flask having the side posts provided with locking notches or shoulders, of a spring-metal clamping-plate pivoted upon the top of said flask and provided with upturned lips adapted to engage said locking shoulders or notches, substantially as set forth.

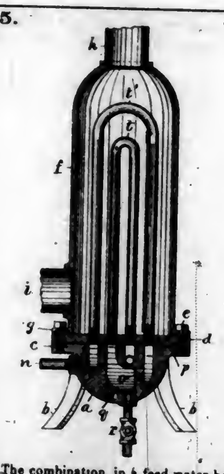
2. In a clamp for dental flasks, the combination, with the flask having the side posts provided with locking notches or shoulders and a top perforation or recess, of a movable spring-metal clamping-plate having a pivot stud or pin engaging said top perforation or recess, a series of upturned spring locking-lips adapted to engage said locking shoulders or notches, and operating-flanges, substantially as set forth.



478,313. HOOK. EDWARD W. DAVIS, Indianapolis, Ind. Filed Mar. 19, 1892. Serial No. 425,553. (No model.)

Claim.—1. In a ceiling-hook, the combination of a hollow shank closed and screw-threaded at one end and having diametrical openings in opposite sides of its threaded portion, a hook provided with a stem adapted to fit the interior of said shank, a pair of arms pivoted at one end to said stem and arranged to project laterally therefrom through the openings in the shank, and means for fastening said stem and shank together, all arranged to co-operate substantially as and for the purpose set forth.

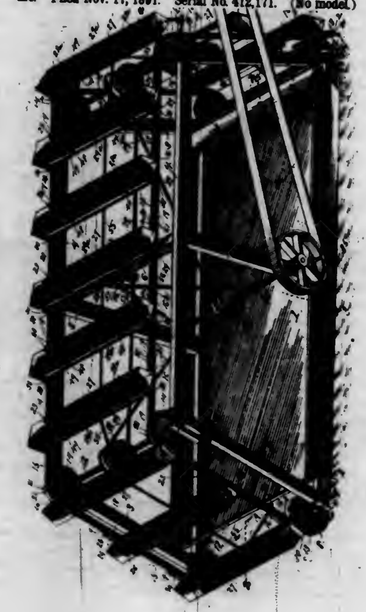
2. The above-described ceiling-hook, consisting of a hollow cylindrical shank threaded at one end and provided in its threaded portion with oppositely-arranged openings, the stem adapted to fit and to slide longitudinally within said shank, said stem being provided with a hook at one end and a pair of laterally-swinging arms at its opposite end, the elastic band arranged to draw said arms toward each other, and means, substantially as shown and described, for fastening said stem and shank together, all combined and arranged to co-operate substantially as set forth.



478,314. HYDRAULIC PUMPING-ENGINE. GEORGE W. DAWSON, Chicago, Ill. Filed Sept. 19, 1891. Serial No. 406,170. (No model.)

Claim.—1. A hydraulic pumping-engine consisting of two cylinders B and C, said cylinders connected longitudinally by means of a frame A, said cylinders having pistons W and W', said pistons directly connected by a rod L, said rod having an upwardly-projecting arm L', shaft c, mounted above and transversely of said rod, firmly secured to said shaft, two arms K and K', said arms having a position in which they can be moved by contact of the end *l* of arm L' when said arm is reciprocated, as described, by piston-rod L, lever F, firmly attached to shaft c, said lever provided with a rod I, suspended below and attached to said lever only at its ends, said rod having a ring I', which is capable of sliding the whole length of said rod between the points of attachment of said rod, said ring having attached thereto a spring J, said spring operating in the manner and for the purpose described, the whole operating in combination with lever G, loosely mounted on shaft c, said lever operated by contact of tongue *f* of collar H in notch *e* of the hub of lever G, said lever connected with the valve-levers N and N' by rods M and M' for the purpose of imparting a partial rotary motion to each valve at the time and in the manner substantially as shown and described.

2. In a hydraulic pumping-engine, means for operating the valves which control the water to and from the machine, consisting of a transverse shaft c, lever F, attached at one end of said shaft and provided with the described rod I, upon which reciprocates ring I' of spring J in the manner and for the purpose described, and collar H, firmly secured to said shaft and capable of operating lever G by the means, at the time and for the purpose, substantially as shown and described.

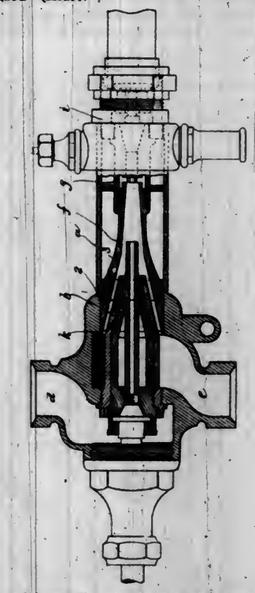


478,315. FEED-WATER HEATER. JOHN DE VRIES, Passaic, N. J. Filed Mar. 10, 1892. Serial No. 424,401. (No model.)

Claim.—1. The combination, in a feed-water heater, of the shell *f*, provided with steam-pipes *h* and *i*, the tube-plate *d*, having the U-shaped tubes secured therein, as described, and the base *a*, provided with supporting-feet and cast with the settling-chamber *q* and the slots therein, as set forth, one of the central slots *k* being connected with the water-inlet *m* and the adjoining slot *k'* being connected with the settling-chamber *q* and the slot *l* and one of the outer slots being connected with the water-outlet *n*, and the settling-chamber being provided with the blow-off cock *r*, the whole arranged and operated substantially as set forth.

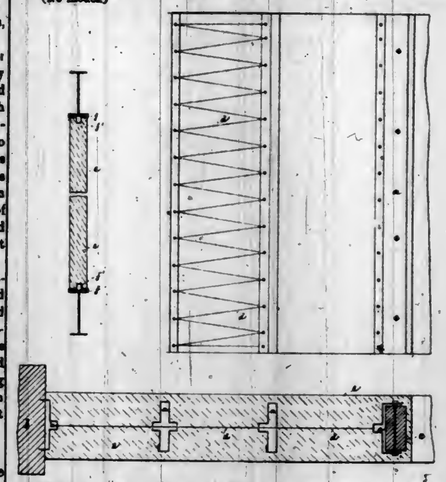
2. The combination, in a feed-water heater, of the shell *f*, provided with steam pipes *h* and *i*, the tube-plate *d*, having the U-shaped tubes *l l'* secured therein as described, and the base *a*, provided with supporting-feet and cast with the settling-chamber *q* and the slots *k k'* and *l l'*, as set forth, the slot *k* being connected with the water-inlet *m*, the slot *k'* being connected with the settling-chamber *q* and by the passages *o* with the slot *l*, and the slot *l'* being connected with the water-outlet *n*, and the settling-chamber being provided with the blow-off cock *r*, the whole arranged and operated as herein set forth.

478,316. CURRENT-MOTOR. FRANK DIEWIDDIE, Kansas City, Mo. Filed Nov. 17, 1891. Serial No. 412,171. (No model.)



Claim.—1. A current-motor comprising a suitable supporting frame-work, a number of shafts journaled thereon, a number of sprocket-wheels carried by said shafts, a number of endless sprocket-chains running over said sprocket-wheels, a number of buckets carried by said chains and each provided with an automatically opening and closing abutment or gate hinged within the bucket, a number of rock-shafts carried by the buckets and having rock-arms to engage the margins of the open abutments, a link-bar connected to said arms, bell crank levers carried by each bucket and connected to the link bars, and an endless flexible connection connected to said bell-cranks, substantially as set forth.

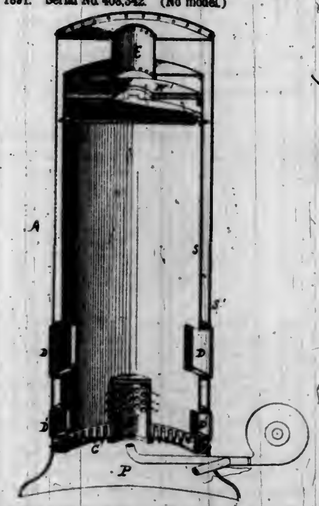
2. A current-motor comprising a suitable frame-work, a number of shafts journaled thereon, a number of sprocket-wheels carried by said shafts, a number of endless sprocket-chains running over said wheels, a number of buckets carried by said sprocket-chains and each provided with an automatically opening and closing abutment, a number of rock-shafts carried by the buckets and having rock-arms to engage the margins of the open abutments, a number of link-bars connecting said rock-shafts, bell-crank levers carried by said buckets and engaging the link-bars, eye-bars carried by the bell-cranks, an endless flexible connection embraced by said eye-bars, and a pair of gripping-levers pivoted upon the frame-work and arranged to surround the flexible connection for engaging the eye-bars, substantially as set forth.



3. A current-motor comprising a suitable float, a suitable supporting frame-work mounted upon and extending longitudinally of said float, a number of endless sprocket-chains running over said shafts and beneath the float, a number of elongated buckets extending transversely of the frame-work and each connected to the sprocket-chains by two pairs of arms, one arm of each pair being pivotally connected at one end to the bucket and its opposite end to the corresponding end of the companion arm, and the opposite end of the companion arm being pivotally connected to the sprocket-chain, substantially as set forth.

478,317. INJECTOR. WALTER R. DODGE, Everett, assignor to the National Tube Works Company, Boston, Mass. Filed Mar. 9, 1891. Serial No. 384,214. (Model.)

Claim.—In an injector, the combination of the casing, the combining-cone, and a seat or stop in said casing adapted to prevent the movement of the combining cone toward the steam and water receiving end of the casing, said seat offering no resistance to the movement of said cone in the opposite direction, the said combining-cone being made in separable sections 2 3, the inner one 2 of which is formed to bear on the said seat in the casing, while the other 3 is adapted to be detachably connected to the delivery cone or tube, said section 2 being of such diameter that it may be introduced into the outer or delivering end of the casing and moved toward the receiving end until it is arrested by said stop, whereby all parts of the combining-cone may be inserted and removed at the delivering end of the casing, the outer portion of the said cone being adapted by the sectional construction of the cone to be removed independently of the seated inner portion, as set forth.

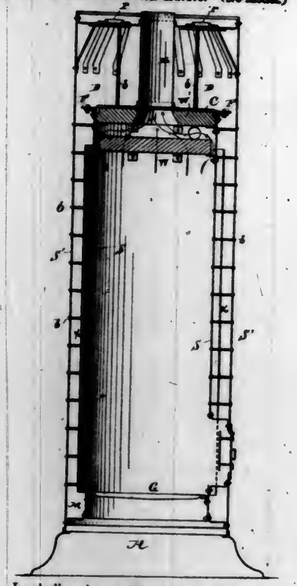


478,318. FIRE-PROOF PARTITION OR CEILING. CARL F. W. DOERING, New York, N. Y. Filed Jan. 16, 1891. Serial No. 377,972. (No model.)

Claim.—1. The combination of the bent sheet-metal uprights *a* with connecting-wires *d* and mortar filling *e*, substantially as and for the purpose specified.

2. The combination of bent sheet-metal uprights *a* with connecting-wires *d*, filling *e*, and with keys *f* for connecting the partition to the ceiling and floor, substantially as specified.

478,319. FURNACE. ELLIS P. EDGAR, Woodbridge, N. J. Filed Oct. 10, 1891. Serial No. 408,342. (No model.)



Claim.—1. An upright shell steam-boiler having an interior shell, an exterior shell, a draft-exit, a steam-space, and a crown-sheet, substantially as set forth, protected by a wall W', arranged as described, from the direct action of the flame, all substantially as set forth.

2. An upright shell steam-boiler having an interior shell, an exterior shell, a draft-exit, a steam-space, a crown-sheet, a wall located near the upper end of the fire box, with an aperture or apertures therethrough at or near its extremity about equal in cross area to the

cross area of the draft-exit, and a second wall beyond the first, provided with an aperture about equal to or a little less in area than the aperture in the first wall, but located out of line with the apertures in said first wall, one or both of which walls are arranged, substantially as set forth, to protect the crown-sheet of the boiler, all substantially as set forth.

478,320. STEAM-BOILER. ELLIS F. EDGAR, Woodbridge, N. J. Filed May 10, 1892. Serial No. 432,475. (No model.)

Claim.—In a boiler, the combination of a circulating-plate located between the inner and outer shells of the boiler and open at both ends, and a spatter-plate located so far or farther above the upper end of the circulating-plate as the width of the space between the circulating-plate and the interior shell and extending from the shell of the boiler to or beyond the line of the said circulating-plate and between the water (which is between said circulating-plate and the interior shell) and the steam-space of the boiler, all substantially as set forth.

478,321. SETTING MECHANISM FOR TIMEPIECES. EDWARD E. ELLIS, Washington, D. C., assignor of one-half to Benjamin L. Wheeler, same place. Filed Mar. 16, 1892. Serial No. 425,155. (No model.)

Claim.—1. In time-setting devices for watches and clocks, a movable or revolving crystal provided with means for engaging and disengaging the hand-post of a watch or clock, substantially as shown, and for the purpose described.

2. In time-setting devices for watches and clocks, a movable or revolving crystal having a central opening and provided with a slide for engaging the hand-post of a watch or clock, substantially as described.

3. In time-setting devices for watches and clocks, a movable or revolving crystal having a central opening, and a disk surrounding said opening and having parallel guides, and a slide moving in said guides having a notch for engaging or receiving the hand-post of a watch or clock, substantially as described.

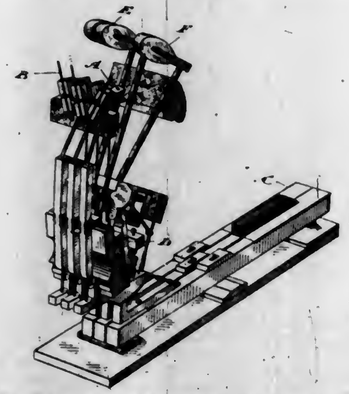
4. In time-setting devices for watches and clocks, a movable or revolving crystal having a central opening surrounded by a disk formed with parallel guides, and a slide moving in said guides having its outer edge upturned slightly and formed with oppositely-arranged notches for engaging the hand-post of a watch or clock when said slide is moved toward the same in either direction, substantially as and for the purpose described.

5. In time-setting devices for watches and clocks, the combination of a movable crystal having a central opening, springs or elastic devices for pressing said crystal outwardly, a disk surrounding said central opening and having parallel guides, and a slide moving in said guides having a notch for receiving the hand-post of a watch or clock, substantially in the manner shown, and for the purpose described.

6. In time-setting devices for watches and clocks, a crystal having an opening therein and provided with a movable key or slide surrounding said opening for engaging and disengaging the hand-post of a watch or clock, substantially as described.

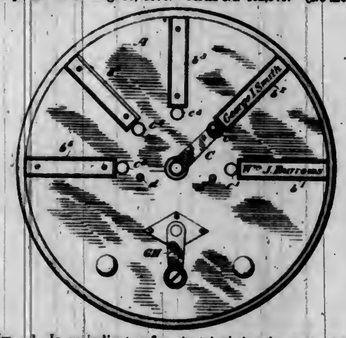
7. In time-setting devices for watches and clocks, the key for engaging and disengaging the hand-post of a watch or clock, the same consisting of a movable slide provided with a central opening intersected at opposite points by notches, substantially as described.

8. In time-setting devices for watches and clocks, the combination of a movable or revolving crystal having an opening therein, the hand-post extending through said opening, and a movable key or slide for engaging and disengaging said hand-post, substantially as described.



478,322. CARRIER ATTACHMENT FOR BUCKET-ELEVATORS. MICHAEL GARLAND, Bay City, Mich. Filed Apr. 25, 1892. Serial No. 430,485. (No model.)

Claim.—1. In an elevator of the type shown and described, the combination, with the twin cables and the buckets arranged between them, of combined sprocket like and attachment devices D, each of which is made in two parts and is provided with means for clamping said parts on a cable and each of which has one of its parts formed with a plate-like portion located intermediately of the two cables and adapted to be fastened to one end of one of the buckets of the elevator, substantially as set forth.

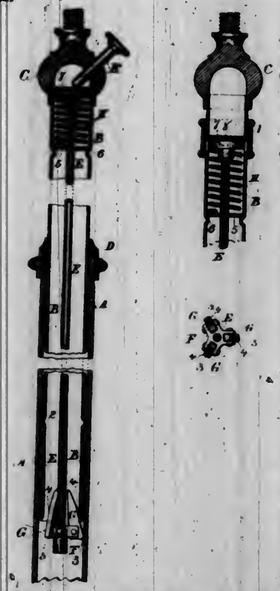


2. In an elevator of the type shown and described, the combined sprocket-like and attachment device composed of the two parts E and G, the first-named one of which has an integral plate-like portion *e* and which are provided with the bolts and nuts *h i*, as described, and which also has its said two parts properly shaped in cross-section in the direction shown to perfectly mesh or work in engagement with the teeth of the sprocket-wheel of the elevator, all as hereinbefore set forth.

478,323. TRANSPOSING PIANO-ACTION. CARL G. GEORGE, Toronto, Canada. Filed Feb. 2, 1892. Serial No. 420,127. (No model.) Patented in Canada Mar. 3, 1892. No. 33,441.

Claim.—In a piano-action for overstrung scales, having a transposing keyboard, the bass or treble hammers deflected at the space where the wires cross each other, in combination with straight keys and straight lifters, arranged substantially as and for the purpose specified.

478,324. INDICATOR FOR ELECTRICAL SIGNALING SYSTEMS. CHARLES F. GILLETTE, New York, N. Y., assignor to Joseph F. Bray, same place. Filed Aug. 13, 1891. Serial No. 402,579. (No model.)



Claim.—1. In an indicator for electrical signal system, the combination of a plate, made of suitable material, a magneto-electric generator, contact-points for connection with different localities, subscribed plates or card-holders adjacent to the contact-points, and a contact-arm for completing the electrical connection between the magneto-generator and contact-points, the magneto-generator, contact-points, card-holders, and contact-arm all being mounted on the plate, substantially as described.

2. The card-holder, in combination with a magneto-electric generator, contact-points, and contact-arm, all being mounted on plate, substantially as set forth.

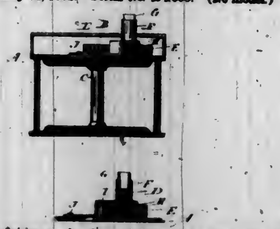
3. A magneto-electrical generator attached to back of plate and card-holders, contact-points, and contact-arm on front of plate and electrically connected with magneto-generator, as previously described.

4. In a magneto-electrical signal system, the combination of a magneto-electric generator, plate, connecting-arm, contact-points, and card-holders, all in combination, as hereinbefore set forth.

478,325. EXTENSION-TUBE FOR LAMPS. THEODORE H. HELLSTROM, New York, N. Y., assignor to the Plume & Atwood Manufacturing Company, Waterbury, Conn. Filed Jan. 2, 1892. Serial No. 416,750. (No model.)

Claim.—1. The combination, with the tubes A and B, sliding telescopically, and the rod E, of a crown-piece attached to the lower end of the rod, levers pivoted upon the crown-piece and having projecting ends or claws and inclined surfaces within the lower end of the inner tube, and mechanism for giving motion to the rod to relieve the inclines of the levers from contact with the inner tube and to release the clamping action or to bring such levers into contact with such tube and cause them to clamp and hold against the exterior tube, substantially as set forth.

2. The combination, with the tube A, of the tube B, sliding telescopically within the same, the cap C and collar upon the upper end of the tube A, the rod within the tube B, and a clamping device for engaging the inner surface of the exterior tube, a spring for moving the rod longitudinally to engage the clamping device, and a push-pin passing through the cap in an inclined position and acting at its lower end against the upper end or head of the rod, substantially as set forth.

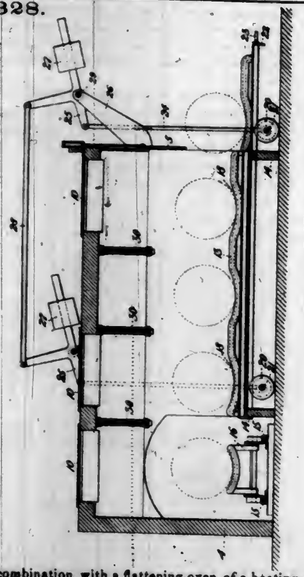


3. The combination, with the external tube A, of the tube B, sliding telescopically within the same, a collar at the upper end of the tube A, a cap at the upper end of the tube B, a longitudinal rod E within the tube B, a crown at the lower end of such rod, wedge-levers pivoted to the crown and passing within and acted upon by the lower end of the inner tube to clamp the inner surface of the outer tube, a washer supported by an inwardly-projecting rib upon the tube B, a spring acting between the washer and the head of the rod for raising such rod and actuating the clamping device, and means for moving the rod downwardly to liberate the clamping device, substantially as set forth.

478,326. FISHING-REEL. ANDREW B. HENDRYX, New Haven, Conn. Filed May 18, 1892. Serial No. 433,409. (No model.)

Claim.—In a click-reel, the two springs E F, formed in a single piece of wire and of substantially ring shape, divided, the two ends of the ring adapted to bear upon opposite sides of the click-finger, the wire having a bend I outward in the plane of the springs and secured to the head of the reel at each side of said bend, substantially as and for the purpose described.

478,327. FISHING-REEL. ANDREW B. HENDRYX, New Haven, Conn. Filed May 31, 1892. Serial No. 434,335. (No model.)



Claim.—In a fishing-reel, substantially such as described, the spindle D, fixed on the head at one side of the spool-shaft, the multiplying gear-wheel E, arranged on said spindle and adapted to engage with a corresponding pinion on the spool-shaft, the wheel E, constructed with a tubular hub F and constructed for the attachment of the crank upon its outer end, combined with the guard I, pivoted to the head and extending over the wheel, constructed with a notch in one side near its end to adapt that end to surround the hub outside the wheel, substantially as described, and whereby the wheel is supported longitudinally between the said guard and head of the reel.

478,328. GLASS-HEATING OVEN. ANDREW O. HURLEY, Jeannette, Pa. Filed Sept. 22, 1891. Serial No. 406,528. (No model.)

Claim.—1. A flattening-oven provided with a heating-oven leading thereto and a cooling-leer leading therefrom, and means located within the heating-oven for carrying the glass therethrough, and mechanism for transferring the glass therefrom into the flattening-oven and from the flattening-oven through the leer, substantially as and for the purposes described.

2. A flattening-oven provided with a heating-oven leading thereto and a cooling-leer leading therefrom, supports within the heating-oven, and means for carrying the cylinders forward on said supports successively nearer the flattening-oven, means for transferring them into said oven, and means for conveying the glass from the flattening-oven through the leer, substantially as and for the purposes described.

478,328.

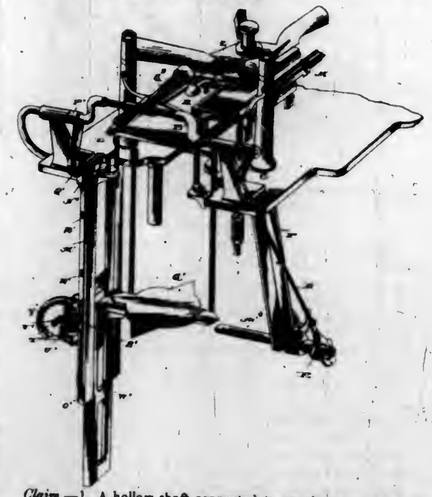
3. The combination, with a flattening-oven, of a heating-oven and a cooling-leer connected therewith, a car arranged to travel from the heating-oven into the flattening-oven, and means for carrying the cylinders forward through the heating-oven to the car, substantially as and for the purposes described.

4. The combination, with a flattening-oven, of a heating-oven connected therewith and a cooling-leer leading therefrom, a car arranged to move from the heating-oven into the flattening-oven, supports within the heating-oven, and means for carrying the cylinders forward into successive positions on the supports and for transferring them from the supports to the car, substantially as and for the purposes described.

5. The combination, with a flattening-oven, of a heating-oven connected therewith and a cooling-leer leading therefrom, supports within the heating-oven, movable bars arranged to carry the glass cylinders forward on the supports, and means for transferring the glass cylinders from the supports to the flattening-oven, substantially as and for the purposes described.

6. The combination, with a flattening-oven, of a heating-oven connected therewith and a cooling-leer leading therefrom, a car arranged to travel from the heating-oven into the flattening-oven, supports within the heating-oven, and movable bars also within the heating-oven and arranged to carry the cylinders forward into positions on the supports successively nearer the heating-oven and to transfer the cylinders from the supports to the car, substantially as and for the purposes described.

7. The combination, with a flattening-oven, of a heating-oven and a cooling-leer connected thereto, valved openings in the roof of the heating-oven, depending mantles between the openings, and means for carrying glass cylinders forward through the heating-oven into the flattening-oven, substantially as and for the purposes described.



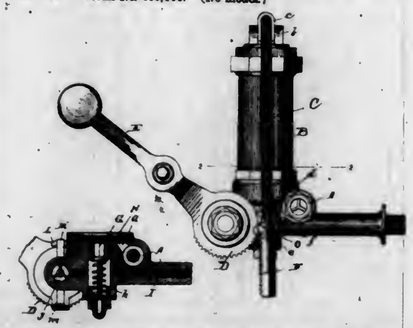
8. The combination, with a flattening-oven, of a heating-oven and a cooling-leer connected thereto, supports and movable bars within the heating-oven, and means for vertically reciprocating the movable bars, said movable bars being arranged to feed the glass cylinders forward through the heating oven, and means for transferring them therefrom into the flattening-oven, substantially as herein set forth.

9. The combination, with a flattening-oven, of a heating-oven connected thereto, a car having supports for cylinders thereon and arranged to travel from the heating-oven into the flattening-oven, and supports and movable bars within the heating-oven arranged to feed forward glass cylinders onto the car, said car-supports and bars being covered with asbestus, substantially as and for the purposes described.

10. The combination of a flattening-oven, a heating-oven connected therewith and a cooling-leer leading therefrom, a car arranged to travel from the heating-oven into the flattening-oven, stationary bars arranged within the heating-oven at substantially right angles with the track upon which the car moves, and movable bars between the stationary bars arranged to carry the cylinders forward to their successive positions upon the stationary bars and from the stationary bars onto the car, substantially as and for the purposes described.

11. The process of working glass, consisting in gradually feeding the cylinders through an oven having a gradually-increasing temperature, depositing them upon the flattening-table, and flattening them, substantially as set forth.

478,329. PAPER-FEEDING APPARATUS. JAMES W. HUTT and ARTHUR J. PHILLIPS, Toronto, Canada. Original application filed Jan. 2, 1891, Serial No. 376,506. Divided and this application filed Aug. 7, 1891. Serial No. 402,050. (No model.)



Claim.—1. A hollow shaft connected to an air-pump and deriving a rocking movement from the driving mechanism of the machine, in combination with a solid head and a hollow finger connected to said head and to the hollow shaft, the driving mechanism being so timed as to bring the hollow finger and solid head in contact with the top of a pile of blanks the moment that the pump is about to exhaust the air from the hollow finger, substantially as and for the purpose specified.

2. A table designed to support the pile of blanks and movably supported in a frame, a rack formed on the back of a table designed to engage with a pinion fixed to a spindle suitably journaled in the frame and having a ratchet-wheel fixed to the said spindle, and a spring-pawl pivoted on a vertically-movable bar and held in contact with the teeth of the ratchet-wheel, in combination with an arm fixed to the rock-shaft on which the hollow finger is attached, and a friction-roller formed on the end of the vertically-movable bar and designed to engage with the hook end of the arm, substantially as and for the purpose specified.

3. The fingers T, connected to the rock-shaft U, which is operated by a rod V, deriving motion from a cam W, in combination with carrier L and gravity-stops Y, pivoted in the guide M, substantially as and for the purpose specified.

478,330. SIRUP-GAGE. JOHN E. JACOBS, Chicago, Ill. Filed Oct. 29, 1891. Serial No. 410,166. (No model.)

Claim.—1. In a sirup-gage, the combination, with the graduating sirup-chamber and its plunger, of arms C for actuating said plunger, said arms being located at opposite sides of said chamber and parallel with the plane of the plunger-axis and carrying racks, and segments meshing with such racks and acting to impart simultaneous movement to said arms without destroying their parallelism with said axis, substantially as specified.

2. In a sirup-gage, the combination, with a water-passage, of a valve K, having a rear stem *m*, extending through the valve-case, a cam moved by the operating-lever, and a hinged arm M, actuated by the cam, substantially as set forth.

3. In a sirup-gage, the plunger of the sirup-chamber, the arms carrying power to said plunger, the racks and projections O upon said arms, and the water-valve having the projecting stem N, in combination with the segments, their operating-lever and cam L, the contact between the teeth of the segments and racks ceasing at the completion of the inward movement of the plunger and the continuing movement of the lever serving to open the water-valve, substantially as set forth.

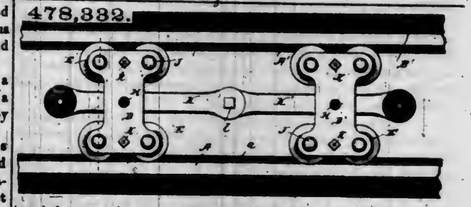
4. The combination, in a sirup-gage, of a graduating-chamber and plunger, arms C for actuating said plunger, racks F upon the arms, the operating-lever, the segments rotated by the lever and meshing with the racks, the cam L upon one of the segments, the projections O above the racks, and the water-valve, substantially as specified.

5. The combination, in a sirup-gage, of the sirup-chamber and plunger, the arms and racks for giving motion to the plunger and the water-valve, with hand-lever and segments rotated by the lever and meshing with said racks, said segments and racks being in non-operative contact during the latter portion of the lever-stroke, and one of the segments having a cam adapted to actuate said valve during such latter portion of the lever-stroke, substantially as specified.

478,331. DOMESTIC COOKER OR BOILER. HENRY C. JORDEN, St. Louis, Mo. Filed Aug. 7, 1891. Serial No. 402,017. (No model.)

Claim.—The combination, with the stove 1, smoke-pipe 2, and the extension 5, secured to the rear end of the stove adjacent to the smoke-pipe, of the boiler 6, mounted upon the support 5 and provided near its upper and lower ends with perforations agreeing with corresponding perforations formed in the smoke-pipe, the vertical pipe 15, located in the smoke-pipe, the upper elbow 13 and the lower elbow 14, connected to the upper and lower ends, respectively, of the pipe 15 and at their outer ends terminating against the wall of the smoke-pipe and registering with the perforations formed therein and in the boiler, the nipple 10, exteriorly threaded, passed through the upper perforations of the smoke-pipe and boiler, and connected with the upper elbow 13, the elbow 19, located in the boiler and connected with the nipple 10, the depending pipe 20, connected to the elbow and extending below the water-line of the boiler, the nipple 9, connected to the lower elbow 14, exteriorly threaded, and passed through the lower pair of perforations formed in the smoke-pipe and boiler, and the pairs of clamping-nuts located upon the nipples 9 and 10 at opposite sides of the wall of the boiler, and the single clamping-nuts mounted on the nipples outside of the wall of the smoke-stack, substantially as specified.

478,332. RAILWAY AND TRUCK. JAMES G. JOHNSON, Chicago, Ill. Filed Aug. 29, 1891. Serial No. 404,097. (No model.)



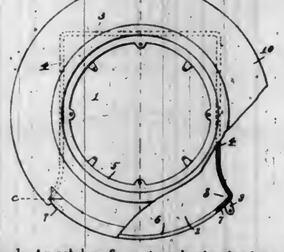
Claim.—1. In a railway, the combination of a truck having two or more horizontal wheels held in the frame thereof with ball-bearings, the peripheral faces of said wheels having beveled or angular faces, with a track of two rails, each provided on its inner side with a beveled or angular face corresponding to the faces of said wheels, all substantially as described.

2. In a railway, the combination of two trucks, each having two or more horizontally-rotating wheels held in the frames thereof and provided with ball-bearings, the peripheral faces of said wheels being beveled or angular, a coupling pivoted at the center and connecting said trucks, and a track constructed of two rails, each provided on its inner side with a beveled or angular face corresponding to the faces of said wheels, all substantially as shown.

3. In a truck for railways, the combination of a frame constructed of an upper and a lower plate with bolts to hold said plates in relative position, blocks E, held rigidly against the upper plate and their lower horizontal faces provided with an annular groove, horizontal wheels held in said frame by vertical axles, their upper horizontal faces provided with annular grooves and their peripheral faces beveled or angular, and a series of balls or spheres adjusted in size to operate in said grooves, all substantially as shown.

4. In a railway-car, the combination of two or more trucks, each provided with two or more horizontally-rotating wheels held by ball-bearings in the frames of said trucks, and the peripheral faces of said wheels being beveled or angular, with a coupling in two sections pivotally attached at their interior ends and uniting said trucks, all substantially as shown.

478,332.



478,333. MATRIX MATERIAL. FRANK A. JOHNSON, Minneapolis, Minn., assignor to the Tachytype Manufacturing Company, same place. Filed Mar. 14, 1892. Serial No. 424,750. (No specimens.)

Claim.—1. A matrix material consisting of a body of soft metal having on its face a surfacing of metal of higher fusibility, substantially as and for the purpose set forth.

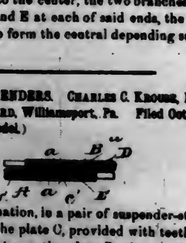
2. A matrix material consisting of a body of lead having on its face a surfacing of copper, substantially as and for the purpose set forth.

478,334. ASH-BOX FOR STOVES. LAZARD KAHN and REINHART CHRIST, Hamilton, Ohio, assignors to F. & L. Kahn & Bros., same place. Filed Apr. 15, 1892. Serial No. 429,261. (No model.)

Claim.—1. An ash-box for a stove having jamb portions formed integrally with the side walls of the box and having recesses to the rear of the jamb portions formed by sidewise deflection of the walls to join the outer edges of the jamb portions.

2. An ash-box for a stove having a door-opening corresponding substantially in width with the distance between the side walls of the box, the front portions of the side walls being extended outwardly to join with the outer edges of the jamb portions of the door-opening.

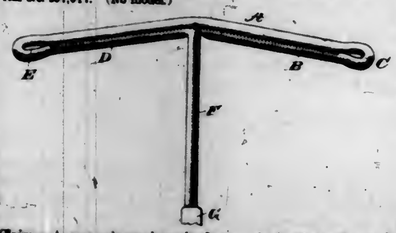
478,335. SUSPENDERS. JACOB KATZENBERG, New York, N. Y. Filed Apr. 26, 1892. Serial No. 430,763. (No model.)



Claim.—1. Suspenders having the shoulder-straps adjustably connected to each other in the rear by two plates secured thereto, one of said plates carrying a stud or button and the other provided with an angular slot forming a bearing for the shank of the stud, so that the shoulder-straps will automatically adjust themselves to the movements of the wearer, substantially as set forth.

2. In suspenders, the combination, with the shoulder-straps, of plate A, carrying a stud or button, and plate B, having vertical and transverse intersecting slots, and means for securing said plates to the webbing, substantially as set forth.

3. The combination, in suspenders, of the shoulder-straps, the pronged stud-plate A, and the pronged angular slotted plate B, and the plate C to cover and conceal the attaching-prongs of the adjusting-plates, substantially as and for the purpose set forth.

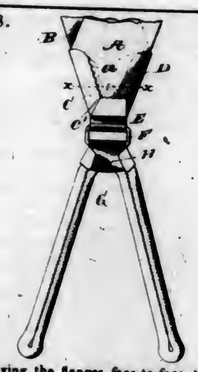


478,336. WRITING-DESK. OTTO KNELLER, Stuttgart, Germany. Filed Nov. 9, 1891. Serial No. 411,234. (No model.) Patented in Germany Jan. 13, 1890, No. 54,428.

Claim.—1. The combination, with slotted brackets and bars pivoted on said brackets and provided with racks, of braces mounted to swing on said brackets and having projections adapted to engage the teeth of racks on said bars, a cross-bar uniting the braces, elbow-levers pivoted to the bars and resting against the cross-bar uniting the braces, and a desk-top plate hinged to the front ends of said bars, the rear or upper end of said desk-top plate resting on the elbow-levers, substantially as set forth.

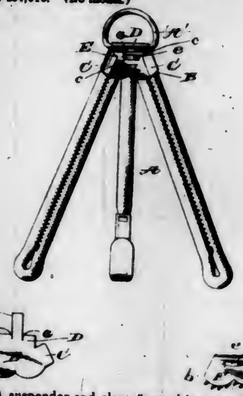
2. The combination, with wall-brackets having slots extending from top to bottom and a rod passed through said slots, of braces mounted to swing on said rod, a cross-bar uniting the braces, bars hinged to the tops of the brackets and provided with racks, projections on the braces, adapted to engage the teeth of said racks, elbow-levers pivoted to the bars and having rounded ends adjacent to the cross-bar uniting the braces, and a top plate hinged to the front ends of the bars, the rear or upper end of said desk-top plate resting on the elbow-levers, substantially as set forth.

478,337. SUSPENDER-END. CHARLES C. KROUSE, HARRY E. MYERS, and CHARLES L. GIRARD, Williamsport, Pa. Filed Oct. 6, 1891. Serial No. 407,917. (No model.)



Claim.—A suspender-end made from a single piece of material doubled from each end to the center, the two branches sewed together to form buttonholes C and E at each of said ends, the piece continued from the center, so as to form the central depending supporter F, substantially as set forth.

478,338. SUSPENDERS. CHARLES C. KROUSE, HARRY E. MYERS, and CHARLES L. GIRARD, Williamsport, Pa. Filed Oct. 6, 1891. Serial No. 407,918. (No model.)



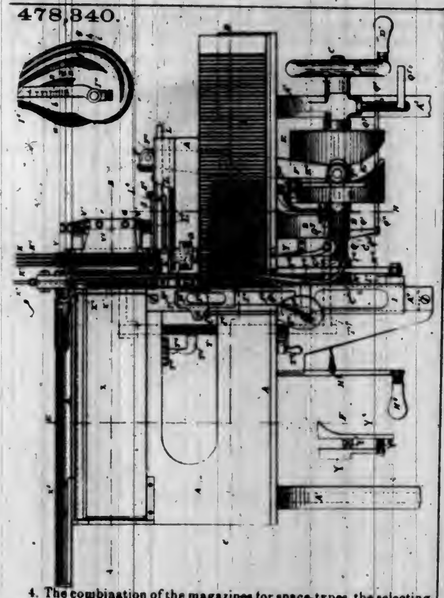
Claim.—The combination, in a pair of suspender-straps, of a back attachment comprising the plate C, provided with teeth which engage the front of one of the straps, the plate D, also provided with teeth which engage the back of the other strap, each plate having a lateral flange which covers the opposite side of the strape to that engaged by

478,338.

the said teeth, leaving the flanges face to face, the pivot *c'*, and the plate E, pivoted to and between the said flanges, substantially as set forth.

478,339. SUSPENDER-END CLASP. CHARLES C. KROUSE, HARRY E. MYERS, and CHARLES L. GIRARD, Williamsport, Pa. Filed Oct. 6, 1891. Serial No. 407,919. (No model.)

Claim.—A suspender-end clasp formed in two separate parts, one part comprising the front plate, having a projection or tongue, the top and side flanges, and the ring A', the other part comprising the back plate, having a straight top, a strap formed in the plate and running parallel with the said top, and teeth formed upon its lower edge, the said tongue being adapted to engage with said strap to unite said two parts at the ring side of the clasp, substantially as set forth.



478,340. TYPE-JUSTIFYING APPARATUS. ALEXANDER LAGERMAN, Jönköping, Sweden. Filed Dec. 10, 1888. Serial No. 293,135. (No model.) Patented in England Feb. 10, 1888, No. 2,066; in France Aug. 11, 1888, No. 192,350; in Belgium Aug. 11, 1888, No. 82,873, and in Italy Oct. 11, 1888, XLVII, 219.

Claim.—1. Apparatus for justifying printing-forms, comprising, in combination with magazines for space-types, a selecting device, as specified, for selecting proper space-types from said magazines, actuating mechanism for inserting said selecting device into the line of type to be justified, and a discharging device, substantially as described.

2. In an apparatus for justifying printing-forms, the combination, with feeding mechanism for advancing the line, of magazines for space-types of different thicknesses, an adjustable selecting device, such as a reciprocating arm or slide, for selecting spaces of proper thicknesses and inserting them in said line, and mechanism for discharging the selected type or types from the selecting device into the composed line, substantially as described.

3. In a justifying apparatus, the combination of feeding devices for advancing the line to be justified, stop mechanism for arresting said line at the interspaces between words, magazines for spaces, a selecting device, such as a grooved arm or slide having a wedge-shaped point for pushing out the space to be removed, and a discharging device for introducing in the line the space-type carried by said selecting device, substantially as described.

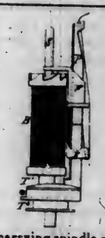
478,340.

4. The combination of the magazines for space-types, the selecting-slide reciprocating beneath said magazines, adjusting devices for said slide, so that it will select the desired type or types from said magazines at each reciprocation, and the discharging device and its actuating mechanism, substantially as described.

5. The combination of the type-feeding slide, the stop mechanism, the magazines for space types, the selecting-slide reciprocating beneath said magazines and having a receiving-groove, the type-discharging device, and means for regulating the depth of the type-receiving groove as the said slide passes beneath each magazine, substantially as described.

6. The combination, with the magazines for space-types, of the selecting-slide reciprocating beneath the same and having a type-receiving groove, a discharging-arm pivoted to said slide and having a forked portion embracing the same alongside of said groove, and adjusting devices for regulating the position of said arm relative to the several magazines, substantially as described.

7. The combination, with the magazines for space-types, of the horizontally-reciprocating selecting-slide having a type-receiving groove, the discharging-arm pivoted to said slide and adjustable vertically to regulate the depth of said groove, vertical slides, one for each magazine, for adjusting the position of said arm, and a notched or stepped bar for setting said vertical slides, substantially as described.

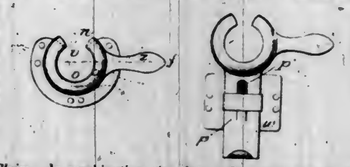


8. The combination, with the reciprocatory selecting device and its discharging-arm, of type-feeding devices comprising an upper and a lower stop, between which the line of type is advanced transversely to the movement of said selecting device, a graduated scale or dial, and an index-finger thereon connected with one of said stops and showing the length of the line in course of justification, substantially as described.

9. In apparatus for justifying printing-forms, the combination, with means for inserting space-types between the words of a line, of feeding devices comprising two stops, between which the line of type is held while being justified, a dial or scale divided into fields or spaces on each side of a zero-point, and an index-finger connected with one of said stops and graduated longitudinally, substantially as and for the purpose described.

10. The combination, with the feed-slide and its appliances for feeding a line of type along a channel to a receiving-galley, and with means, as specified, for justifying said line, of a magazine for leads, a plate for pushing leads from the magazine into the galley, actuating mechanism for operating said plate at each reciprocation of said feed-slide, and a pusher-plate and its actuating mechanism for pushing the justified line from said channel into said receiving-galley, substantially as described.

478,341. SPOOL-CARRIER FOR BRAIDING-MACHINES. JOHN E. LEE, Conshohocken, Pa. Filed Feb. 27, 1891. Serial No. 383,113. (No model.)



478,341.

Brief.—The spool-carrying spindle and tension device are detachably connected to the base-piece in order that they may be easily detached from each other.

Claim.—A thread or spool carrier for braiding-machines, consisting of a traveler part adapted to run in the grooved race-plate of the machine and an upper part consisting of a spindle for the thread-spool and a guide-post, such upper part being readily detachable from the said lower part, substantially as described.

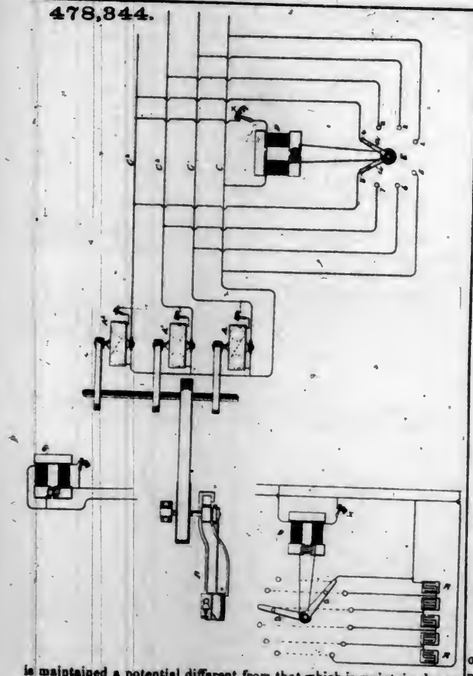
478,342. CRAVAT-HOLDER. HERRMANN LEHMANN, Berlin, Germany. Filed Sept. 19, 1891. Serial No. 406,227. (No model.)

Claim.—In combination, the plate *w* for attachment to the neck-tie, the base-plate *y*, having a central opening and a notch at one side, a locking-ring having a central opening and a handle, the said base-plate having an extension with the attaching-plate *w*, and the spring *p'* for retaining the parts in any relative position desired, substantially as described.

478,343. DENTAL TOOL. CHARLES P. LENNOX, Toronto, Canada. Filed Dec. 11, 1891. Serial No. 414,651. (No model.)

Claim.—1. A tube shaped substantially as shown and designed to be connected by a flexible tube to a reservoir of nitrous oxide or other suitable anæsthetic, in combination with a spiral groove arranged to connect with the passage-way in the tube, the said spiral groove being incased, substantially as and for the purpose specified.

2. A tube shaped substantially as shown and designed to be connected by a flexible tube to a reservoir of nitrous oxide or other anæsthetic, a cavity G, formed in the tube around its passage-way, a plug H, to close the said cavity, in combination with a core E, having a spiral groove *a* made around it, and an outer casing fitted tightly to the core E and to inclose the spiral groove *a*, which connects with the passage-way in the tube, substantially as and for the purpose specified.



478,344. SYSTEM OF ELECTRICAL DISTRIBUTION. HARRY W. LEONARD, New York, N. Y. Filed Nov. 27, 1891. Serial No. 413,287. (No model.)

Claim.—1. The herein-described method of changing the speed of an electric motor, which consists in maintaining upon each one of three or more conductors a potential different from that which is maintained on any other one of the conductors and connecting the armature-terminals of the motor with different pairs of said conductors, substantially as set forth.

2. The herein-described method of varying the speed of an electric motor, which consists in maintaining its field-magnet at a constant strength and connecting its armature terminals with one or another of two or more constant potential sources, the potentials of which are different.

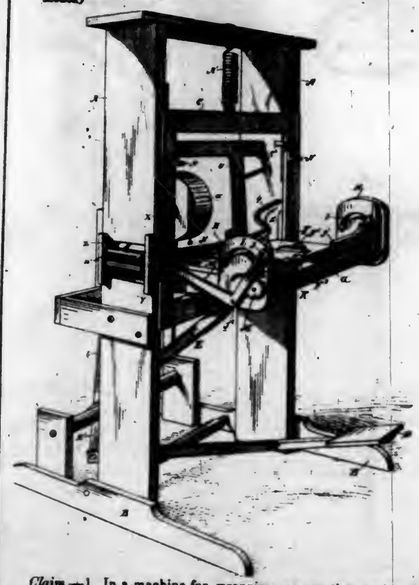
3. The combination of two or more conductors, on each of which

478,844.

is maintained a potential different from that which is maintained on a common return-conductor, an electric motor, and switching devices whereby the motor may be connected between different pairs of said conductors, substantially as set forth.

4. The combination of three or more conductors, between every two of which is maintained a difference of potential different from that which is maintained between every other two, an electric motor, and switching devices whereby the motor may be connected between different pairs of said conductors, substantially as set forth.

5. The combination of two or more generators of different electromotive forces, three or more conductors, said generators all having their like poles connected to one of said conductors and each having its other pole connected to one of the other conductors, an electric motor, and switching devices for connecting said motor between different pairs of said conductors, substantially as set forth.



6. The combination of two or more generators of different electromotive forces, three or more conductors, said generators all having their like poles connected to one of said conductors and each having its other pole connected to one of the other conductors, an electric motor having a constant field-magnet, and switching devices for connecting the armature of said motor between different pairs of said conductors, substantially as set forth.

7. The combination of two or more generators of different electromotive forces, three or more conductors, said generators all having their like poles connected to one of said conductors and each having its other pole connected to one of the other conductors, an electric motor having its field-magnet connected between a pair of said conductors having a constant difference of potential, and switching devices for connecting the armature of said motor between different pairs of said conductors, substantially as set forth.

8. The combination, in a system of electrical distribution, of three or more conductors, each having a constant potential, and there being a different electro-motive force or difference of potential between each two conductors of the system, a translating device, requiring in its operation different electro-motive forces, and switching devices for connecting said translating device between different pairs of said conductors, substantially as set forth.

9. The combination, with three or more conductors, between every two of which is maintained a difference of potential or electromotive force different from that which is maintained between every other two, of an electric motor, and switching devices whereby the terminals of said motor may be connected between different pairs of said conductors and their connection with any pair may be reversed, substantially as set forth.

478,845. MACHINE FOR WRAPPING PAPERS. JOHN F. LINTHICUM, Sacramento, Cal. Filed Aug. 7, 1891. Serial No. 402,041. (No model.)

Claim.—1. In a machine for wrapping papers, the combination of a main stationary frame and a wrapper-supporting table having the paste-trough at one end, a distributing-roller dipping in said trough, a brush or carrier having the edges adapted to form contact with the roller, a vertically-sliding frame movable upon the main frame, the curved slotted guides for the journals or spindles of the brush, and the bell-crank levers having the rocker-arms for supporting said journals or spindles, whereby the vertical movements of the sliding frame are transmitted through the rocker-arms to the brush, so that the latter will deposit paste upon the edge of the wrapper on the table and return to the distributing-roller, substantially as herein described.

2. In a machine for wrapping papers, the combination of vertical stationary and sliding frames, the stationary table upon which the wrappers are supported, a paste-trough, a distributing-roller, a carrying-brush, the side plates having curved guide-slots in which the ends of the paste-brush spindle travel, and the bell-crank levers whose rocker-arms support said spindle, said levers having an arm in the path of the sliding frame whereby the brush is moved, and a pawl-and-ratchet mechanism actuated by the rocker-arm for partially rotating the paste-distributer at each movement of the sliding frame, substantially as herein described.

3. In a machine for wrapping papers, the stationary and vertically-sliding frames, treadle and connecting mechanism whereby the latter is reciprocated, the stationary table upon which the wrappers are supported, the paste-trough, distributing-roller, and carrying-brush, and intermediate mechanism whereby the latter is alternately moved from the trough to the wrappers by the reciprocation of the sliding frame, in combination with the slotted roller, within which the ends of the paper and wrapper are inserted and by which they are rolled together and the wrapper pasted, substantially as herein described.

4. In a machine for wrapping papers, the combination of the slotted roller, whereby the papers and wrappers are rolled and the latter pasted, the rollers P P, located beneath the wrapping-roller and between which and said rollers the paper and wrapper passes, the swinging lever having a forked end by which the papers are removed endwise from the wrapping-roll, and the rollers W at the end of the wrapping-roll, between which the papers are carried after their discharge from the wrapping-roll.

5. The combination of the slotted wrapping-roller O and the rollers P P, by which the paper and wrapper are pressed against the wrapping-roller, the crossed levers Q, in the upper ends of which the rollers P are journaled, the lever R, and the block T, carried by said lever, whereby the crossed levers Q are opened, and the vertically-sliding frame C, with the projection S, which engages the end of the lever R, whereby the latter is forced up and the rollers P are separated after the paper has been wrapped, substantially as herein described.

6. In a machine for wrapping papers, the combination of a slotted wrapping-roller upon which the paper and wrapper are rolled, the rollers P, by which the paper is kept in contact with the wrapping-roller until the wrapper has been pasted, mechanism by which said rollers are separated after the wrapping and pasting are completed, a swinging slotted lever by which the paper is forced from the wrapping-roller, and pressing-rollers between which the paper passes as it leaves the wrapping-roller, substantially as herein described.

7. In a machine for wrapping papers, the combination of a wrapping-roller around which the paper and wrapper are rolled and the wrapper is pasted, a type-carrying roller, a pawl-and-ratchet mechanism for rotating said roller, an arm or frame by which it is carried and alternately brought into contact with the paper upon the wrapping-roller and removed therefrom, and the vertically-sliding frame and intermediate mechanism connecting it with the type-carrying roller, whereby the latter is caused to print addresses successively upon the papers as they are rolled upon the wrapping-roller, substantially as herein described.

478,846. ELECTRIC RAILWAY. FRANK MANSFIELD, New York, N. Y. Filed Nov. 18, 1890. Serial No. 371,824. (No model.)

Claim.—1. In an electric railway, the combination, with a car provided with a contact device, of a conduit having a guide-slot extending along the roadway and movable contacts arranged along the way and adapted to be brought into engagement with the said contact device on the car, and a movable pick-up plow mounted upon the car and hinged upon a horizontal axis, so that it may be raised out of the guide-slot when not in use, for the purpose set forth.

2. In an electric railway, the combination, with a car provided with a contact device, of a conduit having a guide-slot extending along the roadway and movable contacts arranged along the way and adapted to be brought into engagement with the said contact device on the car, and a movable pick-up plow mounted upon the car and hinged so that it may be moved into and out of the guide-slot, and a lock for holding it elevated out of the slot, for the purpose set forth.

3. In an electric railway, the combination, with a car provided with a contact device, of a conduit having a guide-slot extending along the roadway and movable contacts arranged along the way and adapted to be brought into engagement with the said contact device on the car, and a movable pick-up plow mounted upon the car and hinged so that it may be moved into and out of the guide-slot, and a hand-lever connected to the plow for controlling its movement.

4. In an electric railway, the combination, with a car provided with a contact device, of a conduit having a guide-slot extending along the roadway and movable contacts arranged along the way and adapted to be brought into engagement with the said contact device on the car, and a movable pick-up plow mounted upon the car and hinged so that it may be moved into and out of the guide-slot, a hand-lever pivoted to the plow for raising and lowering it, and a lock for holding the plow in raised position, and connections extending from the lock along the hand-lever to the handle thereof, for the purpose set forth.

5. In an electric railway, the combination, with a car provided with a contact device, of a pivoted supporting-bar and a pick-up plow hinged thereto on an axis at right angles to the pivotal axis of the supporting-bar, whereby the plow may be moved laterally, as well as raised and lowered, for the purpose set forth.

6. In an electric railway, the combination, with a car provided with a contact device, of a horizontally-swinging supporting-bar, a horizontal guide engaging the supporting-bar intermediate its ends, so as to support the bar as it is swung on its joint, and a pick-up plow attached to said supporting-bar, for the purpose set forth.

7. In an electric railway, the combination, with a car provided with a contact device, of a horizontally-swinging supporting-bar, a movable pick-up plow hinged to the supporting-bar, so that it may be raised and lowered, and a hand-lever mounted upon the supporting-bar and pivoted to the plow for controlling the movements of the same, for the purpose set forth.

8. In an electric railway, the combination, with a car provided with a contact device, of movable devices arranged at intervals along the roadway for controlling the circuit, a pick-up plow mounted upon the car for engaging and raising the said movable devices into contact with the contact device upon the car, and a guard mounted adjacent to the pick-up plow for preventing the displacement of the said movable devices as the plow passes under them, for the purpose set forth.

9. In an electric railway, the combination, with a car provided with a contact device, of a conduit having a guide-slot extending along the roadway and movable contacts arranged along the way and adapted to be brought into engagement with the said contact device on the car, and a pick-up plow mounted upon the car and consisting in flexible plates secured together and capable of a slight movement on each other when the plow bends in taking a curve.

10. In an electric railway, the combination, with a car provided with a contact device, of a conduit having a guide-slot extending along the roadway and movable contacts arranged along the way and adapted to be brought into engagement with the said contact device on the car, a hinged pick-up plow mounted upon the car, and a hand-lever connected with the plow for raising and lowering it, and a stop for limiting the downward movement of the plow.

11. In an electric railway, the combination, with a car provided with a contact device, of a conduit having a guide-slot extending along the roadway and a pick-up plow hinged so as to swing vertically and extending into the guide-slot, the hinge-pin of the hinge of the said plow being mounted in elongated slots, so as to permit of a lateral movement of the end of the plow, for the purpose set forth.

12. In an electric railway, the combination, with a car, of a beam mounted upon the car and a contact-rod carried thereby, a swinging supporting-bar hinged to the said beam, and a pick-up plow mounted upon the supporting-bar, for the purpose set forth.

13. In an electric railway, the combination, with a car provided with a contact device and a pick-up plow, of a supporting-beam for the pick-up plow, mounted upon the car-axles and provided with a spring-seated bearing, for the purpose set forth.

14. In an electric railway, the combination, with a car provided with a contact device and a pick-up plow, of a supporting-beam for the pick-up plow, mounted upon the car-axles and provided with bearings for the axles, the bearings of one said axles being movable horizontally and provided with springs for opposing its movement, for the purpose set forth.

15. In an electric railway, the combination, with a car provided with a contact device and a pick-up plow, of a supporting-beam for the pick-up plow swung from the axles of the car, one of the axles being provided with a horizontally-movable bearing-block mounted on the supporting-beam so as to be movable on the same, and a spring at opposite sides of the block for opposing its horizontal movement relative to the beam, for the purpose set forth.

16. In an electric railway, the combination, with a car, of a beam mounted upon the running-gear and a contact-rod carried thereby, a supporting-bar mounted upon the beam, and a pick-up plow hinged to the supporting-bar, substantially as and for the purpose set forth.

17. In an electric railway, the combination, with a car provided with a contact device and a pick-up plow, of a conduit formed with a guide-slot for the pick-up plow and comprising two vertically-arranged plates or members disposed parallel with a space between them, forming the slot, a railway-track crossing the conduit, with the ends of the abutting rails slightly spaced on the vertical plane containing the guide-slot, and a spacing-plate interposed between the plates forming the conduit and passing between the ends of the said crossing-rail, substantially as and for the purpose set forth.

18. In an electric railway, the combination, with a car provided with a pick-up device and contact mechanism, of arms or levers pivoted parallel with the car-tracks for controlling the circuit and adapted to be

elevated by the pick-up device on the car, so as to make contact with mechanism on the car, for the purpose set forth.

19. In an electric railway, the combination, with a car provided with a pick-up device and contact mechanism, of a subterranean insulated main conductor provided at intervals along the way with normally-disconnected branch conductors adapted to be placed in circuit with circuit-completing mechanism on a passing car, and pivoted levers for the branch conductors arranged parallel with the tracks and provided upon their ends with contacts adapted to be placed in contact with the said mechanism on the car by means of the pick-up device, substantially as and for the purpose set forth.

20. In an electric railway, the combination, with a car provided with a pick-up device and circuit-completing or contact mechanism, of a subterranean branch conductor provided at intervals along the way with normally-disconnected insulated branch conductors, and pivoted levers, over which the branch conductors pass, located in the road-bed parallel with the track and provided at their ends with a laterally-projecting contact-arm adapted to be engaged by the said pick-up device and raised in contact with the said mechanism on the car, for the purpose set forth.

21. In an electric railway of the class described, the combination, with a casing placed in the road-bed, of a lever pivoted by one end in said casing and provided at its other end with a contact, the said lever adapted to move in and out of the casing and consisting in a broad plate or blade, which in all positions of its movement serves to close the opening of the casing through which the blade moves, whereby foreign matter may be prevented from falling into the casing, for the purpose set forth.

22. In an electric railway, the combination, with a casing placed in the road-bed, of a lever for the branch conductor, pivoted in the casing and adapted to move in and out thereof, the said lever consisting of a broad plate or blade which closes the opening of the casing through which it moves in all positions of its movement, the interior of the said casing being wider at the bottom than at the top, whereby foreign matter in the bottom of the casing may not prevent the lever from moving to its lowest position, for the purpose set forth.

23. In an electric railway, the combination, with a casing placed in the road-bed, of a switch having a switch-box removably mounted in one end of the casing and provided with a shaft for operating the switch, and a lever for the branch conductor, pivoted by one end in the casing and connected to and moving with the said shaft of the switch-box, the lever and switch-box together being removable from the casing, substantially as and for the purpose set forth.

24. In an electric railway, the combination, with a branch conductor and a pivoted lever over which the conductor passes, provided with a contact, of a switch located in the branch conductor and comprising a shaft turning with the said lever, a spring contact-arm extending from said shaft so as to be rotated therewith, and a fixed contact for the contact-arm to engage with, substantially as and for the purpose set forth.

25. In an electric railway, the combination, with a switch mounted in a water-tight switch-box consisting in a box having a fixed tubular shaft extending laterally therefrom, of a switch-shaft extending loosely through said tubular shaft and provided in the switch-box with a contact-arm, a lever for the branch conductor, mounted so as to swing upon the said fixed shaft, and a water-tight cap secured to said lever and to the end of the switch-shaft and covering the end of the said fixed shaft, substantially as and for the purpose set forth.

26. In an electric railway, the combination, with a pick-up plow and a contact device carried by the car, of a conduit 44, formed with a guide-slot 43 and extending along the roadway, the crossing-rails 88 88, extending at an angle to the conduit, with the abutting ends thereof suitably spaced at the crossing-point, and a spacing-plate 87, provided with a curved or bowed upper edge and placed within the conduit, substantially as and for the purpose set forth.

27. In an electric railway, the combination, with a car, of the supporting-beam 51, mounted upon the car-axles, the bearing of one of the axles on the said supporting-beam being movable horizontally thereon and provided with the springs 75 75 for opposing the movement thereof, substantially as and for the purpose set forth.

28. In an electric railway, the combination, with movable contacts arranged along the roadway and a car provided with a pick-up plow for engaging and elevating said contacts, of the supporting-beam 51, mounted upon the car-axles with yielding connection therebetween, and the contact-rod 18, suspended from the said beam and acting in conjunction with the said plow, substantially as and for the purpose set forth.

29. In an electric railway, the combination, with a car provided with a contact device, of the operating-levers pivoted in the roadway and a flexible pick-up plow comprising the plates 55 55, secured together, substantially as and for the purpose set forth.

30. In an electric railway, the combination, with a car provided with a contact device, of the operating-levers pivoted in the roadway, the plate 47, mounted on the car and hinged so as to swing vertically, the plow-arm 52, mounted thereon and insulated therefrom, a pivoted hand-lever 61, connected with the plow for raising and lowering it, and a lock for holding the plow in raised position, substantially as and for the purpose set forth.

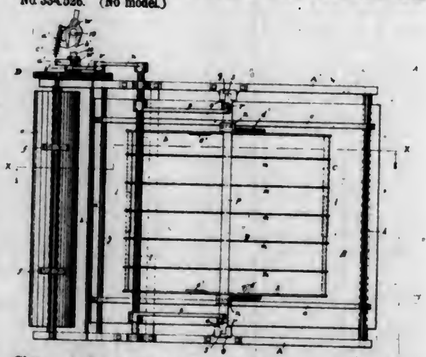
31. In an electric railway, the combination, with a car provided with a contact device, of operating-levers pivoted in the roadway, a plow-arm 52, mounted upon the car, and a guard 56 57 therefor, substantially as and for the purpose set forth.

32. In an electric railway, the combination, with a car provided with a contact device and a hinged pick-up plow swinging vertically, of operating-levers pivoted in the roadway and a hand lever 61, pivoted thereto for raising and lowering the plow and provided with a lock for locking it in raised position, said lock connected with and controlled by the pivoted handle 68, substantially as and for the purpose set forth.

33. In an electric railway, the combination, with a car provided with the supporting-beam 51, formed with a bearing 59, of a pivoted horizontally-swinging supporting-bar 49, formed with a projection 60 and mounted upon said beam, and a pick up plow carried thereby, substantially as and for the purpose set forth.

34. In an electric railway, the combination, with a car, of a supporting-beam 51, mounted thereon, the swinging supporting-bar 49, hinged horizontally thereto, the said beam overlapping the bar and a sliding joint therebetween, and a pick-up plow mounted upon the supporting-bar 49, substantially as and for the purpose set forth.

35. In an electric railway, the combination, with a car, of the supporting-bar 49, hinged horizontally, and a pick-up plow mounted thereon, and a contact-rod 18, supported beneath the car and having its end pivoted to the said supporting-bar, substantially as and for the purpose set forth.

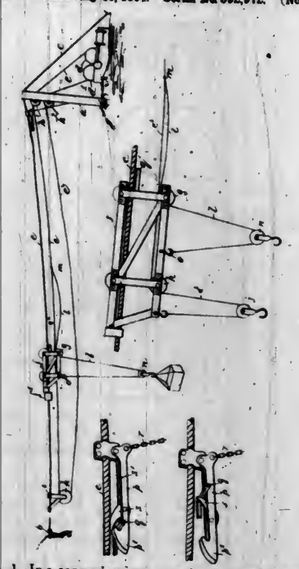


36. In an electric railway, the combination, with a casing 37, formed with a chamber 38, having an opening 39, of a pivoted operating-lever 21, provided with a contact upon its end, the switch-box 23, secured thereto, and a switch within the box, the said lever and switch-box mounted movably in the said casing, and a branch conductor 20, leading from the main through the switch and over the lever 21 to the contact carried thereby, substantially as and for the purpose set forth.

37. In an electric railway, the combination, with a casing 37, formed with a chamber 38, having an opening 39, of the swinging operating-lever 21, carrying a contact, and the branch conductor leading over the lever to the contact, said lever acting to fill the opening 39 at all times, substantially as and for the purpose set forth.

38. In an electric railway, the combination, with the casing 37, of the switch-box 23, mounted therein and provided with a tubular shaft 25, fixed thereto, the rotary switch-shaft 26, mounted in the said tubular shaft 25, the lever 21, turning with the switch-shaft, and a switch controlled thereby, substantially as and for the purpose set forth.

39. In an electric railway, the combination, with the casing 37, of the switch-box 23, mounted therein and provided with the fixed tubular shaft 25, the rotary shaft 26 for controlling a switch within the box, said rotary shaft mounted through the said hollow shaft 25, the lever 21, mounted upon the shaft 25, and the cap 30, connecting the lever with the said switch-shaft 26, and a switch controlled by said lever 21, substantially as and for the purpose set forth.



478,347. SHEET-DELIVERY APPARATUS FOR PRINTING-MACHINES. FRANCIS MEISEL, Boston, Mass. Filed Dec. 21, 1889. Serial No. 334,526. (No model.)

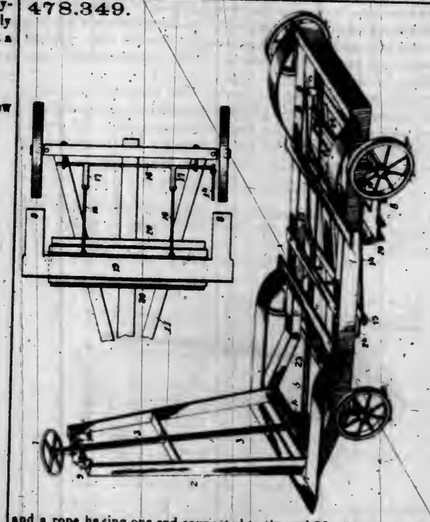
Claim.—1. In a sheet-delivery apparatus for printing-machines, the fly-frame C, composed of side bars *k* and end pieces or tubes *l*, adapted to slide within or past each other, and the adjustable bars *m*, adapted to slide upon the end pieces *l*, substantially as and for the purpose described.

2. In a sheet-delivery apparatus for printing-machines, the fly-frame C, pivoted to the vertical bars *n* and adapted to be normally held at an angle to the table B beneath by a spiral spring *d* against a stop, substantially as and for the purpose set forth.

478,348. CONVEYING APPARATUS. THOMAS S. MILLER, New York, N. Y. Filed May 16, 1891. Serial No. 392,972. (No model.)

Claim.—1. In a conveying apparatus having a cable or track way, a carriage to travel thereon, and a hoisting-rope, the combination, with said parts, of a sheave, a sag-support rope branching from said hoisting-rope at a point of said hoisting rope intermediate the carriage and hoisting-motor and extending around said sheave, and means connected with said sag-support rope beyond said sheave whereby the tension of said sag-support rope is maintained when the apparatus is unloaded, substantially as described.

2. In a conveying apparatus having a cable or track way, a carriage to travel thereon, and a hoisting-rope, the combination, with said parts, of a sheave and a sag-support rope branching from said hoisting-rope at a point of said hoisting-rope intermediate the carriage and hoisting-motor and extending around said sheave and back again to the hoisting-engine, substantially as described.



3. In a conveying apparatus, a cable or track, a carriage to travel thereon, a latch adapted to engage with a projection on the carriage, and a pivoted deflector *s*, the point of which in its forward position overlaps and extends above the point of the hook and in its backward position extends above the shank of the hook, substantially as described.

478,349. WAGON-BRAKE. JOHN MILLER, Velpen, Ind. Filed Dec. 26, 1891. Serial No. 416,250. (No model.)

Claim.—1. The combination of a running-gear, a brake-bar arranged on the running-gear and provided with brake-shoes, a rock-shaft connected with the brake-bar, a hay-rack mounted on the running-gear and provided at its front end with a hinged frame and provided at its rear end with a pulley, a shaft journaled in the frame and provided at its upper end with a wheel and having at its lower end a drum arranged below the point of hinging, a brake-lever fulcrumed intermediate its end and having one end connected with the rock-shaft, and a rope secured to the other end of the brake-lever and passing round the pulley and extending therefrom to the drum and wound around the same, substantially as described.

2. The combination of a running-gear, a brake-bar arranged on the running-gear and provided with brake-shoes, a rock-shaft connected with the brake-bar, a hay-rack mounted on the running-gear and provided at its front end with a hinged frame and having at its rear end a pulley, a brake-lever fulcrumed intermediate its ends and having its end 13 connected with the rock-shaft, a shaft journaled in the frame and having at its lower end a drum arranged below the point of hinging, a rope having one end secured to the other end 22 of the brake-lever and passing around the pulley and wound around the drum.

478,349.

and a rope having one end connected to the end 22 of the brake-lever and its other end attached to the drum, substantially as described.

478,350. OPERA-GLASS HOLDER. ANDREW B. NICHOLSON, New York, N. Y.; Ethel F. Nicholson administratrix of said Andrew B. Nicholson, deceased. Filed Feb. 21, 1891. Renewed May 27, 1892. Serial No. 434,684. (No model.)

Claim.—1. The combination, with a socket provided with a portion that is adapted to engage with and be thereby secured to a handle, cane, or other equivalent support, of a bow or shackle jointed to said socket, whereby to turn upon an axis longitudinally thereof, and means for locking such bow or shackle in one of its extremes of movement, substantially as described.

2. The combination, with a socket provided with a cylindrical orifice extending longitudinally of the same and a handle, of a bow or shackle arranged to turn in said socket and means for locking it in one of its extremes of movement, substantially as described.

3. The combination, with a socket provided with a cylindrical orifice and a handle, of a bow or shackle journaled in said orifice and a stop whereby to limit its movements, substantially as described.

4. The combination, with a handle and a socket provided with a cylindrical orifice arranged longitudinally therein and with a groove formed in its upper end, of a bow or shackle journaled in said orifice with its outer free end extending down in such groove, substantially as described.

5. The combination, with a handle and a socket provided with a cylindrical orifice arranged longitudinally therein and with a groove

formed in its upper end and provided with a recess in its side, of a bow or shackle journaled in said orifice with its outer free end extending down into such groove and engaging with the recess when the bow or shackle is in one of its extremes of movement, substantially as described.

6. The combination, with a handle B and a socket secured to its upper end and provided with a cylindrical orifice arranged longitudinally therein and with a groove formed in its upper end, of a bow or shackle journaled in said orifice with its outer free end extending down into such groove, substantially as described.

478,351. BALL-BEARING FOR RAILROAD-CARS. JOHN E. NORWOOD, Sykesville, Md. Filed Oct. 3, 1891. Serial No. 407,604. (No model.)

Claim.—1. A ball-bearing for railroad-cars, comprising boxes secured to the bolster-beam of the car and located over suitable bearing-plates on the truck, each box having an elongated open channel containing balls and having its side contracted to prevent said balls from dropping out, the balls to bear upon the plates on the truck and travel over the same and from one end of the channel to the other.

2. A ball-bearing for railroad-cars, comprising boxes secured to the bolster-beam of the car and located over suitable bearing-plates on the truck, each box having an elongated open channel containing balls and having its side contracted to prevent said balls from dropping out, and a removable end piece having an ear through which the fastening securing the box to the bolster extends.

3. A ball-bearing for railroad-cars, comprising boxes secured to the bolster-beam of the car and located over suitable bearing-plates on the truck, each box having an elongated open channel containing balls and having its sides contracted to prevent said balls from dropping out, and a removable end piece having an ear through which the fastening securing the box to the bolster extends, the box having a flange at the end, behind which the ear of the end piece fits, in the manner described.

4. A ball-bearing for railroad-cars, comprising boxes secured to the bolster-beam of the car and located over suitable bearing-plates on the truck, each box having an elongated open channel containing balls and having its sides contracted to prevent said balls from dropping out, the channel being so formed that the balls roll to the center when free, in the manner described.

5. A ball-bearing for railroad-cars, comprising boxes secured to the bolster-beam of the car and located over suitable bearing-plates on the truck, each box having an elongated open channel containing balls and having its sides contracted to prevent said balls from dropping out, the opening in the under side of the channel lessening in width from the middle toward each end, for the purpose described.

6. A ball-bearing for railroad-cars, comprising a center plate secured to the bolster-beam of the car and having an annular raised ring with a circular open channel containing balls and having its sides contracted to prevent said balls from dropping out, the plate being made in two parts and their meeting edges overlapping, for the purpose described, the balls to bear upon a center plate on the truck.

7. A ball-bearing for railroad-cars, comprising a center bearing-plate secured to the bolster-beam of the car and having a socket in the middle and an annular raised ring around the same, with a circular open channel containing balls and having its sides contracted to prevent said balls from dropping out, and a center plate on the truck, having a cup fitting in the socket of the upper plate, the balls bearing upon the surface of this lower plate.

478,352. SASH-BALANCE. JAMES J. O'CONNOR, Oakville, Canada, assignor of one-half to John Joseph McDermott, same place. Filed Mar. 31, 1892. Serial No. 427,232. (No model.) Patented in Canada Apr. 26, 1892, No. 38,706.

Claim.—The combination of a sash and its frame with a casting B, attached to said sash and having a fixed stud B, and the flat band A, wound spirally around said stud and having its opposite ends attached to the frame substantially as described.

478,358. PORTABLE CORN-POPPER. ANDREW R. OLSON, Kansas City, Mo. Filed Nov. 3, 1891. Serial No. 410,753. (No model.)

Claim.—1. A machine for popping corn, &c., comprising a drum or cylinder having double heads and a removable peripheral casing having its edges turned inward and inserted between the sections of each head, substantially as set forth.

2. A machine for popping corn, &c., comprising a drum or cylinder having double heads and a peripheral casing having its edges turned inward and inserted between the sections of the heads and having its outer end detachably connected to said heads, substantially as set forth.

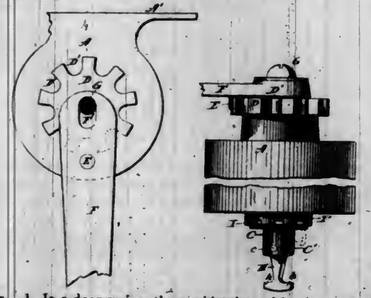
3. A machine for popping corn, &c., comprising a drum or cylinder having double heads composed each of an outer member of circular marginal contour and an inner member of spiral marginal contour and a peripheral casing composed of an inner coarser meshing and an outer finer meshing and arranged spirally between said cylinder or drum heads, the outer meshing having its edges turned inward and interposed between the head members and having its outer end detachably connected to the heads, substantially as set forth.

4. A machine for popping corn, &c., comprising a drum or cylinder having double heads, central openings formed in said heads, a spiral conveyer extending longitudinally of said drum between the heads and in alignment with the axes of their openings, and a detachable peripheral casing extending spirally between the heads and having its edges turned inward and inserted between the head-sections, the outer end of the casing being detachably connected to the said heads, substantially as set forth.

5. A machine for popping corn, &c., comprising a drum or cylinder having double heads, central openings formed through said heads, a peripheral casing having its edges turned inward and inserted through said head-section, a spiral conveyer extending longitudinally between the heads and in axial alignment with the openings, and a cross-bar secured to the front head and extending across its opening and also provided with a U-shaped section, substantially as set forth.

6. An improved portable machine for popping corn, &c., comprising a vertical main casing and a closed warming-compartment located at the top of the main casing and having a closed and arched bottom and a false bottom of foraminous material composed of a number of arch-formed sections, substantially as set forth.

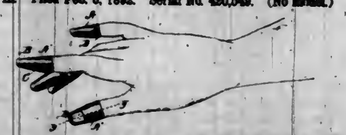
7. A portable machine for popping corn, comprising a vertical main casing, a vertical feed-pipe for liquid fuel located outside of the casing and having a tubular supporting-arm extending horizontally forward through the back of said casing, and a popping drum or cylinder located within the casing and having an axial rod working within the tubular arm, so as to permit the drum or cylinder to be moved outwardly and inwardly upon the arm, the said arm and tubular axial rod constituting the sole support for the drum or cylinder, substantially as set forth.



8. An improved machine for popping corn, &c., comprising a revoluble drum or cylinder having a discharge-opening in its outer head and a circular outwardly extending and flaring annular deflector surrounding said opening, substantially as set forth.

478,354. DOOR-SPRING. ALBERT A. PAGE, New Haven, Conn., assignor to the Sargent & Company, same place. Filed Jan. 6, 1892. Serial No. 417,136. (No model.)

Claim.—In a door-spring, the combination, with a case, coiled spring, and spring-shaft, of a peripherally notched collar rigidly attached to a projecting end of the said spring-shaft, a lever loosely connected with the said end of the shaft, bearing upon the outer face of the collar, and constructed with a perforation in line with the notches of the collar, a clutch-pin located in such perforation and manually movable therein, a stop-pin radially arranged upon the adjacent face of the case, mounted in a lug formed thereupon, having its inner end adapted to be radially entered into the notches in the said collar, and its outer end constructed with a head, and a spring interposed between the said lug and head for holding the stop-pin in its normally-retired position, substantially as described.



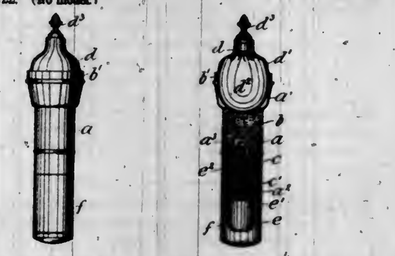
478,355. DOOR-SPRING. ALBERT A. PAGE, New Haven, Conn., assignor to the Sargent & Company, same place. Filed Jan. 6, 1892. Serial No. 417,137. (No model.)

Claim.—1. In a door-spring, the combination, with a case, coiled spring, and spring-shaft, of a clutch-collar rigidly attached to a projecting end of the said shaft and having a series of peripheral retaining-notches formed in it, a lever bearing upon the upper face of the said collar and loosely connected with the said shaft through an elongated slot formed in its extreme inner end, a clutch-pin mounted in the lever in position to be entered into the said notches of the collar, and a stop for locking the shaft against rotation, substantially as described.

2. In a door-spring, the combination, with a case, coiled spring, and spring-shaft, of a clutch-collar rigidly attached to a projecting end of the said shaft and having a series of peripheral retaining-notches formed in it, a lever bearing upon the upper face of the said collar and loosely connected with the said shaft through an elongated slot formed in its extreme inner end, clutch-pin mounted in the lever in position to be entered into the said notches of the collar, a double stop pivotally mounted in the opposite end of the shaft, and a circular series of retaining-points located upon the adjacent face of the said case for engagement by the said double stop, substantially as described.

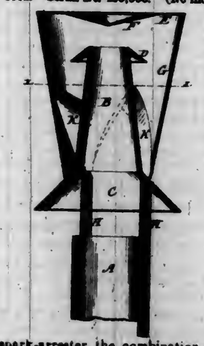
478,356. FINGER-TAPERING DEVICE. ELAM B. PAIGE, Chicago, Ill. Filed Feb. 6, 1892. Serial No. 420,549. (No model.)

Claim.—1. A finger-tapering device made of rigid material, constructed of an open sheath to be fitted upon the finger, the section thereof at the open end cylindrical and thence tapering toward the other end, the upper side or portion thereof being practically straight and the greatest tapering being on the under or lower side or portion thereof, all substantially as shown.



2. A finger-tapering device made of rigid material, constructed of an open sheath to be fitted upon the finger, the section thereof at the open end cylindrical and thence tapering toward the other end, the upper side or portion thereof being practically straight in longitudinal vertical section and having an opening in such upper side or portion near the end thereof and the greatest tapering being on the under or lower side or portion of said device, substantially as and for the purpose set forth.

478,357. HOOK AND EYE. BIRDSALL D. PAINE, Philadelphia, Pa. Filed Sept. 26, 1891. Serial No. 406,966. (No model.)



Claim.—In a hook, the combination of the main or shank portion provided at one extremity with attaching means and at its opposite extremity with a hook portion turning underneath the main or shank portion, said main or shank portion struck up nearest the hook portion, whereby the latter is on the same plane with the attaching means, and a resilient guard or tongue extending from said attaching means to and beyond the hook end and removably seated on the outer or free side thereof, substantially as described, and for the purposes set forth.

478,358. POCKET POWDER-PUFF AND INHALER DEVICE. WILLIAM H. PAYNE, Philadelphia, Pa., assignor, by mesne assignments, to Adeline E. Hoskins, same place. Filed Feb. 16, 1892. Serial No. 421,722. (No model.)

Claim.—A combined pocket powder-puff and smelling-tube or inhaler comprising a body portion expanded at one extremity and contracted at the other extremity and provided with a transversely-ranging partition intermediate of the respective extremities, a socket provided with a handle and a powder puff or pad and adapted for insertion into said expanded extremity, a nozzle adapted for insertion into said contracted extremity, and a detachable cap adapted to be fitted over said nozzle and onto said contracted extremity, substantially as and for the purposes set forth.

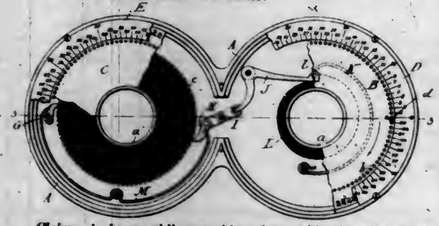
478,359. SPARK-ARRESTER. FREDERICK B. POPE, Augusta, Ga. Filed Apr. 12, 1892. Serial No. 428,880. (No model.)

Claim.—In a spark-arrester, the combination of a smoke-stack having an open top and unobstructed lateral openings therefrom, a tapering pipe B, having its lower end of equal diameter as the smoke-

stack, a wider conical funnel C at the lower end overhanging the smoke-stack, and an overhanging conical head D at the upper end, with an inclosing tapering pipe G, having a closed top E, and deflector F, secured to the under side of said top, pipe H, secured to the lower end of the tapering pipe G, and inclined ways K between the tapering pipes B and G, substantially as described.

478,360. **HOOK AND EYE.** LOUIS M. PORTER, Montclair, N. J. Filed Apr. 7, 1892. Serial No. 428,127. (No model.)

Claim.—1. The combination of a hook having its bend extending toward the shank of the hook to form a contracted opening, and an eye having two separated looped members located one above the other, adapted to pass through the contracted opening formed by the bend of the hook.



2. An eye of a hook-and-eye device having two looped members D and E, located one above the other and normally held slightly apart by the spring action of the metal.

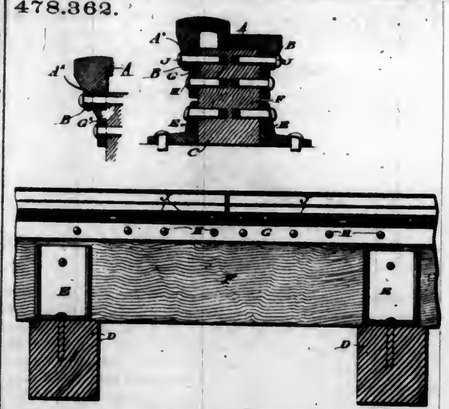
3. An eye of a hook-and-eye device having two looped members D and E, located one above the other and normally held slightly apart by the spring action of the metal, either of said members being widened in cross-section at its looped end.

4. An eye of a hook-and-eye device having two looped members D and E, located one above the other and normally held slightly apart by the spring action of the metal, the looped end of one of said members extending slightly beyond the other.

5. A hook-and-eye device consisting of the hook having the shank A and bent-over end B, extended toward the body of the shank to form a contracted opening to the hook, and the eye C, having the two members D and E, located one above the other and normally separated slightly from one another by the spring action of the metal, but adapted to be pressed together when passed through the contracted opening of the hook, the looped end of one of said members having a width in one direction greater than the width of the contracted opening of the hook.

478,361. **ADDING-MACHINE.** SAMUEL A. POTTER, Cincinnati, Ohio, assignor of one-half to D. G. Monfort, same place. Filed Sept. 18, 1891. Serial No. 406,144. (No model.)

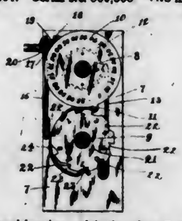
Claim.—1. In an adding-machine, the combination of the units-wheel provided with the graduations, perforations, and cam, the hundreds-wheel having the graduations, perforations, and teeth, the lever bearing on the cam, the second lever actuated thereby, the pawl carried by the latter, and the rings covering the marginal portions of the wheels.



2. In an adding-machine, the combination of the frame having the fixed graduated rings, the independently-revolvable wheels graduated and perforated and provided one with the cam and the other with teeth, the lever upon which the cam acts, the second lever actuated thereby, the pawl carried by the second lever, the pawl to prevent retrograde motion, and the springs acting on the lever and pawl.

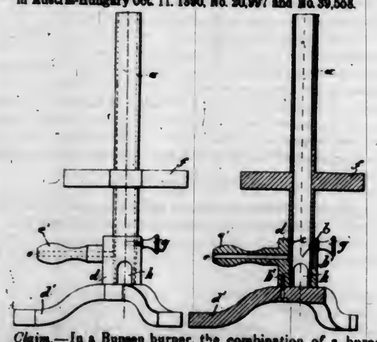
478,362. **SUPPORT FOR STREET RAILWAYS OR TRAMWAYS.** JAMES M. PRICE, Philadelphia, Pa. Filed Apr. 22, 1891. Serial No. 389,915. (No model.)

Claim.—1. A supporting-girder for a street-rail, having a main portion of wood with strengthening-plates of metal secured to the upper portion of its sides, said plates extending below the depending flanges of a rail resting on said girder, said parts being combined substantially as described.



2. A street-rail having depending flanges, a wooden girder with metallic side plates adapted to contact with said flanges, and means, substantially as described, for securing said girder in place, said me-

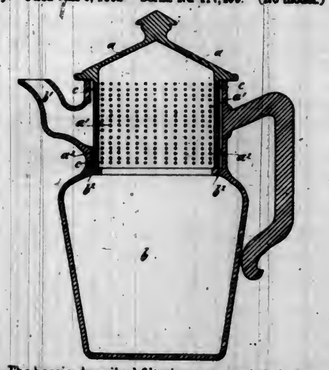
478,362.



tallic side plates extending below said flanges, but not in contact with the chairs, securing said girders laterally, said parts being combined substantially as described.

478,363. **POCKET-REGISTER.** JEROME B. REED, Sanbury, Pa. Filed Apr. 21, 1891. Serial No. 389,800. (No model.)

Claim.—The combination, with the plate 7, the studs located near the upper and lower ends of the same, the disk 10, having the ratchet-wheel 12 and spur 11 located upon the upper stud, the disk 21, mounted upon the lower stud and having peripheral teeth engaged by the radiating spur of the upper disk, the retaining pawl 13, resting in the teeth of the ratchet 12, the retaining-pawl 24, resting in the notches or teeth of the lower disk, the flat spring 15, and the pin 16, located thereabove, of the reciprocating integrally-formed pawl consisting of the push end 18, the spring-pawl 17 engaging the ratchet-wheel of the upper disk and having a shoulder in rear thereof, against which the spring 15 takes and above said shoulder provided with the recess 19 for receiving the pin, substantially as specified.

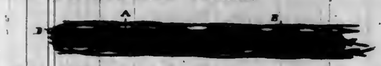


478,364. **BUNSEN BURNER.** GEORG REIMANN, Berlin, Germany. Filed Aug. 6, 1890. Serial No. 361,210. (No model.) Patented in England Dec. 24, 1889, No. 20,744; in Germany Dec. 27, 1889, No. 50,448, and in Austria-Hungary Oct. 11, 1890, No. 20,997 and No. 39,558.

Claim.—In a Bunsen burner, the combination of a burner-tube for conveying the inflammable fluid, said tube being adapted to rotate, and thus regulate the supply, the foot-piece for holding the burner-tube, having openings for the gas and air and adapted to register with

corresponding openings in the burner-tube when the latter is properly turned, substantially as described.

478,365. **FILTER-CAN.** FRANZ REBRICH, Buda-Pesth, Austria-Hungary. Filed Jan. 9, 1892. Serial No. 417,499. (No model.)



Claim.—The herein-described filtering-pot, consisting of the combination, with the lower body portion provided with an interiorly-projecting rib in its upper part, of a filtering-sieve above said lower body portion adapted to rest on said projecting rib, said filtering-sieve being provided with projections whereby an annular space is provided between the outer side of the sieve and the inner side of the pot, substantially as set forth.

478,366. **EXPLOSIVE COMPOUND.** SAMUEL ROGERS, San Francisco, Cal., assignor to the United States Smokeless Powder Company, same place. Filed Aug. 25, 1891. Serial No. 403,717. (No specimens.)

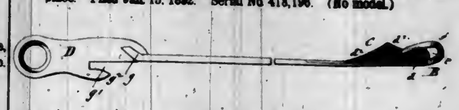
Claim.—A compound consisting of picrate of ammonia, nitrate of ammonia, and nitro-glycerine mixed in proportions substantially as herein described.

478,367. **ELECTRIC CABLE.** WILLIAM H. SAWYER, Providence, R. I., assignor to the American Electrical Works, same place. Filed Feb. 18, 1892. Serial No. 421,935. (No model.)

Claim.—1. The combination, in an electric cable, substantially as hereinbefore described, of a central solid foundation-core and a tubular multi-conductor braid formed thereon and supported thereby, the said tubular braid being composed of two pairs of insulated conductors braided or woven together in a uniform helical direction, the plane of the cross section of each of the said pairs being at a right angle to and bisecting that of the other.

2. In an electric cable, the combination of a solid central foundation-core and an open-work tube of independent insulating conductors braided or woven thereover, resting thereon and supported thereby, the said open work braid being composed of two groups of conductors, each group comprising two pairs of braided insulated conductors of uniform helical direction, the plane of the cross-section of each pair being at a right angle to and bisecting that of the other and the helical direction of the conductors of each group being reversed with respect to those of the other, substantially as described.

3. The combination, in an electric cable, of a stiff and solid central foundation-core consisting of twisted or braided insulated conductors, with four insulated conductors braided thereover into the form of an open-work tube compressing the said foundation-core and maintained in position thereby, the four said conductors being arranged in two pairs of uniform helical direction, the plane of the cross-section of each pair being perpendicular to the center of the plane of the other, substantially as described.



4. The combination, in an electric multi-conductor cable, of a stiff and solid central foundation-core formed of two or more pairs of insulated conductors twisted or braided together, and two groups of insulated conductors braided thereover into the form of an open-work tube compressing the said foundation-core and held in place thereby, each of the said groups comprising four conductors arranged in pairs, having a uniform helical direction, the plane of each pair taken at any cross-section of the cable being perpendicular to the center of the plane of the other, the helical direction of the conductors of one of the said groups being opposed to that of the other, substantially as described.

5. In an electric cable, a central foundation-core composed of two or more insulated conductors braided or woven together into a firm and solid strand, a series or layer of insulated conductors in two groups, respectively, of opposite helical direction braided tightly over said core into a tubular open-work, its two groups each comprising two pairs of conductors adapted, as described herein, to form portions of inductively-neutral metallic circuits, and one or more successive similar series of conductors braided each over the immediately-preceding interior series into successive concentric tubes, each compressing its inner neighbor, the conductors of each succeeding series being braided with a longer pitch or at an increased angle to those of each underlying series, substantially as described.

6. An electric cable comprising a tubular open-work series of insulated conductors braided over and upon a solid central foundation-core formed of a number of pairs of conductors twisted or braided, as indicated, the said series being composed of two groups, each comprising two pairs, the helical direction of the conductors of one group being opposed to that of the other and the two pairs of each group being each arranged so that at any point of cross-section the plane of each pair is at a right angle to the center of the plane of the other, other successive similar series braided over and resting upon the immediately-preceding similar series, the conductors of each being braided with a longer pitch than the immediately-underlying series, and an external protective sheath, such as a lead pipe, inclosing the whole, substantially as and for the purpose described.

7. An electric cable comprising a protecting envelope or sheath, such as a tube of lead or lead alloy, and a series of compound cores or sub-cables inclosed symmetrically therein, each of the said sub-cables consisting of a solid and semi-rigid central core and one or more concentric series braided over and upon said central core into the form of an open-work tube, each of the said series comprising two groups of two pairs of conductors each, the pairs of each group being each arranged in a plane vertical to the center of the other, and the four conductors of each group being all braided in a direction similar to those of the same group, but opposed to that of the other group, substantially as specified herein.

478,368. **PILE-WIRE FOR LOOMS.** GUSTAV SEESCHNEIDER, Yonkers, N. Y., assignor to the Waring Hat Manufacturing Company, same place. Filed Jan. 15, 1892. Serial No. 418,196. (No model.)

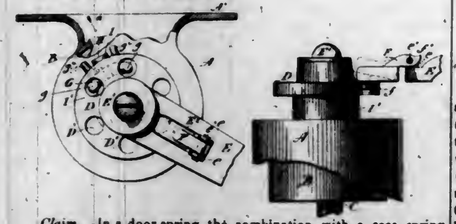
Claim.—1. The combination, with a pile-wire provided with a spring-hook at the end, of a detachable blade retained by said spring-hook, the outer end or heel of the spring-hook being bent at an angle of inclination to the longitudinal plane of the pile-wire, substantially as set forth.

2. The combination, with a pile-wire having a spring-hook at the end of the same, the end of the spring-hook and the shank of the pile-wire being provided with a groove at their inner edges, of a detachable pile-cutting blade provided with a blunt rear portion inserted into the spring-hook so as to form an opening or eye between the same and the rear end of the blade, substantially as set forth.

3. The combination of a pile-wire having an inclined outer end with a head the shank of which is provided with an inclined recess for the end of the pile-wire, said recess extending upwardly from the lower edge of the shank, so that the shank of the pile-wire is on a level with the lower edge of the shank of the head, substantially as set forth.

4. The combination, with a pile-wire having an upwardly-inclined end with a head the shank of which is provided with a corresponding recess for the pile-wire at its outer end, a gage below the shank, and a recess between the shank of the head and the gage, so that the pile-wire is on a level with the lower edge of the shank, substantially as set forth.

478,369. **PILE-WIRE FOR LOOMS.** GUSTAV SEESCHNEIDER, Yonkers, N. Y., assignor to the Waring Hat Manufacturing Company, same place. Filed Mar. 2, 1892. Serial No. 423,581. (No model.)



Claim.—1. A combined pile wire and cutter composed of a pile-

wire having a longitudinal groove in its outer end, a heel at the outer end of said groove, a spring secured in the inner end of the groove, and a detachable blade retained in position by the heel and spring, substantially as set forth.

2. A combined pile wire and cutter composed of a longitudinal groove in its outer end, an inclined heel attached to the outer end of the groove, a spring the shank of which is attached in the inner end of the groove, and a detachable blade having a sharpened inner edge and an inclined blunt outer edge, substantially as set forth.

478,370. **DOOR-SPRING.** JOHN H. SHAW, New Haven, Conn., assignor to the Sargent & Company, same place. Filed Jan. 6, 1892. Serial No. 417,142. (No model.)

Claim.—In a door-spring, the combination, with a case, spring, and spring-shaft, of a collar rigidly attached to a projecting end of the said shaft and having a series of retaining-points formed in it, a lever loosely connected with the said projecting end of the shaft and bearing upon the outer end of the collar, a manual clutch mounted in the lever for engagement with the collar through the retaining-points therein, a rocking stop pivoted on the case under the said collar, and having two corresponding stop-lugs for engagement therewith and two corresponding outwardly-projecting operating-fingers, the said lugs and fingers being respectively located on opposite sides of its center, and a spring engaged with the said stop to hold it in its normally retired position in which it lies in the same plane with the clutch-collar, substantially as described.

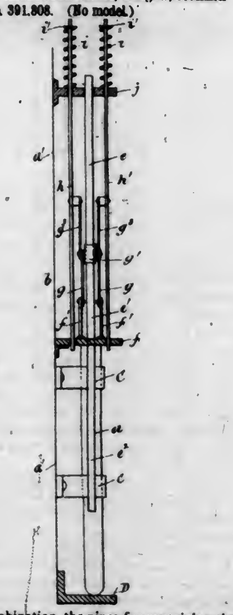
478,371. **DOOR-CHECK.** JOHN H. SHAW, New Haven, Conn., assignor to the Sargent & Company, same place. Filed Jan. 6, 1892. Serial No. 417,143. (No model.)

Claim.—1. The combination, with a cylinder, of a plunger, a stem therefor, a rocking carrier to which the inner end of the said stem is adjustably secured, a bracket in which the carrier is pivoted, and one or more springs interposed between the bracket and carrier and engaging with the latter on opposite sides of its pivot and yielding to permit the stem to conform to the angle on which the cylinder and plunger come together when the door carrying one of them is opened and closed, substantially as described, and whereby provision is made for permitting the stem to yield in either direction without interfering with its initial adjustment for the right presentation of the plunger to the cylinder.

2. In a pneumatic door-check, the combination, with a cylinder, of a plunger, a stem therefor, a holder into which the inner end of the stem is mounted, a rocking carrier to which the holder is adjustably secured, a bracket in which the said carrier is pivoted, and one or more springs interposed between the bracket and carrier and engaging with the latter on opposite sides of its pivot, substantially as described, and whereby provision is made for permitting the stem to yield in either direction without interfering with its initial adjustment for the right presentation of the plunger to the cylinder.

3. In a pneumatic door-check, the combination, with a cylinder, of a plunger, a stem therefor, a rocking carrier to which the inner end of the stem is adjustably secured to be set at any desired angle thereto, a bracket in which the said carrier is pivotally mounted, and two spiral springs respectively interposed between the bracket and the opposite ends of the carrier on the opposite sides of the pivot thereof, substantially as described, and whereby provision is made for permitting the stem to yield in either direction without interfering with its initial adjustment for the right presentation of the plunger to the cylinder.

4. In a pneumatic door-check, the combination, with a cylinder, of a plunger therefor and a bracket carrying the said plunger, the ends of the said bracket and the outer ends of the mouth of the cylinder having centering notches, substantially as set forth, whereby the said plunger and cylinder members of the device may be rightly attached to the door and door-jamb, substantially as described.



478,372. **DOOR-CHECK.** JOHN H. SHAW, New Haven, Conn., assignor to the Sargent & Company, same place. Filed Apr. 4, 1892. Serial No. 427,677. (No model.)

Claim.—1. In a door-check consisting of a cylinder and a piston and in which the piston is withdrawn from the cylinder in the opening movement of the door, the combination therewith of a saddle, the piston-rod hung to said saddle upon a pivot the axis of which is parallel with the axis upon which the door is to swing, the saddle constructed with shoulders to the right and left of the said pivot, and the piston-rod constructed with corresponding shoulders, with a spring between the shoulders of the piston-rod and the shoulders of the saddle, and a bracket to which the said saddle is adjustably pivoted, the axis of the bracket-pivot being parallel with the axis of the pivot between the saddle and piston-rod, substantially as described.

2. In a door-check consisting of a cylinder and a piston and in which the piston is withdrawn from the cylinder in the opening movement of the door, the combination therewith of a saddle, the piston-rod hung to said saddle upon a pivot the axis of which is parallel with the axis upon which the door is to swing, the saddle constructed with shoulders to the right and left of said pivot, and the piston-rod constructed with corresponding shoulders, with a spiral spring around that portion of the piston-rod and saddle between said shoulders, one end of which bears upon the shoulders of the saddle and the other end upon the shoulders of the piston-rod, and a bracket to which the said saddle is adjustably pivoted, the axis of the pivot between the saddle and bracket being parallel with the axis of the pivot between the saddle and piston-rod, substantially as described.

478,373. **APPARATUS FOR AUTOMATICALLY REGULATING TEMPERATURE.** ALEXANDER SHIELS, Glasgow, Scotland. Filed May 6, 1891. Serial No. 391,808. (No model.)

Claim.—1. In combination, the pipes for containing the sensitive fluid, the vessel *a*, connected therewith and having a fluid therein, the piston within the vessel, the piston-rod, the valve for controlling the supply of the refrigerating or heating agent, the connections to the said valve, including the rods *h h'* and the toggle-arms, and the means for operating the said toggle-arms, consisting of the triangle on the piston-rod, substantially as described.

2. In combination, the pipes containing the sensitive fluid, the vessel *a*, having a piston and containing a fluid to act thereagainst, the valve *u* for regulating the supply of the refrigerating agent, the connections from the said valve to the piston, the connections *k k'* from the said vessel *a* to the sensitive pipes, the valve *l* in said pipes, the reservoir *n* for the sensitive fluid, the pipe *m* therefrom to the valve, and the means for controlling the position of the said valve *l*, connected with the sensitive-fluid pipe and actuated by the fluid therein, substantially as described.

3. In combination, the main supply-valve for the refrigerating fluid, the means for controlling the same, including the vessel *a*, having a piston, and the connections between the same and the supply-valve, the sensitive-fluid pipes connected to the said vessel, the three-way valve *l*, the reservoir *n*, connected therewith, the means for controlling the said valve, including the second vessel B, having a piston and piston-rod, the intermediate connections between the same, and the valve and the pipe *x* for the sensitive fluid connected to the said second vessel, substantially as described.

4. In combination, the main supply-valve for the refrigerating agent, the controlling means therefor, the sensitive-fluid pipes in connection with the said controlling means, the valve in said connection, the sensitive-fluid reservoir *n*, connected to said valve, the controlling means for said valve, including the second vessel B, with its piston and the piston-rod and the intermediate operating connections, the locking-slide T, connected with the valve *l*, and the locking-guides U U', movable with the piston, substantially as described.

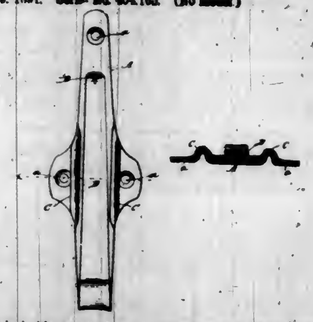
5. In combination, the main supply-valve for the refrigerating agent, the controlling means therefor, the sensitive-fluid pipe in connection with said controlling means, the valve *l* in said connection, the reservoir *n*, connected to the valve, the regulating means for said valve, including the vessel B, with its sensitive-fluid pipe *x* and its piston and piston-rod, the magnet, the armature, the connections between the same and the valve, and the open circuit in which the magnet is arranged, and the contact on the piston-rod for closing said circuit to operate the valve, substantially as described.

6. In combination, the main supply-valve, the controlling means therefor, the sensitive-fluid pipes connected with said controlling means, the valve *l* in said connection, the reservoir *n*, connected with said valve, the regulating means for the said valve, including the vessel B, with its sensitive pipe and piston and piston-rod, the magnets O P, the interposed armature, the connections therefrom to the valve, the independent open circuits, including the said magnets, and the contacts I I' J J', arranged in different planes and adapted to be engaged by contacts on the piston at different points in the movement thereof, substantially as described.

7. In combination, the main supply-valve, the controlling device therefor, including the U-shaped tube, the sensitive-fluid pipes, the connection between the same and the U-shaped tube, the piston in said tube, the piston-rod, and the connections from said rod to the main supply-valve, substantially as described.

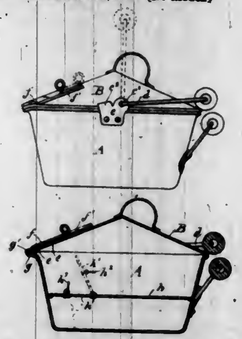
8. In combination, the main supply-valve, the tube *a*, the piston therein connected with the said valve, the sensitive-fluid pipes, the reservoir *n*, connected therewith, and the three-way valve *l*, whereby the sensitive fluid may be directed to the tube *a* or to the reservoir *n*, substantially as described.

478,374. **SLATE-PENCIL SHARPENER.** WILLIAM SHRIVER, Philadelphia, Pa. Filed Oct. 31, 1891. Serial No. 410,433. (No model.)



Claim.—1. A slate-pencil sharpener formed in sections with sharpening-surfaces on the inner faces thereof, a pin connecting the sections at one end thereof, and a tongue on one of the sections, the opposite section having a groove to receive said tongue, said parts being combined substantially as described.

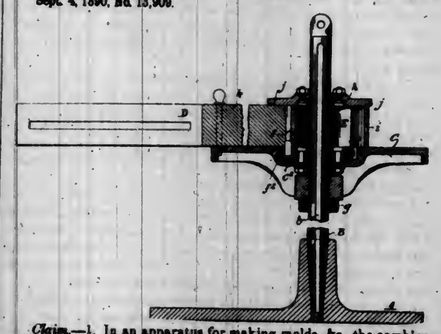
2. The concave sections having sharpening-surfaces, a tongue and a groove, and a connecting-pin, the tongue projecting from one section and entering the groove in the other section, thus locking the sections, substantially as described.



3. A slate-pencil sharpener formed in sections with a tongue and groove on the inner faces thereof, the groove receiving said tongue, and a pin which is passed through the sections, whereby the latter are connected and prevented from rotating on each other, substantially as described.

478,375. **REIN-HOLDER.** JAMES D. SHUMAN, Paint Rock, Tex. Filed Aug. 29, 1891. Serial No. 404,165. (No model.)

Claim.—A rein-holder made from a piece of spring sheet metal, having a base-plate provided with means for attachment to a flat surface and having projections struck up at each side of the tongue and extending lengthwise the base, and a spring-tongue bent upward from the lower end of the plate and normally lying between the line of the projections to hold a rein, substantially as described.

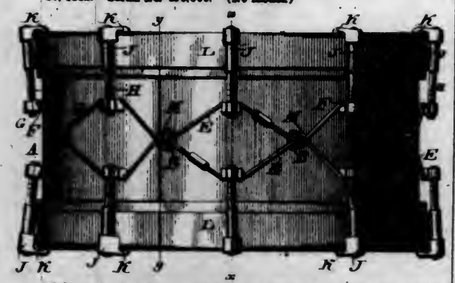


478,376. **COOKING UTENSIL.** SARAH SMITH, Toledo, Ohio. Filed June 6, 1891. Serial No. 395,364. (No model.)

Claim.—1. In a cooking utensil of the class described, the bifurcated bail-ears, one branch thereof engaging the bail, the other branch being bent inwardly and adapted to hold the lid in place, substantially as shown and described, for the purpose specified.

2. In a cooking utensil of the class described, a perforated removable horizontal partition or false bottom provided at one side with a hinged door, substantially as shown and described, for the purpose specified.

478,377. **MOLDING-MACHINE.** SAMUEL SMITH, Bury, England, assignor to John Broad Jackson and George Bentley, same place. Filed Sept. 22, 1891. Serial No. 406,457. (No model.) Patented in England Sept. 4, 1890, No. 13,909.



Claim.—1. In an apparatus for making molds, &c., the combination of a base carrying a spindle and provided with a disk having a

cam-groove, a tool-carrying arm adapted to rotate about the spindle, and a projection from the arm, adapted to work in the cam-groove, substantially as set forth.

2. In an apparatus for making molds, &c., the combination of a base carrying a spindle, a disk vertically adjustable upon the spindle and provided with a cam groove, and a tool-carrying arm having one end forked to embrace the spindle, and a projection from the arm, adapted to work in the cam-groove, substantially as set forth.

478,378. DRUM. ADOLPH G. SOUTHMANN and JAMES W. PEPPER, Philadelphia, Pa.; said Southmann assignor to said Pepper. Filed Apr. 27, 1892. Serial No. 430,869. (No model.)

Claim.—1. A drum provided with heads B, which are grooved to receive the wires or cords E, formed with openings for the fastening-screws C, and caps M, which cover the portion of the cords within said heads and are connected with the heads by means of said screws, substantially as described.

2. A drum provided with sockets J, having feet K, screws H, passed through said sockets, nuts G, fitted to said screws, hooks F on said nuts, heads B, connected with the side of the drum, and wires or cords E, passing from the said hooks to said heads and connected therewith, substantially as described.

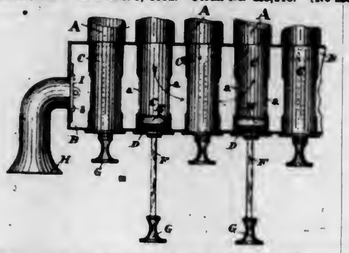
3. A drum having tightening wires or cords E, connected alternately with hooks F and heads B on the side of the body, said heads receiving portions of said wires or cords and provided with caps M to retain the wires in place, said hooks being attached to nuts G, which are engaged by screws H, the latter being swiveled in sockets J, attached by feet K to the upper and lower bands of the drum, substantially as described.

478,379. DUMP WAGON-BOX. FRANK B. SOUTHWICK, Grand Rapids, Mich. Filed May 26, 1891. Serial No. 394,186. (No model.)

Claim.—1. In a wagon-box, the combination of two pairs of hinged sections, a strip between the inner section of each pair, straps G″ and G′, pivotally connecting said inner sections to said strip, said straps G′ being curved, straight straps G, secured to the sides of the box, laterally-curved straps G′, each pivotally secured at one end to the lower end of a strap G and secured to one of the outer sections near an end thereof and projecting from beneath said end, levers secured to the sides of the box, a cable connecting each of said levers with the adjacent ends of the pairs of curved straps G′, and pulleys over which said cables pass.

2. A wagon-box having transverse partitions located in pairs near each end and forming two chambers located one at each end of the part for the load, a longitudinal strip located between said chambers at the center of the load portion of the box, two pairs of hinged sections located on opposite sides of said longitudinal strip and forming, together with said strip, the bottom of the load portion of the wagon-box, the inner section of each pair being hinged to said strip and the outer section of each pair being hinged to the sides of the box, vertical pulleys located within said chambers, horizontal pulleys also located within said chambers and journaled in the side-boards of the box, levers pivoted to said side-boards, and cables or chains attached to said levers, extending over said pulleys and attached to said bottom section, all combined and operating substantially as set forth.

3. In a wagon-box, the bottom thereof, consisting of two pairs of hinged sections and a longitudinal strip located between the pairs of sections, in combination with straight straps G G″, secured, respectively, to the sides of the box and the under side of said strip, and laterally-curved straps pivotally secured to opposite sides and the lower ends of said straight straps, as shown, each of said curved straps being also secured to one of the sections of the bottom near an end thereof and projecting from beneath said end, chambers at opposite ends of said sections, horizontal and vertical pulleys in said chambers, a lever secured to each side of the box, and a cable connecting each of said levers with the adjacent outer ends of the curved straps and engaging said pulleys, substantially as described, whereby none of the operating mechanism will be located in the load portion of the box, as specified.

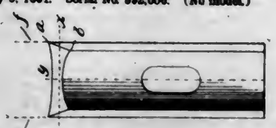


4. The combination of a wagon-box having a bottom consisting of hinged sections, cables or chains extending from opposite ends of said sections to a lever and attached to the same at opposite sides and at a distance from each other, said lever having a slotted opening midway between said points of attachment, and a pivot stud or bolt passing through said slotted opening, substantially as described.

5. In a wagon-box, a bottom consisting of longitudinal sections having hinges, consisting of straight straps attached to the box and curved straps attached to said sections and projecting from the end thereof, and cables or chains extending over pulleys and connected to levers for operating said sections, substantially as described.

6. In a wagon-box, the combination, with hinged sections forming the bottom thereof, straight straps secured to the sides of the box, and curved straps, each pivotally secured at its outer end to the lower end of one of said straight straps, said curved straps being also secured to said sections near the end thereof and extending beyond said ends, of chambers at opposite ends of said sections, pulleys in said chambers, cables secured to the ends of the curved straps and extending thence over said pulleys, and means for operating said cables to raise and lower said sections.

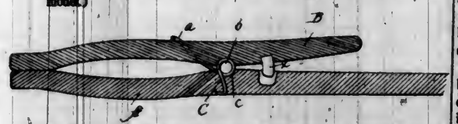
7. In combination, a wagon-box having parallel transverse partitions, as E E, and a seat having attached a strip, as C, adapted to be inserted between said partitions, substantially as described.



478,380. SPEAKING-TUBE EXCHANGE. LEOPOLD STROUSE, Baltimore, Md. Filed Mar. 5, 1892. Serial No. 423,813. (No model.)

Claim.—1. In a speaking-tube exchange, the combination of an assembly-case of suitable form, a number of speaking-tubes having end portions extending through said assembly-case and inclosed thereby, each tube having communication with the interior of the assembly-case through openings *a* in two opposite sides of its end portion, which is within the said case, and a piston-valve for each tube, having a stem and a knob thereon outside the assembly-case and arranged to slide in the tube and open and close communication between the said tube and the interior of the assembly-case through the side openings in the tube.

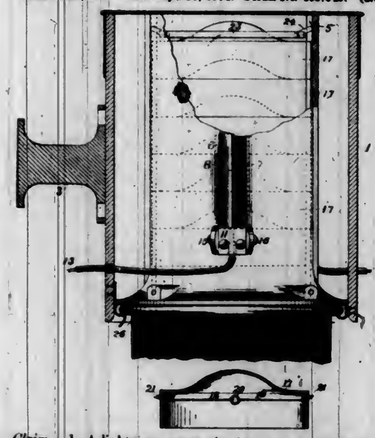
2. In a speaking-tube exchange, the combination of an assembly-case of suitable form, having a mouth and ear piece opening out of it at one part, a cut-off slide-piece fitting in vertical guideways inside the case and closing the inner end of said mouth and ear piece and provided with a suitable handle by which to slide it upward and open the mouth and ear piece, a number of speaking-tubes having end portions extending through the assembly-case and communicating therewith through side openings in the tubes, and piston slide-valves in the tubes controlling communication between them and the assembly-case and having suitable stems and knobs thereon outside the said case.



478,381. CUTTING-KNIFE. WILLIAM E. TAFT, Dunmore, Pa. Filed May 5, 1891. Serial No. 392,056. (No model.)

Claim.—1. A knife for the cutting-heads of turning-lathes, having an edge of curved or angular form, with the edge bevel on one side of the blade at the center and on the other side of the blade at the margin, as and for the purpose set forth.

2. A knife for the cutter-heads of turning-lathes, having an edge of curved or angular form, with bevels on each side, the bevels at the margin being full and the surface of the knife on the sides opposite said full bevels being plain.



478,382. CLOTHES-TONGS. HORACE UPTON and WILLIAM KENNARD, Bar Harbor, Me. Filed Jan. 29, 1891. Serial No. 379,495. (No model.)

Claim.—1. In combination, the two members A B, means for holding them together pivotally, consisting of a loop the two strands of which extend down the sides of the member B and are continued inwardly toward each other and transversely between the two members, forming two sections of a coil, the said sections being held in place by a fastening embedded and protected in the body of the long member, said fastening consisting of the two strands of the wire at the inner ends of the sections, which are continued from the inner to the outer side and clinched to make a flush surface.

2. In combination, the two members A B, the loop-spring connection between them, said spring forming the pivot of the members, and means for preventing lateral displacement, consisting of a tongue on one member entering a slit in the other member, substantially as described.

478,383. LIGHTNING-ARRESTER. CHARLES S. VAN HUIS, New Brunswick, N. J. Filed Sept. 16, 1891. Serial No. 405,845. (No model.)

Claim.—1. A lightning-arrester having sections of fusible wire in line with each other end to end, the meeting ends of which are separated by a short space and the outer ends of which are adapted to be connected to line and to earth, the wires being of such size and material that when an arc is formed they will be quickly fused, thereby opening the circuit, substantially as described.

2. A lightning-arrester consisting of an insulating-bead or similar connecting device and wires connected thereto on different sides in substantially the manner described, whereby the wires are mechanically connected end to end, but are electrically disconnected, substantially as described.

3. A lightning arrester consisting of an insulating-bead or similar connecting device and fusible wires connected thereto on different sides by being wound around the same, the outer ends of said wires being held by a suitable support, substantially as described.

4. A lightning-arrester consisting of an insulating-bead or similar connecting device and fusible wires connected thereto on different sides by being wound around the same, the outer ends of said wires being held by the rim of a cup-shaped support, substantially as described.

5. A lightning-arrester consisting of an insulating bead or similar connecting device and fusible wires connected thereto on different sides by being wound around the same, the outer ends of said wires being held by a suitable support, in combination with circuit-terminals in co-operative relation thereto, substantially as described.

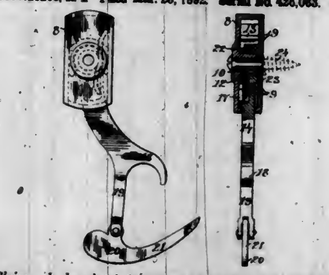
6. The combination of a supporting-body, a fusible conductor supported thereon, said conductor being knotted or twisted at the end and having a projecting end, and a terminal or stop against which said end is adapted to impinge, substantially as described.

7. The combination, in a lightning-arrester or cut-out, of one or more circuit-terminal and several fusible conductors movable successively into contact with the terminals and arranged alternately in different places, said terminal or terminals being so arranged that the alternate conductors make contact therewith at different points, whereby the fuse which is thrown forward is not destroyed by the heat of the terminal due to the burning of the preceding fuse, substantially as described.

8. The combination of an inclosing case, line-terminals near the bottom thereof, and several separate supports and fusible conductors carried thereby in the case, one above another, said conductors having contacts adapted to come to rest successively on the terminals, substantially as described.

9. The combination of an inclosing case having grooves in its inner surface, line-terminals having contact-surfaces projecting into said grooves, and fusible conductors, the ends of which move in said grooves and make contact with the terminals, substantially as described.

10. The combination of an inclosing case having grooves in its inner surface, line-terminals having contact-surfaces projecting into said grooves, fusible conductors, the ends of which move in said grooves and make contact with the terminals, and means for conducting hot gases or fumes from said terminals, substantially as described.



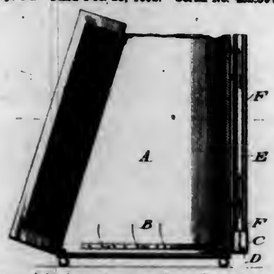
11. The combination of an inclosing case and several lightning-arresters, one above another, therein and movable forward in a straight line when released, said arresters being supported by the bottom one of the series while it is whole, but which are released when the same is burned, whereby when the arrester is burned the reserve arresters fall by gravity, bringing the following arrester into operative position, substantially as described.

12. The combination of line-terminals, several lightning-arresters movable forward in a straight line when released and in position to fall by gravity to bring them successively into operative connection with said terminals, and means operated by burning of the arrester in operative position to release the reserve arresters, substantially as described.

13. The combination, in a lightning-arrester, of line-terminals and a fusible conductor connected to each terminal, said conductors being electrically disconnected centrally between said terminals, said fusible conductors being of such character as to be fused, so as to be broken down or destroyed by the formation of an arc, whereby when an arc is formed between the adjacent ends of the fusible conductor the line-terminals will be at a distance from the point of greatest heat, and whereby the circuit will be opened, substantially as described.

14. The combination, in a lightning-arrester apparatus, of a reservoir having a groove on its inner surface, lightning-arrester conductors and supports therefor in the reservoir, and terminal-contacts, said supports having projections extending into said groove, whereby the conductors are held in line with the contacts, substantially as described.

478,384. LATCH FOR EXTENSION-LADDERS. JOHN A. WESTON, Providence, R. I. Filed Mar. 23, 1892. Serial No. 426,063. (No model.)

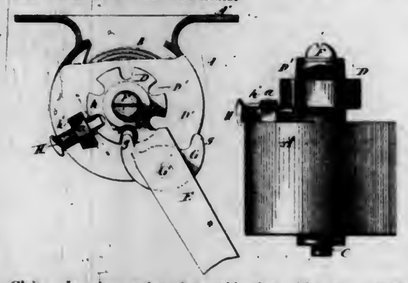


Claim.—1. In a latch for extension-ladders, the combination, with the spring-operated latch-bar 14, having the jaw 18 and downwardly-extending arm 19, and the counterweighted pawl 20, having the finger 21, pivoted to the end of said arm, of means for securing the pivoted end of the latch-bar 14 on the case containing the same to a ladder, as described.

2. In a latch for extension-ladders, the combination, with the case 8, having the spurs 9 9, the tubular bearing-post 10, the bearing-rib 12, and the plate 23 for closing said case, of the latch-bar 14, having the recess 15, lip 17, and perforation 16, adapted to receive said bear-

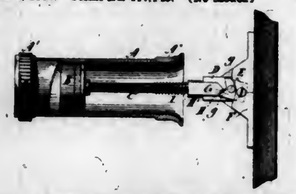
ing-post, a jaw 18, formed in part with said latch, an arm 19, depending therefrom, and a counterweighted pawl pivoted to the end of said arm, as and for the purpose described.

478,385. SOLAR OR OTHER BATH. WILLIAM H. WHITELEY, Darby, Pa. Filed Feb. 23, 1892. Serial No. 422,397. (No model.)



Claim.—A bath having a perforated pipe in the lower portion thereof, a heating-chamber outside of said bath, in communication with said pipe, and a combustion discharge-pipe for said chamber, substantially as described.

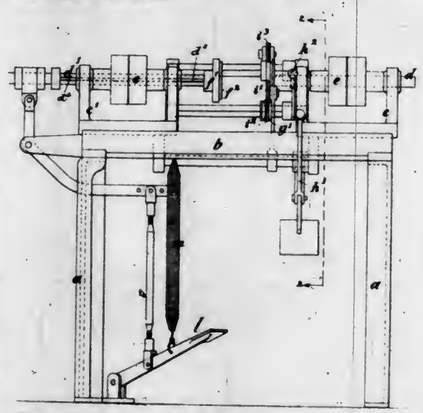
478,386. CLOAK-RACK. FRANK WOLF, New York, N. Y. Filed Mar. 14, 1891. Serial No. 385,037. (No model.)



Claim.—The combination, with an upright standard having a socket at its upper end, of a ring-shaped supporting-rail provided with a groove in its top part, radial arms attached to the inner circumference of the ring-shaped rail, a central connecting-piece for said arms, provided with a fixed pivot-pin at its lower end, said pivot-pin being adapted to be inserted into the socket of the standard, and a cloak-hanger having an anti-friction roller at its upper end guided in the groove of the rail, substantially as set forth.

478,387. DOOR-SPRING. GRANVILLE W. WRIGHT, New Haven, Conn., assignor to the Sargent & Company, same place. Filed Jan. 6 1892. Serial No. 417,144. (No model.)

Claim.—In a door-spring, the combination, with a case, a coiled spring, and a spring-shaft, of a clutch-collar rigidly attached to one end of the shaft and provided with a circular series of peripheral notches, a lever loosely connected with the shaft and bearing upon the outer face of the said collar, a clutch carried by the lever for engagement with the notches of the said collar, and a stop-key mounted for limited axial rotation upon the adjacent face of the case and having its inner end extended radially under the collar and flattened and its outer end constructed for manual engagement, substantially as set forth, and whereby when the key is turned in either direction one of the edges of its inner end will be lifted into the path in which the collar rotates.



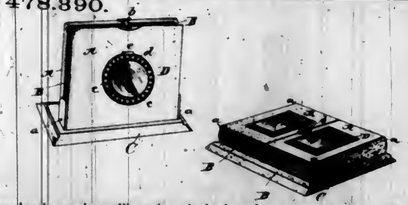
478,388. PNEUMATIC DOOR-CHECK. GRANVILLE W. WRIGHT, New Haven, Conn., assignor to the Sargent & Company, same place. Filed Jan. 6, 1892. Serial No. 417,145. (No model.)

Claim.—1. In a pneumatic door-check, the combination, with a cylinder, of a plunger therefor, a stem for the plunger, a bracket with which the inner end of the said stem is pivotally connected, a sliding spring-actuated cam mounted on the inner end of the stem, and an adjustable cam mounted on the bracket for co-operation with the said sliding cam, substantially as set forth.

2. In a pneumatic door-check, the combination, with a cylinder, of a plunger therefor, a stem for the plunger, a holder or block having the inner end of the stem mounted in it, a bracket in which the said holder or block is pivotally mounted, an adjustable cam swiveled in the said bracket and having its outer end provided with oppositely-inclined cam-faces forming an open notch, means for securing this cam in any desired position of adjustment on its swivel, a sliding cam mounted on the inner end of the stem and having a beveled inner end corresponding to the cam-faces of the adjustable cam, and a spring mounted on the stem and exerting a constant tendency to force the sliding cam into engagement with the adjustable cam, substantially as described.

478,389. MACHINE FOR MAKING METAL CANISTERS. ALBERT E. BENTLEY, Manchester, England. Filed Jan. 13, 1892. Serial No. 417,907. (No model.)

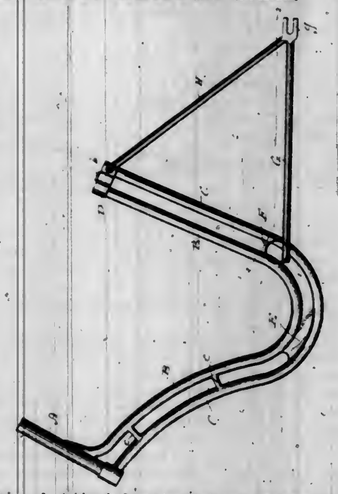
Claim.—1. In a seaming-machine, the combination of a working head adapted to fit into the open end of the cylindrical body of the canister, the said head being provided with a loose cap or ring capable of an eccentric motion, with a tool i', as and for the purpose set forth.



2. In a seaming-machine, the combination of a working head adapted to fit into the open end of the cylindrical body of the canister, the said head provided with a loose cap or ring capable of an eccentric motion, with a plain tool i', a paning-tool i^2, and a double-seaming tool i^3, as and for the purposes set forth.

3. In a seaming-machine, the combination of two rotary spindles, each carrying at one end a head adapted to fit into the open ends of the cylindrical body of the canister, with tools i', i^2, and i^3, set around the head, and pivoted levers g', g^2, and g^3, carrying the said tools, respectively, all substantially as and for the purposes set forth.

478,390. ALBUM-CASE. WILLIAM BERGNER, Baltimore, Md., assignor to F. Bergner & Co., same place. Filed Apr. 8, 1892. Serial No. 428,276. (No model.)



Claim.—An album-case composed of two or more pieces of suitable material hinged together and provided on its outer face with one or more open-center frames superimposed thereon and secured thereto and adapted to receive within said frames ornamental articles which

478,390.

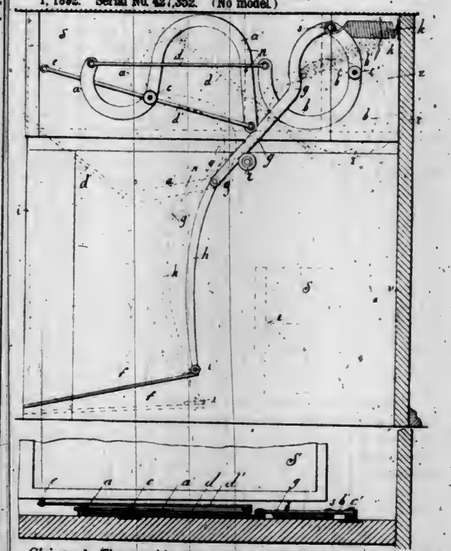
may be changed at will to alter the look and appearance of said album case, substantially as described, and for the purposes specified.

478,391. BICYCLE-FRAME. FRANK H. BOLTE, Milwaukee, Wis., assignor to the Seroombe-Bolte Manufacturing Company, same place. Filed Feb. 13, 1892. Serial No. 421,375. (No model.)

Claim.—1. A bicycle-frame in which two continuous reach rods or tubes are arranged one above the other parallel throughout their length extended downward from the front, then curved, continued upward, and joined at their rear upper ends, and a brace-plate that stands on edge between the lower curved portions of the rods or tubes, conforms to the curve, and extends approximately the whole length of the same, substantially as set forth.

2. A bicycle-frame in which parallel rods or tubes joined to a vertically-disposed steering-head extend down and toward the rear, then turn on curves, and continue upward, and a crank-hanger in the form of a sleeve having seats engaging said parallel rods or tubes, substantially as set forth.

3. A bicycle-frame comprising a vertically-disposed steering-head, parallel rods or tubes that join the front one, extend down and toward the rear, then turn on curves, and continue upward, and a socket cap that joins the upper rear ends of the parallel tubes and is provided with an aperture for engagement with a saddle-post, substantially as set forth.



4. A bicycle-frame comprising a vertically-disposed steering-head, parallel rods or tubes that join the front one, extend down and toward the rear, then turn on curves, and continue upward, a socket-cap that joins the upper rear ends of the parallel rods or tubes and is provided with an aperture for engagement with a saddle-post, and a brace-plate set on edge between the lower curved portions of said parallel rods or tubes, substantially as set forth.

5. A bicycle frame comprising a vertically-disposed steering-head, parallel rods or tubes that join the front one, extend down and toward the rear, then turn on curves, and continue upward, a socket-cap that joins the upper rear ends of the parallel rods or tubes and is provided with an aperture for engagement with a saddle-post, and a crank-hanger in the form of a sleeve having seats engaging said parallel rods or tubes, substantially as set forth.

6. A bicycle-frame comprising a vertically-disposed steering-head, parallel rods or tubes that join the front one, extend down and toward the rear, then turn on curves, and continue upward, a socket-cap that joins the upper rear ends of the parallel rods or tubes and is provided with an aperture for engagement with a saddle-post, a brace in the form of a plate set on edge between the lower curved portions of said parallel rods or tubes, a crank-hanger in the form of a sleeve positioned in rear of the brace-plate and provided with seats that engage the aforesaid parallel rods or tubes, rearwardly-extended rods or tubes having their front ends seated in the crank-hanger, other rods or tubes that have their upper ends joined to the socket-cap, and axle-supports joining the lower ends of the latter rods or tubes with the rear ends of those that extend horizontally from said crank-hanger, substantially as set forth.

7. A bicycle-frame provided with a crank-hanger in the form of a section of tubing cut out to form seats that engage the adjacent frame rods or tubes, substantially as set forth.

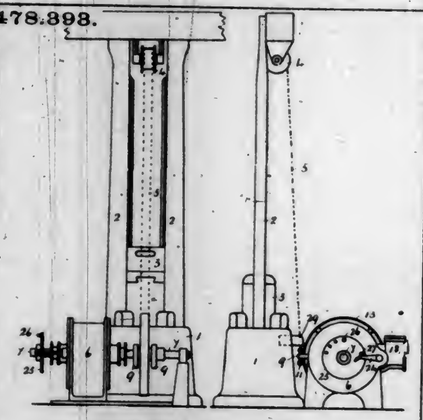
478,392. TILL-LOCK. HUGO BRAV, Berlin, Germany. Filed Apr. 1, 1892. Serial No. 427,352. (No model.)

Claim.—1. The combination, with a drawer, of spring-actuated levers connected therewith and normally tending to maintain the drawer closed and means for throwing the levers against the tension of the spring for opening said drawer, substantially as described.

2. The combination, with a drawer, of two connected levers, one of which is connected with the drawer and the other of which is connected with a spring and provided with means for throwing it to open the drawer through the medium of the first-named lever, substantially as described.

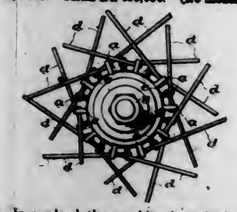
3. The combination, with a drawer, of an oscillating lever in the shape of a compound curve, disposed vertically, a rod connecting the rear downwardly-curved end of said lever with the drawer, a second oscillating lever fulcrumed intermediate its ends, and a rod connecting one end of said lever with the upwardly-curved front end of the first-named lever, the opposite end of said second lever having means for throwing it and provided with a retractile spring, substantially as described.

478,393. STEAM-STAMP. EDWARD S. BRETT, Coventry, England. Filed Feb. 26, 1892. Serial No. 422,950. (No model.) Patented in England Feb 24, 1890, No. 2,924, and Apr. 29, 1891, No. 7,354.



Claim.—1. The combination, in steam-stamps, with the block 1, pillar-guides 2 2, hammer 3, and band 5, of a cylinder having a part-rotating piston 8, shaft 7, and levers 9 9, and the operating-valves, all substantially as set forth.

2. The combination, in steam-stamps, with the cylinder 6, piston 8, valves 14 and 18, and shaft 7, of the lifting-levers 9 9 and loose pulley 13, substantially as described and shown.



3. The combination, in steam-stamps, with the lifting-levers 9 9 the valve 14, piston 8, shaft 7, and the projections 29, of the buffer-pins 11 11, substantially as set forth, and for the purposes specified.

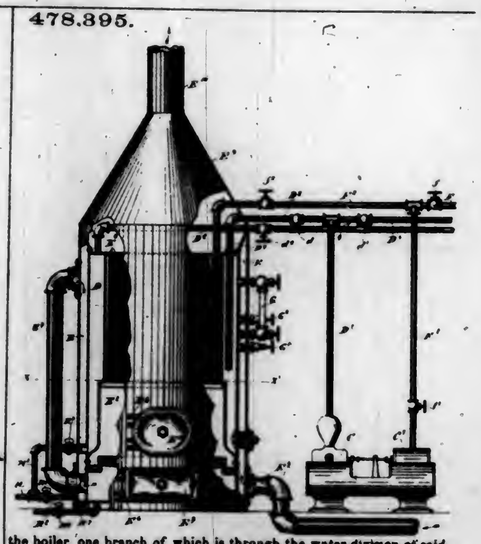
4. In steam-stamps, the combination, with the cylinder 6, piston 8, and shaft 7, having thereon the plate 25, with striking-pieces 26 and 27, of the lever 24, carried upon the spindle 23 of the valve 14, substantially as set forth, and for the purpose specified.

478.398.

478,394. BICYCLE-WHEEL. JACOB S. BENTZ, Philadelphia, Pa. Filed Oct. 14, 1891. Serial No. 408,636. (No model.)

Claim.—1. In a wheel, the combination of a hub having a series of integral independent spurs *a* radiating therefrom, each of the said spurs being provided with smooth-bored orifices *c*, and spokes *d*, inserted through said orifices, tangentially disposed to the hub, said spokes provided at their inner ends with heads *e*, which impinge against the side of the spurs, the outer ends of the spokes being secured to the rim of the wheel, substantially as described.

2. In a wheel, a metallic hub consisting of the central section B and end flanges A, two series of integral independent spurs *a*, provided circumferentially upon each flange A, radiating therefrom, each spur of a series alternately disposed at one side of the circumferential line of the adjoining series of spurs, each of the spurs provided with a smooth-bored orifice *c*, and spokes tangentially disposed inserted through said orifices and provided at or near their inner ends with heads which impinge against the sides of the spurs, substantially as described.



478,395. COMBINATION FEED-WATER HEATER AND BOILER. ANDREW T. BREWER, Minneapolis, Minn., assignor of one-half to James M. Boyd, Jr., same place. Filed Mar. 19, 1892. Serial No. 425,993. (No model.)

Claim.—1. In a steam plant, an apparatus interchangeably usable as a feed-water heater or as a temporary boiler, comprising a receptacle divided into water and heat medium compartments or divisions, valved inflow and outflow circulating-pipes to and from the water-division for the feed-water, a fire-pot constituting one element or compartment of the heat-medium division, suitable inlet and outlet openings for the heat medium, and an outflow live-steam pipe from the water-division to the feed-water pump, substantially as and for the purpose set forth.

2. In a steam plant, an apparatus interchangeably usable as an exhaust-steam feed-water heater or as a temporary boiler, comprising a receptacle divided into water and heat-medium divisions, valved inflow and outflow circulating-pipes for the feed-water, a fire-pot forming one compartment of the heat-medium division, an inlet-pipe for exhaust-steam to said heat-medium division, an outlet for the heat medium, an outflow live-steam pipe from the water-division to the feed-water pump, and means for closing the fire-pot flue and draft-openings steam-tight when employing the apparatus as a feed-water heater, substantially as described.

3. In a steam plant, the combination, with the primary or main boiler for supplying live steam to an engine or system of radiators, of a steam-pump, a receptacle having water and heat-medium divisions, direct and indirect valved feed-water connections from the pump to

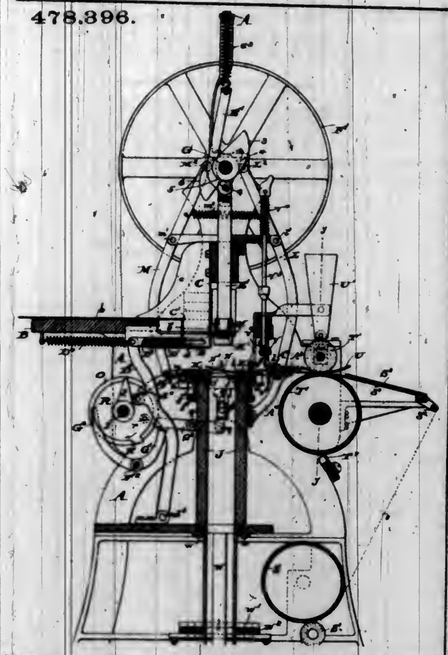
478.395.

the boiler, one branch of which is through the water-division of said receptacle, valved live-steam connections to the pump-engine, one branch of which is from the top of the water-division of the said receptacle, an exhaust-steam pipe delivering to the heat-medium division of said receptacle, and a fire-pot constituting one compartment of the said heat-medium division and provided with removable plugs for closing its fuel and draft register openings steam-tight, substantially as and for the purpose set forth.

4. The combination, with the receptacle composed of closed concentric drums, of a box or dome within the inner drum near the bottom of the same, flues from the said box passing through the inner drum, feed-water-circulating connections to and from the inner drum, an inlet exhaust-steam pipe delivering into the outer drum near its bottom, a circulating exhaust-steam pipe receiving from the top of the outer drum at a point opposite the inlet-pipe and delivering into the said box or dome at the bottom of the inner drum, and an outlet-hood and discharge-pipe for the exhaust steam or other heat medium extended from the top of the drum, substantially as described.

478,396. WRAPPING-MACHINE. MARTIN E. BRIGHAM, Philadelphia, Pa. Filed June 3, 1890. Serial No. 354,114. (No model.)

Claim.—1. In a machine for wrapping packages, the combination, with the folders, of a reciprocating feeding-plunger provided upon two sides only with holding-nippers and a reciprocating pusher located in a line with the nippers of the plunger when the same is in a raised position and adapted to push the article to be wrapped directly between said nippers.



2. In a wrapping-machine, the combination of a support for the article to be wrapped and its wrapper, feeding devices for feeding the wrappers successively over said support, a feeding-plunger for feeding the articles to be wrapped one at a time to said support, provided with nippers for holding the article, a reciprocating pusher to push the articles laterally between the nippers of the plunger, and folders for folding the edges of the wrapper about the article.

3. In a wrapping-machine, the combination of a feeding-chute for the articles to be wrapped, terminating in a support, supporting-jaws for supporting the articles and their wrappers, folding devices for folding the wrappers about the article while held in said supporting-jaws, a feeding-plunger for feeding the articles one at a time to said supporting-jaws, provided with nippers for holding the article, and a pusher to push the articles successively from the support of the feeding-chute to the feeding-plunger.

4. In a wrapping-machine, the combination, with supporting-jaws for the articles to be wrapped and their wrappers, of folding devices for folding the wrapper about the article, the feeding-plunger E, provided with nippers H' H' for feeding the articles to the supporting-jaws, the cam 3 for operating the plunger, the pusher D' for pushing the articles successively to the nippers of the plunger, the lever D^2 for operating the pusher, the cam 2 for operating the lever, and the spring D^4 for withdrawing the pusher after it has been projected by the lever D^2.

5. In a wrapping-machine, the combination, with jaws for supporting the articles to be wrapped, together with their wrappers, of

478.396.

folding devices for successively folding the edges of the wrapper upon the article, feeding devices for feeding the wrappers successively over the supporting-jaws, supports for supporting the wrappers above said jaws, cam mechanism for operating said supports for the wrapper to release the wrapper, and a feeding-plunger for feeding the articles one at a time upon the wrapper and between the supporting-jaws.

6. The combination, in a wrapping-machine, of supporting-jaws to support the article and its wrapper, folding devices to fold the wrapper about the article when so supported, a feeding-plunger to feed the articles one at a time to the supporting-jaws, feeding devices for feeding the wrapper between the plunger and supporting-jaws, supports for holding the wrapper above the jaws, cam mechanism to move said supports from under the wrapper and release it, cam mechanism to reciprocate the plunger, and connections between the cam mechanisms to operate them synchronously.

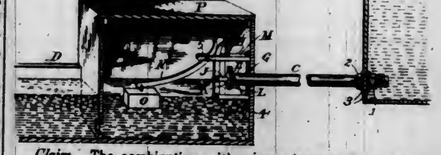
7. The combination, in a wrapping-machine, of supporting-jaws to support the article and its wrapper, folders to fold the wrapper about the article when so supported, a feeding-plunger to feed the articles one at a time to the supporting-jaws, feeding devices to feed the wrappers over the supporting-jaws and under the plunger, supporting-wings N for the paper carried by the pivoted levers N', and wheels O, having cam-grooves *o* for the free ends N^2 of the levers, whereby the wings N are operated to release the wrapper.

8. The combination, in a wrapping-machine, of supporting-jaws to support the article and its wrapper, folders to fold the wrapper about the article when so supported, a feeding-plunger to feed the articles one at a time to the supporting-jaws, feeding devices to feed the wrappers over the supporting-jaws and under the plunger, paste-supplying rollers to supply paste to the edges of said wrappers, and a stripper to prevent the pasted wrapper adhering to the feeding devices.

9. The combination, in a wrapping-machine, of supporting-jaws to support the article and its wrapper, folders to fold the wrapper about the article when so supported, a feeding-plunger to feed the articles one at a time to the supporting-jaws, feeding-rollers for feeding the wrapper over the supporting-jaws and under the plunger, means to supply paste to one of said rollers, and stripping fingers or wires extending between said rollers to prevent the wrapper adhering to the paste-applying roller.

10. In a wrapping-machine, the combination of supporting-jaws having a yielding supporting-surface to hold the article to be wrapped, together with its wrapper, a delivery-chute extending below said supporting-jaws, folding devices to fold the wrapper about the article while held by the supporting-jaws, and a feeding-plunger provided with nippers for holding and feeding the articles one at a time to the supporting-jaws and adapted to push the article, when wrapped from the supporting-jaws to the delivery-chute.

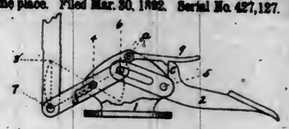
11. The combination, in a wrapping-machine, of two laterally-reciprocating folders for folding over the upper portions of the wrapper, each provided with lateral projections, arranged immediately adjacent to and below the upper portions of said folders, for folding in the sides of the ends of the wrapper, whereby the folding of each upper flap and the corresponding sides of the ends of the wrapper are accomplished simultaneously.



12. The combination, in a wrapping-machine, of the supporting-jaws J' J' for supporting the article to be wrapped and its wrapper, the laterally-reciprocating folders K K, movable over said jaws J' J' and provided with the folding-blocks K^2 K^3, arranged immediately adjacent to and below the upper portions of the folders K K for folding in the sides of the ends of the wrapper, the vertically-movable folders P P for folding down the upper projecting ends of the wrapper, and the vertically-movable folders Q Q for folding up the lower projecting ends of the wrappers, said folders operating successively and entirely folding the package while supported by the jaws J' J', substantially in the manner described.

13. In a machine for wrapping articles, the combination, with folders for folding the wrapper about the article, of a feeding-table to support the articles, terminating in a feeding-chute, side and end guides upon said table to guide the articles to the feeding-chute, and a pusher to push the articles from the chute into a position above the folders.

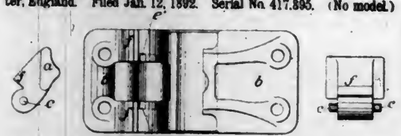
14. In a wrapping-machine, the combination of supporting-jaws for the articles to be wrapped, a feeding-plunger for feeding the articles thereto one at a time, laterally-movable folders located above the supporting-jaws, means to feed the wrapper between the feeding-plunger and supporting-jaws, the vertically-movable folder P P for folding down the upper projecting end of the wrapper, vertically-movable folders Q Q for folding up the lower projecting ends of the wrapper, and cam mechanism for operating said folders P P and Q Q successively.



15. In a wrapping-machine, the combination of supporting-jaws for the article to be wrapped, a feeding-plunger for feeding the articles thereto one at a time, laterally-movable folders located above the supporting-jaws, means to feed the wrapper between the feeding-plunger and supporting-jaws, the vertically-movable folders P P for folding down the upper projecting end of the wrapper, vertically-movable folders Q Q for folding up the lower projecting ends of the wrapper, lever Q^3, connected to the folders Q, supporting-levers G', cams R' for operating the levers Q^3, and pins *r* for operating the supporting-levers G'.

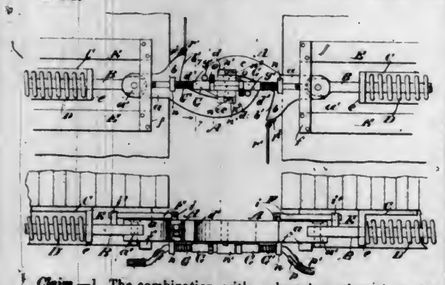
478,397. AUTOMATIC WATERING-TROUGH. JAMES A BROWN, Sublette, Ill. Filed Sept. 21, 1891. Serial No. 406,326. (No model.)

Claim.—The combination, with a watering-trough, of a box at one end thereof provided with openings communicating with the trough, a supply-pipe projecting into the box, a plate upon the inside of the box surrounding the end of the supply-pipe, two standards in the plate, one above and one below the pipe, the inner end of the upper standard being slotted longitudinally, an oblique lever pivotally secured in the outer portion of the slotted end of the upper standard, the upper end of which lever is cam-shaped and projects above said standard and the opposite end is provided with a float, a vertical lever pivotally secured at its lower end to the lower standard and having its upper end cam-shaped and passed through the slot in the upper standard to the rear of the other lever and adapted be engaged and operated thereby, and a valve pivotally secured to the intermediate portion of said vertical lever and engaging with the end of the supply-pipe, whereby the supply of water to be admitted to the trough may be regulated, substantially as set forth.



478,398. CLUTCH-TREADLE. ANDREW C. CAMPBELL, Waterbury, Conn., assignor to the Waterbury Farrel Foundry and Machine Company, same place. Filed Mar. 30, 1892. Serial No. 427,127. (No model.)

Claim.—1. In a clutch-treadle, the combination of a frame or holder 1, a lever 3, supported by the holder, a pin 4, said lever 3 being provided with a series of holes adapted to receive the pin 4, whereby the fulcrum may be located so as to preserve a constant ratio between the two arms of the lever 3, and a pin 6, extending through one end of the lever 3, a lever 2, fulcrumed upon a pin 5, supported by the frame 1, shaped at one end to receive a person's foot and slotted at the other end to receive the pin 6 in the end of the lever 3, whereby motion is imparted from one lever to the other, substantially as described, for the purpose specified.



2. In a clutch-treadle, the combination of a frame or holder 1, a compound lever 2 and 3, fulcrumed upon pins supported by the frame 1, said lever 2, provided with a projecting tooth *c*, and a pawl 9, swinging upon a pin *a*, supported by the holder 1 and adapted to catch under said tooth *c*, whereby the lever 2 is held down, said pawl 9 being provided with a horn extending from one end, whereby said pawl may be raised to release the lever 2, all substantially as described.

478,399. RAIL-CHAIR AND COUPLING FOR PERMANENT WAYS. ROBERT CARDWELL, Liverpool, and SAMUEL WATSON, Manchester, England. Filed Jan. 12, 1892. Serial No. 417,895. (No model.)

Claim.—In single and joint rail-chairs secured to or formed with a sleeper, the movable jaw *a*, having pivots *c*, in combination with eyes *d*, formed on the base *b*, the inner faces of which are formed with slotted sockets *c c'*, adapted to receive the pivots *c* and serve as a fulcrum for the movable jaw *a*, substantially as and for the purpose set forth.

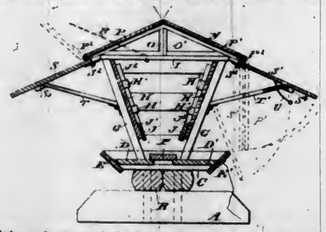
478,400. COMBINED CAR AND HOSE COUPLING. JOHN H. CARROLL, De Smet, S. D. Filed Aug. 24, 1891. Serial No. 403,540. (No model.)

Claim.—1. The combination, with a draw-bar adapted to slide longitudinally on a car-frame and a buffer-spring thereon cushioning the draw-bar in two directions of travel, of a side-latching coupling-head pivoted on the front end of the draw-bar and a plate-spring fastened at one end to the coupling-head and loosely connected with the draw-bar, substantially as described.

2. The combination, with a support for a draw-bar, adanted to retain it on a car-frame free to slide longitudinally, an elongated cylindrical draw-bar, and a buffer spring thereon adapted to cushion the bar against draft force or end-thrust, a coupling-head jointed to swing laterally on the draw-bar front end and provided with a lateral latch-hook, and an abutment-shoulder rearward of said latch-hook, of a flat spring held by one end edgewise on the coupling-head and loosely connected with the draw-bar, substantially as described.

3. The combination, with a bracket-plate on a car-frame, a cylindrical draw-bar held to slide in lugs of the bracket-plate, a buffer-spring thereon, a side-latching coupling-head jointed to swing laterally on the front end of the draw-bar, and a plate-spring affixed by one end on the coupling-head edgewise and loosely connected at the other end upon the draw-bar, of a supporting-plate transversely secured on the car-frame timbers below the coupling-head, a bell-crank lever pivoted on the car-frame in front, a link pivoted to a short limb of the bell-crank lever and by its other end to an ear on the coupling-head, a treadle above on the car, and a connecting-rod between the treadle-lever and bell-crank lever, substantially as described.

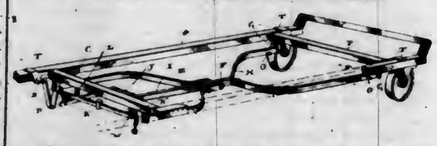
4. The combination, with a car coupling head pivoted to swing laterally and connect with a mating coupling-head, of a hose-coupling half-section positively held upon the car-coupling head and movable into position to couple in response to a corresponding movement of the car-coupling head and adapted to couple with a mating hose-coupling section when the car-coupling heads are joined, substantially as described.



478,401. SMOKE-CONSUMING FURNACE. EDWARD CARTWRIGHT, Wilber, Nebr., assignor of seven-ninths to William H. Mann, John W. Wehn, Jr., Alfred Bigelow, and Frank Jelenik, Jr., same place, James A. Paddock, Deadwood, S. D., Ervin W. Clancy and Emeric Longtin, Beatrice, and Tobias Castor, Lincoln, Nebr. Filed Apr. 28, 1891. Serial No. 390,851. (No model.)

Claim.—1. A furnace having an outlet-flue curved from the side walls of the fire-box through a horizontal arc of ninety degrees and having greater vertical depth along the outer or longer arc than it has along the inner or shorter arc, substantially as shown and described.

2. A furnace having a tapered or contracting outlet-flue curved from the side walls of the fire-box through a horizontal arc of ninety degrees and dipping down at a point between the ends of the flue and also having a greater vertical depth upon the outer or large arc of the curve than it has upon the inner or smaller arc, substantially as shown and described.



478,402. STOCK-FEEDING RACK. HENRY G. CHAMBERLAIN, Ridgeway, Wis. Filed June 23, 1891. Serial No. 397,178. (No model.)

Claim.—1. A stock-feeding rack comprising side troughs, posts projecting upward and outward from the said troughs, side boards held on the said posts, gates permitted to slide on the lower ends of the said side boards to increase or diminish the opening between the said side boards and provided with toothed arms, spring-pawls engaging the said toothed arms, a roof held on the said posts, the said roof comprising peaked sections supported on cross-bars attached to the said posts, roof-doors hinged to the lower or outer ends of the said sections to swing down into a vertical position, and extension-roof doors hinged to the peaked sections and supported on braces hinged to the said posts, substantially as shown and described.

2. A stock-feeding rack comprising side troughs, posts projecting upward and outward from the said troughs, side boards held on the said posts, gates permitted to slide on the lower ends of the said side boards to increase or diminish the opening between the said side boards, and a dividing-board between the troughs, a roof held on the said posts, the said roof comprising peaked sections supported on cross-bars attached to the said posts, roof-doors hinged to the lower or outer ends of the said sections, and a cord or rope having one end attached to one of the said roof-doors and the other end to one of the cross-bars to limit the outward swinging motion of the said roof portion, substantially as shown and described.

478,403. WEIGHING-TRUCK. ELMER E. CHANDLER, Royal Oak, Mich. Filed Mar. 14, 1892. Serial No. 424,849. (No model.)

Claim.—1. In a weighing-truck, the combination, with a frame and a weighing mechanism and platform therein, of movable bars which are supported over the platform, substantially as shown and described.

2. In a weighing-truck, the combination, with a frame and a weighing mechanism and platform therein, of brackets pivoted at their inner ends to the frame and upon opposite sides thereof and bars which connect the free ends of the said brackets, substantially as shown and described.

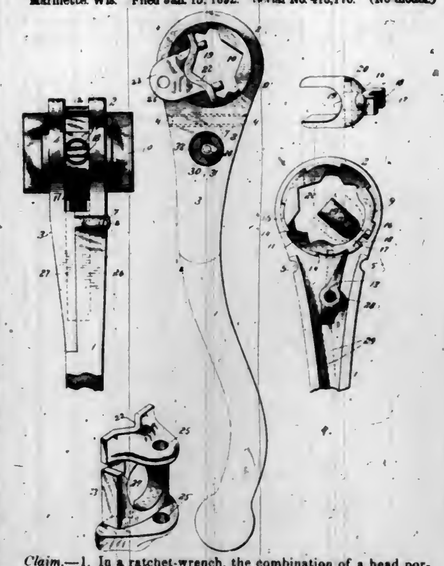
3. In a weighing-truck, the combination, with a frame and a weighing-platform therein, of brackets pivoted upon opposite sides of the frame near the ends of the platform, outwardly-projecting lips on the free ends of the brackets, and bars which connect the free ends of the said oppositely-arranged brackets, substantially as shown and described.

478,404. REGISTERING TOY BANK. WILLIAM R. CHRISTIE, New York, N. Y., assignor of one-half to Jungermann Brothers, same place. Filed Apr. 17, 1891. Serial No. 389,330. (No model.)

Claim.—1. In a registering-bank, the combination, with the registering mechanism and an actuating or trip lever engaging with said mechanism, of a shaft mounted to turn and provided with a coin-slot extending through from side to side, the slotted portion of the shaft being opposite one end of the trip or actuating lever, a spring independent of the shaft and located in front of the shaft slot or opening, adapted to force a coin carried by the shaft through its opening, and a compartment for coin located at one side of the shaft and provided with an opening to receive the coin when it is forced from the shaft by said spring, substantially as shown and described.

2. In a registering-bank, the combination, with a casing, a pocket formed within the casing, semicircular in general contour and provided with an opening therein, an alarm device located opposite the convex surface of the pocket, a registering mechanism, and a trip-lever engaging with the mechanism and facing the concaved surface of the pocket, of a coin-receiver consisting of a shaft held to revolve in the pocket and provided with a coin slot or opening, the said slot or opening being adapted at a point in the revolution of the shaft to face the trip-lever and the opening in the pocket, and a propelling mechanism adapted to act upon a coin while carried by the shaft when the coin-opening in the shaft is opposite the opening in the pocket, substantially as and for the purpose specified.

3. In a registering-bank, the combination, with a casing, a pocket formed within the casing and provided with an opening therein, a registering mechanism, and a trip lever engaging with the mechanism and facing one side of the pocket, of a coin-receiver consisting of a shaft held to revolve in the pocket and provided with a coin slot or opening, said slot or opening being adapted at a point in the revolution of the shaft to face the trip-lever and the opening in the pocket, as and for the purpose specified.



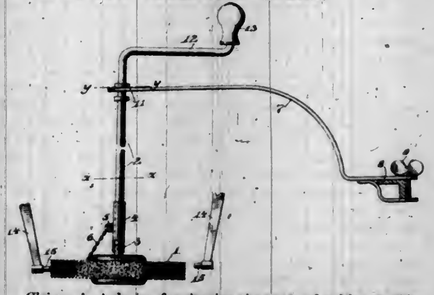
4. In a registering-bank, the combination, with a casing, a pocket formed within the casing and provided with an opening therein, a registering mechanism, and a trip-lever engaging with the mechanism and facing one side of the pocket, of a coin-receiver consisting of a shaft held to revolve in the pocket and provided with a coin-opening, the said coin-opening being adapted at a point in the revolution of the shaft to face the trip-lever and the opening in the pocket, an alarm device located at one side of the pocket in front of the opening therein, and a spring located at one side of the shaft and adapted for engagement with the coin when located in the slot of the shaft, as and for the purpose set forth.

5. In a registering-bank, the combination, with a registering mechanism, of a cover or lock-plate located beneath the mechanism, a lock-lever fulcrumed above the plate and provided with spurs adapted to enter an opening in said plate, the upper end of the lock-lever being actuated by the registering mechanism, and a removable key engaging with the lock-lever, whereby the lock-lever and lock-plate may be disengaged, substantially as described.

6. In a registering-bank, the combination, with a casing divided into compartments and provided with an opening in one face leading into one compartment and a plate closing said opening and provided with an inwardly-extending section, of a registering mechanism, a lock-lever provided with a spur adapted to enter the inwardly-extending portion of the plate, and a key entered into an opening above the plate, the said key being spring-pressed and provided with an opening to receive a spur located upon the lock-lever, the key being removable from the casing, substantially as and for the purpose specified.

7. In a registering-bank, the combination, with a casing and a partition dividing the casing into compartments, the said casing being provided with an opening leading into one of the compartments, and a plate closing said opening and extending within the inwardly-extending section, of a key extending within the casing over the plate, a lock-lever fulcrumed over the plate and provided with spurs entering the openings in the plate and in the key, a registering mechanism, and a trip connection between the registering mechanism and the lock-lever, as and for the purpose set forth.

478,405. WRENCH. HANS P. CHRISTENSEN and HANS NELSON, Marinette, Wis. Filed Jan. 15, 1892. Serial No. 418,176. (No model.)



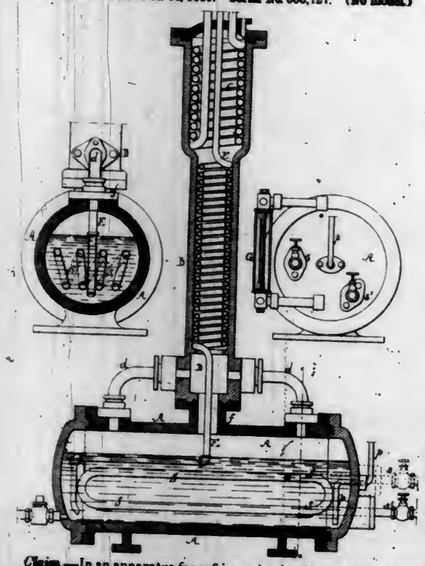
Claim.—1. In a ratchet-wrench, the combination of a head portion and removable cap, both provided with registering-openings, a revoluble nut-socket fitting in said openings, a turn-pin provided with a slotted head, and a pawl adapted to enter said slot, substantially as described.

2. In a wrench of the class described, the combination of a removable socket provided with exterior ratchet-teeth, a pawl, and slotted turn-pin, as specified.

3. The herein-described wrench, provided with a revoluble nut-socket having a ratchet and slotted turn-pin, in combination with a spring-actuated reversible pawl located in a chamber in the head portion of the wrench, substantially as and for the purpose set forth.

4. In a ratchet-wrench, a nut-socket having teeth and a turn-pin, in combination with a reversing-pawl, substantially as described.

478,406. CLEANING DEVICE FOR TYPE-WRITING MACHINES. OSCAR COHN, Bridgeport, Conn., assignor to MAX W. HENIUS, same place. Filed July 8, 1891. Serial No. 398,741. (No model.)



Claim.—1. A device for cleaning the types of writing-machines when arranged in circular or oval form, consisting, essentially, of a suitable attaching-arm, a circular horizontally-acting brush of less diameter than the distance between the nearest types, a shank by which

the brush is carried and which is loosely journaled in the attaching-arm, and means, as a crank, for turning the loosely-journaled shank so that in addition to its rotary movement an oscillatory movement is imparted to the brush, whereby the brush is brought successively in contact with every type in the series but does not remain in contact with any special type while in use.

2. A device of the class described, consisting of a circular brush, a shank by which it is carried, a joint between the shank and brush, a sleeve covering the joint and connected to the brush so as to tilt it when the sleeve is raised, and an attaching-arm in which the shank is loosely held, as and for the purpose set forth.

478,407. AMMONIA-STILL. NATHAN W. CONDICT, Jr., Jersey City, N. J. Filed Dec. 14, 1889. Serial No. 333,727. (No model.)

Claim.—In an apparatus for refrigerating by the ammonia-absorption process, the combination of a still with heating-coils therein, having an active heating-surface of from two to three square feet to about one cubic foot of the normal liquor-space in the still, substantially as described.

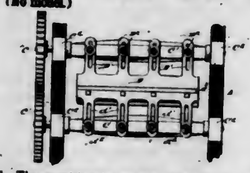
478,408. DITCHING-MACHINE. JOHN CORNELIUS, Oakland, Md. Filed Apr. 5, 1892. Serial No. 427,958. (No model.)

Claim.—1. In a ditching-machine, the combination, with the sole and the ditching-cutters, including a base-cutter, of a rear cutter-plate secured to the sole near the rear end thereof and extended laterally beyond the base-cutter, whereby to cut into the walls of the ditch, substantially as described, and for the purposes set forth.

2. In a ditching-machine, the combination, with the beam, the gage-wheel, and the ditching-cutters, of the track-clearer composed of a base plate or cutter, the side plates converging at their front ends, forming a cutting-edge, the supporting-shafts arranged one in rear of the other, threaded through the beam and having heads at their lower ends, and the cover-plate fitted on the said base-cutter and securing the heads of the shafts thereto, all substantially as set forth.

3. The improved ditching-machine herein described, consisting of the sole-piece, the beam, the adjustable gage-wheel, the adjustable track-clearer arranged in front of the gage-wheel, the base-cutter, the central cutter, the side cutters, the adjustable support for the said cutters, the partition in rear of the central cutter, and the turning-wings, all substantially as and for the purposes set forth.

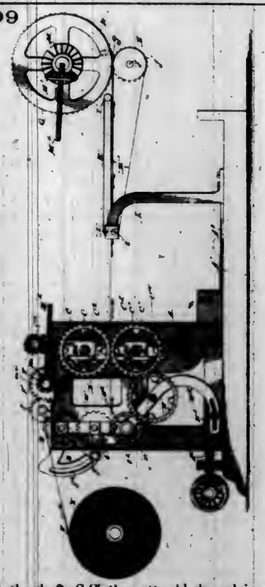
4. An improved ditching-machine comprising the base beam or sole A, provided with the base-cutter, the top bar or beam D, the central cutter C, held between the beams A and D, the side cutters J, secured at their lower ends to the base-cutter, supports for the upper ends of the side cutters, said supports being fixed to the top beams, the partition-plate G, arranged in rear of and in alignment with the cutter C and held between the beams A and D, and the turning-wings connecting with the partition and base-cutter, all substantially as and for the purposes set forth.



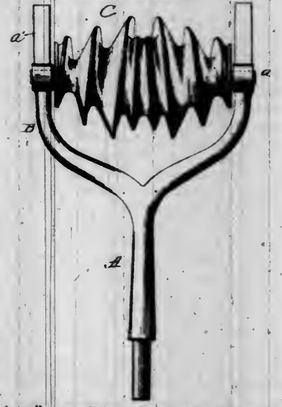
5. In a ditching-machine, substantially as described, the combination of the central cutter, the base-cutter, the side cutters, and the elevating and turning wings located considerably in rear of the central cutter, of the partition-plate arranged in rear of and in alignment with said central cutter, the said partition being arranged at its front edge close to the rear edge of the central cutter and extending rearwardly therefrom to the turning-wings, all substantially as described, whereby well defined slices may be formed and held separated before they are subjected to the action of the elevating and turning wings, substantially as set forth.

6. In a ditching-machine, the combination, with the base, central and side cutters and the beam, of the track-clearer, two independent vertically-adjustable supports arranged one in rear of the other and connecting the track-clearer with the beam, whereby said clearer may be adjusted vertically and to any desired angle to the horizontal, and the gage-wheel adjustably supported and arranged in rear of the track-clearer, substantially as and for the purpose set forth.

7. In a ditching-plow, the combination, substantially as described, of the sole-piece or base, the ditching-cutters, including a base-cutter, the elevating and turning wings, and a cutter L, secured to the sole-piece in rear of the base-cutter, substantially as and for the purposes set forth.



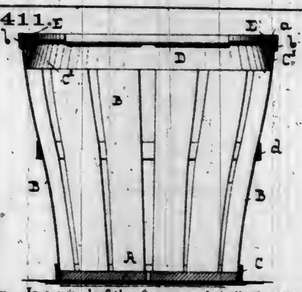
478,409. APPARATUS FOR SEVERING SHEETS FROM WEBS OF PAPER. JOSEPH L. COX, Battle Creek, Mich., assignor to the Duplex Printing Press Company, same place. Filed Nov. 1, 1889. Serial No. 328,949. (No model.)



Claim.—1. The combination of the shafts C C', the bars D d, adjustably secured to said shafts by slotted hangers and bolts, substantially as described, the impact-strip in bar D, the perforating-blade secured to bar d, and the interchangeable gears on said shafts, with the paper-feed rolls, the gears thereon, and the movable gear mounted in an adjustable bracket and adapted to transmit motion from the roll-shafts to the shafts C C', substantially as described.

2. The combination of the paper-rolls intergeared, as described, the horizontal shafts F, driven by gearing from a press-cylinder shaft, the interchangeable gear on shaft F, and the gear mounted on an adjustable bracket for transmitting motion from the gear on shaft F to the roll-shafts, with the shafts C C', the cutter-blade and impact-bars adjustably mounted on said shafts, and the interchangeable gears thereon, and the gear mounted in an adjustable bracket for transmitting motion from the roll-shafts to the shafts C C', substantially as described.

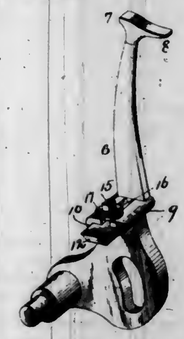
478,409



478,410. TROLLEY. JOHN W. DAVIS, Lynn, Mass. Filed Oct. 22, 1891. Serial No. 409,534. (No model.)

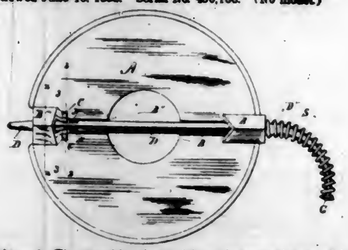
Claim.—A trolley consisting of an elongated body having tapering ends, with a central groove and spiral grooves about the tapered portions, communicating therewith, the said grooves extending into the body of the material and the flanges bounding said grooves being integral with the body portion, substantially as described.

478,411. BASKET. FRANK H. DUANE, Baltimore, Md., assignor of one-half to C. P. Tatem & Co., same place. Filed Mar. 19, 1892. Serial No. 425,622. (No model.)



Claim.—In a vessel of the character described, the body thereof, provided with a resting-piece for the lid, combined with a lid formed of crossed strips of different lengths and locking-segments attached to the body, under which the longer strips of the lid may be slid, substantially as specified.

478,412. WATCH-CASE. OSCAR R. DECKER, Rochester, Ind. Filed Oct. 2, 1891. Serial No. 407,540. (No model.)



Claim.—In a watch-case, substantially as described, the combination, with the inner annular or center part 1, having the projecting side flanges, the notches 2^a 3^a, formed in said flanges, and the inwardly-inclined locking-grooves formed in the outer edges of the side flanges and extending from the notches 2^a 3^a and having their outer side walls milled or corrugated, of the front and back sections having the inwardly-extending locking-lugs milled or corrugated on their inner sides to engage the milled or corrugated outer walls of the inclined grooves of the center part 1, substantially as specified.

478,413. WEFT-HAMMER FOR LOOMS. RALPH DERBYSHIRE and CHARLES H. MULLEN, Fall River, Mass. Filed May 11, 1891. Serial No. 392,386. (No model.)

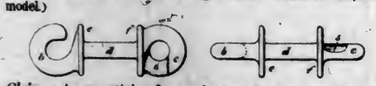
Claim.—In a loom, the combination, with the weft stop-lever having a beveled laterally-extending arm and an upwardly-projecting set-screw, of the laterally-adjustable weft-hammer having a foot at its lower end provided with a dovetailed groove or slot and a washer, substantially as described.

478,414. STOVEPIPE-DAMPER. LEVI M. DEVORE, Freeport, Ill., assignor of one-half to M. H. Wilcoxon, same place. Filed Aug. 12, 1890. Renewed June 10, 1892. Serial No. 436,188. (No model.)

Claim.—1. The combination, with a damper-plate and handle-shank provided, respectively, with devices to mutually engage and prevent longitudinal withdrawal of the shank, of bridges formed upon opposite faces of the plate and spanning the path of the shank, one of said bridges being high enough to permit lateral motion of the shank away from the plane of the plate, whereby the engaging devices may pass while the shank is beneath all the bridges, substantially as set forth.

2. The combination, with the non-cylindrical shank having the notches N and the spring upon its handle end, of the plate provided with the bridges B B' B'' and higher bridge B''' and with the undercut lugs C, arranged to register with said notches when the shank is pressed inward, overcoming the force of said spring, substantially as and for the purpose set forth.

478,415. BICYCLE. WILLIAM H. DE WITT, Wilkes-Barré, Pa. Filed Oct. 31, 1891. Serial No. 410,414. (No model.)



Claim.—1. In a bicycle, the combination, with the axle and wheel, the latter having ribbed hub, of a sprocket-wheel having a hub with grooves and means for moving the sprocket-wheel on its axle, as set forth.

2. The combination, with the axle and the wheel having ribbed hub, of the sprocket-wheel having grooved hub and annular chamber, the bell-crank lever, the arm connected therewith and working in said chamber, and means for actuating the bell-crank lever, as and for the purpose specified.

3. In a bicycle, the combination, with the ribbed hub and wheel and axle, of the sprocket-wheel having grooved hub, the bell-crank lever, the hooked arm adjustably connected therewith, the hand-lever, and pivotal connections between the hand and bell-crank levers, substantially as specified.

478,416. DRIVE-CHAIN. WEST DODD, Sac City, and ARTHUR T. MARTIN, Clinton, Iowa. Filed Aug. 7, 1891. Serial No. 401,939. (No model.)

Claim.—As an article of manufacture, the improved drive-chain link constructed integrally with a hook at one end and an eye at the other and radial flanges located at the respective ends of its shank and contiguous to said hook and eye, as shown and described.

478,417. SWING-JOINT FOR ELECTRIC-LIGHT BRACKETS. HENRY P. DREW, New York, N. Y. Filed Mar. 15, 1892. Serial No. 425,051. (No model.)

Claim.—1. In a swing-joint, two cupped joint-sections, branches thereon, perforated and threaded to receive pipes and further perforated to connect the threaded perforations with the cupped cavities of the joint-sections, a headed coupling-bolt loosely engaging one joint-

478,417.

section and locked to the other joint-section, a washer between the joint-sections, a washer under the coupling-bolt head, a clamping screw-bolt engaging a tapped axial hole in the other end of the coupling-bolt, and a washer between the locked joint-section and the head of the clamping screw-bolt, substantially as described.

2. In a swing-joint, two cupped joint-sections apertured and threaded internally in integral branches, a headed coupling-bolt loose in one joint-section and fast in the other joint-section, an insulating joint-washer between the coupling-bolt head and the loose joint-section, a joint-washer of non-conducting material between the adjacent edges of the two joint-sections, a clamping screw-bolt penetrating the other end of the coupling-bolt, an insulating joint-washer between the clamping screw-bolt head and the end of the fastened joint-section, and an insulating sleeve on the bolt-body engaging the loose joint-section and its washer, substantially as shown and described.

478,418. PROCESS OF FERMENTING. JEAN EFFRONT, Brussels, Belgium, assignor to the Société Générale de Maltose, same place. Filed May 18, 1891. Serial No. 393,204. (No specimens.) Patented in Austria-Hungary Dec. 18, 1888, No. 18,113; in France Dec. 20, 1888, No. 194,904; in England Apr. 1, 1889, No. 5,564; in Germany Sept. 14, 1889, No. 49,141, and in Belgium Nov. 28, 1889, No. 84,509.

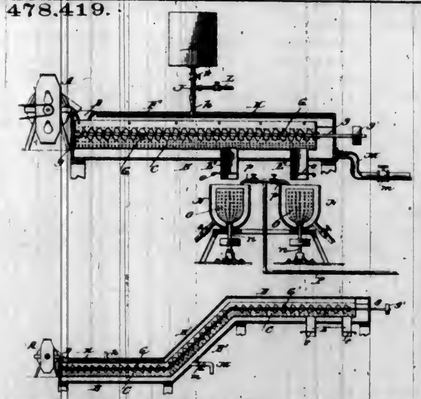
Claim.—1. The process of preventing the development of injurious and destructive ferments in the manufacture of sirups, sugar, alcohol, beer, pressed yeast, &c., which consists in subjecting the amylaceous substances entering into the said manufacture to the action of fluorine compounds in about the proportions specified, substantially as set forth.

2. The process of preventing the development of injurious and destructive ferments in the manufacture of sirups, sugar, alcohol, beer, pressed yeast, &c., which consists in subjecting the amylaceous substances employed in the said manufacture to the action of diastase which has been previously mixed with fluorine compounds in about the proportions and manner indicated, substantially as and for the purpose set forth.

3. The process of preventing the development of injurious and destructive ferments in the manufacture of sirups, sugar, alcohol, beer, pressed yeast, &c., which consists in subjecting the amylaceous substances to the action of diastase and fluorine compounds and then adding yeast which has been treated with fluorine compounds, substantially as and for the purpose set forth.

4. In the manufacture of diastase, the process for preventing the development of injurious and destructive ferments, which consists in making an infusion of malt, adding thereto a compound of fluorine in the proportion indicated, and finally separating the residues from the diastase solution, substantially as set forth.

5. The process of saccharification, which consists in subjecting the amylaceous substances at a low temperature from 20° to 30° centigrade to the action of an infusion of malt treated with a compound of fluorine, substantially in the manner hereinbefore described.

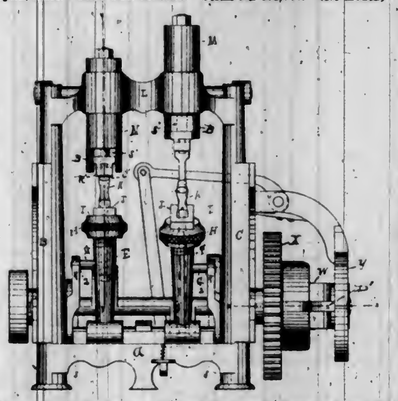


6. The process of preventing the development of injurious and destructive ferments in the manufacture of sirups, sugar, alcohol, beer, pressed yeast, &c., which consists in subjecting the amylaceous substances employed in the said manufacture to the action of hydrofluoric acid in about the proportions and in the manner specified.

478,419. WOOL-WASHING MACHINE. WALTER T. FORBES, Atlanta, Ga., assignor of one-half to James F. Lester, same place. Filed Nov. 19, 1891. Serial No. 412,448. (No model.)

Claim.—1. A wool-cleaning apparatus comprising a box-like receptacle formed with a feed-opening at one end and discharge-openings in the bottom of its opposite end, a foraminated trough suspended in such box formed with discharge portions projected through the discharge-openings in the box, a conveyer journaled in said trough, adapted to convey the wool from the feed end to the discharge end of the box, a scour-holding tank, a spray-pipe located longitudinally over the trough, and a valved pipe connection between said tank and the spray-pipe, all substantially as described, and for the purpose described.

2. An apparatus for cleaning wool, comprising a box like receptacle adapted to hold the scour, a foraminated trough suspended in such tank, adapted to hold the wool, said trough having outlets E, provided with a gate *e*, and means for feeding the wool to such outlet, substantially as shown, of washers disposed to receive the wool from

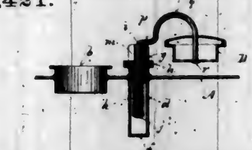


478,419.

the outlet E, consisting of the chambers N, having each a foraminated trough O, mounted to rotate within the chamber N, the supply-pipe P, having a valved lateral projection into the chamber N, and means for operating the trough O, all as set forth, and for the purpose described.

3. In a wool-cleaning apparatus, in combination, a box-like receptacle comprising a lower section adapted to hold the scouring solution and provided with a feed-opening, an upper parallel section having discharge-openings, an inclined section connecting the upper and lower sections, conveyers mounted in the several box-sections, adapted to carry the wool through the scouring solution to the discharge-openings, and means for operating the conveyers, all substantially as and for the purpose described.

478,420. SOLE-PRESSING MACHINE. WILLIAM E. FORSTER, Lynn, Mass. Filed Feb. 16, 1892. Serial No. 421,777. (No model.)



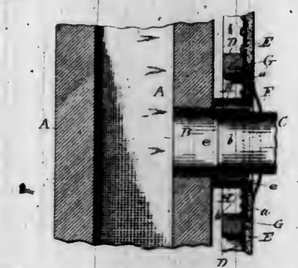
Claim.—1. In a beating-out machine, a pair of pivoted last-supporting arms, means for alternately swinging said arms to and from a vertical position, a pair of plungers for applying pressure to the lasts, and means for alternately reciprocating the plungers, consisting of the pivoted levers carrying segment-gears upon their forward ends, which engage with racks upon the plungers, and connections between the levers and the driving-shaft for rocking said levers, substantially as described.

2. In combination with the alternately-reciprocating plungers and molds and the last-supporting arms pivoted in fixed bearings beneath the plungers, means for alternately swinging said arms to and from a vertical position, consisting of the bell-crank levers having their forward ends pivotally connected to the last-supporting arms, their angle portions pivoted upon a fixed bearing, and their rear ends loosely embracing the crank-shaft and adapted to be operated by eccentrics carried thereby, substantially as described.

478,421. FILLER-CAP FOR OIL-RECEPTACLES. WILLIAM FROSCH, Ballard Vale, Mass. Filed Mar. 24, 1892. Serial No. 426,224. (No model.)

Claim.—1. The combination of a liquid-receptacle provided with

478,421.



a filler-nipple, a slotted plug in a wall of said receptacle adjacent said nipple, a spring-tensioned spindle fitted to slide and rotate in said plug, and a cap for closing said nipple secured on said spindle, substantially as described.

2. The combination of a liquid-receptacle provided with a nipple, as *b*, a plug *g* in a wall of said receptacle and provided with a slot *m* adjacent said nipple, the spring-tensioned spindle *i*, fitted to slide and rotate in said plug and having a shoulder for entering said slot, and the cap D, secured to the outer end of said spindle, substantially as described.

3. The combination, with the receptacle A, having the nipple *b*, of a closed chamber *d* in a wall of said receptacle, the plug *g* in the mouth of said chamber, provided with the slot *m*, the spring-tensioned spindle *i*, fitted to slide and rotate in said plug and having a shoulder for entering said slot, and the cap D on the free end of said spindle, all being arranged to operate substantially as described.

478,422. GUARD FOR CHIMNEY-THIMBLES. JOSEPH T. GERDON, Worcester, Mass. Filed Jan. 22, 1892. Serial No. 418,959. (No model.)

Claim.—1. A guard for chimney-thimbles, consisting of the face-piece G, adapted to be fastened to the woodwork around the usual thimble-opening and to hold the plaster spread thereon, and the cylinder or thimble H, of larger diameter than said usual thimble and fastened transversely in a central opening in said face-piece, substantially as and for the purpose set forth.

2. A guard for chimney-thimbles, consisting of the sheet-metal plate G, adapted to be fastened to the woodwork around the thimble-opening and having holes punched therethrough at various points over its surface, with the metal thus forced through projecting from its face in the form of flaring spurs to produce, in connection with said holes, clinchers for holding the plaster to said face, and the cylinder or thimble H, made of greater diameter than the thimble and fastened transversely in a suitable central opening in said perforated plates, substantially as and for the purpose set forth.

3. The chimney, its usual thimble, the woodwork around said thimble, and the lath and plaster, in combination with a sheet-metal guard adapted to be fastened to the woodwork around said thimble and consisting of the plate G, punched through at various points over its surface to produce openings therethrough as well as flaring spurs upon its face to hold the plaster, and the cylinder H, made of greater diameter than the thimble and fastened transversely in a suitable central opening in said perforated plate, substantially as and for the purpose set forth.

4. The combination of the chimney, its usual thimble, the woodwork around said thimble, the lath and plaster, the stove-funnel and its cap, with a sheet-metal guard adapted to be fastened to the woodwork around said thimble and consisting of the plate G, punched through at various points over its surface to produce openings therethrough as well as flaring spurs upon its face to hold the plaster, and the cylinder H, made of greater diameter than the thimble and fastened transversely in a suitable central opening in said perforated plate, substantially as and for the purpose set forth.

478,423. TOY. WILLIAM H. GREGG, New York, N. Y. Filed Mar. 11, 1892. Serial No. 424,526. (No model.)

478,423.

Claim.—1. A toy comprising series of figures supported on transverse base-strips secured pivotally at both ends on parallel bars, and thus adapted for changing the position of the figures by ranks, substantially as described.

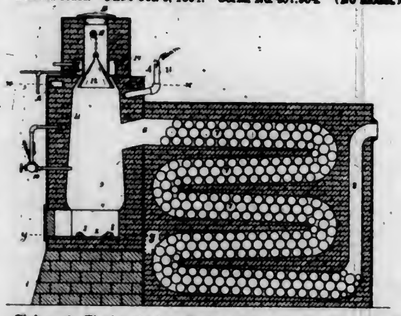
2. A toy comprising series of L-shaped base-strips pivoted by their ends on parallel bars at intervals, each base-strip sustaining a rank of figures, substantially as described.

3. A toy comprising two parallel bars held spaced apart by L-shaped base-strips pivoted at even intervals on the parallel bars, the short limbs of the strips having engagement with the same bar, a rank of soldiers on each base-strip, a holder-lug on one parallel bar, and one or more grip-pieces on the base-strips, substantially as described.

4. The combination of a base-board, two parallel bars, one fast and the other loose, on the base-board, a series of L-shaped base-strips pivoted on the bars by their ends, a rank of soldiers on each base-strip, and a grip-piece on one base-strip, substantially as described.

478,424. MEANS FOR DETECTING THE ESCAPE OF GAS FROM GAS-MAINS. ALPHONSE GUIGUEN, Paris, France, assignor, by mesne assignments, to the Chartier Valley Gas Company, Pittsburg, Pa. Filed Apr. 29, 1886. Serial No. 200,597. (No model.)

Claim.—1. The combination, with an underground gas-conduit, of a layer or a body of stones or similar loose solid material resting on said conduit and extending over a portion thereof and so covered and surrounded by earth as to form a separated and isolated chamber or gallery, and a vent-pipe leading from said chamber to the surface of the ground, through which the gas can escape to the atmosphere, and by which a leakage may be detected and located in any particular part of the conduit, substantially as described.



2. The combination, with an underground gas-conduit, of layers or bodies of stones or similar loose solid material resting on said conduit and extending continuously over portions thereof and covered and surrounded by the earth, such bodies being so separated as to form a series of isolated sections or galleries, and a vent-detector pipe leading from each such section to the surface of the ground and by which leakage from any particular section may be detected and located, substantially as set forth.

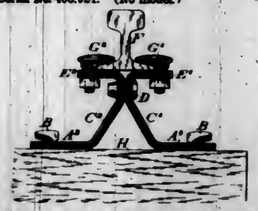
3. The combination, with an underground gas-conduit, of a layer or body of stones or similar loose material extending over any desired portion of the conduit, a tarred cloth or similar cover extending over the stones and covered and surrounded by earth, and a vent or detector pipe leading from the chamber so formed to the surface of the ground, substantially as set forth.

4. The combination, with an underground gas-conduit, of a cover of tarred cloth or similar material extending over and on each side of the gas-conduit, and a vent-pipe communicating with the space between the cover and the conduit, substantially as set forth.

5. The combination, with an underground gas-conduit, of a vent-pipe communicating with an enlarged chamber resting on the conduit, and a cover of tarred cloth or similar material extending over said chamber and down the sides of said conduit, substantially as and for the purposes set forth.

478,425. PROCESS OF GENERATING GAS. WILLIAM H. HARRIS, Boston, Mass. Filed Oct. 6, 1891. Serial No. 407,934. (No model.)

Claim.—1. The herein-described continuous process of making gas in a single generator and regenerator, which consists in introducing at an angle into the heated and ascending currents of the volatile products of combustion from an incandescent body of carbonaceous fuel a continuous current of steam that is decomposed and thoroughly mingled with the volatile products of combustion within a highly-heated generating-chamber between the body of fuel and the gas-uptake and passing the resulting gas directly and continuously into a regenerator, substantially as described.

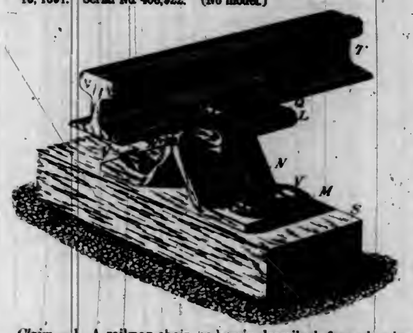


2. A continuous process of making gas in a single generator and regenerator, which consists in burning coal at the base of a generator-chamber, maintaining the combustion at a degree of heat high enough to decompose steam, the combustion being supported by air, introducing steam into the mixing-chamber between the body of fuel and the gas-uptake at an angle to the ascending currents of the volatile products of combustion, whereby the steam is decomposed and thoroughly mixed with the products of combustion in said mixing-chamber within the generator-shaft, and passing this product directly into the regenerator or fixing-chamber, substantially as described.

3. A continuous process of making gas in a single generator and regenerator, which consists in burning coal at the base of the generating-chamber, maintaining the combustion at a degree of heat high enough to decompose steam, the combustion being maintained by hot-air currents introduced into the primary combustion-chamber, introducing steam into the mixing-chamber between the body of fuel and the gas-uptake at an angle to the ascending currents of the volatile products of combustion, whereby the steam is decomposed and thoroughly intermixed with the products of combustion in said mixing-chamber within the generator-shaft, and passing this product directly into the regenerator or fixing-chamber, substantially as specified.

4. The continuous process of making gas in a single generator and regenerator or fixing-chamber, through which generator and regenerator the volatile products of combustion pass continuously in one direction, which consists in burning coal at the base of the generator, the combustion being supported by air forced into the same, admitting steam at an angle to the ascending currents of the products of combustion in a highly-heated generating and mixing chamber between the body of fuel and the gas-uptake, introducing a hydrocarbon liquid into the upper part of the generator, and passing the mingled gases through the regenerator to form a fixed gas, substantially as described.

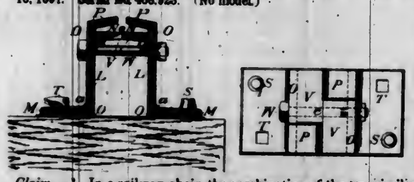
5. The continuous process of making gas in a single generator and regenerator or fixing-chamber, which consists in burning soft coal at the base of the generator-chamber, injecting steam and heated air into said fuel to support combustion, introducing steam above the fuel at an angle to the ascending currents of the volatile products of combustion between the body of fuel and the gas-uptake, thoroughly mingling the steam and heated products of combustion within the generator-shaft, and passing the gas directly and continuously into a regenerator or fixing-chamber, substantially as described.



478,426. RAILWAY-CHAIR. SILAS HARRIS, San Francisco, Cal., assignor to the Pacific Rolling Mills Company, same place. Filed Oct. 16, 1891. Serial No. 408,921. (No model.)

Claim.—1. In a railway-chair, the combination of the two duplicate members having parallel top and bottom horizontal flanges and diagonal webs between said flanges, said webs being in contact with each other at a point near the upper flanges and being considerably distant from each other at the point where the bottom flanges rest upon the tie, the rivets D for securing the webs together, as shown, and the clamping-bolts G' and G², which nip the bottom flanges of the rail and hold it firmly against strains, substantially as described.

2. In a railway-chair, the combination of the two duplicate members, one of which has the base-flange A', fitting upon the sleeper, the upper parallel flange E', on which the rail rests, and the intermediate inclined web C', and the other of which has the bottom horizontal flange A², resting on the sleeper, the upper parallel flange E², which supports the rail, and the intermediate inclined web C² between the upper and lower flanges, the rivets D for fastening the two webs securely together at the top, the clamping-bolts G' and G², held in the flanges E' and E² and nipping the bottom flanges of the rail, and the spikes B, which secure the flanges A' and A² to the sleeper or tie, substantially as described.

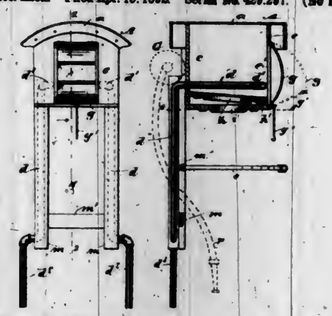


478,427. RAILWAY-CHAIR. SILAS HARRIS, San Francisco, Cal., assignor to the Pacific Rolling Mills Company, same place. Filed Oct. 16, 1891. Serial No. 408,922. (No model.)

Claim.—1. A railway-chair, as herein described, formed, primarily, of a bar having a uniform section, with top flanges L L folded and welded together so as to tie and support the vertical webs N and reinforce the top flanges for clamping-screws P P, substantially in the manner and for the objects described.

2. In a railway-chair, as herein described, the diagonal web-plates N, abutting together below the top flanges L L, the latter folded and welded to increase the thickness when the clamping-bolts P P pass through, in the manner described, substantially as and for the purposes specified.

478,428. RAILWAY-CHAIR. SILAS HARRIS, San Francisco, Cal., assignor to the Pacific Rolling Mills Company, same place. Filed Oct. 16, 1891. Serial No. 408,923. (No model.)

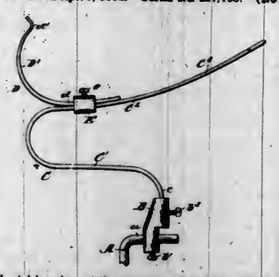


Claim.—1. In a railway-chair, the combination of the two similar sections cut transversely from Z-bars, said sections having the top flanges N, which are slitted to permit the turning up of clips P, which fit closely over the base-flange of the rail, and the securing-bolt W, substantially as described.

2. A railway-chair, as described, consisting of two duplicate members joined by a bolt W and provided with one or more cylindrical holes in the bottom flanges, so the chair can as a whole be swung to a diagonal position and the rail thus inserted or removed, substantially as described, and for the purposes specified.

3. In a railway-chair, the combination of the two similar sections cut transversely from Z-bars, said sections having the vertical part L, bottom flange M, and top flange N, and with the corners at O made acute and the inner corners filleted and rounded at *a* for the purpose of reinforcing the section, said top flanges N being slitted to provide the clips P, which are made to fit closely over the base-flange of the rail, the inner edges of said flanges N being in contact with each other, and the through-bolt W, which joins the two sections together, and with the holding-spikes S and teeth arranged substantially as described.

478,429. SMOKE EXCLUDING HOOD. CHRISTIAN HERLICH, Marquette, Mich. Filed Apr. 15, 1892. Serial No. 429,297. (No model.)



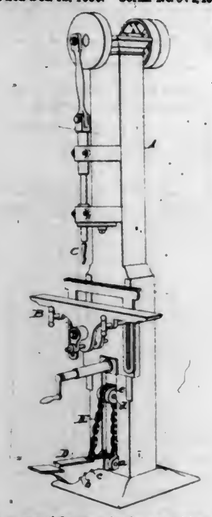
Claim.—1. A smoke-excluding device comprising a forwardly-apertured hood having a glazed door in front, adjustable doors below adapted to inclose the wearer's neck, and means to secure the hood in place, substantially as described.

2. A smoke-excluding device comprising an inclosing hood for the head, having a pendent glazed door in front, an apertured bottom piece, hinged drop-doors scalloped on meeting edges and located below the bottom piece, and means to hold the hood in place, substantially as described.

3. The combination, with an inclosing hood having parallel frame-bars and air-supply pipes supported by the bars and entering the hood, of a pendent glazed door in front on the hood, closing an aperture therein, an apertured bottom board, two hinged doors below the bottom board, scalloped on meeting edges, and a securing-strap, substantially as described.

4. The combination, with an inclosing hood having parallel frame-bars pendent from its rear and air-supply pipes entering the rear of the hood, extending forwardly therein, and also depending below, of a bulged glazed door in front on the hood, covering an aperture in it, a prop-hook therefor, an apertured bottom piece in the hood, two hinged drop-doors below the bottom piece on the hood, scalloped on meeting edges, and a securing-strap, substantially as described.

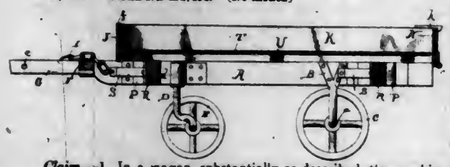
478,430. BICYCLE-SADDLE SPRING. CHARLES H. HOLDSWORTH, Elyria, Ohio. Filed Apr. 5, 1892. Serial No. 427,785. (No model.)



Claim.—1. A bicycle-saddle spring consisting of a main spring having a vertical securing end, from whence it is curved forwardly, upwardly, and finally rearwardly, and an auxiliary front spring mounted

on said main spring and projecting forwardly and upwardly, substantially as and for the purpose set forth.

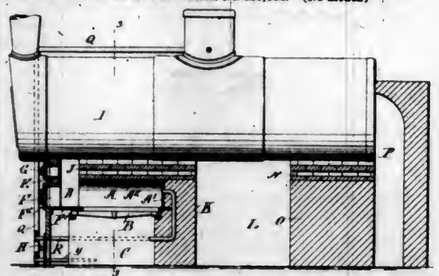
2. As an improvement in bicycle-saddles, the combination of a main spring curved forwardly from its securing end, thence upwardly, and finally rearwardly, an auxiliary front spring adjustably connected at its securing end with said rearward extension of the main spring, and a clip for attaching the saddle to the support or standard and provided with a vertical socket for receiving the securing end of the main spring, a horizontal socket for the support or standard, and with set-screws adapted to engage said socket, substantially as and for the purpose set forth.



478,431. MORTISING-MACHINE. LEVI HOUSTON, Montgomery Station, Pa. Filed Dec. 12, 1890. Serial No. 374,490. (No model.)

Claim.—1. In a mortising or similar machine, the combination, with a main frame, of a reciprocating tool, a bed or work-table movable toward and from the tool, a treadle, and a flexible band or cable connecting the treadle and the bed or table and passing over an intermediate support, all substantially as shown and described.

2. In a mortising or similar machine, the combination, with a main frame, of a reciprocating tool, a bed or table movable toward and from the tool, a treadle pivoted in the main frame, a wheel or pulley also journaled in the main frame, but above the treadle, and a flexible connection passing over the wheel or pulley and secured at its ends to the treadle and work-table, all substantially as shown and described.



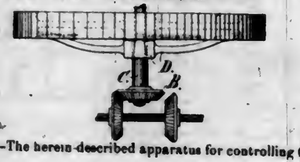
478,432. FARM-WAGON. SAMUEL HOWE, Chicago, Ill. Filed Feb. 23, 1892. Serial No. 422,458. (No model.)

Claim.—1. In a wagon, substantially as described, the combination, with the longitudinal side bars, the rear wheels carried by hangers fixedly connected to said side bars, the front wheel carried by hangers pivotally connected to said side bars, and the castings connected to the side bars and having the vertically-disposed slots of dovetail form in cross-section, of the transverse connecting-bars having angular branches at their ends to take into the vertical slots of the castings, substantially as and for the purpose set forth.

2. In a wagon, substantially as and for the purpose described, the combination, with the longitudinal side bars, of the longitudinal side boards hinged to the said bars, the standards pivotally connected to the bars and having ratchet-wheels at their pivot-points, and pawls connected to the side bars and adapted to engage the ratchet-wheels of the pivoted standards, substantially as and for the purpose set forth.

478,433. BOILER-FURNACE. WALTER HURDLEY, Youngstown, Ohio. Filed Mar. 3, 1892. Serial No. 423,602. (No model.)

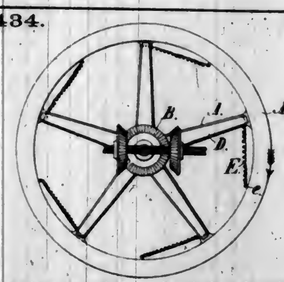
Claim.—1. The combination, with the horizontal boiler having its smoke-stack at its forward end, of the furnace having a fire-box beneath the front end of the boiler and closed at its rear end, an upward-extending passage D from the front end of the fire-box to the lower side of the boiler, and a series of flues extending from the passage D along the under side of the boiler to an intermediate chamber L, thence to the rear chamber P, the latter communicating with the rear ends of the boiler-flues, substantially as set forth.



2. In a boiler-furnace, the combination, with a fire-box having an open front, a closed rear, and a curved top, and a grate arranged in the bottom of the said fire-box and leading to an ash-pit, of a wall extending in the front of the said fire-box and forming a space with the latter at its open end, a firing-opening arranged in the said wall and having a door and a bottom extending from said front wall inwardly across said space and over the front end of the said grate, a checker brick-work arranged above the said fire-box and extending under the boiler and rearwardly, and damper-doors and openings arranged in the said wall above the said charging-opening, substantially as shown and described.

3. In a boiler-furnace, the combination, with a fire-box having an open front, a closed rear, and a curved top, and a grate arranged in the bottom of the said fire-box and leading to an ash-pit, of a wall extending in the front of the said fire-box and forming a space with the latter at its open end, a firing-opening arranged in the said wall and having a door and a bottom extending over the front end of the said grate, a checker brick-work arranged above the said fire-box and extending under the boiler and rearwardly, and a steam-pipe extending through the closed end into the rear end of the fire-box, substantially as shown and described.

4. In a boiler-furnace, the combination, with a fire-box having an open front, a closed rear, and a curved top, and a grate arranged in the bottom of the said fire-box and leading to an ash-pit, of a wall extending in the front of the said fire-box and forming a space with the latter at its open end, a firing-opening arranged in the said wall and having a door and a bottom extending over the front end of the said grate, a checker brick-work arranged above the said fire-box and extending under the boiler and rearwardly, a steam-pipe extending through the closed end into the rear end of the fire-box, and a second steam-pipe discharging into the said fire-box below the said grate, substantially as shown and described.



5. In a boiler-furnace, the combination, with a fire-box having an open front, a closed rear, and a curved top, and a grate arranged in the bottom of the said fire-box and leading to an ash-pit, of a wall extending in the front of the said fire-box and forming a space with the latter at its open end, a firing-opening arranged in the said wall and having a door and a bottom extending over the front end of the said grate, a checker brick-work arranged above the said fire-box and extending under the boiler and rearwardly, a steam-pipe extending through the closed end into the rear end of the fire-box, and a transverse wall arranged at the rear end of the said fire-box and ash-pit to support the rear end of the said checker brick-work, substantially as shown and described.

478,434. SHOCK-CONTROLLING DEVICE. PAUL H. INGERS, Christiania, Norway. Filed Feb. 20, 1892. Serial No. 422,271. (No model.) Patented in Norway Nov. 11, 1891, No. 2,321.

Claim.—The herein-described apparatus for controlling the shock

478,434.

caused by the sudden reversal of propeller-shafts and carriage and other wheels, consisting of a shaft, a fly-wheel mounted thereon, a sleeve rotatable on said shaft, a driving-wheel at one end of said sleeve, a rotating frame secured to the other end of said sleeve, and springs connecting said frame with the fly-wheel, substantially as described.

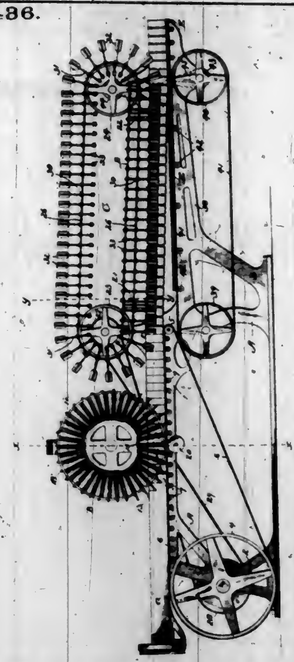
478,435. HORSESHOE. JOHN E. JARVIS, London, England. Filed Jan. 27, 1892. Serial No. 419,425. (No model.)

Claim.—1. A composite horseshoe formed of a leather sole-piece or backing, a rubber horseshoe-shaped cushion on the lower face thereof and having its lower outer edge cut away or rabbeted in front of its heel portion b^3, thus forming the outwardly-projecting flange d', and the metal portion a, fitting snugly within said rabbet or groove and having its heels a' resting against the rear end walls thereof and its upper face engaging said flange, substantially as described.

2. In a horseshoe, the sole-piece or backing d, having a horseshoe-shaped rubber cushion b on its lower side formed with heel portions and rabbeted around its lower outer edge in front of said heel and forming the outward-projecting flange d', substantially as described.

3. A composite horseshoe consisting of the sole-piece or backing d, the horseshoe-shaped rubber cushion b on the lower face thereof, having heel portions b^3 and rabbeted or cut away on its lower outer edge in front thereof, thus forming an outwardly-projecting flange d', and the metal portion resting on the flange d' in said rabbet with its rear ends a' resting against the forward end of the heel portion b^3, the depth of the rabbet being greater than the thickness of the metal portion a, causing the working face of the cushion to lie in a lower plane than that of the metal portion a, substantially as described.

478,436. CUTTER FOR BRICK AND TILE MACHINES. OLIVER W. JOHNSON, Bucyrus, Ohio, assignor to The Frey-Sheckler Company, same place. Filed Apr. 7, 1890. Serial No. 347,003. (No model.)



Claim.—1. In a cut-off for brick and tile machines, the combination, with the carrying-belt for the clay and the column of clay, of a cut-off wheel formed with radially-arranged slots, cutting-wire frames arranged in the slots of the wheel, and cams to engage the cutting-wire frames and push them through the column of clay, substantially as described.

2. In a cut-off table for brick and tile machines, the combination, with the carrying-belt having sprocket-holes in its edges and the column of clay, of a cutting-wheel journaled over the table and formed with radial slots and provided with sprockets on its rim edges, wire frames arranged to slide in the radial slots of the wheel, having lugs on the ends, and cam-frames fixed at the sides of the wheels, whereby the cutting-wire frames are pushed outward and through the clay, substantially as described.

3. In a cut off table for brick and tile machines, the combination, with a carrying-belt adapted to be moved by the advancing body of clay, of a cut-off wheel formed with radial slots, cutting-wire frames in the slots to slide therein, and springs connecting said frames to the shaft of the wheel to hold the cutting-wire frames from sliding free from the slots and to return them to normal position when moved from the center of the wheel, substantially as described.

4. In a cut-off table for brick and tile machines, the combination, with a carrying-belt adapted to be moved by the advancing body of clay, of a cut-off wheel moved by the carrying-belt and formed with

478,436.

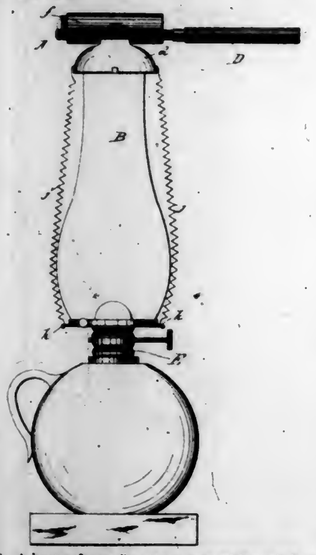
radial slots, cams fixed at the sides of the cut-off wheel, cutting-wire frames arranged to slide in the radial slots and be engaged and moved outward by the cams, and springs to hold the cutting-wire frames inward and in engagement with the cams, substantially as described.

5. In a brick and tile cut-off machine, a rotative cut off wheel formed with radial slots, cutting-wire frames in the slots, cams to engage and push the cutting-wire frames outward, and means to rotate the wheel synchronously with the moving body of clay, substantially as described.

6. In a brick and tile cut-off and delivery table, a rotative traveling belt adjacent to the severed forms of clay, oppositely-fulcrumed arms on the belt provided with rollers on their inner ends, and a track-frame arranged in the path of the rollers to spread the arms and cause the opposite ends of the arms to grasp and hold a severed portion of the clay, substantially as described.

7. In a brick and tile cut-off and delivery table, a board delivery carrying-belt, a delivery-board on the belt, a traveling belt mounted above the board-delivering belt, clamping-arms on the upper traveling belt, and a frame to engage and spread the upper portions of the clamping-arms, substantially as and for the purpose specified.

8. The carrier for carrying the several bricks from the cut-off table, consisting of drums, a belt arranged on the drums, clamping-arms fulcrumed to the edges of the belt, rollers on the inner ends of the arms, and a stationary frame in the path of the rollers to move the arms to grasp a brick with their opposite ends, whereby the brick may be carried along by the belt, and mechanism to rotate the drums, as specified.



9. The combination, with a cut off wheel and a moving column of clay cut into forms thereby, of a carrier consisting of a traveling belt having clamping-arms to grasp the forms, means to operate the arms, and delivery-boards to receive the forms, substantially as described.

10. The carrying and delivering mechanism herein described, consisting of drums journaled on the table, a belt on the drums, arms fulcrumed to the belt, a frame D to spread the arms, and means to rotate the drums, substantially as described.

11. The combination, with the cut-off wheel and the moving column of clay, of the carrying mechanism C, consisting of a belt traveling faster than the column of clay and provided with clamps hinged thereto arranged to hold a form above the table at one end and deliver it at the other end, substantially as described.

12. The combination of the board-delivery table, composed of the frame 38, drums 39 40, and belt 41, arranged with its upper strand at an incline, and the carrying mechanism C, composed of a belt, arms fulcrumed to the belt, and a frame to spread the arms, substantially as set forth.

478,437. CURLING-TONGS HEATER. ALEXANDER W. KENT, Boston, Mass. Filed Apr. 21, 1891. Renewed June 6, 1892. Serial No. 435,654. (No model.)

Claim.—1. A heater for curling-tongs, comprising a bell, a horizontally-arranged tube secured to and opening centrally into said bell, and mechanism for supporting said bell over a lamp or gas burner, substantially as described.

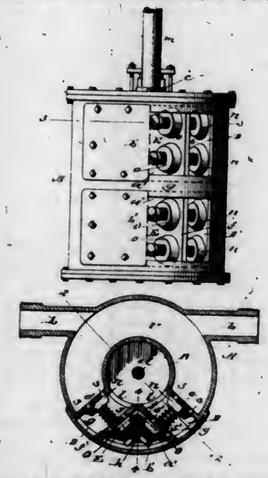
2. The heater A, comprising the bell *d* and tube *f*, secured thereto, the opening *g*, leading from said bell to said tube, the supporting-bars *i*, secured in the mouth of said bell, and means for securing the bell in position on a lamp-chimney, substantially as described.

3. A heater for curling-tongs, comprising a bell, a horizontally-arranged tube secured in the apex thereof and opening centrally in said bell, and corrugated supporting-bars disposed across the mouth of said bell, substantially as and for the purpose set forth.

4. The tube *f*, provided with the flange *h* and slot *v*, in combination with the bell *d*, secured to said tube and opening therein at *g*, and the supporting-bars *i*, secured to said bell, all being arranged to operate substantially as described.

478,438. BRIDGE. THOMAS H. KOBURE, Farmersville, Tex. Filed May 26, 1891. Serial No. 394,202. (No model.)

Claim.—1. A bridge consisting, essentially, of wire cables connected by turnbuckles, the twist of the cables being of the same direction of inclination as to pitch as that of the screw-threads of their respective eyebolts and the said wire cables being composed of wires first strung plainly or in parallel position and then twisted together between the turnbuckles to simultaneously form the cable and tighten the same, substantially as shown and described.



2. The combination of the main cables A B A', made in sections and connected by turnbuckles C, the abutments D, transverse sills E, having bearing-plates *b*, the short columns F, long columns G, having caps *c* at their upper ends, the suspension-cables H H', anchored at one end in the earth and passing over the bearing-plates of the tall columns and connected at the other end to the main cables, and the crossed stay-cables I, substantially as shown and described.

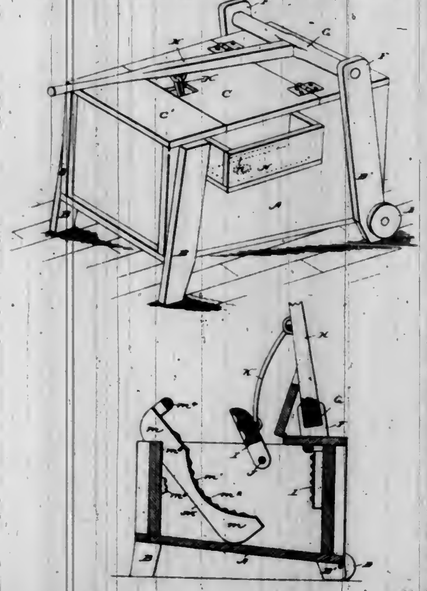
3. The combination, with the main-cable section B, the stay-cable I, and the suspension-cable H, of a single coupling for these three members composed of a shoe for the main cable, an eyebolt for the stay-cable, and a turnbuckle-section for the suspension-cable, substantially as shown and described.

478,438.

478,439. FIRE-ENGINE PUMP. TRUCKSON S. LA FRANCE, Elmira, N. Y. Filed July 15, 1890. Serial No. 358,780. (No model.)

Claim.—1. In a fire-engine pump, the combination, with a casing, of a pump-barrel arranged therein to form a water-chamber at the back and sides of the said barrel and an outlet-chamber between the pump-barrel and the front of the casing and discharging at the top, an upper and lower inlet-chamber on each side of the outlet-chamber and each communicating with the pump-barrel, and valves controlling the admission of water from said water-chamber to the inlet-chambers and from the inlet-chambers to the outlet-chamber, substantially as described.

2. In a fire-engine pump, the combination, with a casing, of a pump-barrel arranged approximately concentrically in the casing and extending from top to bottom thereof, thereby forming a water-chamber at the back and sides of the pump-barrel, said chamber extending from the top to the bottom of the casing, an outlet-chamber between the pump-barrel and the front of the casing, an outlet-pipe leading from the top of the outlet-chamber, an upper and lower inlet-chamber on each side of the outlet-chamber and each communicating with the pump-barrel, valves controlling the admission of water from the said water-chamber to the inlet-chambers, and valves controlling the admission of water from the inlet-chambers to the outlet-chamber, substantially as described.



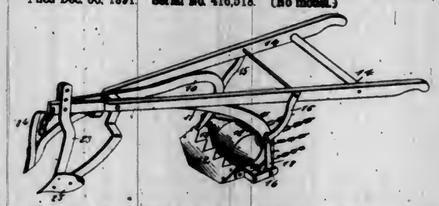
3. In a fire-engine pump, the combination, with a casing, of a pump-barrel arranged approximately concentrically in the casing and extending from top to bottom thereof, four vertical partitions arranged between the pump-barrel and the front of the casing, a horizontal partition extending from the pump-barrel to the front of the casing at about the middle of the height of the said casing, the said horizontal partition being apertured between the two innermost partitions, whereby an outlet-chamber and two upper and two lower inlet-chambers will be formed in the front of the casing, and a water-chamber in the rear thereof, said water-chamber surrounding the back and sides of the pump-barrel and extending from the top to the bottom of the casing, substantially as herein shown and described.

4. In a fire-engine pump, the combination, with a casing having an opening in its front, of a pump-barrel in the casing and extending from the top to the bottom thereof, a water-chamber in the rear of the casing and extending from top to bottom thereof, an outlet-chamber between the pump-barrel and the front of the casing, an outlet-pipe leading from the top of the outlet-chamber, an upper and lower inlet-chamber on each side of the outlet-chamber and communicating with the pump-barrel, valves controlling the admission of water from the water-chamber to the inlet-chambers and from the inlet-chambers to the outlet-chamber, and a lid or lids closing the opening in the front of the casing, substantially as herein shown and described.

5. The combination of the outer pump-casing A, having openings *a' a'* in its front side, lids *b' b'*, closing said openings, the inner pump-barrel B, having upper and lower openings *l l'*, the upright partitions *e e'* and *f f'* between the front side of the barrel and open front side of the outer casing, and the horizontal partition *g*, forming double sets of upper and lower inlet-valve chambers D D D' D' and a double outlet-chamber E, the suction-valves *n*, controlling admission of water from the outer casing into said inlet-chambers, and the delivery-valves *o*, controlling the discharge into the outlet-chamber E, essentially as shown and described.

6. In a double-acting fire-engine pump, a plunger formed of upper and lower solid heads, each having a reduced end, the said heads being mounted on the plunger-rod with their reduced ends adjacent to each other, and flexible cup shaped packings fitting on and arranged between the reduced ends of the said heads, substantially as and for the purpose set forth.

478,440. WASHING-MACHINE. STEPHEN LA POINT, Derrick City, Pa. Filed June 9, 1891. Serial No. 395,724. (No model.)



Claim.—In a washing-machine, the combination of a box or tub formed with the end rubbing board, the convertible false bottom and hand rubbing-board forming a continuation of said end rubbing-board and provided with a concave upper surface and notched lower edges for the purpose explained, and a perforated concave dasher suspended in the tub and having means for actuating it, said convertible false bottom and hand rubbing-board being formed of a series of wooden strips having concave recesses in their upper edges, and a perforated corrugated metal sheet secured to said strips in said concave recesses, substantially as set forth.

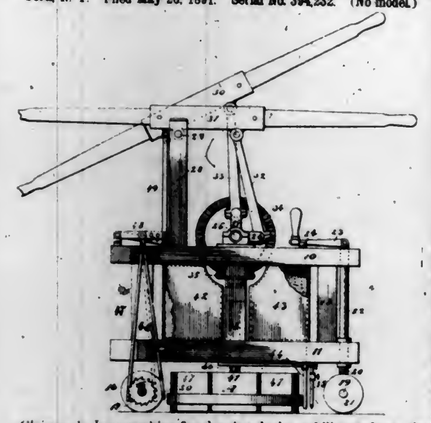
478,441. COTTON AND CORN PLANTER. JOSEPH W. LEHR, Fremont, Ohio, assignor to the Lehr Agricultural Company, same place. Filed Jan. 21, 1892. Serial No. 418,534. (No model.)

Claim.—The combination of the hopper-bottom plate having a circular opening therethrough and a depressed plate-like projection *k'*, a slotted slide *k*, arranged in the latter and adapted to receive a guide-lug *k''* on said projection, a bolt and nut k^3 k^4 to regulate the adjustment of said slide, a serially-perforated disk having pendent teeth or cogs, the fixed peripherally-notched disk B', the spring-pressed pawl-like arm pivoted in said bottom plate, the housing having an extension for inclosing said pawl-like arm and its spring, the pronged wheel, the driving-shaft, and the disk G, geared to said shaft, substantially as specified.

478,442. POTATO-DIGGER. DAVID LIVINGSTON, Thornville, Ohio. Filed Dec. 30, 1891. Serial No. 416,518. (No model.)

Claim.—1. In a potato-digger, the combination, with a shovel, of a roller located directly at the rear of the shovel and parallel therewith, the said roller being provided with a circular central surface and tapering ends, substantially as shown and described.

2. In a potato-digger, the combination, with a shovel and supports maintaining said shovel at an angle of about forty-five degrees to the ground, of a roller held to revolve directly at the rear of the shovel and parallel therewith, the central portion of which is circular and the end portions tapering or conical in cross-section, as and for the purpose specified.



3. In a potato-digger, the combination, with a shovel provided with a central point at its lower or cutting surface, the said surface at each side of the point being beveled in opposite directions, and supports maintaining the shovel at an angle of about forty-five degrees to the ground, of a roller located directly at the rear of the shovel and

parallel therewith, the roller being cylindrical at its central portion and tapering at its extremities, substantially as shown and described.

4. In a potato-digger, the combination, with a shovel the cutting-edge whereof tapers from the center in opposite directions, the face of the shovel being concaved and its upper edge provided with teeth, and a support maintaining the shovel at an angle to the ground over which it is to pass, of a roller held to revolve at the rear of the shovel, said roller being cylindrical at its central portion and tapering at its extremities, a guard surrounding the rear portion of the roller, arms projected from the guard, and drag chains carried by sundry of the arms, substantially as and for the purpose specified.

5. In a potato-digger, the combination, with a shovel the cutting-edge of which is beveled in opposite directions from its center, the said shovel being provided with a transversely-concaved forward face and teeth produced at its outer edge, and a support maintaining the shovel at an angle of about forty-five degrees to the ground, of plow-shanks attached to the support projected outward and downward in opposite directions and having shares attached thereto, the said plow-shanks being located in front of the shovel, a roller held to revolve at the rear of the shovel, the central surface of which is cylindric and its extremities tapering, a guard located adjacent to the rear surface of the roller, arms horizontally projected from the guard, and drag-chains attached to sundry of the arms, as and for the purpose specified.

478,443. DECK-CLEANING MACHINE. SAMUEL LOWBERG, New York, N. Y. Filed May 26, 1891. Serial No. 394,232. (No model.)

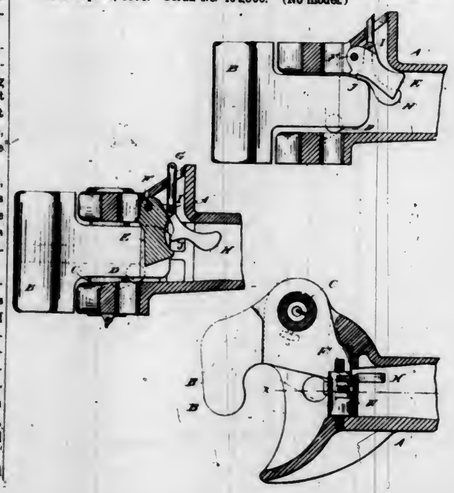
Claim.—1. In a machine for cleaning decks and like surfaces, the combination, with a wheeled frame and a stone carrier located beneath the frame, of a drive-shaft provided with crank-arms having a gear connection with the stone-carrier, walking-beams having a pitman connection with the crank-arms of the drive shaft, and means for propelling the frame from the walking-beams, as and for the purpose specified.

2. In a machine for cleaning the decks of vessels and similar surfaces, the combination, with a frame supported by wheels, a carrying-frame provided with pockets adapted to receive polishing or cleaning stones, and a shaft attached to said carrying-frame, of a drive-shaft provided with crank-arms, a gear connection between the drive-shaft and the shaft of the carrying-frame, levers fulcrumed upon the frame, and link connections between the levers and the crank-arms of the drive shaft, as and for the purpose specified.

3. In a machine for cleaning decks of vessels and similar surfaces, the combination of a carrier consisting of a central hub, spider-like arms radiating from the hub, and a band secured to the outer ends of the arms and forming pockets open at top and bottom, and polishing-stones in said pockets and extending above and below the carrier, substantially as described.

4. In a machine for cleaning the decks of vessels and similar surfaces, the combination, with a wheel-supported frame, ratchet-wheels secured to the rear axle, and a carrier adapted to receive blocks of polishing or cleaning material, of a drive-shaft provided with crank-arms, a gear connection between the drive-shaft and the block-carrying frame, walking-beams fulcrumed upon the main frame, link connections between the walking-beams and the crank-arms of the drive-shaft, levers fulcrumed upon the frame and pivotally connected with the walking-beams, and dogs adjustably attached to the said levers, the said dogs being in engagement with the ratchet-wheels, as and for the purpose set forth.

5. In a machine for polishing or cleaning the decks of vessels and similar surfaces, the combination, with a wheel-supported frame, the axle of the forward wheel being swiveled in the frame, a guide-shaft attached to the swiveled axle, ratchet-wheels secured upon the rear axle, and a carrier-frame located beneath the main frame and adapted to receive blocks of polishing or cleaning material, of a drive-shaft, a gear connection between the drive-shaft and the block-carrying frame, walking-beams pivoted upon the main frame, link connections between the walking-beams forward of their fulcrums and the drive-shaft, levers pivoted upon the rear of the frame and having link connections with the walking-beams at the rear of their fulcrums, and dogs adjustably attached to the said levers, the said dogs being adapted for engagement with the ratchet-wheels of the rear axle, as and for the purpose set forth.



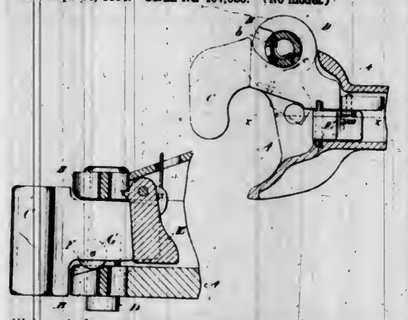
478,444. DEVICE FOR OPENING AND CLOSING COCKS, &c. OSCAR LOEWE, Berlin, Germany. Filed Nov. 20, 1891. Serial No. 412,511. (No model.)

Claim.—1. A key-turner consisting in the tubular body having an arm or bracket projecting from its upper end, a rod extending through the body and provided at its lower end with a handle, an inclined shaft journaled in said arm or bracket, bevel-gears connecting said shaft and rod, and a key-engaging clip on said shaft, substantially as set forth.

2. A key-turner and gas-lighter consisting in the tubular body *a*, having the lighting-tube *g* and the arm or bracket *b* projecting from its upper end, the shaft *c*, journaled in the inclined bearing *b'* on said arm and having a clip c^3 at both ends and a bevel-gear f^2 between its ends, and the rod *e*, extending through the body and provided with a handle *d* at its lower end and a bevel-gear *f'* at its upper end, meshing into gear f^2, substantially as set forth.

478,445. CAR-COUPLING. RODNEY F. LUDLOW, Springfield, Ohio. Filed Sept. 2, 1891. Serial No. 404,506. (No model.)

Claim.—1. The combination, with a draw-head and a knuckle, of a locking-pawl for said knuckle pivotally mounted in said head and a pivoted auxiliary pawl adjacent to said locking-pawl and adapted to support the same in its inoperative position.



2. In a car-coupler, the combination, with a draw-head, a knuckle pivoted therein, and a movable piece constituting the locking member for said knuckle, of a pawl pivoted to the said locking member and adapted to engage with said knuckle to support said locking member when the latter is raised to its inoperative position till the knuckle swings outward, whereby the locking member may be set to uncouple the interlocked knuckles and be retained in said position till the opening of said knuckles.

3. In a car-coupler, the combination, with a draw-head and a knuckle pivoted therein, of a locking-pawl adapted to lock said knuckle and an auxiliary pawl carried by the locking pawl and pivoted thereto eccentric to the pivot of the locking-pawl and adapted to gravitate into engagement with the rear end of the knuckle when the locking-pawl is raised to its inoperative position, the eccentricity of mounting of said auxiliary pawl on the locking-pawl effecting a support for the latter as long as the auxiliary pawl rests on said knuckle.

4. In a car-coupler, the combination, with a draw-head and a pivoted knuckle, of a locking-pawl pivoted in said head and having an irregular opening therein, and a pivot-pin having a projection thereon and mounted in said opening, whereby the irregularity of said pin-and-pawl opening will retard the movement of said pawl from its locking position.

5. In a car-coupler, the combination, with a draw-head and a knuckle pivoted therein, of a pawl adapted to lock said knuckle and having an inclined surface engaged by the end of the knuckle in swinging inward, and a pivot axle-pin for said pawl having an offset adapted to engage a matching offset in said pawl, the said pin being loosely mounted in said pawl, substantially as shown and described, whereby the knuckle will first raise the pawl and then swing it backward in the act of returning to its coupling position.

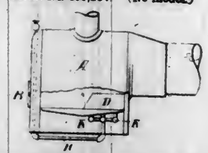
478,446. CAR-COUPLING. RODNEY F. LUDLOW, Springfield, Ohio. Filed Sept. 28, 1891. Serial No. 407,023. (No model.)

Claim.—1. In a car-coupler, the combination, with a draw-head and a knuckle pivoted therein, of a wheel and its axle mounted in said knuckle, and thus adapted to rotate at the same fixed point relatively to the knuckle, the draw-head being provided with an inclined ledge or surface concentric with the knuckle-pivot to serve as a path of travel for said wheel, whereby the outward swing of the knuckle is effected automatically.

2. In a car-coupler, the combination, with a draw-head and a knuckle pivoted therein, one member having an inclined ledge or plane surface concentric with the axis of the knuckle-pivot, of a wheel rotatably mounted in fixed bearings in the other member, so as to preserve its constant relative position in said latter member and to rotate in contact with said ledge or surface on the other member.

3. In a car-coupler, the combination, with a draw-head and a pivoted knuckle therefor, of a wheel mounted on an axle in said knuckle and adapted to travel on an inclined ledge or surface on the draw-head concentric with the axis and open at the ends and outside to discharge clogging particles therefrom and means to check the rotation of said knuckle at predetermined points of its swing.

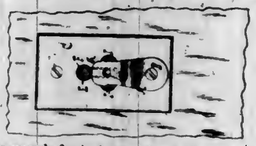
4. In a car-coupler, the combination, with a draw-head and a pivoted knuckle therein adapted to swing outward automatically, of a movable pivot for said knuckle having an interlocking and sliding engagement with both the knuckle and the draw-head by interconnecting projections and grooves between the respective members.



5. In a car-coupler, the combination, with a draw-head and a knuckle pivoted therein, of a pivot for said knuckle having grooves or recesses formed lengthwise and around the same, the knuckle and draw-head being provided with projections matching said grooves, whereby the said pivot may be rotated and moved vertically and an interlocking engagement of all the members effected.

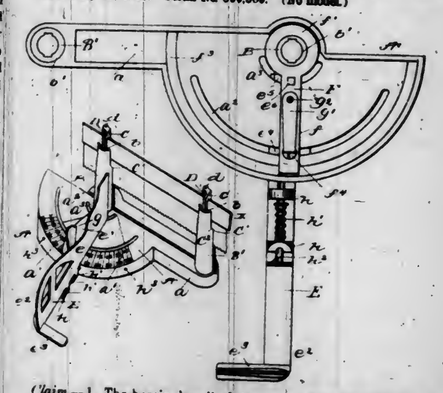
6. The combination of a draw-head, a knuckle, and a rotatable and slidable pivot therefor, the latter having a circular groove and also a vertical groove or recess at each end of said groove and the knuckle and draw-head having projections respectively entering said groove or recesses to allow a slight opening of the knuckle and adapted to allow a further opening when one of said projections is operated in said circular groove.

7. In a car-coupler, a pivot adapted to slide and to rotate in its bearings and having circular and longitudinal grooves or shoulders formed thereon adapted to match corresponding parts of its bearings to effect an interlocking engagement of the pivot therewith.



8. In a car-coupler, a pivot having a recess at one side of its axis, a vertical groove or recess at substantially the opposite side, and a circular groove connecting said oppositely-located grooves or recesses, substantially as and for the purpose described.

478,447. SMOKE-BURNER. THEODOR LUSTIG, Chicago, Ill. Filed Oct. 19, 1891. Serial No. 409,237. (No model.)



Claim.—In a smoke-consuming device for furnaces, the combination, with a case D, of a perforated cover E therefor, having the ribs E^2 on its under side and also the lugs E^3, the latter being shorter and of greater depth than the ribe E^2, substantially as set forth.

478,448. KEY-FASTENER. ADDISON J. LYON, Mount Vernon, N. Y. Filed Oct. 29, 1891. Serial No. 410,237. (No model.)

Claim.—In guards for locks and keys, the elastic guard A, provided with a nipple H and ear-pieces I and pivoted to a door or lock below the keyhole, the free end of the guard being adapted to swing over the keyhole below the barrel of the key, the nipple H being adapted to fall into the keyhole and interlock the guard therewith substantially as shown and described.

478,449. MITER-MACHINE. ABRAHAM L. MAXIM, Omaha, Nebr. Filed July 13, 1891. Serial No. 399,309. (No model.)

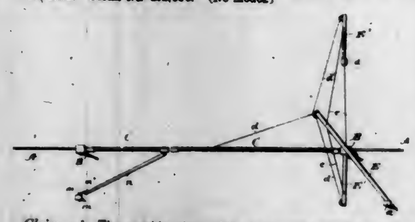
Claim.—1. The herein-described improved miter-machine comprising the base, having the inner and outer saw-supporting posts at one side thereof, the slide movable thereover in circular relation to said inner post, the clamp beneath said base provided with an inner circular end surrounding said inner post and having engagement with

said slide, and means for binding said clamp to said slide, substantially as set forth.

2. The herein-described improved miter-machine comprising the base, having the saw-supporting posts at one side thereof and provided with curved slots, the slide having lugs projected through said slots, the clamp pivoted on the under side of said base and engaging said lugs, the threaded rod or screw connecting said clamp with said slide, and the binding nut or arm on said rod or screw, substantially as set forth.

3. The herein-described improved miter-machine comprising the base having the saw-supporting posts at one side thereof and provided with curved slots, the slide having lugs extending through said slots, the clamp having a circular portion encircling one of said posts, the rod or screw connecting said clamp with said slide and having a slot in its lower head, the plate-spring secured to said clamp at one end and having its free end in said slot, and the nut or arm in the upper end of said rod or screw having a vertical flange or projection, substantially as set forth.

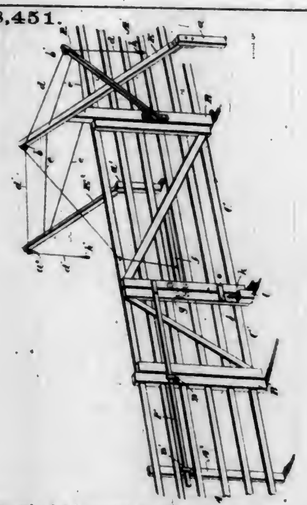
4. The herein-described improved miter-machine comprising the circular base having an arm or elongated portion provided with threaded openings, the slotted posts having reduced threaded ends fitting said openings and provided with projecting pins or studs, the saw-holders or guides movable in grooves in said slotted posts and having upper overhanging portions, the adjustable screws working in holes in said overhanging portions, and the lugs projecting from said saw-holders or guides and designed to limit the upward movement of the latter by contact with said pins or studs, substantially as set forth.



478,450. CRADLE. JAMES H. MEEK and GEORGE W. MEEK, Denison, Tex. Filed Jan. 2, 1892. Serial No. 416,889. (No model.)

Claim.—1. A swinging cradle comprising the folding end bars A, the cross-bar B, having a depressed portion *b*, and end projections b^3, forming the pivotal axes for the bars A, the catches L, pivoted to the end bars and adapted to engage the depressed part *b* of the bar B, the cradle G, and the spring-suspensions F, connecting the cradle with the upper ends of the arms, all arranged substantially as shown, and for the purpose described.

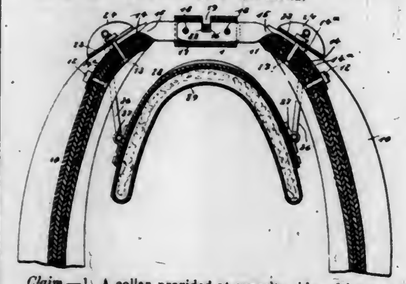
2. The combination, with the crossed bars A A, the rod B, having a depressed portion *b*, and projections b^3, forming the axial bearing for the bars A A, and with a lateral extension b^4, the cradle G, and the spring connections F, of the sheaves I, swiveled on the extension b^4 of the bars B, the guard or shield J, and the cord H, secured to the bottom of the cradle and passed under the sheave, substantially as shown and for the purpose described.



478,451. GATE. JOSEPH N. MORGAN, Wallace, Ind. Filed Feb 18, 1892. Serial No. 422,060. (No model.)

Claim.—1. The combination, with a large and a small gate hinged at their outer edges and a latch carried by the larger gate, of a keeper on the smaller gate for the reception of said latch, and a pivoted bar for locking said smaller gate independent of the larger gate, substantially as set forth.

2. The combination, with a large and a small gate hinged at their



478,451.

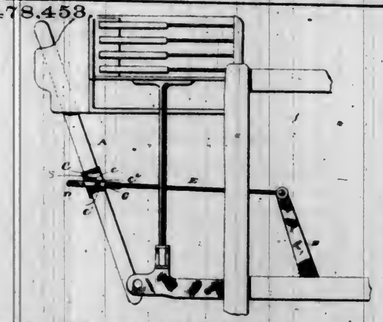
outer edges and a latch carried by the larger gate, of a keeper on the smaller gate for the reception of said latch, and a pivoted bar for independently locking said smaller gate, said bar constituting an abutment for the larger gate, substantially as set forth.

3. The combination, with a fence and two gates hinged thereto, of a locking-bar connected with one gate and with the fence and forming an abutment for the other gate, substantially as set forth.

478,452. HORSE-COLLAR. JOHN B. MUELLER, Streator, Ill. Filed Jan. 26, 1892. Serial No. 419,274. (No model.)

Claim.—1. A collar provided at opposite sides of its upper end with two depending bails or links swinging toward and from the inner sides of the collar and a pad pivotally connected at its sides with the lower ends of the bails or links, substantially as set forth.

2. The combination, with the collar, of bearing-pieces secured to the collar at opposite sides of its upper end, bails suspended from said bearings to swing at their lower ends laterally between the two sides of the collar, and a pad pivotally connected at opposite sides with the lower ends of the bails, substantially as shown and described.

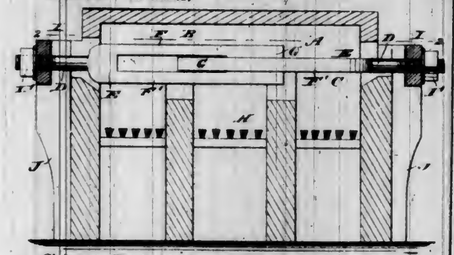


3. The combination, with the open-ended collar having bearing-pieces on each side of its opening, which bearing-pieces have flanged ends, of a pad suspended within the collar to freely swing laterally between the two sides thereof, and bails pivoted on the pad-back and pivoted in the flanges of the bearing-pieces, substantially as described.

4. The collar-pad having attaching-plates 23 23 for attachment to the collar at the sides of its top openings and bails pivoted to the said plates and through which bails the ends of the collar project, the lower ends of the bails being pivotally connected with the said pad, thus permitting it to swing freely toward and from the sides of the collar, substantially as described.

478,453. MEANS FOR OPERATING THE PICKER-STAFFS OF LOOMS. ALFRED MUSCH, West Fitchburg, Mass. Filed Dec. 3, 1891. Serial No. 413,906. (No model.)

Claim.—1. As an improvement in looms, the combination, with a picker-staff, of a sleeve mounted thereon and provided at opposite sides with two outwardly-projecting trunnions, a yoke embracing said



478,453.

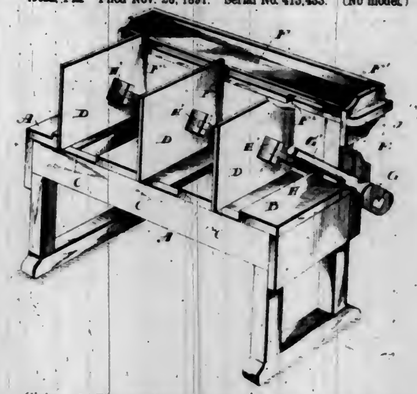
sleeve between the trunnions, transversely disposed pins or bolts connecting the members of the yoke in front and in rear of the sleeve, said pins or bolts being adjustable longitudinally with relation to the yoke, and means for reciprocating said yoke, substantially as and for the purpose set forth.

2. As an improvement in looms, the herein-described means for operating picker-staffs, consisting of a sleeve adapted to be disposed upon a picker-shaft and provided at opposite sides with two outwardly-projecting trunnions, a yoke for embracing said sleeve between the trunnions, transverse pins or bolts disposed at opposite ends of the yoke and longitudinally adjustable with relation thereto, and an operating-rod projecting from the yoke and adapted to be connected with a power-shaft, substantially as and for the purpose set forth.

478,454. METHOD OF AND APPARATUS FOR EQUALIZING LINKS. THOMAS MURPHY, Sewickley, Pa. Filed Nov. 23, 1891. Serial No. 412,732. (No model.)

Claim.—1. The herein-described method of equalizing the lengths of the two sides of a link, which consists in subjecting it to the action of heat and at the same time to a gradual strain until its sides or members are of equal lengths, substantially as set forth.

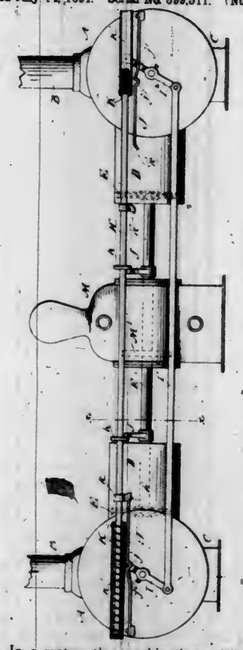
2. The herein-described method of equalizing the lengths of two sides of a link, which consists in subjecting two connected links to the action of heat and at the same time straining the said links apart until the two sides or members are of equal lengths and then permitting the links to cool while under strain, substantially as set forth.



478,455. NAILLESS HORSESHOE. JAMES MCCAFFREY, Philadelphia, Pa. Filed Sept. 22, 1891. Serial No. 406,512. (No model.)

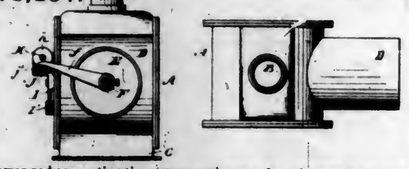
Claim.—1 A horseshoe-clip having arms extending rearwardly and concaved or corrugated in-cross-section, in combination with an elongated nut fitting in said concavity and a screw or bolt for fastening the arms together by said nut, substantially as shown and described.

2. A horseshoe consisting of the combination of two clip-plates A A, the spring splice-plate B, riveted to and connecting the front end of said clip-plates, the clamping-arms C C, riveted to the rear ends of the clip-plates and having a screw and nut for connecting them, and the detachable wearing-plates D D, substantially as shown and described.



478,456. BOX-MAKING MACHINE. JOSEPH C. MCEWEN, Lochloosa, Fla. Filed Nov. 28, 1891. Serial No. 413,433. (No model.)

Claim.—1. The combination of the main frame having recesses to receive the bottom and rear edges of the box-heads, a rock-shaft journaled to the rear of the frame, the arms H attached to the shaft and carrying presser-heads, as described, and the operating handle or lever for actuating the shaft, substantially as and for the purpose described.



2. The herein described machine for use in the manufacture of boxes or crates, the same comprising the main frame having recesses to receive the lower edges of the box-heads, the shelf to the rear of the frame and supported upon uprights rising from the frame, the rock-shaft journaled to the rear portion of the frame and longitudinally movable within its bearings, the arms attached to the shaft, the presser blocks carried by the arms, the lug I upon the shaft and engaging an inclined surface upon the frame, and the lever for actuating the shaft, substantially as and for the purpose described.

478,457. WATER-MOTOR. BENJAMIN S. PARTRIDGE, Jacksonville, Fla. Filed July 14, 1891. Serial No. 399,511. (No model.)

Claim.—1. In a motor, the combination, with oppositely arranged and spaced valve-chests and opposing cylinders at one side of the valve-chests, of spring-actuated valves in the valve-chests, means for alternately locking the valves stationary, pistons in the cylinders,

478,457.

a power-rod connecting the pistons, and means for releasing the valves, substantially as described.

2. In a motor, the combination, with oppositely arranged and spaced valve-chests and opposing cylinders at one side of the valve-chests, of spring-actuated oscillating valves in the said chests, means for alternately locking the valves stationary, a connection between the valves, pistons in the cylinders, a power-rod connecting the pistons, and means for releasing the valves from the power-rod, substantially as described.

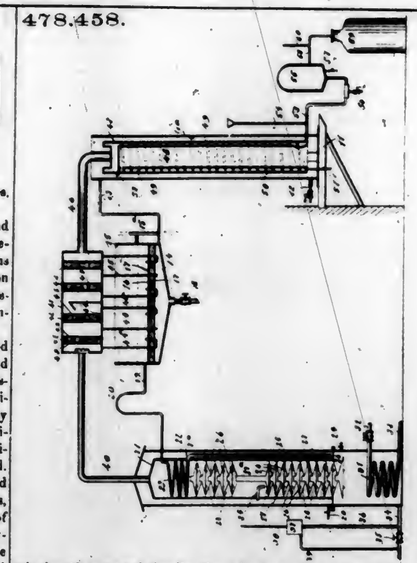
3. In a water-motor, the combination, with oppositely arranged and spaced valve chests, opposing cylinders at one side of the said chests, pistons in the cylinders, and a power-rod connecting the pistons, of oscillating valves in the chests, a spring-pressed and longitudinally-movable rod connected with the said valves, means for alternately locking the valves stationary, and mechanism between the said longitudinally-movable rod and the power-rod for operating the said longitudinally-movable rod to release the valves, substantially as described.

4. In a water-motor, the combination, with oppositely arranged and spaced valve-chests, opposing cylinders at one side of the chests, pistons in the cylinders, and a power-rod connecting the pistons, of oscillating valves in the chests, a spring-pressed and longitudinally-movable rod connected with the said valves and operated from the power-rod, spring-catches for temporarily locking the valves, and means for operating the said catches from the spring-pressed rod, substantially as described.

5. In a motor, the combination, with oppositely arranged and spaced valve-chests and opposing cylinders at one side of the valve-chests, of pistons in the cylinders, a power-rod connecting the pistons, oscillating valves in the chests, crank-levers connected with the valves, a spring-pressed rod connected with the upper ends of the crank-levers, a rod connecting the lower ends of the said crank-levers together, catches for engaging the crank-levers, and means for operating the catches from the spring-pressed rod, substantially as described.

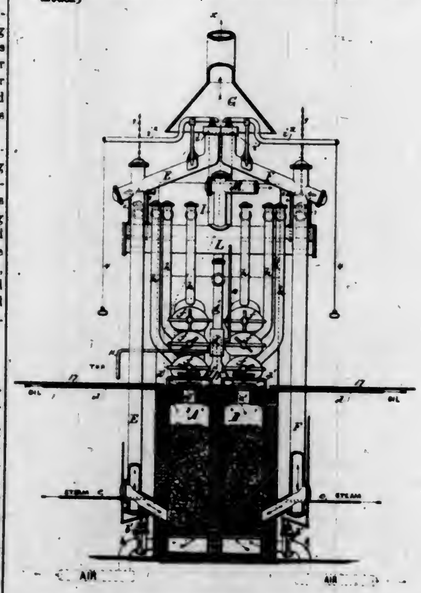
6. In a water motor or engine, the combination, with two opposing valve-chests having aligning inlet and outlet ports, of oscillating valves in the valve chests, having curved opposing wings, crank-levers on the shafts of the valves, connected with each other at their lower ends, spring-catches for the crank-levers, casings pivoted to the upper ends of the crank-levers, and a rod entering the casings and provided therein with springs and carrying trips adapted to engage the catches for the crank-levers, substantially as shown and described.

7. In a water motor or engine, the combination, with two opposing valve-chests having aligning inlet and outlet ports and opposing horizontal power-cylinders at one side of the valve-chests, reciprocating rotary valves in the chests, having curved opposing wings, pistons in the power-cylinders, and a rod connecting the pistons and carrying arms near its ends, of crank-levers on the shafts of the valves and connected with each other at their lower ends, spring-catches for the crank-levers, casings pivoted to the upper ends of the crank-levers, and a rod entering the casings and provided therein with springs and carrying trips adapted to engage the catches for the crank-levers, and collars adapted to be engaged by the arms on the piston-rod, substantially as shown and described.



478,458. WATER-STILL. JOHANNES PETTERSON and LOUIS H. LIEBECK, New York, N. Y. Filed Mar. 11, 1892. Serial No. 424,553. (No model.)

Claim.—1. An apparatus of the character described, comprising a water-tank connected with a source of water-supply, a filter connected with the tank, a boiler having a steam-dome therein and having a pipe connection with the filter, a steam-filter connected with the steam-dome, and a cooling-cylinder held within the tank, the cylinder having its upper end connected with the steam-filter and its lower end provided with a discharge-pipe, substantially as described.

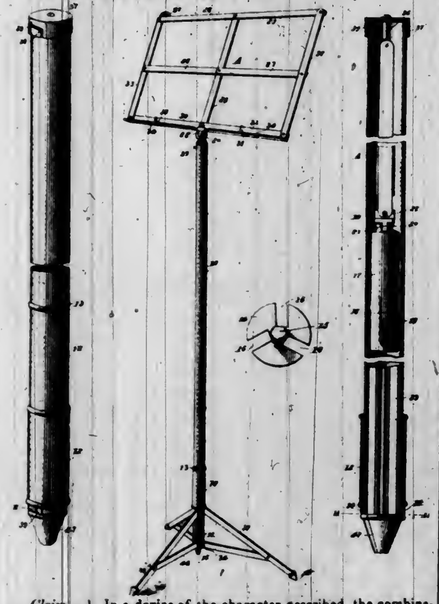


2. An apparatus of the character described, comprising a water-tank having a suitable inlet, a water-filter connected with the tank, a steam-boiler having a steam-dome therein, a pipe leading from the filter through and into the steam-dome, the pipe being formed into a coil within the dome, a steam-filter connected with the steam-dome, a water-cooling cylinder held within the tank and connected with the steam-filter, and a discharge-pipe opening from the cooling-cylinder, substantially as described.

3. The combination, with the water-receptacle 10, of the cooling-cylinder 47 arranged therein, the cylinder having a central bore open at one end and closed at the other, an inlet-pipe opening into one end of the cylinder, an outlet-pipe opening from the opposite end of the cylinder, and a cooling-coil held within the chamber which surrounds the bore of the cylinder, the coil having a suitable inlet and outlet, substantially as described.

478,458.

478,459. METHOD OF MANUFACTURING GAS. HENRY M. PIERSON, Brooklyn, N. Y. Filed Dec. 30, 1891. Serial No. 416,552. (No model.)



Claim.—1. The process of making a permanent compound gas, which consists in forming water-gas by passing steam through a bed of incandescent fuel, forming coal-gas by distilling bituminous coal, enriching the water-gas first formed by passing it through the hot retorts used in distilling the coal during the process of distillation,

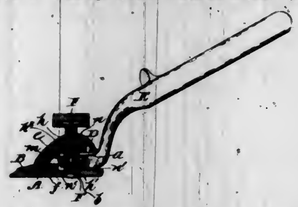
making oil-gas by delivering liquid hydrocarbons upon a bed of fuel at a dull-red heat, and passing the products downward through the same and conducting the gases to a common holder, where they are mixed and whereby a compound gas is formed without the use of the usual refractory-material fixing-chamber, substantially as described.

2. The process of making a permanent compound gas, which consists in blowing up companion beds of fuel alternately, the one to incandescence and the other to a dull-red heat, forming water-gas by passing steam through the said bed of incandescent fuel, forming coal-gas and coke by distilling bituminous coal, enriching the water-gas first formed with the surplus light tarry matters of the coal-gas retorts during the process of distillation by passing said water-gas through the hot coal-gas retorts and fixing the said enriched water-gas therein, making oil-gas by delivering liquid hydrocarbons upon the said bed of dull-red-hot fuel and passing the resulting hydrocarbon vapors down through the said bed of fuel, wherein they are converted into a fixed gas, and conveying all the gases to a common holder, where they are mixed inseparably, forming a permanent compound gas without the use of the usual refractory-material fixing-chamber, substantially as described.

3. The process of making a permanent compound gas, which consists in blowing up companion beds of fuel alternately, the one to incandescence and the other to a dull red heat, forming a water-gas by passing steam through said bed of incandescent fuel, heating the feeding part of coal-gas retorts by relatively low heat and the delivery part by a high intermittent heat, and forming coal-gas and coke by distilling bituminous coal, enriching the water-gas first formed with the surplus light tarry matters of the coal-gas retorts during the process of distillation by passing said water-gas through the hot coal-gas retorts and fixing the said enriched water-gas therein, making oil-gas by delivering liquid hydrocarbons upon the said bed of dull-red-hot fuel, and passing the resulting hydrocarbon vapors down through said bed of fuel, wherein they are converted into a fixed gas and conducting all the gases to a common holder, where they are mixed inseparably, forming a permanent compound gas without the use of the usual refractory-material fixing-chamber and replenishing said beds of fuel with red-hot coke from the coal-gas retorts as fuel for repeating the operations, substantially as described.

478,460. FOLDING MUSIC-RACK AND TELESCOPIC STAND THEREFOR. HENRY W. POTTER, Wellington, New Zealand, assignor of one-half to John Edward Hayes, same place. Filed Aug. 19, 1890. Renewed Nov. 5, 1891. Serial No. 410,906. (No model.) Patented in New Zealand Jan. 18, 1890, No. 4,132.

Claim.—1. In a device of the character described, the combination, with a shell and an adjusting-tube held to slide in the upper portion thereof, provided with pressure-springs engaging with the shell, of a folding table hinged to the upper end of the tube and a cap hinged to the table, adapted to cover the shell when the table is folded therein, as and for the purpose set forth.

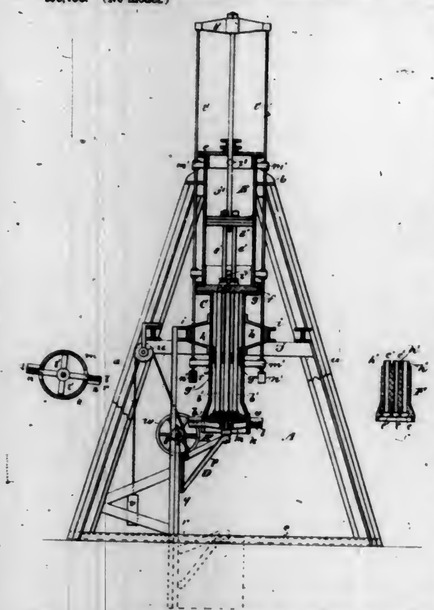


2. In a device of the character described, the combination, with a shell, an adjusting-tube held to slide in the upper part thereof, provided with pressure-springs, and spring-pressed legs capable of folding and sliding in the shell and of radial extension therefrom, of a folding table hinged to the upper portion of the adjusting-tube, an arm hinged to the table, a cap swiveled upon the arm, and means for locking the cap upon the shell, substantially as specified.

3. In a device of the character described, the combination, with a shell open at its upper and lower ends and provided with longitudinal slots in its lower extremity, a sleeve held to slide upon the shell and over the slotted portion thereof, an adjusting-tube capable of sliding within the shell and provided with pressure-springs, and a table hinged to the upper end of the said tube, of spring-pressed legs capable of folding and sliding in the shell and extending radially from the shell through the slots in the lower end thereof, as and for the purpose specified.

4. In a device of the character described, the combination, with a shell open at its upper and lower ends and provided with longitudinal slots at its lower extremity, a sleeve held to slide upon the exterior of the shell and over the slotted portion thereof, an adjusting-tube held to slide in the interior of the shell, having pressure-springs secured thereto, and a table hinged at the upper end of the tube, of a disk held to slide in the lower end of the shell, provided with a series of peripheral slots and a downwardly-extending post, a similarly-constructed disk held to slide upon the post, a spring bearing against the opposed faces of the disks, a leg pivoted in each of the slots of the upper disk, and a brace pivoted in each of the slots in the lower disk and to the said legs, the number of legs and their location corresponding with the number and location of the slots in the shell, substantially as shown and described, and for the purpose specified.

5. In a device of the character described, the combination, with a shell open at its upper and lower ends and provided with longitudinal slots at its lower extremity, a sleeve held to slide upon the exterior of the shell and over the slotted portion thereof, an adjusting-tube held to slide in the interior of the shell and having pressure-springs secured thereto, and a table hinged at the upper end of the tube, of a disk provided with peripheral slots and held to slide in the lower end of the shell, a post projected downward from the under face of the disk, a second correspondingly-slotted disk held to slide upon the post, a spring coiled around the post and having a bearing against the opposed faces of the disk, legs having their upper ends pivoted in the slots of the upper disk, brace-bars pivoted in the slots of the lower disk and to the said legs, and feet secured to the lower extremities of the legs and extending downward at an angle to the said extremities, the number of legs and their location corresponding with the number and location of the slots in the shell, substantially as and for the purpose specified.

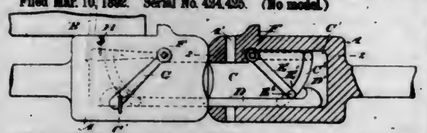


478,461. HAIR CLIPPER AND SHEARS. JOSEPH K. PRIEST, Nashua, N. H. Filed Apr. 2, 1892. Serial No. 427,508. (No model.)

Claim.—1. In a clipper of the type described, a movable cutter and operating-handle, in combination with a stationary handle and comb-plate spring connected to said handles and the axial portion of the clipper, said operating-handle and the other parts named being constructed to allow of the spring being arranged on the said axial portion and below the highest portion of the movable handle in a space between said highest portion of the handle and the comb-plate, whereby compactness is secured and the spring can be removed downwardly when the comb-plate is removed, substantially as described.

2. In a clipper, the combination of the cutter-operating handle formed with an arched or bowed portion and with a pendent hollow cylindrical bearing, the stationary handle having a housing portion and a hollow shouldered cylindrical bearing projecting from said housing portion and passed through the cylindrical bearing of the movable handle, the coupling and spring-tension key-bolt, the comb-plate, the cutter-plate, and a spring arranged in a space between the arched portion of the movable handle and the upper surface of the comb-plate and made removable in a downward direction when the comb-plate is removed, substantially as described.

478,462. CLAY-CONDUIT MACHINE. JAMES J. POWERS and ROBERT VAN BUREN, Brooklyn, N. Y. Filed Oct. 15, 1891. Serial No. 408,758. (No model.)



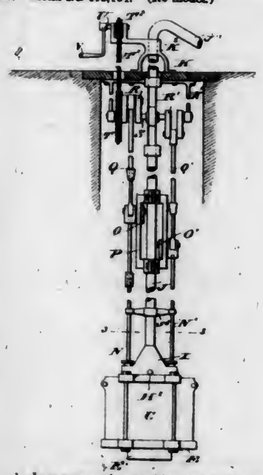
Claim.—1. In a machine for making clay conduits, the combination, with a power-cylinder, a molding-cylinder below the same, pistons in the said cylinders and connected together, a spider locked to the lower end of the cylinder by a bayonet-joint, and means for releasing the spider by the descent of the said pistons, of an elevator connected to the spider and sliding on the frame, a drum, and ropes or chains connected to the elevator, wound on the drum, passed over guide-pulleys, and having weights at their ends, substantially as herein shown and described.

2. In a machine for making clay conduits, the combination, with a supporting-frame, a power-cylinder mounted in the upper part of the frame, a molding-cylinder below the power-cylinder and having a flaring lower end, pistons in the said cylinders and connected together, a spider locked to the flaring end of the said cylinder by a bayonet-joint, and means for releasing the spider by the descent of the said pistons, of the elevator D, sliding on vertical guides *r* on the frame, the windlass E, mounted on the said guides and provided with the handle *a'*, guide-pulleys *u* on the frame, and ropes *t*, secured to the elevator, wound around the windlass, passed over the guide-pulleys, and provided with the weights *v*, substantially as herein shown and described.

3. In a machine for making clay conduits, the combination, with a vertical molding-cylinder, of an inclined filling-cylinder communicating with the molding-cylinder near the top and provided with a hopper, a follower in the filling-cylinder, a hydraulic cylinder connected with the filling cylinder, and a piston in the hydraulic cylinder and connected by rods with the follower in the filling-cylinder, substantially as herein shown and described.

478,463. CAR-COUPLING. REUBEN QUATERMASS, Moline, Kans. Filed Mar. 10, 1892. Serial No. 424,425. (No model.)

Claim.—1. A car-coupling comprising a shaft mounted to turn, a plate held thereon, and a coupling-link provided with a head and adapted to engage the free end of the said plate, a handle for turning the said shaft to swing the said plate up or down and provided with a link or projection, and a suitable catch adapted to be secured on the side of the car to engage said link or projection and hold the handle raised, substantially as set forth.

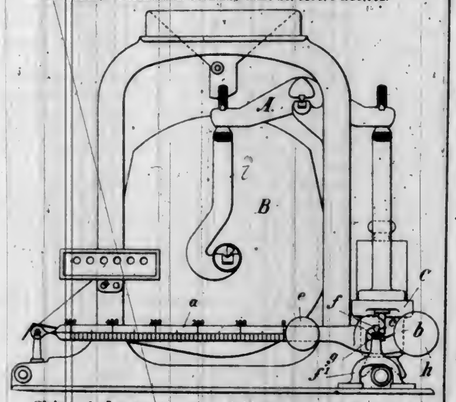


2. In a car-coupling, the combination, with a draw-head, of a shaft mounted to turn in the sides of the said draw-head, a plate secured to the said shaft and extending in a recess in the said draw-head, and pins projecting from the free ends of the said plate and engaging segmental slots or grooves arranged in the sides of the said draw-head, substantially as shown and described.

3. In a car-coupling, the combination, with a draw-head, of a shaft mounted to turn in the sides of the said draw-head, a plate secured to the said shaft and extending in a recess in the said draw-head, pins projecting from the free ends of the said plate and engaging segmental slots or grooves arranged in the sides of the said draw-head, and handles held on the outer ends of the said shaft to turn the latter to swing the said plate up and down, substantially as shown and described.

4. In a car-coupling, the combination, with a draw-head, of a shaft mounted to turn in the sides of the said draw-head, a plate secured to the said shaft and extending in a recess in the said draw-head, pins projecting from the free ends of the said plate and engaging segmental slots or grooves arranged in the sides of the said draw-head, handles held on the outer ends of the said shaft to turn the latter to swing the said plate up and down, and a spring-catch held on the side of the car and adapted to be engaged by a link on one of the said handles, as set forth.

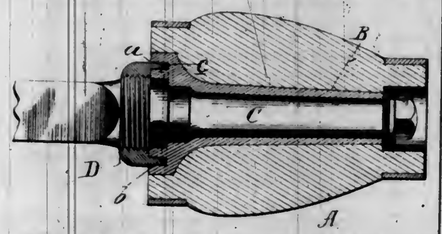
5. In a car-coupling, the combination, with a draw-head, of a shaft mounted to turn in the sides of the said draw-head, a plate secured to the said shaft and extending in a recess in the said draw-head, pins projecting from the free ends of the said plate and engaging segmental slots or grooves arranged in the sides of the said draw-head, handles held on the outer ends of the said shaft to turn the latter to swing the said plate up and down, a spring-catch held on the side of the car and adapted to be engaged by a link on one of the said handles, and means, substantially as described, for operating the said handles from the top of the car, as set forth.



478,464. PUMP. ROBERT H RAPRAGER, Lakota, N. D. Filed Jan. 15, 1892. Serial No. 418,191. (No model.)

Claim.—1. In a pump, the combination, with two plunger-barrels connected with each other at their bottoms, of inlet-valves and outlet-valves arranged in the upper ends of the said barrels, an outlet-pipe formed with a casing, into which discharge the said outlet-valves, plungers fitted to slide in opposite directions in the said barrels, plunger-rods carrying the said plungers, cross-heads rigidly connected with the said plunger-rods, a slide secured on the said outlet-pipe and on which travel the said cross-heads, pitmen connected with the said cross-heads, crank-arms arranged diametrically opposite each other and connected with the said pitmen, and a shaft mounted to turn and carrying the said crank-arms, substantially as shown and described.

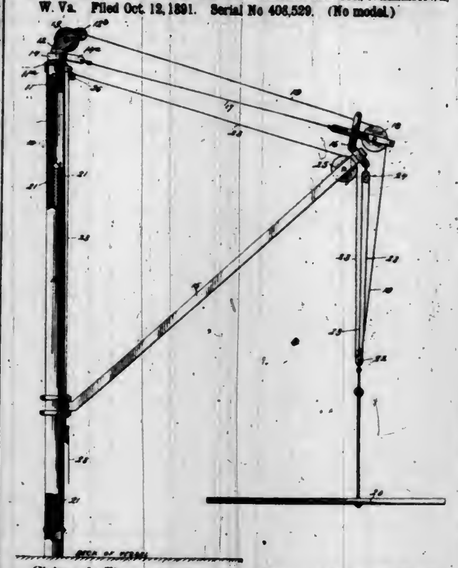
2. In a pump, the combination, with two plunger-barrels connected with each other at their bottoms, of inlet-valves and outlet-valves arranged in the upper ends of the said barrels, an outlet-pipe formed with a casing, into which discharge the said outlet-valves, plungers fitted to slide in opposite directions in the said barrels, plunger-rods carrying the said plunger, cross-heads rigidly connected with the said plunger-rods, a slide secured on the said outlet-pipe and on which travel the said cross-heads, pitmen connected with the said cross-heads, crank-arms arranged diametrically opposite each other and connected with the said pitmen, and a shaft mounted to turn and carrying the said crank-arms, a sprocket-wheel secured on the said shaft, a sprocket-chain passing over the said sprocket-wheel, a second sprocket-wheel over which passes the said chain, and a second shaft provided with a crank-arm and carrying the said second sprocket-wheel, substantially as shown and described.



478,465. GRAIN-WEIGHING APPARATUS. CARL REUTHER, Hennef-on-the-Sieg, Germany. Filed Dec. 17, 1891. Serial No. 415,440. (No model.) Patented in Germany June 26, 1891, No. 59,962.

Claim.—1. In an automatic weighing apparatus of the class described, means for determining the weight of a fraction of a load in the receiving-vessel without varying the load on the scale-beam, which consist in the combination, with the main scale-beam A and vessel B, of an auxiliary scale-beam *a* and a weight or weights adapted to be connected therewith, said auxiliary scale-beam operating to counterbalance both the load on the main scale-beam and the load in vessel B, as set forth.

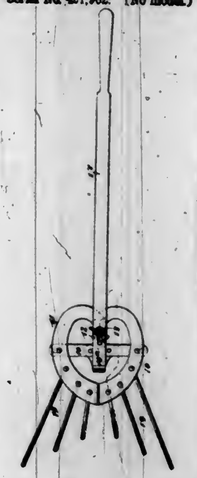
2. In an automatic weighing apparatus of the class described, means for determining the weight of a fraction of a load in the receiving-vessel without varying the load on the scale-beam, which consist in the combination, with the main scale-beam A and vessel B, of an auxiliary scale-beam *a*, adapted to be influenced by the load in said vessel and to influence the load on the main scale-beam by acting directly upon such load, and a weight or weights for connection with the auxiliary scale-beam to counterbalance both the load on the main scale-beam and the load in the receiving-vessel, as set forth.



478,466. DUST-GUARD FOR HUBS. JOHN T. RICHARDS, Gardiner, Me. Filed Feb. 24, 1892. Serial No. 423,663. (No model.)

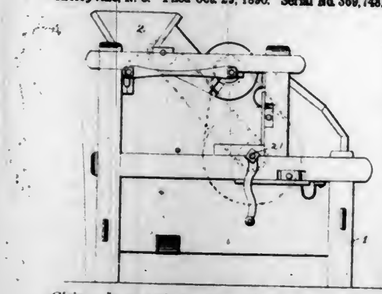
Claim.—1. The combination, with an axle, of a dust-guard located on the axle, said dust-guard provided with an annular outwardly-projecting flange, and an axle-box having an enlarged inner end, in which an annular groove is formed adapted to receive the annular flange on the dust-guard, said groove of greater depth than the length of the flange, whereby a recess is formed for a washer, and the portion of the dust-guard adjacent to the flange forming a shoulder or abutment for the inner end of the axle-box, substantially as set forth.

2. The combination, with an axle having a screw-thread thereon and a dust-guard screwed on these threads of the axle, said guard provided with an annular flange at its outer edge and a shoulder within this flange, of an axle-box provided with an annular groove in its inner end, adapted to receive the flange, this inner end constructed to abut against the shoulder within the annular flange, substantially as set forth.



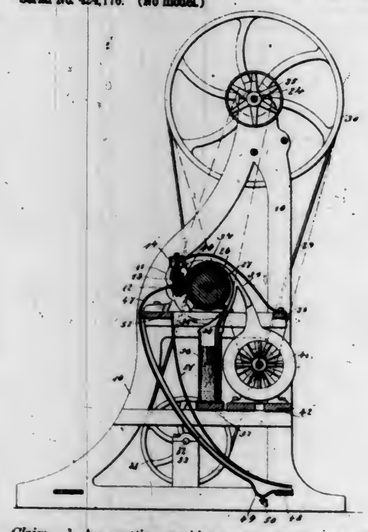
478,467. BALANCED STAGE. MAURICE RICHTER, Williamstown, W. Va. Filed Oct. 12, 1891. Serial No. 408,529. (No model.)

Claim.—1. The combination, with a tubular post or standard, of a counterbalancing-spring arranged within the post or standard, the lower end of said spring being secured therein, a sleeve inserted in the upper end of the post, a bracket having a tubular shank inserted in said sleeve, a pulley carried by said bracket, a boom attached to the post or standard, a bracket secured upon the upper end of said boom and projecting beyond the same, a pulley carried by said bracket, a stage or gang-plank, a rope connected with said stage and with the upper end of the spring, passing over the pulley carried by the bracket, the guy-rope, and lifting-ropes, all arranged as described.



2. The combination, with the tubular post or standard, of the balance-spring arranged therein, the metallic bushing or sleeve, the bracket consisting of the tubular shank and curved arms, the pulley journaled between the arms, the collar provided with a projection, the boom, the bracket rigidly attached to the end of same and carrying a pulley, the guy-rope connecting the said bracket and projection on the collar, the stage, the rope connecting the stage and balance spring, and the rope and pulleys for raising and lowering said stage, substantially as shown and described.

478,468. HAND-CULTIVATOR. TYREE T. RODES, Paris, Mo. Filed Feb. 18, 1892. Serial No. 421,902. (No model.)



Claim.—A hand-cultivator, comprising the handle 17, having a longitudinal slot 18, and provided with a transverse cross-bar 16 in front of said slot, the curved tooth-carrying jaws 10 11, pivoted between their ends to the ends of the cross-bar 16 and extending at their rear overlapped ends to the slot 18, and a set-screw passing through the said overlapped ends and the slot 18, substantially as set forth.

478,469. MACHINE FOR CLEANING WHEAT. JACOB RUDASILL, Cherryville, N. C. Filed Oct. 29, 1890. Serial No. 369,748. (No model.)

Claim.—In a grain-separator, the combination of a hopper, a cockle-separator consisting of metal and elastic faced rollers and scrapers to remove the cockle from the said elastic-faced rollers, and a series of sieves and a fan intermediate the hopper and cockle-separator to remove the light trash, sand, dust, and material specifically heavier and smaller than wheat from the latter before it passes to the said cockle-separator, substantially as and for the purpose described.

478,470. MACHINE FOR CARROTTING FUR. JOHN H. SANDERS, New York, and JAMES E. CARLIN, Brooklyn, N. Y. Filed Mar. 8, 1892. Serial No. 424,176. (No model.)

Claim.—1. A carrotting-machine comprising a pair of feed-rollers, a revoluble brush arranged behind the rollers and parallel therewith, and an atomizer adapted to deliver between the brush and the lower feed-roller, substantially as described.

2. A carrotting-machine comprising a pair of feed-rollers, a revoluble brush arranged adjacent to the feed-rollers and parallel therewith, an atomizer adapted to deliver between the brush and rollers, and a blower connected operatively with the atomizer, substantially as described.

3. The combination, with the feed-rollers and the brush arranged adjacent thereto, of the atomizer comprising a tank, a curved outlet-pipe extending upward from the tank, a blower arranged adjacent to the tank, and a pipe leading from the blower and extending over the top of the brush, said blower-pipe being connected with the outlet-pipe of the tank, substantially as described.

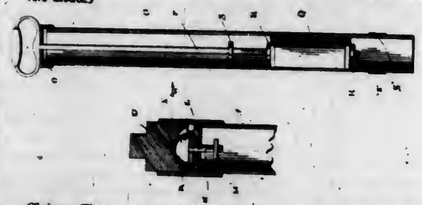
4. The combination, with the feed-rollers and brush, of an atomizer comprising a tank having a suitable outlet-pipe and a blower having a pipe extending over the top of the brush and delivering between the brush and rollers, the said blower-pipe being connected with the tank-outlet and having its free end widened, substantially as described.

5. In a carrotting-machine, the combination of the feed-rollers, the brush arranged near them, the atomizer adapted to deliver between the rollers and brush, and a hood held to cover the brush and rollers, substantially as described.

6. The combination of the feed-rollers, the revoluble brush, and a liquid-supply apparatus arranged to deliver between the brush and rollers, a curved guard-plate extending at an inclination below the brush and rollers, and a receiving-tank connected with the guard-plate substantially as described.

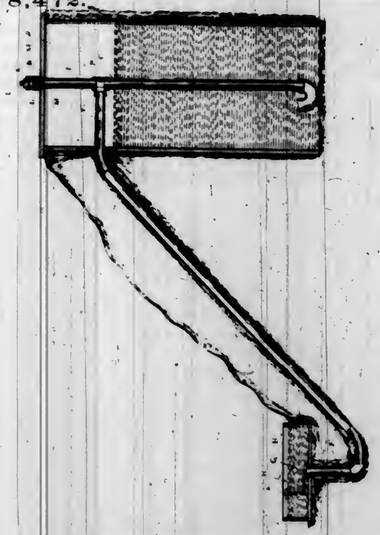
7. The combination of the feed-rollers, the revoluble brush arranged near them and parallel therewith, a liquid-supply apparatus to deliver between the brush and rollers, and the curved guard-plate having its upper end extending between the rollers and its lower portion extending downward and terminating in a receiving-tank, substantially as described.

8. The combination of the feed-rollers, the revoluble brush, the liquid-supply apparatus to deliver between the brush and rollers, the guard-plate arranged below the brush and rollers, and the curved and slotted guide-plate supported above the guard-plate and between it and the brush and rollers, substantially as described.



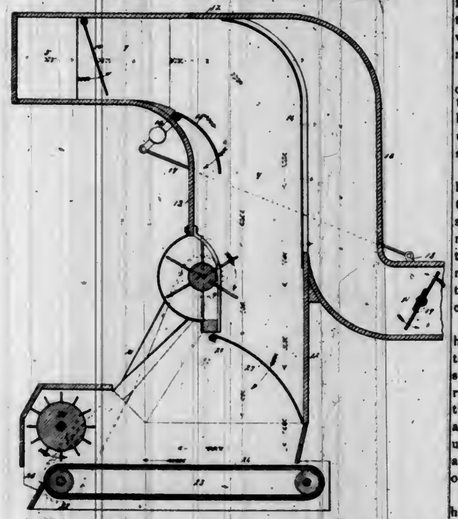
478,471. SASH-PULL. RENSEN SCHENCK, New York, N. Y. Filed July 8, 1891. Serial No. 398,765. (No model.)

Claim.—1. A window sash attachmont consisting in a plate adapted to be secured to the stile of a window-sash, in combination with an angle-bar having a part, as *d*, arranged parallel to the plate, substantially as set forth.



2. A window-sash attachment consisting in a plate adapted to be secured to the inner face of the stile and provided with a T-headed projection having arms, as *d*, extending to both sides thereof and arranged parallel to the plate, substantially as set forth.

478,472. AUTOMATIC WATERING DEVICE. GOTTLIEB W. SCHROEDER, Huntington, Ind. Filed Mar. 10, 1892. Serial No. 424,413. (No model.)



Claim.—The combination, with a tank or cistern, a discharge-pipe therefor, and a pipe-section connected to said discharge-pipe, of a perforated plug adapted to fit within said pipe-section, a valve for said perforated plug, having a rounded upper end, and a stopper which is adapted to close the top of said pipe-section and which is formed with a concave lower end which fits over said valve, for the purpose substantially as shown and described.

478,472.

478,473. SEED-COTTON RECEIVER. ANDREW SCHULER, Temple, Tex. Filed Jan. 16, 1890. Serial No. 337,095. (No model.)

Claim.—1. The combination, with a cotton-conveyer, of an apparatus for delivering cotton to a gin or feeder, and mechanism governing the delivery of cotton to said gin or feeder, said mechanism consisting of means for arresting the flow of cotton, and a movable member controlled by the cotton connected with said means.

2. The combination, with a cotton-conveyer, of a plurality of apparatus connected therewith in multiple arc for delivering cotton to gins or feeders, and mechanism governing the delivery of cotton to each gin or feeder, said mechanism consisting of means for arresting the flow of cotton, and a movable member controlled by the cotton connected with each means.

3. An apparatus for delivering seed-cotton to gins or feeders, having air-passages, a plurality of receivers connected therewith, means for causing a circulation of air in said passages and receivers to carry the cotton to said gins or feeders, and valves for automatically controlling the quantity of cotton delivered to each of said receivers.

4. An apparatus for delivering seed-cotton to gins or feeders, having air-passages and a plurality of receivers connected therewith in parallel or multiple arc, means for causing a circulation of air in said passages and receivers to carry the cotton to said gins or feeders, and valves for automatically controlling the quantity of cotton delivered to each of said receivers.

5. An apparatus for delivering seed-cotton to a gin or feeder, having air-passages and a receiver with means for causing a circulation of air therethrough to carry the cotton to said gin or feeder, a valve controlling the passage of air through said receiver, and a movable member controlling said valve, automatically operated by the pressure of the cotton.

6. An apparatus for delivering seed-cotton to a gin or feeder, having air-passages and a receiver with means for causing a circulation of air therethrough to carry the cotton to said gin or feeder, a shut-off valve controlling the passage of air through said receiver, and a hinged flap arranged within the path of the cotton, having suitable connections with said valve for governing the same.

7. An automatic seed-cotton-delivery apparatus having receivers or chambers connected with gins or feeders, a cotton-conveying pneumatic tube connected in multiple arc with said apparatus, and valve mechanism interposed between the pneumatic tube and each receiver for preventing back-pressure of air from the receiver to the pneumatic tube, but allowing the passage of air and cotton from the pneumatic tube to the receiver.

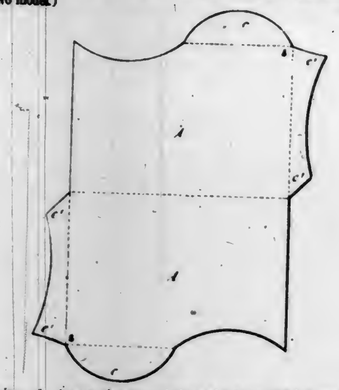
8. An apparatus for delivering seed-cotton to a gin or feeder, having air-passages and a receiver with means for causing a circulation of air therethrough to carry the cotton to said gin or feeder, a shut-off valve controlling the passage of air through said receiver, regulating means for said shut-off valve, automatically operated by the pressure of the cotton, and a check-valve controlled by the passage of air through said air-passages and receiver for preventing back-pressure therethrough.

9. An apparatus for delivering seed-cotton to a gin or feeder, having air-passages and a receiver with means for causing a circulation of air therethrough to carry the cotton to said gin or feeder, a shut-off valve controlling the passage of air through said receiver, a hinged flap arranged within the path of the cotton, having suitable connections with said shut-off valve for governing the same, and a check-valve controlled by the passage of air through said air-passages and receiver for preventing back-pressure therethrough.

10. An automatic seed-cotton-delivery apparatus having a cotton-conveying pneumatic tube, a receiver or chamber suitably connected therewith and with a gin or feeder, and valve mechanism interposed between the receiver and the gin or feeder for preventing back-pressure of air from the gin or feeder to the receiver, but allowing the passage of cotton from the receiver to the gin or feeder.

11. An apparatus for delivering seed-cotton to a gin or feeder, having air-passages and a receiver with means for causing a circulation of air therethrough to carry the cotton to said gin or feeder, a shut-off valve controlling the passage of air through said receiver, regulating means for said shut-off valve, automatically operated by the pressure of the cotton, and a cut-off valve arranged between the receiver and gin or feeder within the path of the cotton and adapted to cut off air communication between said gin or feeder and said receiver, for the purpose described.

12. An apparatus for delivering seed-cotton to a gin or feeder, having air-passages and a receiver with means for causing a circulation of air therethrough to carry the cotton to said gin or feeder, a shut-off valve controlling the passage of air through said receiver, regulating means for said shut-off valve, automatically operated by the pressure of the cotton, a check-valve controlled by the passage of air through said air-passages and receiver for preventing back-pressure therethrough, and a cut-off valve arranged between said receiver and the gin or feeder to cut off air communication between said gin or feeder and said receiver.

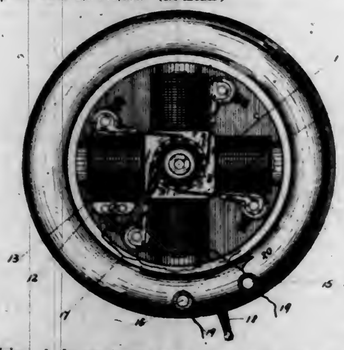


13. An apparatus for delivering seed-cotton to a gin or feeder, having air-passages and a receiver with means for causing a circulation of air therethrough to carry the cotton to said gin or feeder, a shut-off valve controlling the passage of air through said receiver, a hinged flap arranged within the path of the cotton, having suitable connections with said shut-off valve for governing the same, a check-valve controlled by the passage of air through said air-passages and receiver for preventing back-pressure therethrough, and a cut-off valve arranged between said receiver and the gin or feeder to cut off air communication between said gin or feeder and said receiver.

14. An apparatus for delivering seed-cotton to a gin or feeder, having air-passages and a receiver with means for causing a circulation of air therethrough to carry the cotton to said gin or feeder, a shut-off valve controlling the passage of air through said receiver, regulating means for said shut-off valve, automatically operated by the pressure of the cotton, and a screen interposed between said shut-off valve and the receiver for permitting the passage therethrough of air, but preventing the passage of cotton through the same.

15. An apparatus for delivering seed-cotton to a gin or feeder, having air-passages and a receiver with means for causing a circula-

tion of air therethrough to carry the cotton to said gin or feeder, a shut-off valve controlling the passage of air through said receiver, a hinged flap arranged within the path of the cotton, having suitable connections with said shut-off valve for governing the same, a check-valve controlled by the passage of air through said air-passages and receiver for preventing back-pressure therethrough, a screen interposed between the said shut-off valve and the receiver for permitting the passage therethrough of air, but preventing the passage of cotton through the same, a cut-off valve arranged between said receiver and the gin or feeder to cut off air communication between said gin or feeder and said receiver, and a spiked wheel arranged in said receiver for preventing the choking of the cotton therein.



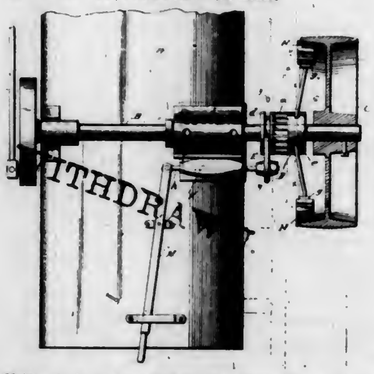
478,474. MANUFACTURE OF ENVELOPES. ANDREAS SCHWANENBERGER, Düren, Germany. Filed Dec. 30, 1891. Serial No. 416,581. (No model.)

Claim.—1. An envelope consisting of a front and a back suitably joined at the bottom and side edges and the closing-flap consisting of the two parts *c c*, one forming an extension of the front of the envelope over the right-hand half thereof and the other an extension of the back of the envelope over the left-hand portion, substantially as described.

2. An envelope or wrapper having the two halves A A of which it is formed of equal and reverse formation, comprising double closing flaps or parts *c c* and double parts or overlaps *c' c'*, by which the opposite sides or ends are closed and secured, substantially as described.

478,475. ELECTRIC MOTOR. JEROME B. SECOR, Bridgeport, Conn., assignor of one-half to Mark Anthony, Berkeley, Cal. Filed Jan. 30, 1891. Serial No. 379,668. (No model.)

Claim.—1. In an electric motor, the combination of a base of magnetic material, a series of radial field-magnets whose cores are magnetically connected with said base, a commutator and electrical connections adapted to energize said magnets successively, and a concentric non-wound and non-magnetized armature of magnetic material provided with inwardly-projecting teeth which approach the poles of the respective magnets successively and having its lower portion revolving in close proximity to the base upon which the field-magnets are mounted, all substantially as set forth.



2. In an electric motor, the combination of the circular base-plate of magnetic material, the field-magnets mounted radially upon said base-plate and having the inner ends of their respective poles magnetically connected with said plate, a commutator and electrical connections for energizing the magnets successively, and the armature surrounding said base-plate and field-magnets and consisting of the web by which it is supported, the annular flange extending downward from said web and the inwardly-projecting teeth forming a series of points of increased bulk, the edge of said armature being made to rotate in close proximity to the outer periphery of the base-plate of the field, as and for the purpose explained.

3. In an electric motor, the combination of the base-plate of magnetic material, the post projecting centrally from the magnetic base and adapted to receive the spindle, the radially-arranged field-magnets having the inner ends of their respective cores magnetically connected with the base-plate, the non-wound and non-magnetized shell-armature surrounding the base and field-magnets and consisting of the web carrying the concentric commutator and the spindle adapted to enter the central post, and the annular flange projecting from said web, with its edge rotating in close proximity to the base-plate and having the inwardly-extending enlargements intermediately of the edge and the web, all substantially as and for the purpose set forth.

4. In an electric motor, the combination of the magnetic base or support, the series of radially-extending magnets on said base or support, the non-wound and non-magnetized armature surrounding said magnets and in close proximity to the base, the commutator consisting of a solid ring having an intermittent conducting-surface, a binding-post having electrical connection with one pole of each magnet, a second binding-post having electrical connection with the ring through a brush bearing constantly thereon, and a series of independent brushes constantly bearing upon the intermittent conducting-surface of the commutator and connected with the other poles of the respective magnets, substantially for the purpose explained.

5. The combination of the shaft carrying the shell-like armature, an electric circuit comprising terminals 21 22, connected together by the resistance 23, the commutator also carried by said shaft and having the interspaced segments 8 9 and the continuous commutator-ring 10, the radial magnets, the switch 24, having engagement with said terminals, the brush 11, engaging said ring, the governor 25 26, having connection with said shaft, and the right-angled lever actuated by said governor and connected to said switch, substantially as set forth.

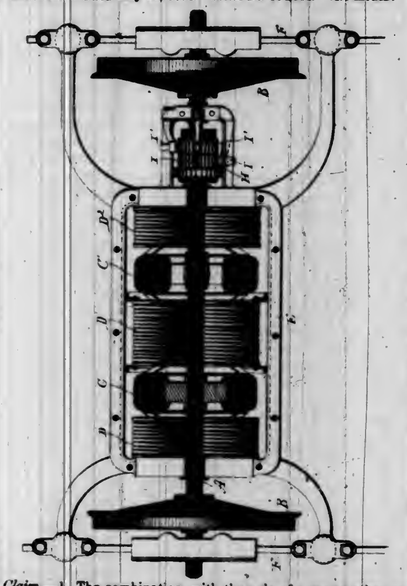
478,476. CLUTCH. REUBEN SHETTLER, Port Huron, Mich. Filed Oct. 13, 1890. Serial No. 367,980. (No model.)

WITHDRAWN

Claim.—1. In a friction-clutch, the combination of a clutched wheel flared or coned interiorly, a hub sliding on the same shaft therewith, sectional brake-shoes, and elastic spokes connecting said hub to said sectional shoe, said spokes being connected to the hub at an angle oblique to the axis of the shaft, whereby the perimeter of the sectional brake-shoe is increased as the angle between the spoke and the hub approaches a right angle.

2. In a friction-clutch, the combination, with a sliding pinion and a fly-wheel, of rods fixed to the pinion and curved outwardly therefrom and carrying on their outer ends friction-shoes adapted to engage the fly-wheel, whereby when said pinion has been moved toward the fly-wheel the rods carrying the friction shoes will be somewhat straightened, so as to increase the frictional contact between the shoes and their connection with the fly-wheel.

3. In a friction-clutch, the combination, with a sliding sleeve, of a rod or rods secured about midway of their length thereto and curved therefrom and carrying friction-shoes at their ends, substantially as specified.



4. In a friction-clutch, the combination, with a sliding sleeve, of rods secured thereto about midway of their length and curved therefrom and also having their ends threaded, the shoe-irons perforated to receive the threaded ends of the rods, and jam-nuts for adjustably securing the irons to the rod, substantially as specified.

5. The sliding sleeve having the pinion-teeth formed therein and a wall or flange at the opposite end of said teeth, said sleeve also having an annular groove to receive the arm of the shifting-lever, and the rods carrying the shoes, which rods are curved or inclined outwardly, so that when their outer ends are met with resistance and their inner portions moved outwardly they will be somewhat straightened out, substantially as specified.

6. A friction-clutch having a sliding toothed sleeve adapted to mesh with a gear-wheel, in combination with yielding rods or bars carrying friction-shoes and having their ends bent outwardly and their inner portions fixed to the sleeve, substantially as specified.

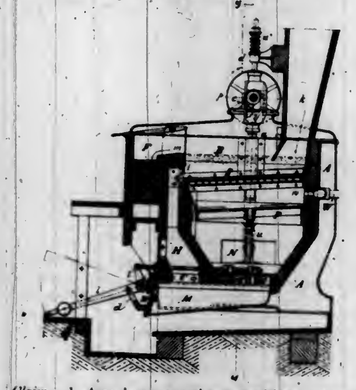
7. The combination, with a power-shaft and fly-wheel thereon, of a sliding sleeve having a pinion and an annular groove formed therein, rods secured to said sleeve and curved therefrom, friction-shoes adjustably secured to said rods, the transversely-movable rod, the forked arm secured to one end of said shaft, and the hand-lever secured to the opposite end of the shaft, substantially as specified.

478,477. ELECTRIC LOCOMOTIVE. SIDNEY H. SHORT, Cleveland, Ohio. Filed May 26, 1891. Serial No. 394,161. (No model.)

Claim.—1. The combination, with the axle of a car or other vehicle, of field-magnets and two or more armatures arranged axially with reference to the axle, the bobbins on said armatures being relatively arranged so as to intersect or alternate one with the other, substantially as set forth.

2. The combination, with an electric motor encircling the axle of a car or other vehicle, of a series of guard-bars extending beneath the motor and serving to protect the same from injury, substantially as set forth.

478,478. PICTURE-HOLDER. ARTHUR D. STEWART, Ithaca, N. Y. Filed Apr. 4, 1892. Serial No. 427,739. (No model.)



Claim.—1. A card or picture holder consisting of a bar slotted inward and downward from one edge, and a spring secured to the bar lying within the slot and pressing against the wall thereof by its elastic force.

2. A bar slotted obliquely inward from one edge, combined with a spring secured to the bar lying in the slot and exerting a yielding pressure against the wall thereof.

3. The bar slotted obliquely inward from one edge at a plurality of points and an equal number of spring-loops lying in the slots, respectively, and each secured to the bar above the slot in which it lies, substantially as set forth.

4. The combination, with the bar provided with the slots in one edge, of the spring-loops wider than the bar lying in the slots, respectively, and each having its projecting end bent and fixed against the edge of the bar above the slot in which it lies, substantially as and for the purpose set forth.

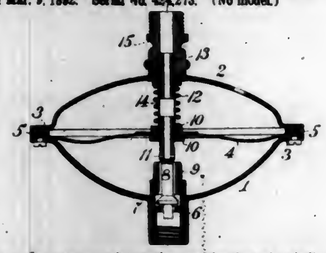
478,479. COAL-WASHER. SEBASTIAN STUTZ, Pittsburg, Pa. Filed Mar. 3, 1892. Serial No. 423,581. (No model.)

Claim.—1. A coal or ore washer comprising a separating-chamber, a sieve or screen arranged in the chamber, a slate-chamber adjacent to the separating-chamber, and an auxiliary receiver arranged below the washer and communicating with both the separating-chamber, and the slate chamber, substantially as described.

2. A coal-washer comprising a separating-chamber, a sieve or screen fitted in the chamber, a piston working underneath the sieve or screen, a slate-chamber adjacent to the separating-chamber, and an auxiliary receiver secured below the bottom of the washer and communicating with both the separating-chamber and slate-chamber, substantially as described.

3. A coal or ore washer comprising a separating-chamber, a slate-chamber adjacent to the separating-chamber, and an auxiliary receiver arranged below the separating-chamber and communicating with both the separating-chamber and the slate-chamber, substantially as described.

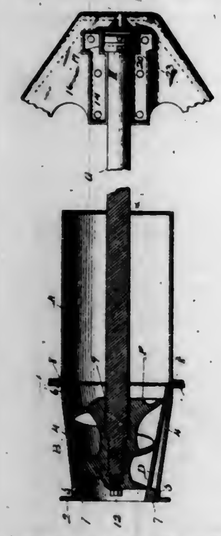
4. A coal or ore washer comprising a separating-chamber, a sieve or screen fitted in the chamber, a piston or plunger arranged beneath the sieve or screen, designed to reciprocate vertically, cams connected with the piston or plunger, a spring arranged beneath the piston or plunger to impart a differential movement thereto, a slate-chamber adjacent to the separating-chamber, and an auxiliary receiver arranged below the separating-chamber and communicating with both the separating-chamber and the slate-chamber, substantially as described.



5. A coal or ore washer comprising a separating-chamber, an auxiliary receiver arranged below the separating-chamber and communicating therewith by means of openings, valves for controlling said openings, a slate-chamber adjacent to the separating-chamber and communicating therewith through an opening, and a gate for governing said opening, substantially as described.

6. A coal or ore washer comprising a separating-chamber, a slate-chamber adjacent thereto and communicating therewith, an auxiliary chamber arranged below the separating-chamber and communicating with the separating-chamber and slate-chamber, valves for controlling the openings between the separating-chamber and the auxiliary chamber, a gate for governing the outlet-opening from the auxiliary chamber, and a lever connected to the gate, and valves for opening and closing the same, substantially as described.

7. A coal or ore washer comprising a separating-chamber, a screen or sieve arranged in said chamber, a piston working underneath the sieve or screen, cams connected with the piston or plunger, a spring arranged beneath said piston or plunger, an auxiliary receiver secured below the separating-chamber and connected therewith by means of openings, valves for controlling said openings, a gate governing an outlet from the auxiliary receiver, a lever connected to said valves and gate for opening and closing the same, a slate-chamber adjacent to and communicating with the separating-chamber and auxiliary receiver,



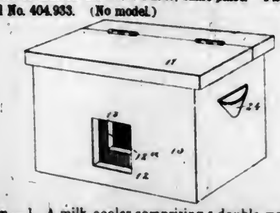
and a gate for governing the opening between the separating-chamber and slate-chamber, substantially as described.

478,480. GAS-REGULATOR. JAMES M. SWEENY, Pittsburg, Pa. Filed Mar. 9, 1892. Serial No. 424,273. (No model.)

Claim.—In a gas-regulator, the combination of a shell, a flexible diaphragm interposed between the inlet and outlet of the shell, a valve controlling the flow of gas into the portion of the shell below the diaphragm, a stem, hollow for a portion of its length, connecting the valve with the diaphragm and provided with inlets, and a flexible tube connecting the stem with the outlet-nipple, substantially as set forth.

478,481. BRICK AND TILE MACHINE. JOHN THOMPSON, Bucyrus, Ohio, assignor to the Frey-Sheckler Company, same place. Filed Mar. 14, 1891. Renewed Mar. 22, 1892. Serial No. 426,001. (No model.)

Claim.—1. In a mud-box for a brick and tile machine, the combination of an outer tapering shell having its ends formed as true cylinders of different diameters, an interior tapering shell formed with exterior lugs having their outer surfaces in alignment with the planes of the cylindrical faces of the outer shell, and adjusting-screws to engage the ends of the lugs on the inner shell, substantially as and for the purpose specified.



2. In a mud-box for a brick and tile machine, the combination of an outer tapering shell formed with cylindrical end portions of different diameters, an interior-tapering shell formed with exterior lugs having faces parallel with the planes of the cylinders of the outer shell, set-screws to adjust the inner shell in longitudinal direction, and a tapering clay-screw fitted to the inner shell, substantially as and for the purpose specified.

3. In a brick and tile machine, the combination of the shaft G, having a pin-hole transversely through its outer end, a cap-bearing on the end of the shaft, having seats in it to take the ends of a pin in the pin-hole of the shaft, and a coupling-pin in the shaft and cap-bearing, substantially as described.

4. In a brick and tile machine, the combination of the shaft G, having a pin-hole transversely through its outer end, a coupling-pin in the pin-hole with its ends projecting beyond the shaft, a cap-bearing fitted over the end of the shaft and formed with seats to take the ends of the coupling-pin, and an abutment-plate against the outer face of the cap-bearing, substantially as described.

5. In a brick and tile machine, the combination of the shaft G, having a pin-hole through its end, a cap-bearing fitted over the end of the shaft, formed with oil-ducts in its outer face, a coupling-pin to lock the shaft and cap-bearing together, and an abutment-plate against the outer face of the cap-bearing, formed with an oil-duct leading to the oil-ducts of the cap-bearing, substantially as described.

478,482. MILK-COOLER. SAMUEL W. TOBEY, Fairfield, Nebr., assignor to himself and C. J. Furer, same place. Filed Sept. 7, 1891. Serial No. 404,933. (No model.)

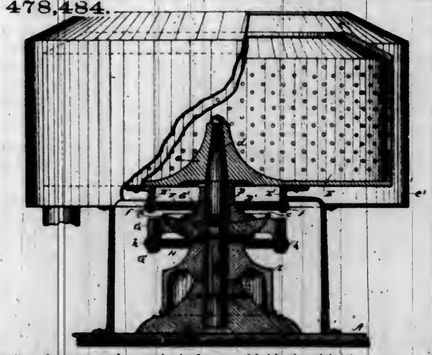
Claim.—1. A milk-cooler comprising a double-walled box having suitable covers, a tank arranged centrally within the box, an inlet-pipe having its inner end arranged transversely in the tank-bottom and provided with a series of holes and its outer end provided with a funnel, an outlet-pipe adjacent to the tank-bottom, and an overflow-pipe adjacent to the tank-top, substantially as described.

2. A milk-cooler consisting of an inner and outer box having an air-space between them and each provided with a registering opening in one side and with covers, an inlet-pipe having a T-shaped and apertured portion on the inside of the tank at the bottom thereof, and discharge and overflow pipes leading from the tank out through the boxes, substantially as herein shown and described.

478,483. BOTTLE-STOPPER. ISIDOR TRAUBE and AUGUST KATTENTIDT, Hanover, Germany. Filed June 5, 1890. Serial No. 354,338. (No model.) Patented in England Sept. 9, 1889, No. 14,167, and in France Sept. 30, 1889, No. 201,038.

Claim.—In a device of the character herein described, the combination, with the nose-like projection *g*, having the circular end drop-surface *h*, the normally-disconnected grooves *a b* on one side of the stopper, groove *c* on the opposite side, said stopper adapted to be moved so as to connect grooves *c* and *e* for the passage of air, and groove *d* in neck of bottle for connecting at the same time grooves *a* and *b* to allow the passage of fluid from the bottle, substantially as set forth.

478,484. CENTRIFUGAL MACHINE. BYRON VAN WIE, Troy, N. Y., assignor of five-sixths to William F. Greene, same place, and W. Everett Johnson, New York, N. Y. Filed Aug. 22, 1891. Serial No. 403,425. (No model.)



Claim.—1. In a centrifugal extractor, the combination of the extractor and a support therefor with gimbal-rings connected to the extractor and means for revolving the rings, and thereby driving the extractor, substantially as described.

2. In a centrifugal extractor, the combination of the extractor, a support therefor, a drive mechanism, and universal-joint connections between the same for revolving the latter and extractor independently of the support, substantially as described.

3. The combination of the concave-surfaced support with the convex-faced block resting thereon, and the stub-shaft fixed to said block and engaging a socket in the bottom of the extractor, substantially as specified.

4. The combination of the concave support, the convex-faced block

478,484.

resting thereon, and a stub-shaft on said block with the extractor mounted on said stub-shaft and mechanism for revolving said extractor, substantially as described.

5. The combination of the concave support, the convex-faced block resting thereon, and a stub-shaft fixed to said block, and the extractor mounted on said stub-shaft with the gimbals connected to said extractor and means for driving the same, substantially as specified.

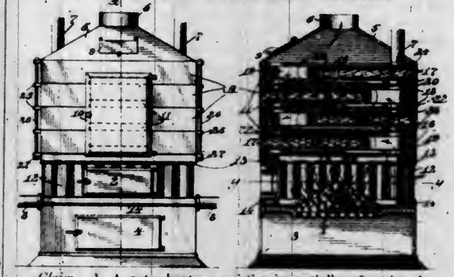
6. The combination of the revoluble extractor loosely mounted on a fixed shaft, but independent thereof, and the pulley loosely journaled on shaft below the extractor with the universal connections between said pulley and extractor for driving the latter and retaining it on the shaft, substantially as described.

7. The combination of the revoluble extractor loosely supported on the top of a fixed shaft, the pulley loosely journaled on said shaft below the extractor, and the gimbals pivotally connecting said pulley with the extractor, constructed and arranged substantially as and for the purpose described.

8. The combination of the dish fixed to the upper end of a vertical shaft, the convex-faced block fitting in said dish, the extractor mounted on said block, and the gimbals connected to the extractor and to a drive-pulley loosely journaled on said shaft, all substantially as and for the purpose described.

9. The combination of the concave dish, the convex-faced block resting therein, the stub-shaft fitting in a socket in said block, and the extractor mounted on said block and centered by said stub-shaft, and means for revolving said extractor, substantially as specified.

10. The combination of the concave dish mounted on a fixed support, the convex-faced block resting therein, the stub-shaft fitting in a socket in said block, and the extractor fitted on said stub-shaft with the series of gimbal-rings below the extractor, the uppermost being pivotally connected to the extractor and the lowermost to the revolving hub, all constructed and arranged substantially as and for the purpose set forth.



478,485. ELECTRIC BATTERY. CHARLES F. WALDRON, Boston, Mass. Filed Aug. 22, 1891. Serial No. 403,429. (No model.)

Claim.—1. A battery element consisting of a wooden base or blanket of a practically rigid character and a metallic plate presenting a surface of active material in immediate contact with said base or blanket, said parts together constituting a horizontal tray and remaining in permanent contact without intermediate spacing, substantially as set forth.

2. In an electrical battery, the receptacle A, the series of trays B D C D, each of substantially the same area as the interior of the receptacle and having openings G for the passage of the terminals E F, such terminals being formed in sections amalgamated together, combined with said plates and secured alternately thereto, substantially as set forth.

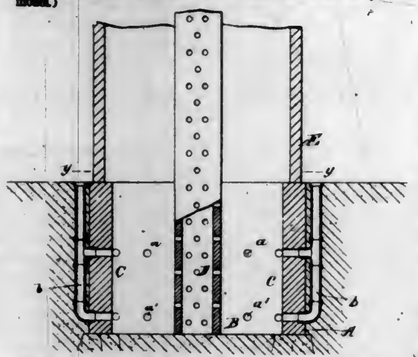
478,486. WATER-HEATER. GEORGE W. WASHBURN, Danbury, Conn. Filed Sept. 9, 1891. Serial No. 405,183. (No model.)

Claim.—1. A water-heater consisting, essentially, of sections having water-spaces with openings through them near one end for the products of combustion and at each end on one side solid hubs 20 and on the opposite side in line therewith hubs 21, having openings through which the water circulation is established, and flanges 18, surrounding said sections, by which heating-chambers are formed between them, said sections being so assembled that openings 19 are alternately at opposite sides of the heater, the solid hubs register, and the hubs having openings register, whereby the products of combustion are compelled to pass across each heating-chamber before passing to the next heating-chamber, the water in each water-space likewise having to pass from side to side before passing into the next section.

2. A water-heater consisting of a fire-box having its walls formed of water-pipes, sections above the fire-box, having water-spaces with openings through them near one end for the products of combustion and at each end on one side solid hubs 20 and on the opposite side in line therewith hubs 21, having openings through which the water circulation is established, and flanges 18, surrounding said sections, by which heating-chambers are formed between them, said sections being so assembled that openings 19 are alternately at opposite sides of the heater, the solid hubs register, and the hubs having openings register, whereby the products of combustion are compelled to pass across each heating-chamber before passing to the next heating-chamber, the water in each water-space likewise having to pass from side to side before passing into the next section.

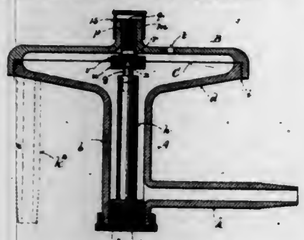
3. A water-heater consisting of a fire-box having its walls formed of water-pipes, sections above the fire-box, having water-spaces with openings through them near one end for the products of combustion and at each end on one side solid hubs 20 and on the opposite side in line therewith hubs 21, having openings through which the water circulation is established, flanges 18, surrounding said sections, by which heating-chambers are formed between them, and a dome above the upper section, through which the products of combustion pass and which is provided with a check-door to regulate the draft, ears 25 upon the fire-box, sections, and dome, and bolts engaging the ears by which said parts are secured together.

478,487. MINER'S LAMP. JULIUS R. WATTS, Springfield, Ill., assignor of one-half to Edward W. McCullough, same place. Filed June 23, 1891. Serial No. 397,197. (No model.)



Claim.—1. The combination, with the lamp having a spout provided with a wick-raiser, of a guide between the spout and the body of the lamp, and a wick-retaining device having an opening at its lower end freely embracing the spout and the base thereof and extending upward and outward therefrom through the guide to the upper edge of the spout, substantially as set forth.

2. In a miner's lamp, the combination, with the spout thereof, a sleeve held to slide in the spout and adapted to receive the wick of



the lamp, and a rod located at the outer side of the spout and connected with the sleeve, of a wick-retaining device capable of vertical movement around the spout, the upper end of which retaining device is curved in the direction of the spout and is provided with prongs projecting adjacent to the upper end of the spout and adapted to cross the same and enter the wick, and a forked guide through which the upper part of the curved retaining device passes, as and for the purpose specified.

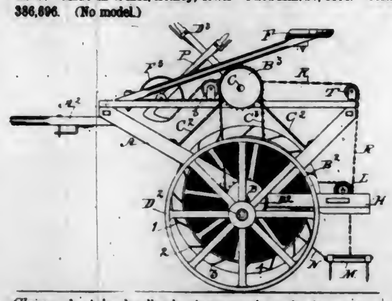
478,488. WHITE-LEAD CORRODING-PIT. WILLIAM H. WETHERILL, Philadelphia, Pa. Filed Mar. 1, 1892. Serial No. 423,386. (No model.)

Claim.—The combination, with the pit-walls C, having the ventilating-holes *a a'*, of a series of pipes *b*, open at the top, embedded in the surrounding earth arranged around the walls exteriorly, and leading upward from said holes, as shown and described, for the purpose specified.

478,489. COMBINED AUTOMATIC RELIEF AND VACUUM AIR-VALVE FOR RADIATORS. WILLARD O. WHITMAN, Boston, Mass. Filed Feb. 29, 1892. Serial No. 423,198. (No model.)

Claim.—1. In a relief-valve mechanism for radiators, the combination, with a casing, of a heat-actuated valve disposed therein and a flexible diaphragm within the casing, carrying a valve-seat in position to be engaged by said valve, the outer side of said diaphragm being exposed to the atmosphere, substantially as described.

2. A combination relief-valve and vacuum-maintaining valve for radiators, comprising a casing opening into the radiator, a flexible diaphragm in said casing, provided centrally with a valve-seat, an air-vent in the casing at one side of said diaphragm, and a valve of heat-expansible material disposed at the opposite side of said diaphragm in position to engage said seat, substantially as described.



3. In a device of the character described, a casing, a flexible diaphragm in said casing, a valve-seat in said diaphragm, having a port opening therethrough, a valve of heat-expansible material at one side of said diaphragm and adapted to engage said seat, an air-vent in the casing at the opposite side of said diaphragm, and an adjustable stop for said seat, substantially as described.

4. A valve mechanism for radiators, comprising a casing, a nipple for connecting said casing to the radiator, a flexible diaphragm extending across said casing, a valve-seat in said diaphragm, a valve of heat-expansible material on the steam side of said diaphragm in position to close said seat, a stop on the opposite side of said diaphragm in position to engage said seat and having an air-port registering with the seat-port, and a vent in said casing, substantially as described.

5. The combination, with the casing having an air-vent and radiator connection, of the flexible diaphragm secured across said casing and provided with a valve-seat, as *w*, opening therethrough, a heat-actuated valve for engaging said seat, and an adjustable stop for engaging said seat and limiting its movement away from said valve.

6. The combination of the casing comprising members A B with the diaphragm C, secured between said members, the valve-seat *w* in said diaphragm having a port *s*, the heat-actuated valve *g* for engaging said seat, the adjustable stop *p*, having a port *r*, registering with the seat-port, and a vent in said member B, substantially as described.

478,490. COMBINED LAND-ROLLER, PULVERIZER, AND HARROW. JESSE H. WILTS, Ackley, Iowa. Filed Mar. 27, 1891. Serial No. 386,696. (No model.)

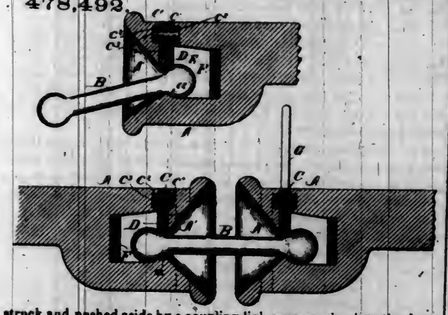
Claim.—1. A land-roller having sprocket-wheels on the ends of its axle stub-axles on the sprocket-wheels, traction-wheels on the stub-axles, a rock-shaft having sprocket-wheels on its ends and connected with the sprocket-wheels on the axle of the roller by means of chains, and means for operating the rock-shaft, arranged and combined with a carriage for raising and lowering the roller, for the purposes stated.

2. The combination of an endless chain having scrapers projecting outward and adapted in shape and size to enter spaces between spiral cutters on the surface of the land-roller, and mechanism for actuating the chain and scrapers in concert with the land-roller, in combination with a land-roller and a carriage, to operate in the manner set forth, for the purposes stated.

3. A machine for rolling, pulverizing, and harrowing land, comprising a roller mounted on the axle of a carriage frame and provided with spiral cutters on its periphery, sprocket-wheels journaled to the carriage-frame in line with the axis of the roller and provided with stub-axles, traction-wheels on the stub-axles, a rock-shaft in bearings fixed to the carriage-frame, sprocket-wheels on the ends of the rock-shaft, connected with the sprocket-wheels that carry the stub-axles by means of chains, means for actuating and locking the rock-shaft to the carriage-frame, an endless chain carrying scrapers for cleaning the spiral cutters on the roller, means for automatically actuating the chain and scrapers, a harrow, and means for raising and lowering it in rear of the roller, arranged and combined to operate in the manner set forth.

478,491. DEVICE FOR ASCERTAINING GRADES, &c. DAVID C. WOLFE, Lyons, Kans. Filed May 27, 1891. Serial No. 394,248. (No model.)

Claim.—1. In a device for ascertaining grades, the combination of the hollow case A, with projecting angle-irons *r* at the corners and spring-clasps *g*, and a reversible base-board B, bearing upon one side a set of graduated plates and scales and having pins *u* projecting in central position from the ends, substantially as shown and described.



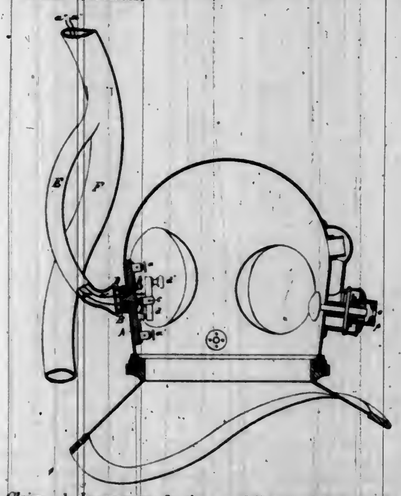
2. The combination of the plate *a*, provided with slot *b*, the side plates *w w*, graduated as described, the adjustable carrier C, having sector *c*, and the gradnated lever or rule J, hung to the carrier and provided with limb *k*, substantially as shown and described.

478,492. CAR-COUPLING. ALBERT R. WOOLF, New York, N. Y., assignor to Rosamond Woolf and Thomas J. Montgomery, same place. Filed Mar. 11, 1892. Serial No. 424,572. (No model.)

Claim.—1. In a car-coupling, the combination, with a bell-mouthed draw-head, of a slide loosely connected with the draw-head and a drop hinged to the draw-head and located in position to be pushed aside by the coupling-link and constructed to drop back automatically into position to retain the link in the draw-head, substantially as described

2. In a car-coupling, the combination, with a draw-head, of a slide, a drop hinged to the slide and located in position normally to be struck and pushed aside by a coupling-link upon passing into the draw-head, and a bar or bars having a loose sliding connection with the slide, whereby the latter is moved by an endwise movement of the bar or bars, substantially as described.

478,492.



3. The combination, with a bell-mouthed draw-head having an enlarged cavity formed therein and a lip at the junction between the mouth and cavity, said lip rounded or concaved, the draw-head provided with a recess leading into the cavity approximately over the lip, the forward edge of this recess forming a stop, of a slide located in the recess, and a drop hinged to the slide in position to extend across the throat of the draw-head and be struck and pushed aside by an entering link until the latter has passed into the cavity, after which the drop falls into place and locks the link in position, substantially as described.

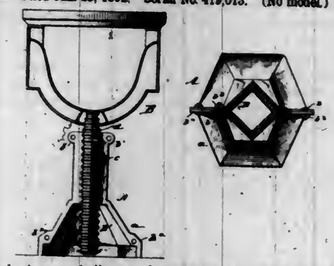
4. The combination, with a draw-head, of a slide, a drop hinged thereto and adapted to automatically lock a link upon the latter passing into the draw-head, the slide provided with a diagonal guide or slot, a bar or bars having a pin which enters the slot, and a hand-lever or equivalent device connected with the bar or bars, whereby they are moved endwise, substantially as described.

5. The combination, with a draw-head and link constructed substantially as described, of a gravity-drop and a movable support from which the drop depends, as specified.

6. The combination, with a bell-mouthed draw-head having a cavity formed therein, the latter having a cushioned inner wall, of a slide, means for operating the latter, and a drop hinged to the slide and adapted to co-operate with the lip to hold a link, substantially as described.

478,493. MICROTELEPHONIC APPARATUS FOR DIVERS. ROBERT WREDEN, St. Petersburg, Russia. Filed Mar. 28, 1890. Serial No. 345,663. (No model.)

Claim.—1. In apparatus for the use of divers, an elastic bandage adapted to be placed on the diver's head and provided on its inner surface with a receiver to be placed near the ear and on its outer surface provided with a microphone, all substantially as set forth.



2. In apparatus for the use of divers, the combination of the helmet provided with binding posts in electrical communication with conducting-wires with a bandage adapted to be placed on the diver's head and provided with a receiver and a microphone, and conducting-wires leading to the said binding-posts, all substantially as set forth.

3. In apparatus for the use of divers, the combination of an electric circuit, a transmitter, a receiver, and an electric bell in the said circuit with a diver's helmet provided with a commutator placed in the interior thereof and adapted to be moved by the diver's head, substantially as described.

4. In apparatus for the use of divers, the combination of two sets of telephone receiving and transmitting instruments, one for the diver and one for the above-water station, an electric bell, a battery, and a switch adapted to place the bell in the electric circuit while cutting out the above-water-station telephone-instruments, and vice versa, and a commutator in the helmet and adapted to normally retain the diver's telephone-instruments in the circuit, but to cut these instruments out of the circuit at the will of the diver, substantially as and for the purposes set forth.

5. In a diver's helmet, an exhaust-air valve provided with one large opening and covered internally with lead or other poor conductor of sound, substantially as and for the purpose set forth.

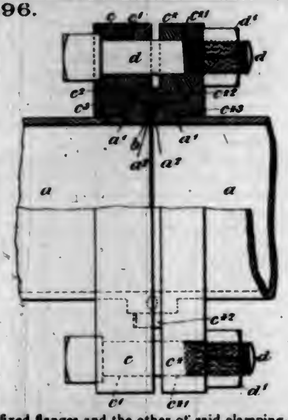
478,494. STAND FOR RANGE-BOILERS. JAMES M. YOUNG, Pittsburg, Pa. Filed Jan. 23, 1892. Serial No. 419,013. (No model.)

Claim.—1. A range-boiler stand consisting of a cast base and an adjustable upper part fitting inside the same and interlocking therewith, the base part being made in two vertical and separable halves secured together by removable bolts and nuts, substantially as described.

2. A range-boiler stand consisting of a base part made in two vertical separable cast-metal halves or sections transversely channeled or grooved on their inner surfaces and connected together by removable bolts and nuts and an adjustable section having a transversely-serrated stem, the interior of the upright tubular portion of the base and the stem of the adjustable part being angular in cross-section, substantially as described.

3. In a range-boiler stand, the combination, with the adjustable section B B, having the horizontally-serrated stem B' of angular form in cross-section, of the base or pedestal A, consisting of two twin castings secured together at their abutting edges by detachable fastenings and formed with interior horizontal serrations, the space inclosed by the twin castings being of angular form in cross-section, to correspond with the form of the stem B', substantially as described.

478,495. ANTISEPTIC QUINOLINE. JOSEF ZIEGLER, Biebrich, Germany. Filed Nov. 14, 1891. Serial No. 411,901. (No specimens.)



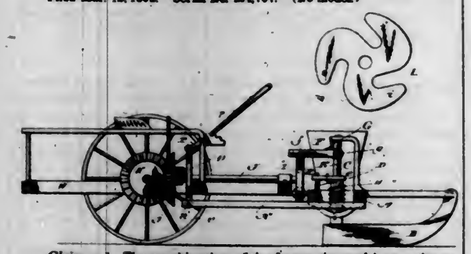
Claim.—1. A soluble antiseptic consisting of quinoline, combined with a saponaceous solution, prepared substantially as described.

2. The hereinbefore-described process for the manufacture of soluble quinoline antiseptics, which consists in saponifying oils or fats in the presence of quinoline, boiling until the solution is complete, and thereafter adding water to the solution, substantially as described.

478,496. JOINT OR COUPLING FOR METALLIC PIPES OR TUBES. JOSEPH AIRD, Tipton, England. Filed Mar. 11, 1891. Serial No. 384,563. (No model.) Patented in England Oct. 23, 1890, No. 16,896; in France Feb. 25, 1891, No. 211,708; in Belgium Feb. 25, 1891, No. 93,924, and in Germany Feb. 25, 1891, No. 58,452.

Claim.—A joint or coupling for metallic pipes or tubes, consisting of a fixed flange or collar upon each of the lengths of pipe to be connected, an annular groove formed in one or both of such flanges, a ring of packing material located in the groove, two loose clamping-collars abutting against the flanges of the tubes, one being provided with an annular flange c^{23}, arranged around the exterior of the said fixed flanges and projecting beyond the packing and the opening be-

478,496.



tween said fixed flanges and the other of said clamping-collars being formed with annular recesses c^3 c^3, the latter being deeper than the former and its outer wall being extended around and overlapping the outer edge of one of the fixed flanges a', so as to form, substantially, a continuation of the flange c^{32}, and the outer wall of the recess c^3 being extended around and overlapping the outer edge of the flange c^{32}, and means for forcing such clamping-collars together, substantially as herein shown and described.

478,497. PUZZLE. ANTENOR ASBORATI and ARTURO CUYÁS, New York, N. Y., assignors, by direct and mesne assignments, to the Columbus Egg Company, same place. Filed June 30, 1891. Serial No. 397,955. (No model.)

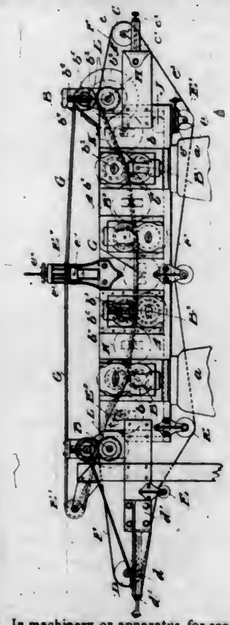
Claim.—In a puzzle, the combination, with an egg-like shell, of a casing shaped substantially as a truncated cone, fixedly located within one end of the shell, a track attached to said casing and extending to the opposite end of the shell, the said track being essentially U-shaped and its members made to diverge at their connection with the casing, and a movable weight adapted to travel upon the track and enter the casing, as set forth.

478,498. CORN-PLANTER. FRANK BAYLESS, Wilberforce, Ohio. Filed Mar. 12, 1892. Serial No. 424,707. (No model.)

Claim.—1. The combination of the frame, the seed-boxes, the reciprocating dropper-actuating bar, the vertical rock-shaft operating said bar, the horizontally-projecting vertically-yielding lever connected to said rock-shaft, and a revolving cam-disk for operating said lever, substantially as described.

2. The combination of the reciprocating bar, the vertical rock-shaft having a horizontal arm connected to said bar, the horizontal swinging lever connected to said bar, and the rotatable cam-disk operating said lever, and springs for throwing said parts back to normal position, substantially as described.

3. The combination of the dropper-actuating bar, a rock-shaft, an arm connecting said shaft and bar, a vertically-swinging spring-controlled lever connected to said shaft, a friction-sleeve on the end thereof, and a revoluble cam-disk upon which the free end of said lever bears, substantially as and for the purpose specified.

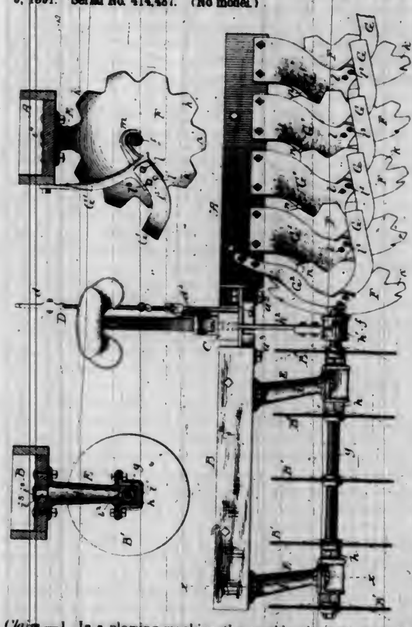


4. The combination of the reciprocating dropper-actuating bar, the spring-controlled rock-shaft for shifting said bar, and the lever connected to said rock-shaft, with the frame mounted on a rotatable wheeled shaft, the longitudinal shaft geared to said wheeled shaft, and the cam-disk on the end of the longitudinal shaft engaging said lever, substantially as described.

5. The combination of the furrow-opening frame, the wheeled frame shackled thereto, the longitudinal shaft journaled in the wheeled frame, a cammed disk mounted on the front end of said shaft, and mechanism for operating said longitudinal shaft from the main wheels, with the dropper-actuating bar on the furrow-opening frame, the vertical rock-shaft for operating said bar, and the lever connected to said rock-shaft and bearing against the cams of said disk and operated thereby, substantially as described.

6. The combination of the seed-boxes, dropping mechanism therein, and the reciprocating actuating-bar therefor, with the spring-controlled rock-shaft, its arm connected to said bar, and the spring-controlled swinging lever connected to said shaft, and a revoluble cam-disk engaging the free end of the lever, substantially as described.

7. The combination of the furrow opening frame, its seed-boxes, and reciprocating dropper-actuating bar, the rear frame, its wheeled axle, the yoke connected to the front frame, and the adjusting-link connections between said yoke and rear frame, the transverse shaft in the rear frame, the gearing for operating said shaft, the cam-disk on the front end thereof, the rock-shaft on the front frame, the lever connected thereto and engaging said disk, and the springs for throwing said shaft, lever, and reciprocating bar back to normal position, all substantially as and for the purpose set forth.



478,499. APPARATUS FOR SCOURING AND WASHING SKINS, &c. THOMAS BURNS, Edinburgh, Scotland. Filed Sept. 13, 1889. Serial No. 323,886. (No model.) Patented in England Feb. 9, 1889, No. 2,311, and July 10, 1889, No. 11,133; in Victoria Aug. 20, 1889, No. 7,013; in South Australia Aug. 20, 1889, No. 1,397; in New South Wales Aug. 21, 1889, No. 1,639; in Queensland Aug. 22, 1889, No. 826; in New Zealand Aug. 29, 1889, No. 3,918, and in Canada Oct. 27, 1891, No. 37,692.

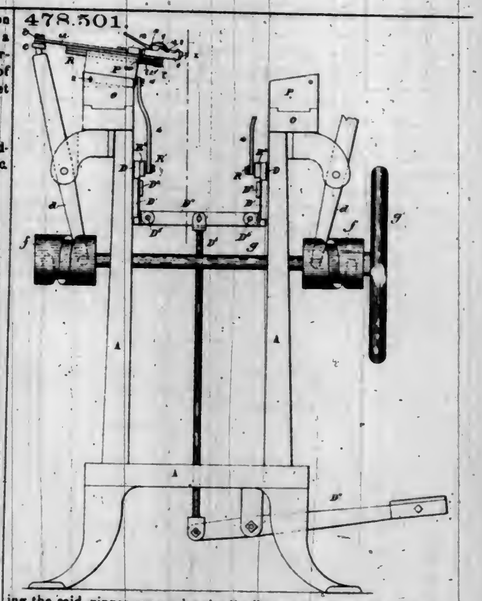
Claim.—1. In machinery or apparatus for scouring and washing skins, wool, &c., the combination of the tank A, carrying a series of squeezing-rolls and grooved guide-rollers E, E', and E^2, an endless band F, passing about said guide-rollers and between the squeezing-rolls, adjustable pulleys C and D for regulating the tension of the endless band, endless ropes G, passing around grooved guide-rollers E^2 E^4 and between the squeezing-rolls, and gearing for connecting together and simultaneously driving the squeezing-rolls, substantially as described.

2. In a machine or apparatus for scouring and washing skins, wool, &c., the combination of a tank of ordinary or suitable construction carrying a series of squeezing-rolls, a steeping trough N, carrying a series of entering-rollers mounted upon the end of said trough, a spur-gear P, and means for connecting together and driving the gearing of the tank and trough simultaneously, substantially as hereinbefore set forth.

478,500. LAND-PLOWING MACHINE. GEORGE M. CLARK, Haddam, Conn., assignor to Clement S. Hubbard, same place. Filed Dec. 9, 1891. Serial No. 414,487. (No model.)

Claim.—1. In a plowing-machine, the combination, substantially as hereinbefore described, of a gang of rotary plowshares, each having a stationary mold-board and the whole arranged angular to the pole or line of draft, and a gang of land-side-disks at the other side of the pole or line of draft for resisting the lateral thrust of the plowshares and mold-boards.

2. In a plowing machine, the combination, substantially as hereinbefore described, of a gang of rotary plowshares and stationary mold-boards, all angularly adjustable with relation to the pole or line of draft and located wholly at one side thereof, and a gang of landside-disks at the other side of the pole or line of draft.



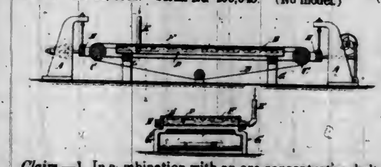
3. In a plowing-machine, the combination, substantially as hereinbefore described, of a gang of rotary plowshares angular to the pole or line of draft and at one side of said line, and a gang of landside-disks at the opposite side of said line and at right angles thereto.

4. In a plowing-machine, the combination, substantially as hereinbefore described, of a gang of rotary plowshares, each having a stationary mold-board, said gang being at one side of the line of draft, and a gang of landside-disks at the other side of said line, both of said gangs being angularly adjustable to said line of draft.

5. The combination, with a gang of rotary plowshares and mold-boards, of pendent hangers between each two shares, each hanger serving as a support for a mold-board and having one edge conforming to the concave side of one share and the other edge conforming to the convex side of the adjacent share, substantially as described.

6. The combination, with the gang-frames and gang-axles, of closed journal-boxes coupled to the gang-frames by tubular hangers or standards, which are internally accessible by way of holes in the gang-frames for the introduction of lubricants to the closed boxes, substantially as described.

478,501. LASTING-MACHINE. FRANK CHASE, Malden, Mass., assignor to the Chase Lasting Machine Company, Portland, Me. Filed Jan. 20, 1890. Serial No. 337,447. (No model.)



Claim.—1. A lasting-machine comprising the following instrumentalities, viz: two series of vertically-moving nipper-wipers or pinchers, one at each side of the last, means, substantially as described, for moving the said nipper-wipers longitudinally toward the last, and independent actuating mechanism for each series of nipper-wipers, said actuating mechanism containing equalizers and unyielding connections actuated by them and in operative connection with the nipper-wipers to lift the same vertically, combined with an equalizer G^4, connecting the two sets of actuating mechanisms for imparting vertical movement to the two series of nipper-wipers or pinchers, substantially as set forth.

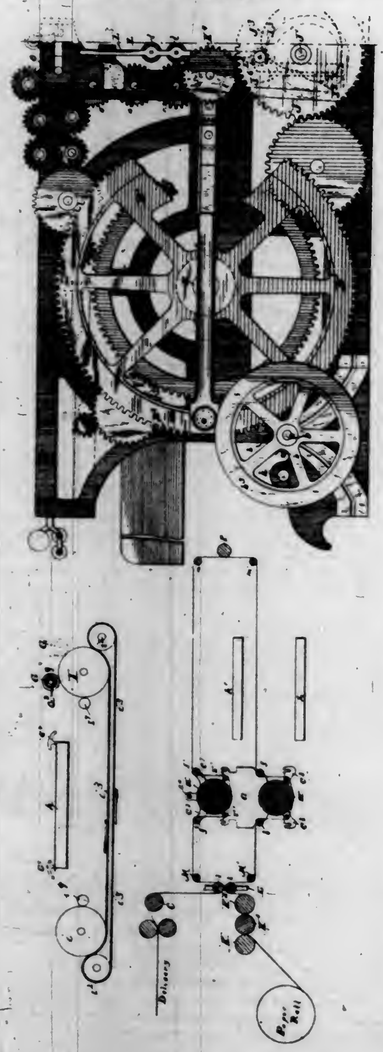
2. A lasting-machine containing the following instrumentalities, viz: two series of nipper-wipers or pinchers, one at each side of the last, wiper-slides, equalizers connected to the said slides, means to reciprocate the said wiper-slides transversely of the shoe, guides in which the said slides reciprocate, equalizers $R' R^3$ at opposite sides of the last, connecting-rods 16 between the said equalizers R and the said blocks, and the carriers D and equalizer D^4, connecting the said carriers at opposite sides of the last, substantially as described.

3. In a lasting-machine, a nipper-wiper composed of a jaw 6, a movable jaw 7, sliding thereon, a lever 12, and an independent spring pivotally attached to and connecting the jaw 7 and the said lever 12, to operate substantially as described.

4. A lasting-machine comprising the following instrumentalities, viz: two series of vertically-moving nipper-wipers or pinchers, one at each side of the last, means, substantially as described, for moving the said nipper-wipers longitudinally toward the last, and independent actuating mechanism for each series of nipper-wipers, said actuating mechanism containing equalizers and unyielding connections actuated by them and in operative connection with the nipper-wipers to lift the same vertically, combined with a centrally-pivoted equalizer-bar D^4, connecting the two sets of actuating mechanisms, the pivot of said equalizer-bar being arranged approximately under the longitudinal center of the last, and devices to raise and lower the said equalizer-bar to effect the arrest of the vertical movement of nipper-wipers at one side of the last before the termination of the vertical movement of the nipper-wipers at the other side of the last, substantially as set forth.

478,502. FLUID-SUPPORT FOR ORE-CONCENTRATING BELTS. FREDERICK G. CORNING, New York, N. Y. Filed Aug. 25, 1891. Renewed June 14, 1892. Serial No. 436,645. (No model.)

Claim.—1. In combination with an ore-concentrating belt, a fluid-pressure reservoir beneath it, having outlets directed toward the under surface of the belt, for the purposes described.



2. In an ore-concentrator, the combination of a flexible apron or belt and a fluid-distributer for maintaining the same, formed of a perforated plane surface underlying the said apron, and means for introducing through said perforations a fluid under pressure, for the purposes described.

3. In an ore-concentrator, the combination of an endless apron or belt, rollers whereon the belt is revolved and intermediate to said rollers, a fluid-distributing box having a plane perforated surface adjacent the belt, and means for supplying said distributer with fluid under pressure.

4. In an ore-concentrator, the combination of a flexible apron or belt, a plane table beneath the belt, and perforations through the surface of the table for supplying a film of fluid beneath the same and the belt.

5. The combination, with a flexible apron or belt for washing and separating ore pulp, of a perforated fluid-distributer beneath the belt, provided with interior subdivisions and independently-controlled supply-pipes for each said subdivision, substantially as and for the purposes set forth.

478,503. PRINTING-PRESS. JOSEPH L. COX, Battle Creek, Mich., assignor to the Duplex Printing Press Company, same place. Filed July 22, 1890. Serial No. 359,563. (No model.)

Claim.—1. The combination, in a printing-press, of a pair of parallel opposite type-beds each arranged face uppermost, with an impression-cylinder for each bed, and means, substantially as described, for reciprocating said cylinders, substantially as and for the purpose set forth.

2. The combination, in a printing-press, of a pair of type-beds with a pair of reciprocating impression-cylinders coacting with said beds, only one of which cylinders moves between the beds, substantially as specified.

3. The combination of the pair of parallel type-beds arranged one above the other and having their type-bearing surfaces facing in the same direction, the pair of revolving impression-cylinders, and mechanism, substantially as described, for simultaneously reciprocating the said cylinders over the respective beds, with mechanism for feeding a continuous web of paper between one cylinder and bed and, after the first impression produced thereby, feeding it between the second cylinder and bed to produce a perfected sheet, substantially as and for the purpose set forth.

4. The combination of a type-bed and ink-rolls at the opposite ends thereof, with an ink distributing or carrying belt adapted to deliver ink from one roll to the other, substantially as described.

5. In a printing-press, the combination of the type-bed, the ink-distributing rolls at opposite ends thereof, and the inking-fountain for supplying ink to one of said rolls, with an endless belt and its supporting-rollers for transmitting ink from one of said rolls to the other, substantially as and for the purpose specified.

6. The combination of the type-bed, the impression-cylinder mounted in movable carriers and adapted to be reciprocated over the type-bed, and the guide-rollers for directing a web of paper between the impression-cylinder and type-bed, substantially as set forth, with movable looping-rollers over which the web is looped in opposite directions before and after it passes between the impression-cylinder and bed, substantially as described.

7. The combination, with the pair of type-beds arranged parallel and both facing upwardly, of a pair of reciprocating carriers moving in guides between the type-beds and the impression-cylinders supported by said carriers and arranged to contact, respectively, with the said beds when the carriers are reciprocated, substantially as set forth.

8. The combination of the type-beds, the carriers moving in guides between said beds, and the impression-cylinders carried thereby adapted to respectively contact with the forms on said beds, with the paper-guiding rollers, whereby a web of paper can be directed between one impression-cylinder and type-bed and thence between the other cylinder and bed, for the purpose and substantially as described.

9. In a printing-press, the combination of type-beds arranged one above the other, a pair of impression-cylinders adapted to be respectively reciprocated over said beds, and inking devices for the forms on the beds, with guide-rollers arranged to direct a web of paper between the lower bed and cylinder and thence between the upper bed and cylinder, and mechanism, whereby said web is looped before it enters between the first bed and cylinder and again looped after it passes the second bed and cylinder, whereby the web can be fed into and delivered from the press continuously and yet have portions thereof stopped during the taking of an impression thereon, substantially as specified.

10. The combination, with a type-bed, of a pair of reciprocating carriers mounted in guides on the frame, an impression-cylinder journaled in said carriers, and the web-guide rollers and form-rollers mounted on the carriers at opposite sides of the impression-cylinder, substantially as described.

11. The combination of the type-bed, the revolving impression-cylinder mounted in reciprocating carriers above said bed and adapted to be reciprocated thereover, and inking and paper-web guide rollers at each side of the cylinder carried by and movable with said carriers and cylinder, with stationary web-guide rollers and ink-supply rolls at each end of the bed, substantially as specified.

12. The combination of the main frame, the type-bed, the carriers reciprocating above said bed, and the main shaft and pitmen connected directly to and operating said carriers from said main shaft, with the impression-cylinder journaled in said carriers and operating with the type on said bed, substantially as set forth.

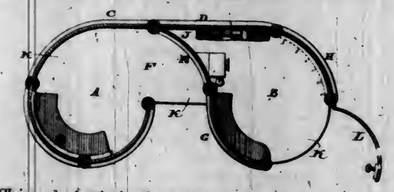
13. The combination of the type-beds, the carriers, the crank-wheels, shaft, and pitmen for reciprocating said carriers, and the impression-cylinders journaled in and movable with said carriers, with the looping-frame L, having looping-rollers *l l*, the shaft carrying cams for operating said frame, and the paper-guide rollers, all substantially as described.

14. The combination of the type-beds, the carriers, the pitmen and crank-wheel and shaft for reciprocating the same, the impression-cylinders, form-rollers, and paper-guide rollers carried by said carriers and movable therewith, the paper-looping frame carrying looping-rollers, the shaft and cams for operating said frame, and the paper-web-guide rollers, all substantially as set forth.

15. In a web-printing press, the combination of a stationary type-bed, the impression-cylinder, mechanism for reciprocating the same over the bed, and paper-web feed and delivery mechanism, with a pair of connected looping devices, over one of which the web is looped between the feed mechanism and cylinder and over the other of which the web is looped between the cylinder and delivery mechanism, whereby one loop is formed simultaneously with the paying out of the other, as and for the purpose set forth.

16. The combination of a type-bed, an impression-cylinder adapted to be reciprocated thereover, and mechanism, substantially as described, whereby the web is continuously fed into and from the press, with a mechanism, substantially as described, whereby the web is positively looped between the feeding devices and cylinder during the taking of an impression and positively looped between the cylinder and delivery mechanism after the impression, the looping devices being connected and synchronous in operation, so that one loop is formed while the other is being paid out during the taking of an impression, substantially as set forth.

17. The combination of the type-bed, ink supplies at each end thereof, a revoluble impression-cylinder, form-inking rollers at each side thereof, and mechanism, substantially as described, whereby the cylinder and form-rolls are simultaneously reciprocated over the type-bed and the type inked at each movement of the cylinder, with a pair of connected looping-rollers, over one of which the paper-web is looped previous to passing under the cylinder and over the other of which the web is looped after passing from the cylinder, whereby the feed and delivery of web is rendered continuous and one loop formed simultaneously with the paying out of the other all substantially as specified.

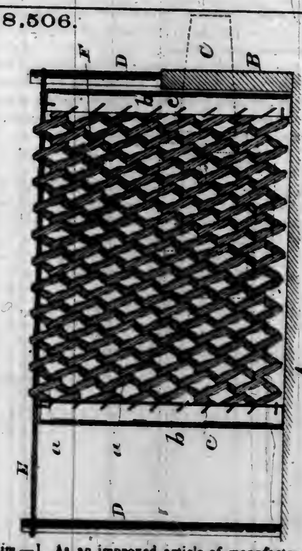


478,504. FOOT-GUARD FOR RAILWAY-FROGS. WILLIAM DRISCOLL, Brockville, Canada, assignor of one-half to James Hall, same place. Filed May 8, 1891. Serial No. 392,116. (No model.)

Claim.—1. A foot-guard for railways, consisting of a spring-steel bar having one end bent downward and extended at an angle with an opening therethrough to receive a fastening-spike, and the opposite end bent down and under in a curved line and of bifidate form to provide a double-spring action at the free end of the bar, the said front end of the bar being reduced in width, substantially as and for the purposes set forth.

2. A foot-guard for railways, consisting of an elongated spring-steel bar having both ends bent downward, one of said ends being secured and the other free, the free end being bent under or backward in a curved line and of bifidate form, and a leaf pivoted on the top surface of the bar to modify the resiliency thereof, substantially as described.

478,505. URINAL AND PATROL-BOX. WILLIAM BELIN, Philadelphia, Pa., assignor of one-half to John L. Hill, same place. Filed Dec. 19, 1891. Serial No. 415,569. (No model.)



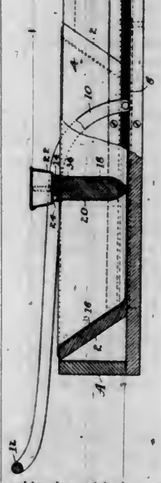
Claim.—1. A urinal and patrol-box having the rear walls thereof continuous of each other and a side wall common to both the urinal and box, substantially as described.

2. A patrol-box and a urinal, the former having its side wall forming a guide and guard for the entrance-passage of the urinal, substantially as described.

3. In a combined urinal and patrol-box, the rear walls of the frames of said parts being continuous of each other, in combination with the side wall of the patrol-box, diverging from the rear wall thereof, forming a guide and guard for the entrance-passage of the urinal and producing with the rear wall of the patrol-box a storage-chamber, substantially as described.

4. The wall C, forming an inclosure A, with the entrance F, and the walls D, H, E, and G, forming an inclosure B, the wall E being opposite the said entrance F, and the said inclosure B having a door or inlet, substantially as described.

478,506. SHIELD FOR GUNNERS. JAMES E. EMERSON and THOMAS MIDDLEY, Beaver Falls, Pa., assignors of one-third to John Lynch, Washington, D. C. Filed Feb. 3, 1892. Serial No. 420,151. (No model.)

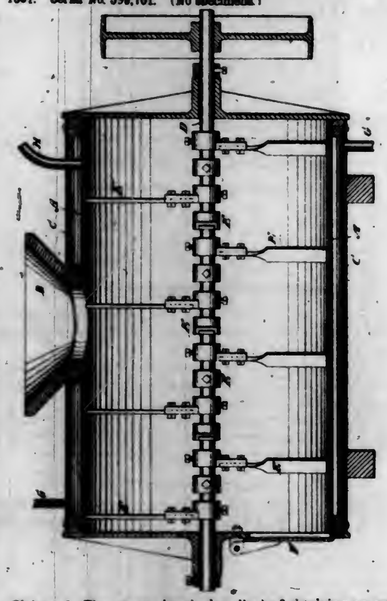


Claim.—1. As an improved article of manufacture, a shield for gunners, consisting of a sheet of intertwined coiled-wire helices having their ends incased.

2. As an improved article of manufacture, a shield for gunners, consisting of a sheet of intertwined coiled-wire helices having their ends incased in flexible material.

3. As an improved article of manufacture, a shield for gunners, consisting of a sheet of intertwined coiled-wire helices composed of a plurality of twisted strands of wire having their ends incased.

478,507. DOUGH-KNEADER. FRANK ERREN and OTTO LOEBER, St. Paul, Minn. Filed Mar. 7, 1892. Serial No. 423,963. (No model.)

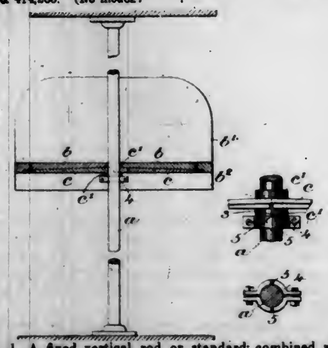


Claim.—1. The combination, with the rectangular box provided with longitudinal guides, of the arms engaging said guides and provided with a suitable handle, the removable sheet-metal tray fitted to said box, the block carried by said arms and fitted transversely in said tray, and the flour-receptacle arranged on the top of said box, substantially as described.

2. The combination, with the rectangular box provided with longitudinal guides, of the arms pivotally and slidably connected to said guides and provided with a suitable handle, the convex sheet-metal block carried by said arms and standing transversely in said box, the

perforated flour-receptacle carried by said arms, the removable sheet-metal tray arranged in said box, and the removable flanged cover for said tray, substantially as described.

3. The combination, with a rectangular box provided with longitudinal guides, of the handle pivotally and slidably connected to said guides, the convex metallic block fixed to said handle and fitting transversely in said box, and the perforated flour-receptacle carried by said handle above said box, substantially as described.

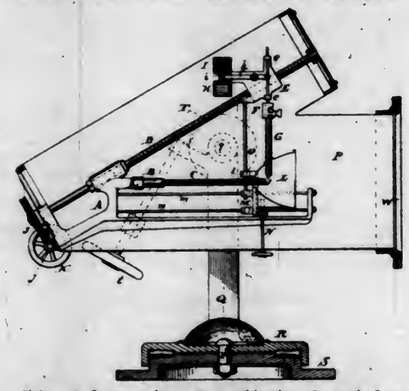


478,508. PROCESS OF OBTAINING EXTRACTS FROM HOPS. CHARLES H. PRINCE and BERTHA O. PRINCE, New York, N. Y., assignors to the Brewing Improvement Company, Maywood, N. J. Filed July 16, 1891. Serial No. 399,701. (No specimens.)

Claim.—1. The process herein described of obtaining an extract from hops, which consists in subjecting them to the action of dry heat at a temperature of about 212° Fahrenheit and then treating the same with cold water.

2. The process herein described of obtaining an extract from hops, which consists in comminuting them, then subjecting them to the action of dry heat at a temperature of about 212° Fahrenheit, and when the required state of torrefaction has been obtained allowing the hops to cool, and then treating the same with cold water.

478,509. ADJUSTABLE SHELVING. CHARLES R. GODFREY, Milford, assignor to the Library Bureau, Boston, Mass. Filed Dec. 7, 1891. Serial No. 414,285. (No model.)



Claim.—1. A fixed vertical rod or standard; combined with a vertically-adjustable shelf having attached to it a bracket provided with an eye or hub to embrace the rod or standard and notched on its under side, and a clamping-ring adjustable longitudinally on said rod or standard, and projections on said ring to co-operate with the notched hub to prevent rotation of and positively fix the bracket and shelf in any desired adjusted position upon the rod or standard, substantially as described.

2. A vertically-adjustable shelf grooved at its under side, a bracket having several arms secured to the under side of said shelf at one side and midway its length, the arms entering the grooves, a ring on said bracket encircling a fixed rod or standard, a clamping ring on which the bracket-ring rests for maintaining the shelf at any desired point, and a projection on one ring to enter a recess in the other to prevent rotation of said shelf, substantially as described.

3. A shelf having a ring at one side thereof midway its length and cut away upon its under side to form a shoulder extended diametrically across the ring, combined with a second shelf having a ring at one side thereof midway its length and cut away upon its upper side to leave a shoulder extended diametrically across the same, and a clamping device to contact with one of said rings, the shoulders of said rings abutting one against the other to prevent independent rotation of the two shelves, substantially as described

4. A fixed vertical rod or standard, combined with a series of independent rotatable and vertically-adjustable shelves, each shelf having a support attached to its end and extended above and below it to co-operate with books on the said shelf and with the tops of books on the next lower shelf, a bracket attached to each shelf and provided with an eye or hub to embrace the rod or standard and notched on its under side, a clamping-ring for each shelf adjustable longitudinally on said rod or standard, and projections on the ring to co-operate with the notched hub to prevent rotation of and positively fix the bracket and shelf in adjusted position upon the rod or standard, substantially as described.

478,510. ELECTRIC-ARC LAMP. RUDOLPH M. HUNTER, Philadelphia, Pa., assignor to the Thomson-Houston Electric Company, of Connecticut. Filed Nov. 12, 1891. Serial No. 411,671. (No model.)

Claim.—1. In an arc lamp, the combination of a main frame, a holder for one of the carbons, carried by said main frame and having a relatively fixed position, a carriage or movable part mounted to move at an oblique angle to said relatively fixed carbon, a holder for the other carbon, carried by the carriage or movable part and adapted to hold the last-mentioned carbon at an angle to the first-mentioned carbon, and a feeding device for feeding the carriage at an oblique angle to the first-mentioned carbon and its holder.

2. In an arc lamp, the combination of a main frame, a holder for one of the carbons, carried by said main frame, a carriage or movable part, a holder for the other carbon, carried by the carriage or movable part and adapted to hold the last-mentioned carbon at an angle to the first-mentioned carbon, feeding devices consisting of a screw for feeding the carriage at an angle to the first-mentioned carbon and its holder, and hand-operated devices for rotating the said screw.

3. In an arc lamp, the combination of a main frame, a holder for one of the carbons, carried by said main frame, a carriage or movable part movable at an oblique angle to both of the carbons, a holder for the other carbon, carried by the carriage or movable part and adapted to hold the last-mentioned carbon at an angle to the first-mentioned carbon, feeding devices for feeding the carriage at an oblique angle to the first-mentioned carbon and its holder, and an electric regulator for moving the carbon-holder carried by the carriage or movable part for the purpose of moving the carbon thereof to or from the other carbon to regulate the arc.

4. In an arc lamp, the combination of a main frame, a holder for one of the carbons, carried by said main frame, a carriage or movable part, a holder for the other carbon, carried by the carriage or movable part and adapted to hold the last-mentioned carbon at an angle to the first-mentioned carbon, feeding devices for feeding the carriage at an angle to the first-mentioned carbon and its holder, and an electric regulator for moving the carbon-holder carried by the carriage or movable part for the purpose of moving the carbon thereof to or from the other carbon to regulate the arc carried by and moving with the said carriage or movable part.

5. In an arc lamp, the combination of a main frame, a holder for one of the carbons, carried by said main frame, a carriage or movable part, a holder for the other carbon, carried by the carriage or movable part and adapted to hold the last-mentioned carbon at an angle to the first-mentioned carbon, feeding devices consisting of a screw for feeding the carriage at an angle to the first-mentioned carbon and its holder, hand devices for rotating the said screw, and an electric regulator for moving the carbon-holder carried by the carriage or movable part for the purpose of moving the carbon thereof to or from the other carbon to regulate the arc carried by and moving with the said carriage or movable part.

6. In an arc lamp, the combination of a main frame, a holder for one of the carbons, carried by said main frame, a carriage or movable part, a holder for the other carbon, carried by the carriage or movable part and adapted to hold the last-mentioned carbon at an angle to the first-mentioned carbon, feeding devices for feeding the carriage at an angle to the first-mentioned carbon and its holder, a reflector, guides for the reflector, whereby it is moved parallel to the first-mentioned carbon, and means to move it so as to maintain the focal point coincident with the arc.

7. In an arc lamp, the combination of a main frame, a holder for one of the carbons, carried by said main frame, a carriage or movable part, a holder for the other carbon, carried by the carriage or movable part and adapted to hold the last-mentioned carbon at an angle to the first-mentioned carbon, feeding devices for feeding the carriage at an angle to the first-mentioned carbon and its holder, a reflector, guides for the reflector, whereby it is moved parallel to the first-mentioned carbon, and means to move it so as to maintain the focal point coincident with the arc, consisting of a connection between the carriage or movable part and said reflector, whereby the latter is moved at a speed commensurate with that of the carriage or movable part.

8. In an arc lamp, the combination of a main frame, a holder for one of the carbons, carried by said main frame, a carriage or movable part, a holder for the other carbon, carried by the carriage or movable part and adapted to hold the last-mentioned carbon at an angle to the first-mentioned carbon, feeding devices for feeding the carriage at an angle to the first-mentioned carbon and its holder, a reflector, guides for the reflector, whereby it is moved parallel to the first-mentioned carbon, means to move it so as to maintain the focal point coincident with the arc, and means to adjust the reflector transversely to the direction of its movement, so as to permit the adjustment of the focal point with respect to the arc.

9. In an arc lamp, the combination of a main frame, a holder for one of the carbons, carried by said main frame, a carriage or movable part, a holder for the other carbon, carried by the carriage or movable part and adapted to hold the last-mentioned carbon at an angle to the first-mentioned carbon, feeding devices consisting of a screw for feeding the carriage at an angle to the first-mentioned carbon and its holder, hand devices for rotating the said screw, and an electric regulator carried by and moving with the said carriage or movable part for moving the carbon-holder carried by the carriage or movable part for the purpose of moving the carbon thereof to or from the other carbon to regulate the arc.

10. In an arc lamp, the combination of a main frame, a holder for one of the carbons, carried by said main frame, a carriage or movable part, a holder for the other carbon, carried by the carriage or movable part and adapted to hold the last-mentioned carbon at an angle to the first-mentioned carbon, feeding devices consisting of a screw for feeding the carriage at an angle to the first-mentioned carbon and its holder, hand devices for rotating the said screw, a reflector, guides for the reflector, whereby it is moved parallel to the first-mentioned carbon, and means to move it so as to maintain the focal point coincident with the arc, consisting of a connection between the carriage or movable part and said reflector, whereby the latter is moved at a speed commensurate with that of the carriage or movable part.

11. In an arc lamp, the combination of two carbons arranged at an angle to each other, a substantially stationary support for one of the carbons, a movable support for the other of said carbons movable at an angle to the stationary carbon, guides for guiding said movable support at an angle to the stationary carbon, and feed mechanism to feed the obliquely-movable carbon-support obliquely with respect to the length of the other carbon to compensate for the combined consumption of both carbons.

12. In an arc lamp, the combination of two carbons arranged at an angle to each other, a substantially stationary support for one of the carbons, a movable support for the other of said carbons movable at an angle to the stationary carbon, guides for guiding said movable support at an angle to the stationary carbon, feeding mechanism to feed the movable carbon-support obliquely with respect to the length of the other carbon to compensate for the combined consumption of both carbons, and an automatic regulating device independent of the feeding device for regulating the size of the arc maintained between the two carbons.

13. In an arc lamp, the combination of two carbons arranged at an angle to each other, feeding mechanism to feed one of the carbons obliquely with respect to the length of the other to compensate for the combined consumption of both carbons, and a reflector guided along one carbon with a speed commensurate with the horizontal travel of the other carbon, whereby the focal point of the reflector is maintained at the arc during the consumption of the carbon.

14. In an arc lamp, the combination of a main frame, a holder for one of the carbons, carried by said main frame, a carriage or movable part, a holder for the other carbon, carried by the carriage or movable part and adapted to hold the last-mentioned carbon at an angle to the first-mentioned carbon, feeding devices for feeding the carriage at an angle to the first-mentioned carbon and its holder, a reflector, guides for the reflector, whereby it is moved parallel to the first-mentioned carbon, means to move it so as to maintain the focal point coincident with the arc, a support for the lamp, having horizontal trunnions, and a base sustaining the said support and upon which it is movable about a vertical axis, whereby the beam of light from the lamp may be projected in all directions.

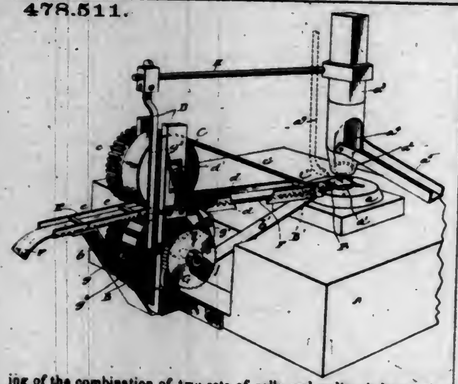
15. In an arc lamp, the combination of a main frame, a holder for one of the carbons, carried by said main frame, a carriage or movable part, a holder for the other carbon, carried by the carriage or movable part and adapted to hold the last-mentioned carbon at an angle to the first-mentioned carbon, feeding devices consisting of a screw for feeding the carriage at an angle to the first-mentioned carbon and its holder, hand devices for rotating said screw, a reflector to reflect the arc, and means to support the lamp upon a base with the provision for vertical and lateral motion.

16. In an arc lamp, the combination of a carbon, a holder for said carbon, a second carbon arranged at an angle to the first-mentioned carbon and adapted to maintain an arc between the extreme ends of the carbon, and means to move the last-mentioned carbon bodily in the direction of the length of the first-mentioned carbon with a speed commensurate with the speed of the consumption of said carbons.

17. In an arc lamp, the combination of a carbon, a holder for said carbon, a second carbon arranged at an angle to the first-mentioned carbon and adapted to maintain an arc between the extreme ends of the carbons, and means to move the last-mentioned carbon bodily in the direction of the length of the first-mentioned carbon and also feed it transversely to the length of said first-mentioned carbon.

18. In an arc lamp, the combination of a carbon, a holder for said carbon, a second carbon arranged at an angle to the first-mentioned carbon and adapted to maintain an arc between the extreme ends of the carbons, means to move the last-mentioned carbon bodily in the direction of the length of the first-mentioned carbon, and an electric regulator operating upon the carbon independently of its movement parallel to the first-mentioned carbon for the purpose of moving the carbons to or from each other to regulate the extent of the arc.

19. In an electric lamp, the combination of two carbons arranged at an angle to each other so as to maintain an arc between their extreme ends, a holder for each of the carbons, feeding means to move one of the holders in the direction of the length of the carbon of the other holder with a speed commensurate with the consumption of the said carbon while maintaining the arc.



20. In an electric lamp, the combination of two carbons arranged at an angle to each other so as to maintain an arc between their extreme ends, a holder for each of the carbons, feeding means to move one of the holders in the direction of the length of the carbon of the other holder with a speed commensurate with the consumption of the said carbon while maintaining the arc, and an electric regulator to cause said carbons to have a relative movement independent of the feeding movement to regulate the extent of the arc automatically.

478,511. FEED MECHANISM. HENRY JANSEN, Brooklyn, assignor to Schloss & Sons, New York, N. Y. Filed Oct. 9, 1891. Serial No. 408,277. (No model.)

Claim.—1. A feeding mechanism consisting of the combination of two sets of rolls and endless belts running around each set, the rolls in each set standing opposite each other in pairs and the belts running parallel and in contact with each other throughout the entire distance from one pair of rolls to the other, whereby a grip upon the article being fed is established and maintained throughout the distance between the pairs of rolls, and guides located each side of the portions of the belts that are in contact, substantially as described.

2. The combination, with a die, of a feeding mechanism consist-

478,511.

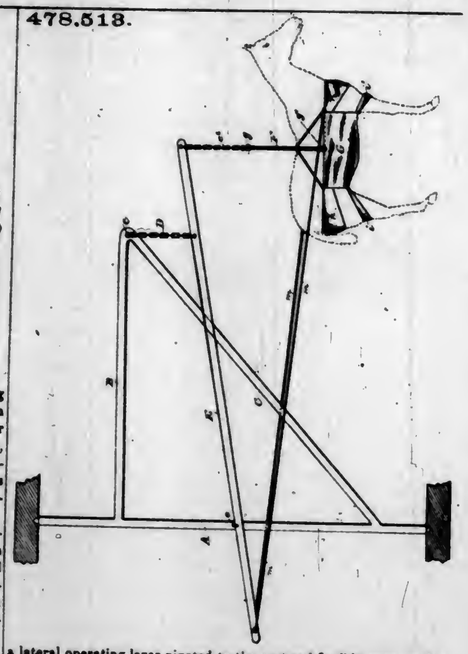
ing of the combination of two sets of rolls and endless belts running around each set, the rolls in each set standing opposite each other in pairs and the belts running parallel and in contact with each other throughout the entire distance from one pair of rolls to the other, whereby a grip upon the article being fed is established and maintained throughout the distance between the pairs of rolls, and guides located each side of the portions of the belts that are in contact, substantially as described.

3. The combination of the pair of large and small rolls B B', respectively, with the pair of large and small rolls C C', respectively, an endless belt carried by each pair, gearing connecting the rolls B and C, a ratchet-wheel connected with one of the large rolls, a pawl engaging the ratchet-wheel, a punch, and connections between the punch and the pawl, whereby motion of the punch causes the pawl to intermittently move the ratchet and belts, substantially as described.

4. The combination of the pair of large and small rolls B B', respectively, with the pair of large and small rolls C C', respectively, an endless belt carried by each pair, gearing connecting the rolls B and C, a ratchet-wheel connected with one of the large rolls, a slotted lever having a pawl engaging the ratchet-wheel, a movable punch, a rigid projection from the punch, and a rod or bar connected at one end to the said projection and having at its other end a screw adapted to enter the slot of the lever and secure it adjustably thereto, substantially as described.

478,512. CAR WHEEL AND AXLE. ABNER JOHNSTON and WILLIAM A. JOHNSTON, Jersey City, N. J., assignors of one-half to Richard Parker, New York, N. Y. Filed Oct. 6, 1891. Serial No. 407,924. (No model.)

Claim.—1. The combination, with an axle, of a wheel thereon provided with a passage-way therethrough and a collar having a coincident passage-way, said passage-ways being for the lubricant, as and for the purpose specified.

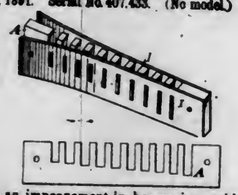


2. The combination, with an axle, of a wheel loose upon the axle and provided near its bore with a groove extending through the wheel and a collar outside the wheel and provided with a similar groove, substantially as and for the purpose specified.

3. The combination, with the axle having a convex shoulder, of a wheel having oil-passages and a circumferential concavity to form a chamber, substantially as and for the purpose specified.

478,513. APPARATUS FOR TRAINING ANIMALS. CHRISTOPHER C. KELLY, New York, N. Y., assignor to John C. Kelly, Denver, Colo. Filed July 9, 1890. Serial No. 358,131. (No model.)

Claim.—1. An apparatus for training animals, comprising a pivoted vertical post or support having a lateral arm extending therefrom,

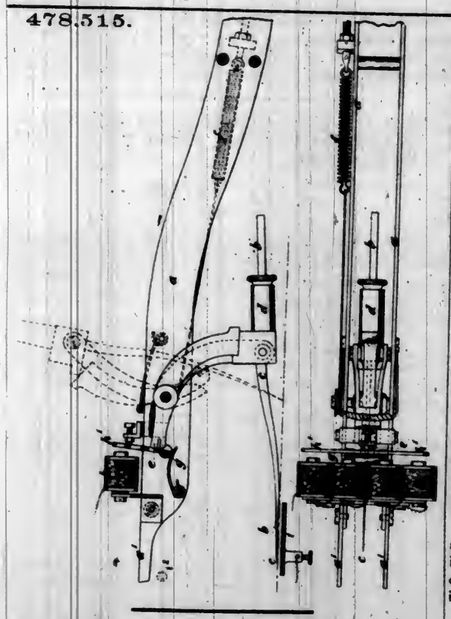


478,513.

a lateral operating-lever pivoted to the post and flexibly connected to the end of the lateral arm, said operating-lever having at its front end a flexible swiveled chain or rope carrying a sling for supporting the animal, and ropes or chains connected with the sling and extending to the rear end of the operating-arm, substantially as described.

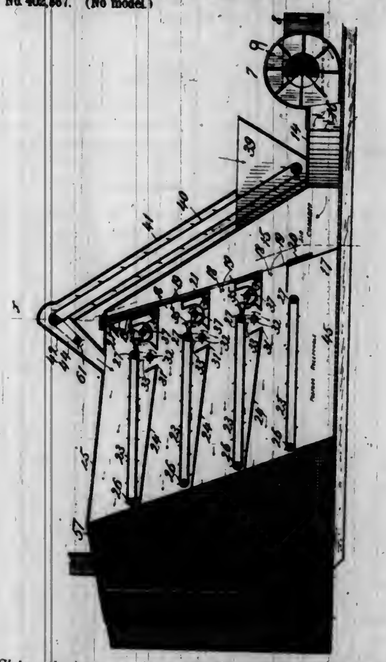
2. An apparatus for training animals, comprising a pivoted vertical post or support having a lateral arm extending therefrom consisting of a horizontal member and a diagonal brace, a lateral operating-lever pivoted to the post and flexibly connected to the end of the lateral arm, said operating-lever having at its front end a flexible swiveled chain or rope carrying a sling for supporting the animal, ropes or chains connected with the sling and extending to the rear end of the operating-arm, and bands secured to the sling and adapted to support the animal, whereby the animal may be suspended and moved and turned in different directions, substantially as described.

478,514. HARMONICA. LESTER G. LAWRENCE, Chicago, Ill., assignor of two-thirds to A. O. Cooper and Ed. L. Bradbury, same place. Filed Oct. 1, 1891. Serial No. 407,433. (No model.)



Claim.—As an improvement in harmonicas, which are provided with metal frame-plates, the combination, with such metal frame-plates, of reed-plates, which are bent longitudinally to give the faces which are to lie on the frame-plate convex contours, the convex faces being sprung flat on the opposite sides of the frame-plate and secured to the ends of said plate by screws or bolts, as and for the purpose specified.

478,515. APPARATUS FOR CUTTING PILE FABRICS. JOHN J. MANN, Salford, England. Filed Apr. 9, 1892. Serial No. 428,470. (No model.)



Brief.—If the knife cuts the fabric, an electric circuit is closed and causes the movement of the knife to free itself from the cloth.

Claim.—A pile-cutting knife having a handle and movable cutter and a trigger to normally hold the cutter in position, with electro-magnetic devices to release the trigger and free the knife when the latter passes through the cloth, substantially as described.

478,515.

478,516. PNEUMATIC GRADING AND SORTING MACHINE. HERMAN O. MOONEY, Farmington, N. H., assignor to the United States Down Extractor Company, same place. Filed Aug. 17, 1891. Serial No. 402,867. (No model.)

Claim.—1. Apparatus for pneumatic grading and sorting, comprising an air-blower, an air-distributing chamber into which said blower discharges, a series of conveyers arranged one above the other and separated by intervening air-passages leading from the air-distributing chamber, a depositing-chamber into which said passages discharge, and a feeding device for supplying the material to the upper conveyer, substantially as described.

2. Apparatus for pneumatic grading and sorting, comprising an air-blower, an air-distributing chamber into which said blower discharges, a series of conveyers arranged one above the other and separated by intervening air-passages leading from the air-distributing chamber, a depositing-chamber into which said passages discharge, and a feeding device for supplying the material treated to the upper conveyer, and an exhaust-fan from the depositing-chamber, the exhaust-fan inlet being screened, substantially as described.

3. Apparatus for pneumatic grading and sorting, comprising an air-blower, an air-distributing chamber into which said blower discharges, a series of conveyers arranged one above the other and separated by intervening air-passages leading from the air-distributing chamber, and adjustable gates for varying the inlets of said passages, and a feeding device for supplying the upper conveyer with the material to be treated, substantially as described.

4. Apparatus for pneumatic grading and sorting, comprising an air-blower, an air-distributing chamber into which said blower discharges, a series of conveyers arranged one above the other and separated by intervening air-passages leading from the air-distributing chamber, and beater-shafts located in the path of discharge from one conveyer to the next in the series, and a feeding device for supplying the material to be treated to the upper conveyer, substantially as described.

5. Apparatus for pneumatic grading and sorting, comprising an air-blower, an air-distributing chamber into which said blower discharges, a series of conveyers arranged one above the other and separated by outwardly-flaring air-passages leading from the air-distributing chamber, and a feeding device for supplying the upper conveyer with the material to be treated, substantially as described.

6. Apparatus for pneumatic grading and sorting, comprising an air-blower having a regulating-damper, an air-distributing chamber into which said blower discharges, and a series of conveyers arranged one above the other and separated by intervening air-passages leading from the distributing-chamber, substantially as described.

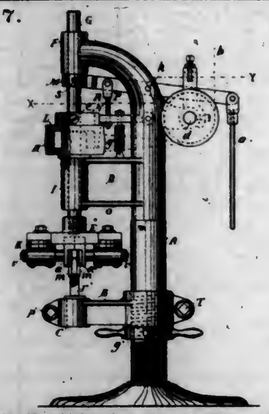
7. In apparatus for pneumatic grading and sorting, the combination, with a conveyer, of an air-blower furnishing an air-current above the upper surface of the conveyer at the discharge end thereof and a winged shaft at the discharge end of the conveyer for throwing the material up into the air-current, substantially as described.

8. In apparatus for pneumatic grading and sorting, the combination, with a conveyer, of an air-blower furnishing an air-current above the upper surface of the conveyer at the discharge end thereof, and a winged shaft at the discharge end of the conveyer for throwing the material up into the air-current, and a trough in which said winged shaft is located, said trough having an adjustable side, so as to either receive the material from the conveyer or not, according to its position of adjustment, substantially as described.

9. In apparatus for pneumatic grading and sorting, the combination, with a conveyer, of an outwardly-flaring air-passage above the upper surface of the conveyer, an air-blower communicating with the air-passage at the discharge end of the conveyer, and a feeding device for supplying to the conveyer the material to be treated, substantially as described.

10. In an apparatus for pneumatic grading and sorting, the combination, with the depositing-room and its exhaust-fan, of a two-part screen interposed between the exhaust fan and the main-room space and means for cutting off communication between the fan and either screen, substantially as described.

11. In apparatus for pneumatic grading and sorting, the combination, with the depositing-room and its exhaust-fan, of a damper-box communicating with the fan and having two openings provided with separate dampers and separated by an intervening partition extending from top to bottom of the room and removable screens, one on each side of the partition, substantially as described.



12. In apparatus for pneumatic grading and sorting, the combination, with the depositing-room, its exhaust-fan, and screens, of a door or window adapted to be opened to supply additional air to dilute the dust-laden air of the depositing-room, and thereby facilitate its passage through the screens, substantially as described.

13. In apparatus for pneumatic grading and sorting, the combination, with an air-blower provided with a regulating-damper, a conveyer having an air-passage above its upper surfaces, communicating with the air-blower, a feeding device for admitting the material to be treated into the air-current above the conveyer, a depositing-room beyond the conveyer, and an exhaust-fan leading from the depositing-room and provided with a damper, substantially as described.

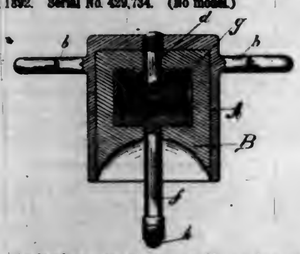
478,517. MACHINE FOR CLOSING THE EDGES OF STUDS, &c. FRANK MOSSBERG, Attleborough, Mass., assignor, by direct and mesne assignments, to the Mossberg Manufacturing Company, same place. Filed Apr. 27, 1891. Serial No. 390,565. (No model.)

Claim.—1. The combination of the standard A, supporting the operating parts, an arbor G, held in bearings on arms attached to said

478,517.

standard, a pulley H, held loosely on the arbor G, a collar L, sliding with spline on the arbor G, a collar M, held loosely in a recess in the arbor G, a lever P, pivoted to the standard A and connected with the collar M, a lever N, pivoted to standard A and connected with the lever P by a rod R, the rod R, and a chuck-plate E, fast on the arbor G and carrying the devices for closing the edges of the studs, substantially as described.

2. In a machine for closing the edges of studs and like articles, the combination of the arbor G, plate E, fast thereon and having the blocks K adjustably secured thereto, pistons *n*, sliding in said blocks, and pins *m*, carried by said pistons and having rolls *d'* attached to them, substantially as and for the purpose specified.



3. A chuck for rolling over the edges of studs and like articles, consisting of a plate E, having blocks K adjustably secured thereto and capable of being set at an angle to the radius of said chuck, and pistons sliding radially in said blocks, with springs to press the pistons in toward the center, and pins *m*, having a limited rotary motion, held in said block, with small turning-rolls pivoted on the sides of said pins, and devices, substantially as described, to limit the motion of said pistons, substantially as herein set forth.

4. A chuck for rolling over the edges of studs and like articles, consisting of a plate having blocks adjustably secured thereto and pistons sliding in said blocks, carrying rolls having a short lateral motion, substantially as herein set forth.

5. In a machine for closing the edges of studs and like articles, a mandrel to hold the stud, having a head with the same contour as the shape of the head of the stud to be closed and recessed in its end to hold a stud or like article, said mandrel being held stationary in an arm on standard A, in combination with rolls having an axial motion to and from the mandrel and a short freedom of motion laterally, substantially as and for the purpose set forth.

6. In a machine for closing the edges of studs and like articles by means of rolls, a mandrel to hold the stud, having a head with the same contour at its periphery as the head of the stud to be closed, said mandrel being held stationary in an arm on the standard A, in combination with rolls for closing the edges, held on studs in carriages sliding to and from the mandrel in supports adjustably secured to the chuck E, said studs having a bearing against the guiding-head of the mandrel to control the radial movements of the carriages, according to the shape of the head of the stud-button operated on, substantially as set forth.

478,518. INSULATOR. LOUIS MCCARTHY, Boston, Mass. Filed Apr. 19, 1892. Serial No. 429,734. (No model.)

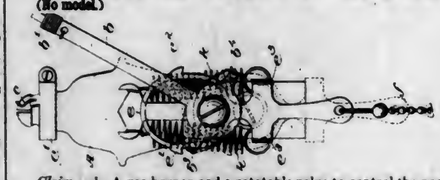
Claim.—An insulator comprising metallic portions separated by an interposed series of sheets of mica compressed together, securing devices by which said metallic portions and said mica are secured together, a mass of insulating material in which said metallic portions and said sheets of mica and their securing devices are embedded, and an outer metallic covering or case, substantially as shown and described.

478,519. LACING FOR SHOES OR OTHER ARTICLES. FRANKLIN S. MCKENNEY, Detroit, Mich. Filed Sept. 22, 1890. Serial No. 365,709. (No model.)

Claim.—1. A loop-fastener blank consisting of a base having an aperture *b* and attaching-prongs thereto, and a tongue *b'*, having a rounded terminal recess b^3 in its edge, the terminal end being adapted to be bent over and secured by an eyelet passed through the said aperture, substantially as set forth.

2. The loop-fastening herein described, consisting of an eyelet and a loop-shank constructed with an orifice to receive the eyelet, a tongue provided with a rounded terminal recess, and integral points, said tongue bent over toward said orifice to form a loop, substantially as set forth.

478,520. HOOK AND FASTENING FOR GLOVES, SHOES, &c. FRANKLIN S. MCKENNEY, Detroit, Mich. Filed Jan. 15, 1891. Serial No. 377,823. (No model.)



Claim.—A fastening consisting of a head and a body portion A^2, curved under the head and provided with curved inwardly-projecting arms *a a'* and with a downwardly-projecting extension A^4, which is bent back beneath the body portion A^2 to form a pocket B and thence into a convolute form.

478,521. LACING-STUD. FRANKLIN S. MCKENNEY, Detroit, Mich. Filed Feb. 27, 1891. Serial No. 383,031. (No model.)

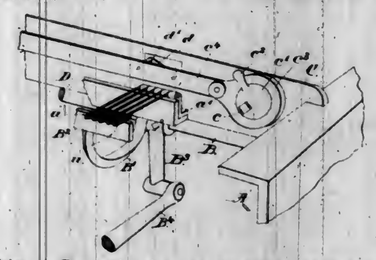
Claim.—A lacing-hook for gloves, shoes, and other articles of wearing-apparel, of wire, consisting of a head, an inverted-cup-shaped shoulder *a*, formed from the wire, a stem a^2, projecting downward from said shoulder, and a flat spiral A^2, projecting laterally from said stem.

478,522. GAS-LIGHTING DEVICE. DAVID J. QUINN, Brookline, and PAUL W. HOFFMANN, Boston, Mass., assignors to the Iona Manufacturing Company, of Maine. Filed Nov. 27, 1891. Serial No. 413,290. (No model.)

Claim.—1. A gas-burner and a rotatable valve to control the passage of gas thereto, a spark-arm fast on and movable with said valve, and a co-operating fixed contact, combined with a reciprocating actuating device for said valve and spark-arm, substantially as described.

2. A gas-burner and a rotatable valve therefor, a pivoted spark-arm provided with ears, and a co-operating fixed contact, combined with a frame having projections to engage the said ears, respectively, on alternate downward movements of said frame to oscillate said valve and arm, substantially as described.

3. A gas-burner, a rotatable valve therefor, a pivoted spark-arm provided with diametrically-opposite ears, and a co-operating fixed contact therefor, combined with a frame spanning said valve and having projections upon its opposite sides to engage the said ears to oscillate the said valve and arm when the frame is drawn down, and a spring to return said frame to its normal position, substantially as described.

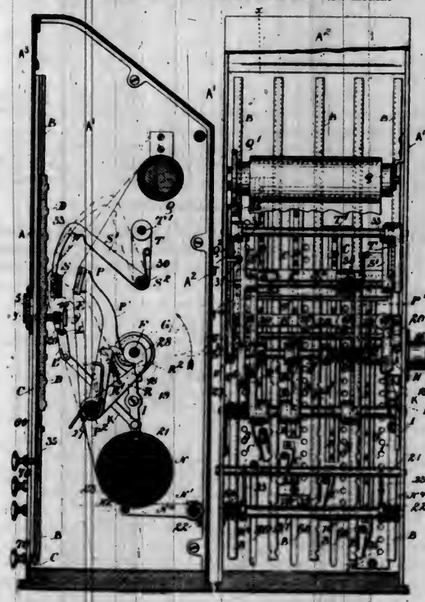


4. A gas-burner, a rotatable valve therefor, a pivoted spark-arm provided with ears, and a co-operating fixed contact therefor, combined with a frame *c*, having projections to engage said ears and having the guide-arms c^2, substantially as described.

5. A gas-burner, a rotatable valve therefor, an arm fast on said valve and provided with inturned ears, the plate b^2, and a fixed contact to co-operate with said arm, combined with the frame *c*, arranged between said arm and plate and having projections to co-operate with said ears and the springs *h*, substantially as described.

6. A gas-burner, a rotatable valve therefor, an arm fast on said valve and provided with inturned ears, the plate b^2, and a fixed contact to co-operate with said arm, combined with the frame *c*, arranged between said arm and plate and having projections to co-operate with said ears, the bracket *m*, and the springs *h*, substantially as described.

478,523. WARPING-MACHINE. ALONZO E. ROGERS, Hopedale, Mass., assignor to the Hopedale Machine Company, same place. Filed Mar. 11, 1892. Serial No. 424,502. (No model.)



Brief.—Each drop-wire is attached to a separate foot, which feet are placed on an L-shaped holder and clamped in place by a bar pivoted on swinging links. The bar is actuated by suitable means, such as an eccentric.

Claim.—1. The combination, with the holder, a series of drop-wires, and a series of separate blocks or feet to which the said drop-wires are jointed, of a pivotally-supported locking-bar movable toward and from said blocks, thereby to co-operate with and keep the blocks or feet on the said holder, substantially as described.

2. The combination, with the holder, a series of drop-wires, and a series of blocks or feet to which the said drop wires are jointed, of a pivotally-supported locking-bar to co-operate with and keep the blocks or feet on the said holder, and devices to actuate said locking-bar on its pivotal supports to raise and lower it with relation to the said blocks, substantially as described.

478,524. COLUMN-PRINTING DEVICE. WILLIAM W. ROSENFIELD, New York, N. Y., assignor to the Empire Cash Register Company. Filed Apr. 15, 1891. Serial No. 389,003. (No model.)

Claim.—1. The combination, in a registering apparatus, of slides having visible characters, corresponding types connected to and moving with the character-slides, automatic locking mechanism for holding the types and characters firmly when the instrument is not in use, and a handle and mechanism therewith connected for first effecting the printing and afterward withdrawing the locking mechanism, the automatic locking mechanism coming into action for holding the slides upon the handle being released, substantially as set forth.

2. The combination, in a registering apparatus, of visible characters and their movable holders, types corresponding to the characters and connections for moving the two simultaneously, an automatic locking mechanism for holding the types and characters rigidly in their normal condition when the machine is not in use, an inking mechanism and a printing mechanism, and a handle and the connections therefrom to the inking, printing, and locking mechanism, substantially as specified, whereby the handle when moved first brings into action the inking mechanism, then the printing mechanism, and then the unlocking mechanism, and the visible characters cannot be moved until an impression has been taken and the locking mechanism comes into action automatically upon releasing the handle, substantially as set forth.

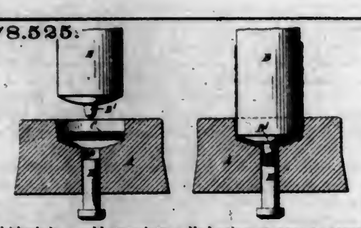
3. The combination, in a registering apparatus, of a case with an opening, slides within the case having characters visible through the opening and corresponding types upon the slides, a printing mechanism, an automatic locking mechanism, a handle, and means for returning the same to its normal position when unacted on, a connection from the handle to the printing mechanism for effecting an impression, and a connection from the handle to the unlocking mechanism for releasing the slides after the printing has been effected, substantially as set forth.

4. The combination, in a registering apparatus, of a case with an opening, slides within the case having characters visible through the opening and types upon the backs of the slides, a printing mechanism, a handle and connections from the same to the printing mechanism, and an automatic locking mechanism for holding the slides in their normal position when the handle is released, substantially as set forth.

5. The combination, in a registering apparatus, of a case with an opening, movable slides behind the opening having visual characters and corresponding printing-types, an inking-pad and its bolding-arms and rock-shaft, a printing-pad and its actuating-cam, locking-pins and lever connections for withdrawing the same, an actuating-shaft carrying the operative cams, a crank-handle and clutch connection for giving motion to the actuating-shaft, and a spring for returning the handle to its normal position without turning back the actuating-shaft, substantially as set for forth.

6. The combination, in a register, of an inclosing case with an opening, an actuating-shaft, handle and clutch for rotating such shaft progressively, cams upon such shaft, slides with visible characters and corresponding printing-types, adtomatic holding devices for retaining the slides when in position, mechanism for supporting a roll of paper and moving the same progressively, a printing-pad, and lever connections for actuating the same, substantially as set forth.

7. The combination, in a registering apparatus, of a case with an opening, slideways and slides within the case, having characters visible through the opening, type upon the backs of the slides, automatic locking mechanism for holding the slides in position, a printing mechanism, a shaft, a handle upon the same, and clutch mechanism for rotating the shaft progressively by the action of the handle, cams and connections from the shaft for first actuating the printing mechanism and then withdrawing the automatic locking mechanism to allow the slides to be moved, a paper-feeding mechanism, and a spring to return the handle when liberated to its normal position, substantially as set forth.

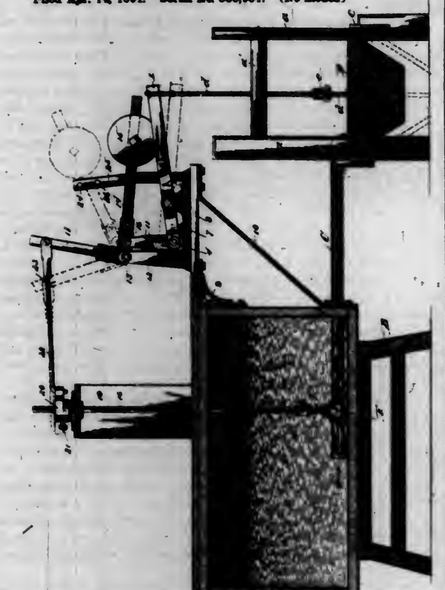


8. The combination, in a registering mechanism, with the types and the corresponding visual characters and the devices for carrying the same, of an impression mechanism, a shaft and connection from the same to the impression mechanism, a handle capable of being turned first in one direction and then the other, and a clutch mechanism between the handle and the shaft acting in one direction, whereby the shaft receives from the handle a rotary movement in one direction only and cannot be moved backwardly by the handle, substantially as set forth.

9. The combination, with the inking-pad, of arms carrying such pad, a rock-shaft and levers to which the arms are pivoted, a cam for acting upon the arms to swing them and the inking-pad into or out of position for use, and a cam to press the pad to the types and allow it to be drawn back therefrom, substantially as specified.

478,525. PROCESS OF MANUFACTURING COLLAPSIBLE TUBES. HENRY C. SANDERS, London, England. Filed May 26, 1891. Serial No. 394,230. (No model.) Patented in England Jan. 3, 1890, No. 3,243.

Claim.—1. The herein-described method of making an ornamental collapsible tube or soft-metal tubular case, consisting in placing a soft-

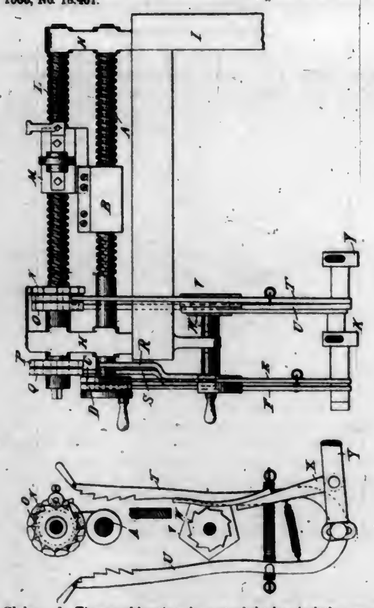


478,525.

metal blank in a cold state into a die having grooves or corrugations around its operative wall or edge and then forcing a punch into the metal in the die, so as to squeeze the said metal out through the annular space between said punch and the grooved wall or edge of the die, substantially as described.

2. The herein-described method of making an ornamental tube, consisting in placing a soft-metal blank in a cold state into a die having grooves or corrugations around its operative edge and then forcing a punch into the metal in the die, so as to squeeze the said metal out through the annular space between the said punch and the grooved wall or edge of the die, leaving sufficient metal in the die to form a closed end to the tube, which, if desired, can be afterward partially removed to form an internal flange, substantially as described.

478,526. WATER-SUPPLY REGULATOR. FREDERICK G. SCHUERMAN, Twin Bluffs, Wis., assignor to Schuerman Brothers, same place. Filed Apr. 14, 1891. Serial No. 388,951. (No model.)



Claim.—1. The combination, in a water-supply regulator, of two bell-crank levers, separate pivots therefor, a pivot between an arm of one of said levers with the arm of the other lever, a trough suspended from one of said bell-cranks, a weight upon one arm of the other bell crank, a valve, a valve-stem, a crank-arm upon said valve-stem, and a rod connecting said bell-crank with the remaining arm of the bell-crank lever, substantially as described.

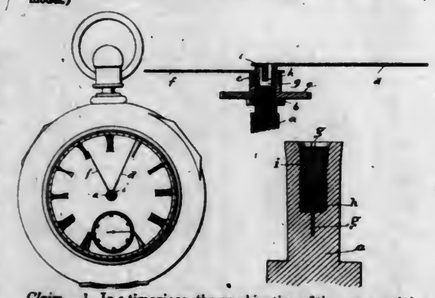
2. In a water-supply regulator, the combination of two bell-crank levers pivoted together upon different axes, a trough suspended from one of said levers, an adjustable weight upon the arm of the other lever, a valve, and an adjustable connection between an arm of said latter lever and valve, substantially as described.

3. In a water-supply-regulating device, the trough D, the suspending-arms therefor, and the guard-frame therefor, comprising the posts A, bar *a'*, and board C at the front thereof opposing the trough, substantially as described.

4. The combination, in a water-supply regulator, of two bell-crank levers, each having a short and a long arm, a standard in which one of said levers is pivoted, an adjustable weight on the long arm of said pivoted lever, and said long arm being pivoted to the short arm of the other lever between said weight and standard, a stock-watering trough suspended from the long arm of said other lever, and a valve connected to the short arm of the weighted lever, both of said long arms being arranged on the side next to the trough, substantially as set forth.

478,527. FASHIONING APPARATUS FOR STRAIGHT-KNITTING MACHINES. GEORGE SAWYER, Nottingham, England. Filed Oct. 22, 1889. Serial No. 327,868. (No model.) Patented in England Dec. 18, 1888, No. 18,461.

Claim.—1. The combination, in a straight-bar knitting-machine, of the lengthened brackets H, screws A and L, respectively carrying selvage-stops B and fastening-box M, and pawls and ratchet-wheels for operating said screws, substantially as described.



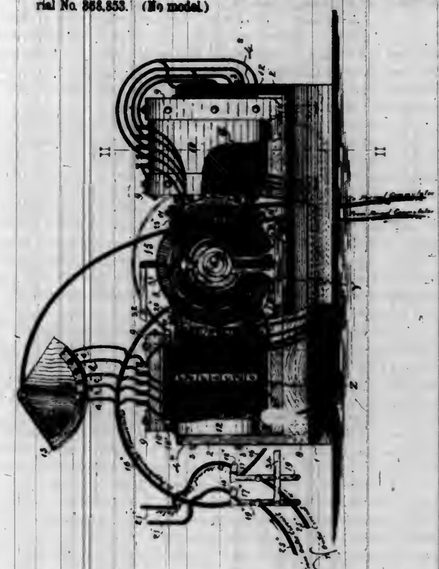
2. The combination of the screws and their ratchet-wheels with the clawkers E and F, having attached thereto the clawkers R and S to move the screws at the same time, substantially as described.

3. The combination of the clawkers U and T with the cam V, ratchet-wheel W, and pawl X to control said clawkers, substantially as described.

4. The combination of shaft E and wide sets of points c, hinged thereto, with selvage-points *b* and screws *d* to connect said wide points and selvage-points, substantially as described.

5. The combination of screw A and selvage-stop B with screw L, box M, ratchet-wheels N and O, and clawkers U and T to revolve said screw L independently of said screw A, substantially as described.

478,528. CENTER ARBOR FOR WATCHES. NATHANIEL A. TERRELL, Charlottesville, Va., assignor to himself, T. S. Keller, and John Arundale, same place. Filed Sept. 10, 1890. Serial No. 364,560. (No model.)



Claim.—1. In a timepiece, the combination of the cannon-pinion,

the center arbor having its outer end split, tapped longitudinally, and countersunk, forming the threaded opening, and the tapered headless continuously-threaded screw fitted in said opening and so proportioned in relation to said opening as to expand the arbor when the screw is forced in.

2. The combination, in a cannon-pinion tension for watches, of the central arbor having the internally-screw-threaded bore and longitudinally split to a point below said bore and countersunk, and a tapered screw so proportioned to fit the bore of the arbor when expanded, substantially as described.

478,529. DYNAMO-ELECTRIC MACHINE. CHARLES W. THOMAS, Jersey City, N. J., assignor of part to Philip Van Volkenburgh, New York, and John H. Pendleton, Brooklyn, N. Y. Filed Oct. 21, 1890. Serial No. 368,853. (No model.)

Claim.—1. A duplex commutator of electric currents, which consists of a series of long insulated segments alternated with pairs of short segments in two different planes and having diametric connection, in combination with two pairs of brushes for conversion of a continuous into an alternating current, and vice versa, substantially as set forth.

2. In a dynamo-electric machine, the combination, with a continuous-current commutator, of the optionally-included supplemental commutator Y, having two pairs of brushes, of which one pair connects with the armature through the normal commutator and the other pair connects with the outer circuit, said supplemental commutator having long segments which communicate direct from a brush of the interior pair to one of the exterior pair, so as to transmit direct current, and interposed short segments which communicate in reverse diametrically through the commutator and transmit reverse currents.

3. An attachment for a dynamo-electric machine of shunt-type, consisting of a supplemental commutator in which for each long segment there are two interposed short segments in two separate planes of rotation, all of said segments revolving with and being insulated from the armature-winding and (except as to the diametrically-paired short segments) from each other.

4. In a dynamo-electric machine having the field-magnet and armature in shunt of one another, the combination, with a normal commutator thereof, of a supplemental commutator whose segments connect with the armature-winding only through said normal commutator, the segments of said supplemental commutator consisting of long and intervening pairs of short segments arranged in two separate planes of rotation, all of said segments (except the diametrically-paired short ones) being insulated from one another.

5. The means whereby a continuous-current dynamo-electric machine can be converted at will into an alternate-current machine, and vice versa, said means consisting of the combination of the supplemental commutator whose electrical connection with the armature is wholly through the normal commutator, said supplemental commutator having arranged alternately upon it long segments and interposed couples of short diametrically-connected segments, two pairs of brushes in two separate planes, of which one pair connects with the line and the other pair is capable of connection with the brushes of the normal commutator, and means for cutting said alternate-current devices out of circuit and for simultaneous direct connection of the line-wires with the normal brushes, and vice versa, substantially as set forth.

6. The means for discretionary change of a normally-continuous dynamo circuit to one transmitting alternate current, which consists of the combination, with the alternate or supplementary commutator composed of long segments 28 and of interposed diametrically-united short segments 29 29′ in two planes, of the respectively interiorly and exteriorly communicating pairs of pivoted brushes 20^+ 20^- 23^+ 23^-, a shifting ring 31, having link connection 33 with said brushes and with switches 19^+ 19^-, that connect with the brushes of the normal commutator, contact-plates 17^+ 17^-, that connect with the interiorly-communicating brushes 20^+ 20^- of the said supplementary commutator, and contact-plates 18^+ 18^-, which connect the normal commutator direct with the dynamo-circuit, the whole being arranged and operating substantially as set forth.

7. The combination of the metallic outer and motor circuits, the interposed duplex commutator or alternator, and a duplex switch by which such alternator is cut in or out of the said motor-circuit at will.

8. A polar limb or element Z of a dynamo-field, which consists of a grid-formed core, each of whose bars has a separate bobbin or winding, in the described combination with a general or enveloping winding.

9. In a dynamo-electric machine, a field-magnet having a series of cored bobbins, in combination with interposed oppositely-wound coreless bobbins, for the purpose set forth.

10. In a dynamo-electric machine, a field-magnet having a series of bobbins on iron cores parallel to the plane of the magnetic axis and the axis of armature rotation and in magnetic connection with pole plates and heads, in combination with interposed coreless and oppositely-wound bobbins, substantially as and for the purpose set forth.

11. In the field-magnet of a dynamo-electric machine, the combination, with a series of cored bobbins and interposed oppositely-wound coreless bobbins, of means for coupling such cored and coreless bobbins either in series or multiple, as set forth.

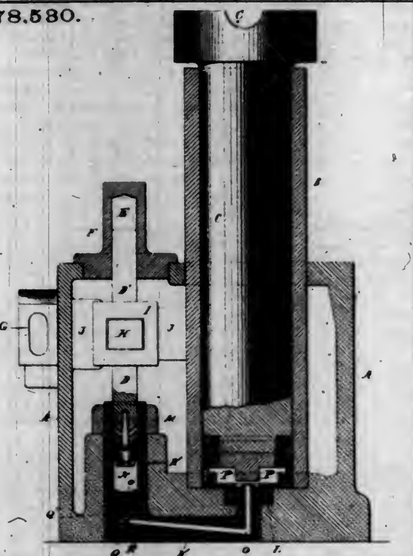
12. In a field-magnet of a dynamo-electric machine, the combination of two series of interior bobbins whose geometrical axes are all parallel to the magnetic axis—to wit, a series of cored and a series of interposed oppositely-wound coreless bobbins—a pole-plate and a head-plate in magnetic continuity with the bobbin-cores, an exterior bobbin or winding permanently in circuit, and means for cutting one or more pairs of said interior bobbins in or out of circuit.

13. In a field-magnet of a dynamo-electric machine, the combination of two series of interior bobbins arranged in pairs—namely, a series of cored bobbins and a series of oppositely-wound coreless bobbins—an encircling exterior bobbin permanently in circuit, and means for placing one or more pairs of said interior bobbins in circuit and in serial or multiple connection with such exterior bobbin.

14. A grid-formed field-magnet core which consists of parallel and detachable I-formed component plates or layers in planes parallel to the magnetic axis and to the axis of armature rotation.

15. A grid-formed field-magnet which consists of a bundle of separate I-formed plates constituting the cores proper and contiguous portions of the pole-plates, said I-formed plates being in planes parallel to the magnetic axis and to the axis of armature rotation and carrying the bobbins proper, in combination with interposed oppositely-wound coreless bobbins, the whole being inclosed by an exterior winding, substantially as set forth.

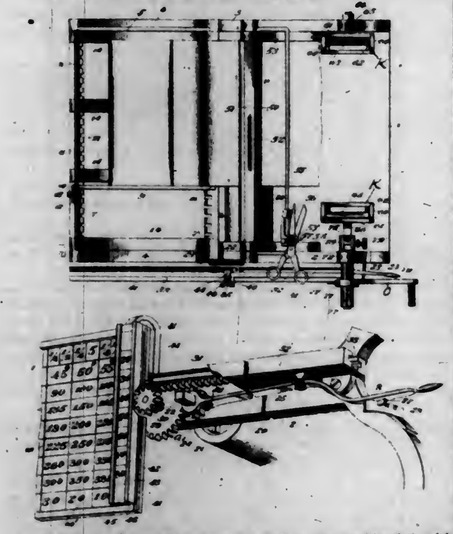
16. A multiple field-magnet having an external and an interior winding, the external winding being of coarser wire than the interior winding.



17. A multiplex field-magnet having cored bobbins and having interposed coreless bobbins differentially wound with wire of a coarser grade.

18. A faradic shocker in which, combined with an internal closed circuit 59 and an external normally-open circuit 57, having handles 58, both circuits having suitable collectors 20^+ 20^- 23^+ 23^-, is the manually-rotatable duplex alternator Y, having long segments 28 and interposed diametrically-connected short segments 29 29′ in different planes of rotation, substantially as set forth.

478,530. HORIZONTAL HYDRAULIC JACK. JOHN WEEKS, New York, N. Y., assignor to Richard H. Dudgeon, same place. Filed Jan. 12, 1892. Serial No. 417,793. (No model.)



Claim.—1. In a horizontal jack or like apparatus, the combination of a base for the apparatus, made of a single casting and having a recess therein which connects with the force-chamber at one part and with the reservoir at another part, a pump block within the said recess and confined therein, said pump-block having a pump-cavity, a passage connecting the pump-cavity with the force-chamber of the ram, and a backflow-passage connecting with said passage in the block and with the reservoir and a valve for said backflow-passage, substantially as set forth.

478,580.

2. In a horizontal jack or like apparatus, the combination of a base for the apparatus, made of a single casting and having a recess therein which connects with the force-chamber at one part and with the reservoir at another part, a pump-block within the said recess and confined therein, said pump-block having a pump cavity, a passage connecting the pump-cavity with the force chamber of the ram, and a backflow-passage connecting with the said passage in the block and with the reservoir and a valve for said backflow-passage, and a rod connected with said valve and projecting to the outside of the jack, whereby said valve is controlled, substantially as set forth.

478,531. CLOTH-MEASURING MACHINE. GEORGE L. WILCOX, HENRY F. HALLENBECK, and TIMOTHY WANDELL, Albany, Oreg. Filed July 23, 1891. Serial No. 400,510. (No model.)

Claim.—1. In a cloth-measuring machine, the combination, with a measuring-roller and drawing devices, of a basket comprising cross-bars supported by the frame and connected by curved straps, said bars having notches, an end piece at one end of said bars, and a partition within the basket, its ends engaging said notches and adjustable in the length of the bars, substantially as described.

2. In a cloth-measuring machine, the combination, with a roller and measuring devices driven thereby, of a basket comprising end pieces, notched cross-bars connecting them, a rod also connecting them above one bar, a block movable on said rod and adjustable by a set-screw, curved straps connecting said bars, an end piece at one end of the basket, and a partition having tongues at its ends, one of which engages a notched bar and the other of which slides on said rod, substantially as described.

3. In a cloth-measuring machine, the combination, with a base having end frames and a basket on the base, of a cloth-roller whose shafts are journaled in said frames, one of said shafts being squared, a gear-wheel loosely mounted on said shaft, shifting mechanism for said gear-wheel, and measuring devices connected with this wheel by an idle-gear engaging the wheel when the latter is in one of its adjusted positions, substantially as described.

4. In a cloth-measuring machine, the combination, with a cloth-roller, one of whose shafts is squared, a gear-wheel loosely mounted thereon, and shifting mechanism for said gear-wheel, of a large idle-gear having a small pinion on its shaft, a rack-bar engaging said pinion and sliding in the casing, a table, and an arm on said rack-bar moving over the table, substantially as described.

5. In a cloth-measuring machine, the combination, with a cloth-roller having a gear-wheel on its shaft, a large idle-gear meshing therewith, and a small pinion on the shaft of this idle-gear, of a longitudinally-slotted casing, a rack-bar moving therein and in mesh with said pinion, a table, and an arm projecting from said rack-bar through the slot in the casing and moving over the table, substantially as described.

6. In a cloth-measuring machine, the combination, with the cloth-roller, a pinion connected to its shaft, and a rack-bar moved longitudinally by said pinion, of an arm projecting from said rack-bar and marked with various prices per yard, and a table beneath said arm marked opposite each price with the prices of several yards and fractions thereof, substantially as described.

7. In a cloth-measuring machine, the combination, with a cloth-roller, an arm driven thereby, and a strip removably secured to said arm and marked with various prices per yard, of a plate beneath the arm and a card removably attached to the plate and marked with a table giving opposite each price-mark on said strip the prices of several yards and fractions thereof, substantially as described.

8. In a cloth-measuring machine, the combination, with the cloth-roller, a pinion connected to its shaft, and a rack-bar moved longitudinally by said pinion, of an arm projecting from said rack-bar and having turned-over edges, a strip removably secured beneath said edges and marked with various prices per yard, a plate beneath the arm, having turned-over edges, and a card removably inserted beneath said edges and marked with a table giving opposite each price-mark on said strip the prices of several yards and fractions thereof, substantially as described.

9. In a cloth-measuring machine, the combination, with the cloth-roller, a ratchet connected therewith, and a pawl engaging said ratchet, of a pinion engaging a rack-bar, an arm connected to said rack-bar, a table over which said arm moves, connections between said roller and pinion, and a shifting device for throwing said connections out of gear, as and for the purpose set forth.

10. In a cloth-measuring machine, the combination, with the cloth-roller and measuring devices driven thereby, of a swinging frame pivoted to the frame of the machine, a presser-roller in said swinging frame resting normally upon the cloth-roller, a guide connecting the sides of this frame in rear of and parallel with the rollers, and a scissors-clamp sliding on said guide, substantially as described.

11. In a cloth-measuring machine, the combination, with the cloth-roller and the measuring devices driven thereby, of a crank-shaft journaled in the frame of the machine, a clamp detachably connected to said shaft, and a clamp journaled in a frame opposite said crank-shaft, each clamp comprising U-shaped ends connected by a rear cross-web, curved arms centrally pivoted inside the lower ends, and cross-bars connecting the ends of said arms, as and for the purpose set forth.

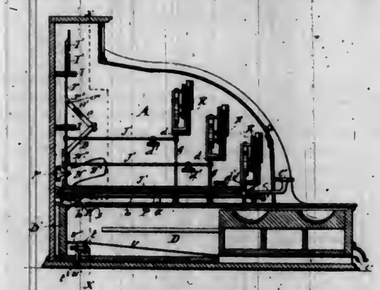
12. In a cloth-measuring machine, the combination, with the cloth-roller and the measuring devices driven thereby, of a clamp journaled in the end frame of the machine, a crank-shaft also journaled in the end frame opposite said clamp and having a hollow body, and another clamp having a squared shaft detachably engaging said body, the clamps being adapted for the reception of a winding-reel, substantially as described.

13. In a cloth-measuring machine, the combination, with the cloth-roller and the measuring devices driven thereby, of a clamp journaled in the end frame of the machine, a crank-shaft also journaled in the end frame opposite said clamp and having a head at its inner end provided with a hole opening through one side, a slide closing said open side, a winding-reel detachably secured in said clamp, and a square shaft connected with said reel and detachably mounted in said hole, as set forth.

14. In a cloth-measuring machine, the combination, with the cloth-roller and the measuring devices driven thereby, of a clamp journaled in the end frame of the machine, a crank-shaft also journaled in the end frame opposite said clamp and having a square hole through its body and a head at its inner end through one side of which said hole opens, a slide having tongues engaging grooves within the open side in said head, a handle connected to said slide and extending throughout the length of the crank-shaft beyond the crank, a winding-reel detachably secured in said clamp, and a square shaft connected with said reel and removably mounted in said hole, substantially as described.

15. In a cloth-measuring machine, the combination, with the cloth-roller and the measuring devices driven thereby, of a crank-shaft journaled in the frame and having a square hole through its body, a winding-reel, and a square shaft connected therewith and detachably mounted in said hole, as and for the purpose set forth.

16. In a cloth-measuring machine, the combination, with the cloth-roller and the measuring devices driven thereby, of eyes in the end frames of the machine opposite each other, a clamp having a stub-shaft journaled in one eye, a shaft journaled in the other eye and having a hole in its body, a set-screw through the inner end of said shaft into said hole, a crank on the outer end of said shaft, a set-screw holding it adjustably thereon, a winding-reel, and a square shaft connected therewith and extending into the inner end of the hole in said shaft substantially as described.



17. In a cloth-measuring machine, the combination, with the cloth-roller and the measuring devices driven thereby, of reel comprising end pieces connected at one end by a cross-piece and having longitudinal slots in their other end, clamping-bars whose extremities move in said slots, eccentric cams pivoted in said slots and one of them having a handle, a rod connecting the cams, so as to cause them to move in unison, and means for revolving said reel, as set forth.

18. In a cloth-measuring machine, the combination, with the cloth-roller and the measuring devices driven thereby, of a reel, clamping-bars therein at one side thereof, cams for operating said bars, a square shaft connected with and projecting from said reel, and a crank-shaft journaled in the frame and having a square hole through its body in which said shaft is removably seated, substantially as described.

19. In a cloth-measuring machine, the combination, with the cloth-roller and measuring devices driven thereby, of a clamp journaled in the end frame of the machine, a crank-shaft journaled in the other end frame opposite said clamp, another clamp having a shaft detachably connected with said crank-shaft, a reel detachably engaged by said clamps and having clamping-bars at one side thereof, and cams for operating them, substantially as described.

20. In a cloth-measuring machine, the combination, with the cloth-roller, a gear-wheel on the shaft thereof, a swinging frame, and a cutter-guide carried by the frame adjacent said roller, of a table, an arm moving over the same, a gear to which said arm is connected, connections between said gear and gear-wheel, and a shifting mechanism for throwing said connections into and out of operative position, substantially as hereinbefore set forth.

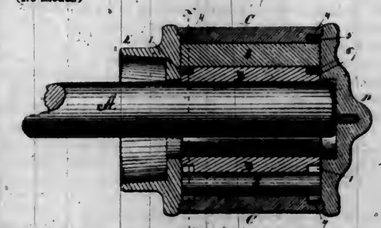
478,532. CASH-REGISTER. NAPOLEON B WRIGHT, Syracuse, N. Y., assignor of nine-twentieths to Charles H. Knapp and William J. Walters, same place. Filed Nov. 24, 1891. Serial No. 412,986. (No model.)

Claim.—1. A cash-register comprising a plurality of key-levers, separate registers connected to the respective key-levers to receive positive action thereby, supplemental levers acting independently of each other by the respective key-levers and having lost motion in their constructions, and indicating-slides each of which is actuated by one of the supplemental levers, as set forth.

2. In combination with key-levers *c c c*, pivoted at their rear ends, registers R R R, one for each of said levers, the plungers *g g g*, connecting the registers with the key-levers in front of their fulcrums, levers J' J' J', pivoted intermediate their lengths and actuated at their front ends by said plungers and connected at their rear ends to vertically-movable slides *r*, carrying indicator-disks I, and means for holding said slides when raised, substantially as shown and described.

3. In combination with the inclosing case, key-levers *c c c*, pivoted at their rear ends to the case, levers *b b*, extending from the rear to the front of the interior of the case and pivoted intermediate of their lengths, a cross-bar attached to the front end of the levers *b b* and extending across the entire series of key-levers to receive the pressure thereof, the levers J' J' J', fulcrumed intermediate of their lengths and connected at their front ends to the key-levers with a vertical lost motion between them, the indicating slides *r r*, connected, respectively, to the rear ends of the levers J' J' J', a bar extending across said slides and adapted to engage and release the same, and levers transmitting motion from the levers *b b* to the said bar, as set forth.

4. In combination with the key-levers *c c c*, pivoted at their rear ends, the levers J' J' J', actuated at the front ends by the respective key-levers, the indicating-slides *r r r*, connected to the rear ends of the levers J' J' J' and provided with the shoulders *r' r' r'*, the levers *b b*, pivoted intermediately of their lengths, the cross-bar *b''*, attached to the front end of the said levers and extending across the under side of the series of key-levers, the cross-bar *b'*, uniting the rear ends of the levers *b b*, the cross-bar *o''*, extending across the series of indicating slides and adapted to engage the shoulders thereof, and tripping-levers connected to said cross-bar and actuated by the rear cross-bar *b'*, substantially as set forth.

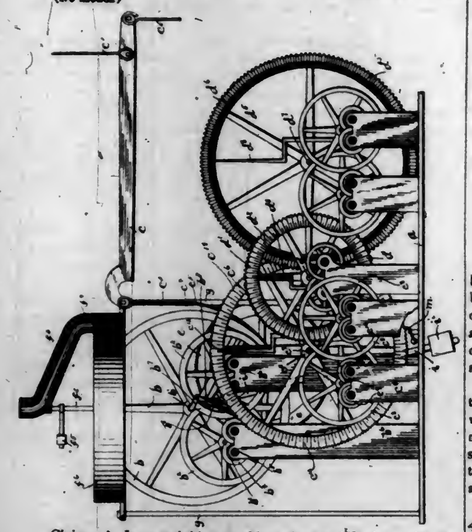


5. In combination with the case and the key-levers *c c c*, pivoted to the rear portion of said case, the levers J' J' J', actuated at their front ends by the key-levers, the indicating-slides *r r r*, connected to the rear ends of the levers J' J' J' and provided with the shoulders *r' r' r'*, the levers *b b*, pivoted intermediate of their lengths, the cross-bar *b''*, attached to the front ends of the latter levers and extending across the under side of the series of key levers, the cross-bar *b'*, attached to the rear ends of the levers *b b*, the lug *p*, fixed to the case, the arms N, riding on the cross-bar *b'* and provided with the cam N'', engaging the aforesaid lug, the bar *o''*, lying across the indicating-slides beneath the shoulders *r'* thereof, and levers connecting said bar to the arms N, substantially as described and shown.

6. In combination with the case A, drawer D, key-levers *c c*, and indicating-slides *r r r*, actuated by the said key-levers, the levers *b b*, cross-bars *b' b''*, attached to opposite ends of the latter levers and actuated by the key-levers, the cross-bar *o''*, adapted to engage and release the indicating-slides, levers transmitting motion from the cross-bar *b'* to the cross-bar *o''*, and the gravitating arm H, pivoted to the case and having its rear end adapted to support the rear cross-bar *b'* and its front end curved downward and upward and in the path of the rear wall of the drawer to be lifted by the closing of the drawer and thereby release the cross-bar *b'*, substantially as described and shown.

7. In combination with the indicating-slides *r*, provided with shoulders *r'*, and the key-levers *c c*, actuating said slides, the levers *b b*, actuated by said key-levers, the arms N, formed with the weighted supplemental arm N' and with the cam N'', the stationary lug *p*, engaging said cam, the levers *o*, pivoted to the case and movable longitudinally, the links B, connecting the lower ends of said levers to the arms N, and the cross-bar *o''*, connected to the upper ends of said levers and adapted to engage and release the shoulders *r'* of the indicating-slides, substantially as described and shown.

8. A cash-register comprising a series of key-levers, a separate register connected to each key-lever, a dial for each register, a plate for each dial, said plate being provided with an opening for exposing to view the figures on the dial, a supplemental lever for each key-lever, and an indicating-slide for each of said key-levers, each supplemental lever actuated by a key-lever and each slide by a supplemental lever, substantially as specified.



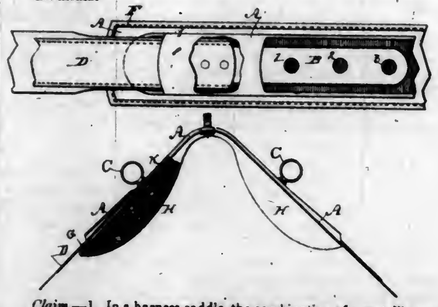
478,533. JOURNAL-BEARING. JAMES M. ANDREWS and MARION A. ANDREWS, Syracuse, N. Y. Filed June 19, 1891. Serial No. 396,841. (No model.)

Claim.—In a journal-bearing, the combination, with the axle, of a sleeve encircling it and provided with a central opening of much greater diameter than the axle, recesses exteriorly in the ends of said sleeve, an outer casing having interior recesses, anti-friction rollers interposed

between and bearing against said sleeve and the inner wall of the casing, loose rings upon the alternate rollers bearing against the adjacent rollers and lying in the recesses in the sleeve and fitting loosely in the recesses in the casing out of contact with said interior recesses, and caps, one closing the outer end of the casing and the other fitting loosely over the axle and closing the inner end thereof.

478,534. REGISTERING PENDULUM-SCALE. JAMES P. ARMSTRONG, Nelsonville, Ohio, assignor to Isaac F. Primrose, J. M. Hyde, and William G. Crook, same place. Filed Jan. 11, 1892. Serial No. 417,662. (No model.)

Claim.—1. In a weighing-machine, the combination, with the frame-work, a suspended scale-beam, a journaled power-wheel *b*, a crank on the shaft of said power-wheel, one or more pawls carried by said crank, a weight carried by said shaft, and a strap connection between the rear end of said scale-beam and said wheel *b*, of a register and ratchet wheel c^4, with the teeth of which said pawls are adapted to engage, as described, a graduated scale on said wheel-rim, and a stationary indicating-hand rising in front of said rim, substantially as and for the purpose specified.



2. In a weighing-machine, the combination, with the frame-work, a suspended scale-beam, a journaled power-wheel *b*, a crank on the shaft of said power-wheel, one or more pawls carried by said crank, a weight carried by said shaft, and a strap connection between the rear end of said scale-beam and said wheel *b*, of a register and ratchet wheel c^4, with the teeth of which said pawls are adapted to engage, as described, a graduated scale on said wheel-rim, a stationary indicating-hand rising in front of said rim, a pinion on the shaft of said wheel c^4, a combination register and gear wheel d^4 engaging therewith, and a stationary indicating-hand d^5 opposite the scale-marks of said wheel d^4, substantially as and for the purpose specified.

3. In a weighing mechanism, the combination of the frame-work, a suspended beam, a journaled power-wheel *b*, a strap connection between said scale-beam and power-wheel, a crank b^{15} on the shaft of said power-wheel, pawls c^3, carried by said shaft, a weight i^3, depending from said shaft, and a register and ratchet wheel *e*, journaled adjacent to said pawls c^3, the latter adapted to engage with the teeth of said register and ratchet wheel *e*, substantially as and for the purpose set forth.

4. In a weighing-machine, the combination of the frame-work, a suspended scale-beam, a journaled power-wheel *b*, cranks b^7 b^{15} on the shaft of said power-wheel on the opposite side of the latter, one or more pawls carried by each of said cranks, a weight carried by said shaft, a strap connection between the rear end of said scale-beam and said wheel *b*, a register and ratchet wheel c^4, with which said pawls b^8 are adapted to engage, as described, and a register and ratchet wheel *e*, with which the pawls g^3 are adapted to engage, and stationary indicating-hands, as described, for each of said ratchet and register wheels, substantially as and for the purpose specified.

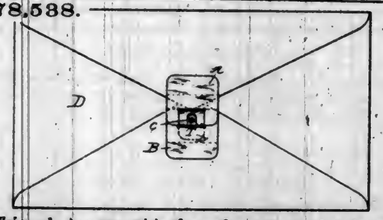
5. In a weighing-machine, the combination, with the frame-work, a suspended scale-beam, a journaled power-wheel *b*, a weight depending from the shaft thereof, and a strap connection between the scale-beam and wheel *b*, of an annular check-box f^6, having compartment f^7, a pivoted spindle or standard f^3, a check-tube f^2, supported thereby and adapted to be rotated therewith, a pinion-wheel on said spindle, and a check-segment with which said spindle is adapted to engage, substantially as and for the purpose specified.

478,535. HARNESS-SADDLE. ALONZO B. ARNOLD, Marshalltown, Iowa. Filed Mar. 10, 1890. Renewed Jan. 16, 1892. Serial No. 418,222. (No model.)

Claim.—1. In a harness-saddle, the combination of a metallic tree having suitable terret holes therein and an offset portion below said holes adapted to receive the upper end of the girth-strap and form a covering for the same, and a girth-strap having a metallic end piece attached thereto, the said end piece having holes therein adapted to coincide with those in the tree, whereby the girth is connected with and adjusted on the tree by the terret, substantially as described.

2. In a harness-saddle, the combination of a tree having suitable terret-holes therein, perforated cross-bars at the lower ends, a pad with holes in its housing coinciding with those in the tree and fixed nuts thereunder, suitable terrets and connecting-screws, and girth-straps having metallic end pieces provided with holes to receive the terrets, whereby pad and girths are made detachable and adjustable, as set forth.

478,536. TRANSFORMATION-BOX. CURTIS DUNHAM, New York, N. Y., assignor, by direct and mesne assignments, to John J. Wohltman and Albert L. Gibbs, same place. Filed Mar. 15, 1892. Serial No. 424,952. (No model.)

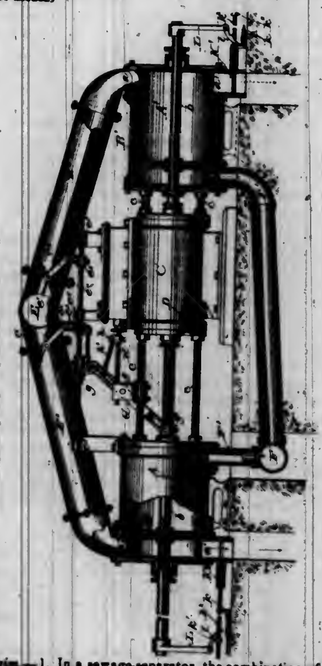


Claim.—In combination, a box having a fragmentary picture, the cover thereof, a reciprocating member adapted to hold said cover closed in one position and to permit said cover to open in another position, and a slide connected with said member and having a fragmentary picture adapted to combine with the fragmentary picture on the box, substantially as decribed.

478,537. PENCIL-HOLDER. OSCAR A. ELLIOTT, York, Nebr., assignor of one-half to Charles Fishbaugh, same place. Filed May 7, 1891. Serial No. 391,943. (Model.)

Claim.—A pencil-holder comprising an open-ended casing adapted to receive one or more pencils endwise and a series of springs extending across said casing and adapted to embrace the pencils or other articles inserted in the casing, substantially as set forth.

478,538. ENVELOPE-FASTENER. JOHN W. GIBBONEY, Lynn, Mass. Filed Feb. 4, 1892. Serial No. 420,295. (No model.)



Claim.—1. As a new article of manufacture, an envelope-fastener consisting of two separable parts A and B, each made of a fibrous flexible material, such as paper or a cloth-backed paper, a slot S in the part A, a tongue T, extending from the part B and adapted to pass through the slot in the part A, a slot S′ in the part B, through which the free end of the tongue T may be passed under the part B and be pressed flat, and an adhesive gum on the surfaces of the parts A and B, whereby they may be attached to a wrapper or envelope in their engaged relation, substantially as shown and described.

2. An envelope-fastener consisting of two parts, each made of a flexible material, such as paper, a tongue formed integral with one part adapted to pass through a slot in the other part, and a slot in the tongued part, through which the free end of the tongue may be tucked under the body portion of such part and lie flat, as set forth.

3. The combination, in a separable envelope-fastener, of two parts, each made of a flexible fibrous material, such as paper, a tongue extending from one part and adapted to pass through a slot in the other part, a slot in the tongued part, through which the free end of the tongue may be tucked under the body of such part and be pressed flat, and an adhesive substance for securing said two parts to the envelope or wrapper.

478,539. SEWAGE SEPARATING AND PURIFYING APPARATUS. WILLIAM F. GOODRUE, Milwaukee, Wis., assignor of one-half to Christopher Paulus, same place. Filed Oct. 3, 1891. Serial No. 408,092. (No model.)

Claim.—1. In a sewage-separator, the combination of a cylinder or chamber connected at one end with a sewage-supply and having a sludge-discharge port at the same end and a liquid-discharge port at the opposite end, and a reciprocating screen-piston adapted to said cylinder or chamber, substantially as and for the purposes set forth.

2. In a sewage-separator, the combination of two cylinders or chambers connected at one end with the sewage-supply and having discharge-ports for the sludge and liquid at opposite ends thereof, reciprocating screens adapted to work within said cylinders or chambers, and valves adapted to admit the sewage alternately to said cylinders or chambers, substantially as and for the purposes set forth.

3. In a sewage-separator, the combination of two cylinders placed in line with each other and provided with reciprocating screens adapted to work within the same, a steam-cylinder provided with a piston connected with the rod upon which said screens are mounted and arranged to actuate the same, a sewage supply pipe or conduit connected with said separator cylinders, valves arranged to admit the sewage alternately thereto, liquid and sludge ports and connections at opposite ends of the cylinders, and sludge-valves arranged to be opened at the proper time to discharge the sludge from said cylinders, substantially as and for the purposes set forth.

4. In a sewage-separator, the combination of a separating chamber or cylinder provided with a reciprocating screen adapted to work therein and having sewage-supply and sludge-discharge ports at one end and a liquid-discharge port at the opposite end, a supply-valve, and a sludge-valve with mechanism arranged to open and close the same alternately, substantially as and for the purposes set forth.

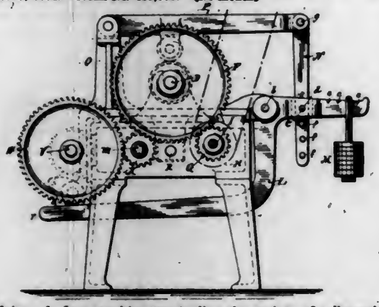
5. In a sewage-separator, the combination of a separating-cylinder, a steam-cylinder placed in line therewith, a piston-rod common to said cylinders, a piston mounted upon said rod in the steam-cylinder, and a screen mounted thereon in the separator-cylinder, a sewage supply connection with one end of the separator-cylinder, a liquid-discharge connection with the opposite end of said cylinder, and a sludge-discharge valve communicating with the feed end of said separator-cylinder, substantially as and for the purposes set forth.

6. In a sewage-separator, the combination of a pair of separator-cylinders and an interposed steam-cylinder placed in line with each other and provided with a common piston rod, a piston mounted upon said rod in the steam cylinder, and screens mounted thereon in the separator-cylinders, a sewage-supply pipe connected by branches with said separator-cylinders, a liquid-discharge pipe or conduit connected by branches with the opposite ends of said cylinders, feed-valves placed in the branches of the supply pipe or conduit, and connections between said valves and the piston-rod, whereby they are alternately opened and closed and sewage is admitted first into one and then the other separator-cylinder, substantially as and for the purposes set forth.

7. In a sewage-separator, the combination of a separator-cylinder and a steam-cylinder located in line with each other and provided with a common piston-rod, a piston mounted upon said rod in the steam-cylinder, and a screen mounted thereon in the separator-cylinder, a supply-pipe connected with one end of the separator-cylinder and provided with a feed-valve, a liquid-discharge pipe or conduit leading out of the opposite end of said cylinder, and connections between said feed-valve and piston-rod, whereby the sewage is intermittingly admitted into said separator-cylinder, substantially as and for the purposes set forth.

8. In a sewage-separator, the combination of a cylinder provided with a reciprocating piston-rod and a screen mounted thereon within said cylinder, a sewage-supply connection provided with a feed-valve communicating with one end of said cylinder, a sludge-discharge port leading out of the same end of the cylinder and provided with a valve, and connections between the piston-rod and feed and discharge valves, whereby the latter are alternately opened, substantially as and for the purposes set forth.

9. In a sewage-separator, the combination of a separating cylinder or chamber provided with a reciprocating rod, a screen mounted upon said rod within said cylinder, a supply connection with one end of said cylinder, provided with a feed-valve, a sludge-discharge port opening out of the same end of the cylinder and provided with a valve, a spring normally closing said valve, and a hook pivoted to the piston-rod and arranged to engage with a projection on the sludge-valve stem so as to open said valve at the proper time, substantially as and for the purposes set forth.

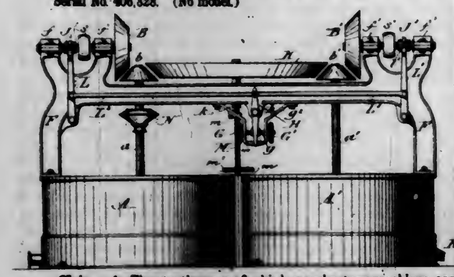


10. In a sewage-separator, the combination of a separating cylinder or chamber provided with a reciprocating piston-rod, a screen mounted upon said rod within said cylinder, a sludge-discharge port opening out of said cylinder and provided with a slide-valve, a spring normally closing said valve, a hook pivotally connected with said piston-rod and arranged to engage with a projection on said valve-stem and to open said valve, and a relatively fixed projection by which said hook is tripped and released from the projection on the valve-stem at the proper point, substantially as and for the purposes set forth.

11. In a sewage-separator, the combination of separator-cylinders, an interposed steam-cylinder in line therewith, a piston-rod upon which the steam-piston is mounted, screens mounted upon said piston-rod within the separator-cylinders, sewage-supply connections communicating with said cylinders and provided with feed-valves, a sliding rod connected with crank-arms on the feed-valve stems, and a lever pivotally connected at one end with the piston-rod and at the opposite end with said sliding valve-rod, substantially as and for the purposes set forth.

12. In a sewage-separator, the combination, with a steam-cylinder provided with a piston and piston-rod, of a separator-cylinder in line therewith, a screen mounted upon said piston-rod within the separator-cylinder, a sewage-supply pipe provided with a feed-valve, connected with one end of the separator-cylinder, a reciprocating rod parallel with said piston-rod and connected with a crank-arm on the feed-valve stem, a lever fulcrumed to a suitable support and pivotally connected with the piston-rod on the one hand and said sliding valve-rod on the other hand, and a rod connecting said lever with the stem of the steam-valve, substantially as and for the purposes set forth.

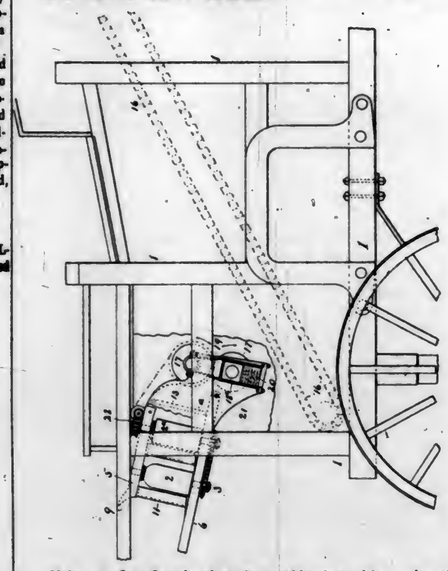
13. In a sewage-separator, the combination of a cylinder provided with an actuating-piston and piston-rod, a separator-cylinder, a screen mounted upon said piston-rod within said separator-cylinder, a sewage-supply connection with one end of the separator-cylinder, provided with a feed-valve, a reciprocating rod parallel with the piston-rod, adjustably connected with a crank-arm on the feed-valve stem, and a lever fulcrumed to an adjustable support and adjustably pivoted on opposite sides thereof to said piston-rod and reciprocating valve-rod, substantially as and for the purposes set forth.



478,540. MACHINE FOR SHADING THE SURFACES OF CALICO-PRINTING ROLLS. GEORGE HANCOCK, Providence, R. I. Filed Dec. 3, 1891. Serial No. 413,899. (No model.)

Claim.—1. In a machine for shading the surface of calico-printing rolls, the combination, with means for rotating the printing-roll, of the sliding carriage, the shading-mill supported upon the sliding carriage and adapted to press against the surface of the roll, means for causing the traversing movement of the carriage, and the cam for raising and lowering the mill to produce the shading effect, substantially as described.

2. In a machine for shading the surface of calico-printing rolls, the combination, with the roll-supporting mandrel D and means for rotating the same, of the sliding carriage K, the screw R and nut S for causing the traverse of the carriage, the shading mill Q, the lever P, carrying the shading-mill, the weighted lever L, connected with the lever P, the pattern-cam B', adapted to actuate the lever P, and the connecting-gears for operating the cam, substantially as described.



478,541. STARTING-GEAR FOR HIGH-SPEED ROTARY MACHINES. JOHN HEAD, King William's Town, Cape Colony, assignor of one-half to Henry O'Kelly Webber, same place. Filed Sept. 25, 1891. Serial No. 406,328. (No model.)

Claim.—1. The starting-gear for high-speed rotary machines, consisting in the combination, with the bevel-gear for driving alternately a plurality of such machines, of an independent bevel-wheel K, adapted to gear simultaneously with a plurality of driving-spindle cones, and disconnecting mechanism, substantially as set forth.

2. The combination, with the coned driving-spindles, driving-wheels B B', sliding shafts S S', levers H L L' L', and hand-gear G G' for operating same, of starting-wheel R, provided with operating-gear, all substantially as and for the purposes set forth.

478,542. FLAX-THRASHER. JOHN M. SMITH, Minneapolis, Minn., assignor of one-half to Patrick H. Gunckel, same place. Filed Aug. 31, 1891. Serial No. 404,175. (No model.)

Claim.—1. In a flax-thrasher, the combination, with a series of relatively vertical rollers co-operating in pairs, of the angular guards intervening the pairs of rollers at the front and the inclined tapering guides at the top for directing flax to the co-operating rollers, substantially as set forth.

2. In a flax-thrasher, a series of rollers having tapering ends arranged in relatively vertical position with their tapering ends uppermost, devices for rotating them in opposite directions and causing them to co-operate in pairs as thrashers, and devices for directing the flax to the upper ends of the rollers at an inclination to their axes, whereby the flax is moved axially along the rollers as it is being carried onward, substantially as set forth.

3. In a flax-thrasher, a series of rollers in relatively vertical position for thrashing the flax and conducting the straw inward in vertical planes, and co-operating horizontal rollers for spreading it on a lateral plane, substantially as set forth.

4. A flax-thrashing mechanism comprising co-operating pairs of rollers in relatively vertical position, devices for feeding the grain to the upper ends of the rollers, and upper and lower plates providing the bearings for the rollers, the said mechanism being adapted to be inserted in the space usually occupied by the concave and cylinder of an ordinary thrashing-machine, substantially as set forth.

5. In a flax-thrasher, a primary thrashing mechanism consisting of a series of relatively vertical rollers co-operating in pairs, guiding devices for feeding flax to their upper ends at an inclination to their axes, and a secondary thrashing and carrying mechanism consisting of a corresponding series of rollers co-operating in pairs and arranged to take the straw from the rollers of the first series and carry it onward in vertical planes, substantially as set forth.

6. In a flax-thrasher, a series of rollers having their upper ends tapering and arranged in relatively vertical position, means for rotating them in opposite directions, whereby they co-operate in pairs as thrashers, and slotted guides for directing the flax in downward direction to the space between the upper ends of the rollers of each pair and causing it to be caught by the rollers at an inclination to their axes, substantially as set forth.

7. In a flax-thrasher, a plurality of series of co-operating rollers arranged in corresponding vertical planes, whereby the straw is carried onward from one pair of rollers to the next in horizontal direction, but in vertical layers, substantially as set forth.

8. In a flax-thrasher, a series of relatively vertical rollers co-operating in pairs, and upper and lower plates providing bearings for the rollers, and the former also providing the guides for directing the flax to the rollers, substantially as set forth.

9. The combination, with the series of rollers co-operating in pairs as thrashers, of the cap-plate providing the guides and slots for directing the flax to the heads of the rollers, substantially as set forth.

10. In a flax-thrasher, a suitable frame-work, series of rollers in relatively vertical position, devices for directing the flax to the rollers, means in rear of the rollers for agitating the straw laterally, and means for spreading it, in combination with screening and conveying devices, substantially as set forth.

11. In a flax-thrasher, a series of rollers in nearly vertical position and co-operating in pairs, and devices for feeding flax stalks in substantially horizontal position to them, substantially as set forth.

12. In a flax-thrasher, a series of rollers in nearly vertical position and co-operating in pairs, devices for directing flax-stalks in substantially horizontal position to them, and a second series of co-operating rollers parallel to the first and arranged to engage and advance the flax delivered by the rollers of the first series, substantially as set forth.

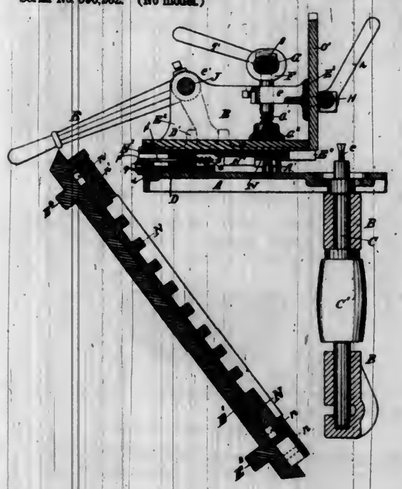
13. In a flax-thrasher, a series of rollers in nearly vertical position and co-operating in pairs as thrashers, and guides intermediate the pairs of rollers, substantially as set forth.

14. The combination, with a series of oppositely-rotating co-operating rollers in relatively vertical position and having their upper ends tapering, of a series of guides projecting above and to the front thereof for directing the flax in substantially horizontal position to the upper ends of the pairs of rollers, substantially as set forth.

15. In a flax-thrasher, a plurality of series of rollers, those of each series co-operating in pairs, arranged to carry the straw onward in vertical planes, means for agitating the straw as it passes from the last of said rollers, and means for spreading the straw laterally after it has passed the agitating device, substantially as set forth.

16. In a flax thrasher, a plurality of series of co-operating substantially vertical rollers arranged in corresponding vertical planes, and guiding devices at the sides and top and bottom of the pairs of rollers for directing the straw, substantially as set forth.

478,543. MANUFACTURE OF COMPOUNDS OF PYROXYLINE. JOHN H. STEVENS, Newark, N. J., assignor, by mesne assignments, to the Celluloid Company, of New Jersey. Filed Mar. 24, 1888. Serial No. 268,387. (No specimens.)



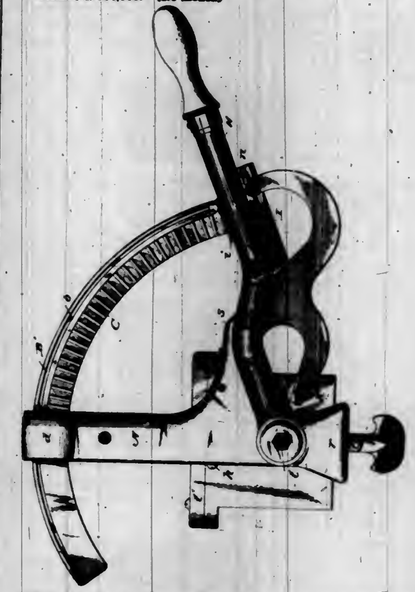
Claim.—1. A solution of pyroxyline in a menstruum composed of wood-alcohol, benzine, and a volatile liquid soluble in alcohol but not in water, substantially as described.

2. A solvent for pyroxyline, consisting of a mixture of wood-alcohol, benzine, and a volatile liquid soluble in alcohol but not in water, substantially as described.

3. A solvent for or solution of pyroxyline, consisting of a mixture of wood-alcohol, benzine, camphor, and a volatile liquid soluble in alcohol but not in water, substantially as described.

4. A solvent for pyroxyline, consisting of a mixture of benzine, wood-alcohol, and acetate of methyl, substantially as described.

478,544. DOVETAILING-MACHINE. HENRY J. CORDEMAN, Cincinnati, Ohio, and EDWARD CREMMER, Covington, Ky., assignors to the Cordeman Machine Company, Cincinnati, Ohio. Filed Apr. 23, 1891. Serial No. 390,202. (No model.)



Claim.—1. In a dovetailing-machine, a laterally-sliding bed-plate resting upon the machine-table, a reciprocating chuck thereon and means for reciprocating the same, a rack N, rigidly secured to said chuck, and a reciprocating rack N', with means for engaging the successive teeth of said rack with a stud or projection upon the machine-table by the reciprocating motion of the chuck, substantially as specified.

2. In a dovetailing-machine, the combination of table A, provided with boss A', a laterally-sliding bed-plate mounted on said table, the reciprocating chuck E and means for reciprocating the same, the sectional rack N N', secured to said chuck, and means for reciprocating one of the sections of said rack with the reciprocating movement of the chuck to successively engage the several teeth of said rack with the boss A', substantially as and for the purpose specified.

3. The combination, substantially, of table A, provided with ways or guides in which are mounted the laterally-sliding bed-plate D, the chuck E, reciprocating thereon and carrying racks N N' and lever M, and dogging devices p² P', secured to the bed-plate, whereby the rack N' is reciprocated with each reciprocation of the chuck to engage the successive teeth thereof, with a boss or projection upon the table A, substantially as specified.

478,545. CORK-EXTRACTOR. RAYMOND B. GILCHRIST, Chicago, Ill., assignor to Rupert Whitehead, same place. Filed Mar. 25, 1891. Serial No. 386,300. (No model.)

Claim.—1. In a cork-extractor, the combination, with the corkscrew and a device for lifting the same, of an internally-bored and externally-screw-threaded extension to the corkscrew, and a rod entering and splined in the extension, and mechanism to revolve the rod, substantially as described.

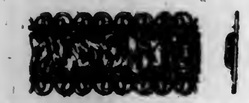
2. In a cork-extractor, the combination, with the corkscrew and its revolving mechanism, of a sliding sleeve prevented from rotating, a lifting-arm to engage the sliding sleeve, and a catch engaging the sliding sleeve to prevent its elevation and engaged by the lifting-arm to release the sleeve, substantially as described.

3. In a cork-extractor, the combination, with the corkscrew having the internally-bored and externally-screw-threaded extension, of a depending rod entering and splined in the extension, a pinion revolving said rod, and a lever revolving the pinion, substantially as described.

4. In a cork-extractor, the combination, with the corkscrew and a device for revolving the same, of a sliding sleeve surrounding and engaging the corkscrew, a catch to prevent the elevation of the sleeve, a lifting crank-arm engaging the sleeve to lift the same and having a cam projection engaging and releasing the catch, and a lever operating the lifting-arm, substantially as described.

5. In a cork-extractor, in combination with the corkscrew and mechanism for lifting the same, the pinion connected with and driving the corkscrew and the rack-bar operated by a lever and engaging and

driving the pinion and having the blank surface, substantially as described.



6. In a cork-extractor, in combination with the corkscrew and mechanism for lifting the same, the pinion connected with and driving the corkscrew, the blank-surfaced washer on and moving with the pinion, and the rack-bar operated by a lever and engaging the pinion and having the longitudinal recess and blank surface, substantially as described.

7. In a cork-extractor, in combination with the corkscrew and mechanism for lifting the same, the pinion connected with and driving the corkscrew, the blank-surfaced washer on and moving with the pinion, the guide-washer, and the rack-bar operated by a lever and engaging the pinion and having the longitudinal recesses for the blank and guide washers and the terminal blank surface, substantially as described.

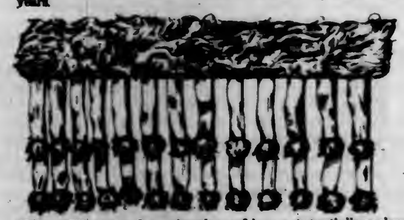
8. In a cork-extractor, in combination with the corkscrew provided with a laterally-projecting ear for lifting it, the hollow slotted standard, the lifting-arm pivoted to enter the slot and engaging the ear, and the lever pivoted on one side of the standard and having a sliding connection with the lifting-arm, substantially as described.

DESIGNS.

21,675. DRESS-TRIMMING. BENJAMIN LIPPER, Philadelphia, Pa., assignor to himself, Augustus A. Lazarus, and Isaac Schwarz, all of same place. Filed June 8, 1892. Serial No. 435,988. Term of patent 3½ years.

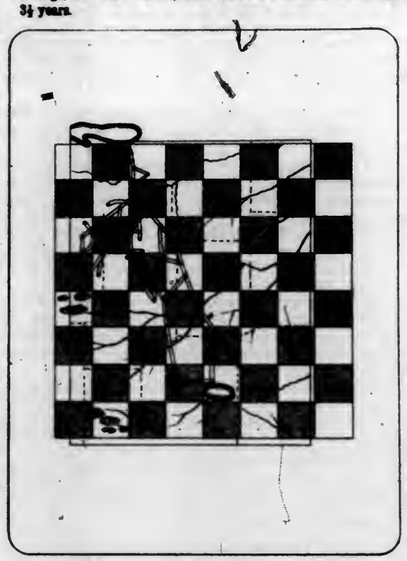
Claim.—The design for a dress-trimming, substantially as described, and as shown in the accompanying drawings.

21,676. DRESS-TRIMMING. BENJAMIN LIPPER, Philadelphia, Pa., assignor to himself, Augustus A. Lazarus, and Isaac A. Schwarz, same place. Filed June 8, 1892. Serial No. 435,989. Term of patent 3½ years.



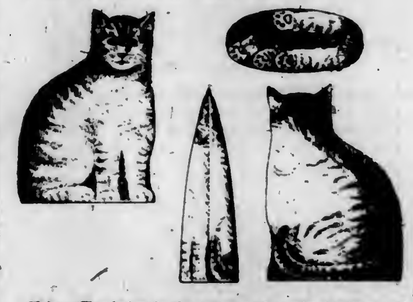
Claim.—The design for a dress-trimming, substantially as described, and as shown in the accompaning drawing.

21,677. DRESS-TRIMMING. BENJAMIN LIPPER and ALFRED A. COHEN, Philadelphia, Pa., assignors to Augustus A. Lazarus, Isaac A. Schwarz, and Benjamin Lipper, same place. Filed June 8, 1892. Serial No. 435,997. Term of patent 3½ years.



Claim.—The design for a dress-trimming, substantially as described and as shown in the accompanying drawing.

21,678. TRIMMING OR FRINGE. ALBERT A FRANKL, New York, N. Y. Filed May 27, 1892. Serial No. 434,675. Term of patent 3½ years.



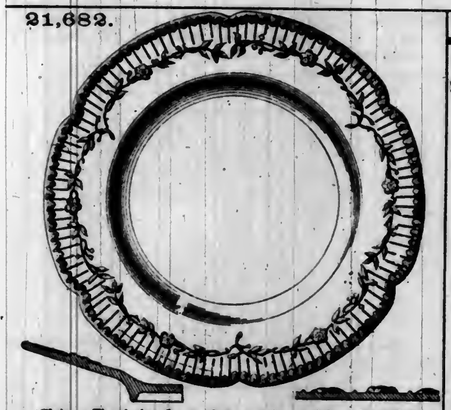
Claim.—The design for a trimming or fringe, substantially as shown and described.

21,679. ADVERTISING GAME-BOARD. ROGER G. MARTINDALE, Chicago, Ill. Filed Feb. 11, 1892. Serial No. 421,194. Term of patent 3½ years.

Claim.—The design for an advertising game-board herein described, the same comprising the board A, with its beaded or ornamental edge, provided with the ornamental central portions consisting of the outlines B, the checkered diagram composed of the squares C and C', and a map of a section of country provided with lakes, rivers, mountains, cities, towns, and intersecting railways on the surface of the checks, substantially as shown.

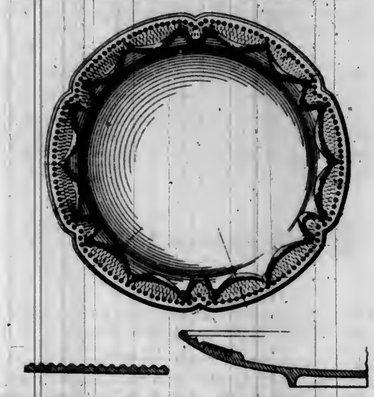
21,680. STATUETTE. CELIA M. SMITH, Ithaca, N. Y. Filed June 2, 1892. Serial No. 435,516. Term of patent 14 years.

Claim.—The design for the statuette of an animal, substantially as set forth.



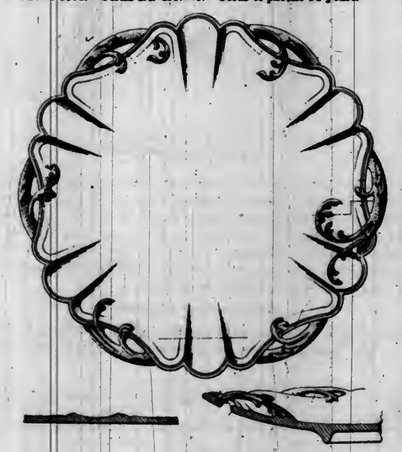
21,681. BOWL. JAMES D. BERGEN, Meriden, Conn., assignor to the J. D. Bergen Company, same place. Filed Feb. 23, 1892. Serial No. 422,568. Term of patent 3½ years.

Claim.—The herein-described design for a bowl, as shown in the accompanying illustration.



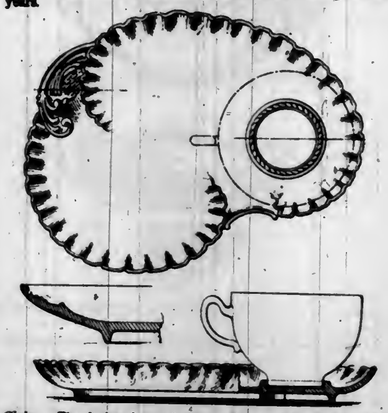
21,682. PLATE. CHARLES E. HAVILAND, Limoges, France. Filed June 7, 1892. Serial No 435,893. Term of patent 14 years.

21,682.



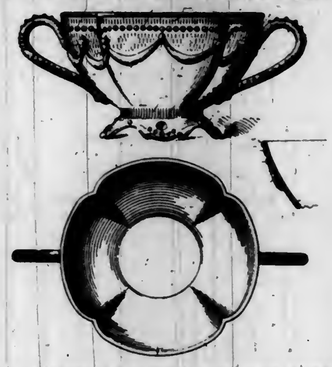
Claim.—The design for a plate or other article, substantially as shown and described.

21,683. PLATE. CHARLES E. HAVILAND, Limoges, France. Filed June 7, 1892. Serial No. 435,894. Term of patent 14 years.



Claim.—The design for a plate or other article, substantially as shown and described.

21,684. PLATE. CHARLES E. HAVILAND, Limoges, France. Filed June 7, 1892. Serial No. 435,895. Term of patent 14 years.



Claim.—The design for a plate or other article, substantially as shown and described.

21,685. SANDWICH-PLATE. CHARLES E. HAVILAND, Limoges, France. Filed June 7, 1892. Serial No. 435,896. Term of patent 14 years.

Claim.—The design for a plate or other article, substantially as shown and described.

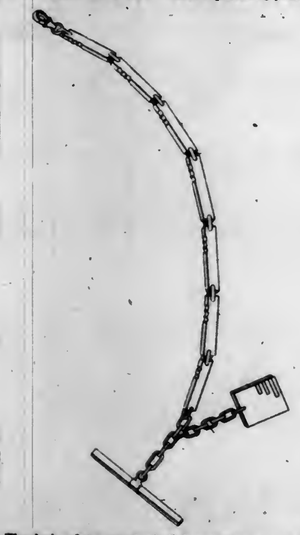
21,686. CUP. CHARLES E. HAVILAND, Limoges, France. Filed June 7, 1892. Serial No. 435,897. Term of patent 14 years.

Claim.—The design for a cup or other article, substantially as shown and described.

21,687. COVER-DISH. CHARLES E. HAVILAND, Limoges, France. Filed June 7, 1892. Serial No. 435,898. Term of patent 14 years.

21,687.

Claim.—1. The design for a cover-dish and other articles, substantially as shown and described.



2. In the design for the cover of the dish, the handle, substantially as shown and described.

21,688. BADGE. JOSEPH K. DAVISON, Philadelphia, Pa. Filed May 5, 1892. Serial No. 431,954. Term of patent 14 years.

Claim.—The design for a badge, substantially as shown and described.

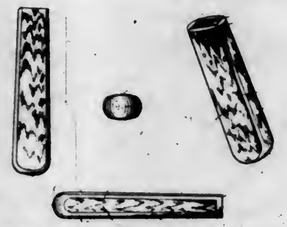
21,689. WATCH-CHAIN. DAVID L. FRY, Lebanon, Oreg. Filed June 11, 1892. Serial No. 436,388. Term of patent 3½ years.

Claim.—The design for a watch-chain herein shown and described, the same comprising the type-shaped link-bars and the quad-shaped charm, as set forth.

21,690. FLORAL LAPEL ORNAMENT. HENRY F. G. FOCHS, Jersey City, N. J. Filed Mar. 31, 1892. Serial No. 427,282. Term of patent 3½ years.

Claim.—The design for the floral lapel ornament, substantially as herein shown and described.

21,691. FINGER-RING. JAMES A. DAWLEY, Denver, Colo. Filed Sept. 19, 1891. Serial No. 406,263. Term of patent 3½ years.

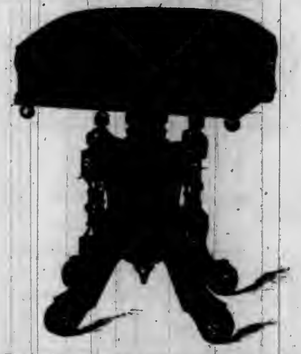


Claim.—The design for finger-rings, herein shown and described

21,692. SPOON OR FORK HANDLE. HARRY I. CULLEN, Wallingford, Conn., assignor to R. Wallace & Sons Manufacturing Company, same place. Filed May 23, 1892. Serial No. 434,112. Term of patent 3½ years.

Claim.—The design for the handles of spoons and forks, as herein described, and shown in the accompanying illustration.

21,693. KNIFE-HANDLE. FREDERICK J. KALDENBERG, New York, N. Y. Filed Oct. 5, 1891. Serial No. 407,791. Term of patent 14 years.



Claim.—The design for a knife-handle herein shown and described, the same consisting of the body *a*, having two rounded sides, two rounded edges, four rounded corners, and a convex butt and having panels *b* in the sides and panels *c* in the edges, the said panels being separated by bands of material contrasting in appearance with the panels and the latter having a rounded contour at one extremity and a square contour at the opposite extremity, as set forth.

21,694. SHOE-SHAPER PLATE. JOSEPH W. SKINNER, La Crosse, Wis. Filed May 5, 1891. Serial No. 391,693. Term of patent 7 years.

Claim.—The design for a shoe-shaper plate, as shown and described.

21,695. PIANO-STOOL. MAX TOSK, Chicago, Ill. Filed Mar. 26, 1892. Serial No. 426,606. Term of patent 3½ years.

Claim.—The design for piano-stools herein shown and described.

21,696. ORNAMENTATION OF SHEET METAL. LEOPOLD KAHN, New York, N. Y. Filed June 2, 1892. Serial No. 435,317. Term of patent 3½ years.

Claim.—The design for the ornamentation of metal herein shown and described.

21,697. METAL BORDER. LOUIS C. HILLER, Meriden, Conn., assignor to the Meriden Silver Plate Company, same place. Filed May 31, 1892. Serial No. 435,082. Term of patent 3½ years.

Claim.—The design for a metal border, as herein described, and shown in the accompanying illustration.

21,698. METAL BORDER. LOUIS C. HILLER, Meriden, Conn., assignor to the Meriden Silver Plate Company, same place. Filed May 31, 1892. Serial No. 435,083. Term of patent 3½ years.

Claim.—The design for a metal border, as herein described, and shown in the accompanying illustration.

TRADE-MARKS

REGISTERED JULY 5, 1892.

21,399. ANTIPYRETICS AND SEDATIVES. CHARLES TRUAX, GREENE & COMPANY, Chicago, Ill. Filed June 4, 1892.

CAFBROMALID

Essential feature.—The word "CAFBROMALID." Used since February 15, 1892.

21,400. LINIMENT. ALBERT HORN, Buffalo, N. Y. Filed May 16, 1892.

Essential feature.—The representation of a cow's horn. Used since May, 1885.

21,401. DIPHTHERIA SPECIFIC. HUNT & Co., Salt Lake City, Utah Territory. Filed June 7, 1892.

Essential feature.—The representation of two heads, those of a boy and a girl. Used since January 1, 1892.

21,402. WRITING-PAPER AND ENVELOPES. GEO. B. HURD & Co., New York, N. Y. Filed May 31, 1892.

Prince of Wales

Essential feature.—The words "PRINCE OF WALES." Used since March 1, 1892.

21,403. FINE WRITING-PAPER AND ENVELOPES. GEO. B. HURD & Co., New York, N. Y. Filed May 31, 1892.

Essential feature.—The representation of three plumes arising from within a crown. Used since March 1, 1892.

21,404. TOILET, LAUNDRY, AND SCOURING SOAPS, WASHING FLUIDS AND POWDERS. KENDALL MANUFACTURING COMPANY, Providence, R. I. Filed May 20, 1892.

Essential feature.—The representation of a frog. Used since August, 1854.

21,405. MEN'S SHIRTS, COLLARS, AND CUFFS. MILLER, HALL & HARTWELL, Troy, N. Y. Filed May 9, 1892.

Essential feature.—The representation of an antelope's head with the word "ANTELOPE" beneath. Used since February, 1887.

21,406. CERTAIN NAMED MEDICINAL REMEDIES. F. & D. RACICOT, Sherbrooke, Canada. Filed Jan. 23, 1892.

Essential feature.—The representation of a shield, an Indian standing and holding a bottle in one hand and herbs in the other, and the words "F. & D. RACICOT'S INDIAN REMEDIES." Used since 1875.

21,407. COLOGNES. RICH & MANHEIMER, New York, N. Y. Filed Aug. 7, 1891.

Essential feature.—The representation of a globe surmounting a quiver filled with arrows. Used since July 1, 1891.

21,408. THIMBLES. STERN BROS. & Co., New York, N. Y. Filed May 11, 1892.

Essential feature.—A representation of the Fishery building in the Columbian World Exposition at Chicago. Used since April 13, 1892.

21,409. PHOTOGRAPHIC PAPER. ARTHUR SEWARD, New York, N. Y. Filed June 8, 1892.

A.S.P.

Essential feature.—The letters "A. S. P." Used since September 1, 1891.

21,410. REMEDIES FOR THE RELIEF OF DISEASES AFFECTING THE MUCOUS MEMBRANE OF THE THROAT, HEAD, AND LUNGS. EMMA J. ST. HILAIRE, Hartford, Conn. Filed May 26, 1892.

HYTHOR

Essential feature.—The word "HYTHOR." Used since July 30, 1891.

21,411. THREAD OF COTTON, SILK, FLAX, AND OTHER FIBROUS MATERIALS FOR MACHINE AND HAND SEWING. THE KERR THREAD COMPANY, East Newark, N. J. Filed May 24, 1892.

Essential feature.—The combined figures of a triangle and a concentrically-circumscribing circle with the word "TRIANGLE" arranged within the circle outside of the triangle. Used since December 1, 1891.

21,412. THREAD OF COTTON, SILK, FLAX, AND OTHER FIBROUS MATERIALS FOR MACHINE AND HAND SEWING. THE KERR THREAD COMPANY, East Newark, N. J. Filed May 25, 1892.

Essential feature.—The word "PYRAMID." Used since May 18, 1892.

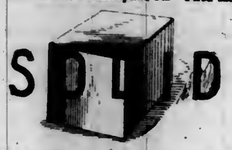
21,413. BOOTS AND SHOES MADE OF LEATHER. THE GIESECKE BOOT AND SHOE MANUFACTURING COMPANY, Jefferson City, Mo. Filed May 23, 1892.

SHAMROCK

Essential feature.—The word "SHAMROCK." Used since January, 1889.

21,414. PEARL BUTTONS. URBIE J. CLERET, Beauvais, France, and Philadelphia, Pa. Filed June 8, 1892.

Essential feature.—The representation of a hen and rooster. Used since April 1, 1892.



21,415. BROAD SILKS, RIBBONS, AND SILK THREADS. W. G. HITCHCOCK & Co., New York, N. Y. Filed May 23, 1892.

Capitol

Essential feature.—The representation of the Capitol at Washington and the word "CAPITOL." Used since May 1, 1892.

21,416. MEDICINE IN TABLET, LOZENGE, OR OTHER SOLID FORM. LOUIS A. MAYO, Philadelphia, Pa. Filed May 23, 1892.

Essential feature.—The representation of a block in connection with the word "SOLID." Used since May 24, 1892.

21,417. DRESS-SHIELDS. LEVI BROS. & BLUM, New York, N. Y. Filed June 11, 1892.

CHARM

Essential feature.—The word "CHARM." Used since January 1, 1891.

21,418. RYE AND BOURBON WHISKY. ISAAC MAISMAN, New Orleans, La., and Philadelphia, Pa. Filed July 29, 1891.

PAROLE

Essential feature.—The word "PAROLE." Used since April, 1879.

21,419. BAKING-POWDER AND YEAST. JOSEPH E. BLACKBURN, Bellaire, Ohio. Filed June 8, 1892.

IDEAL

Essential feature.—The word "IDEAL." Used since May 1, 1892.

21,420. LINEN THREAD. FINLAYSON, BOUSFIELD & Co., Johnstone, Scotland, and Grafton, Mass. Filed May 17, 1892.

Essential feature.—The representation of a globe surmounted by an eagle. Used since January, 1875.

21,421. WHISKY. W. H. JOHNS & Co., Boston, Mass. Filed Mar. 9, 1892.

BLACKSTONE

Essential feature.—The word "BLACKSTONE." Used since February 15, 1892.

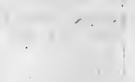
21,422. SPECIFIC FOR DIPHTHERIA AND OTHER THROAT TROUBLES. DOMINGO PERAZA, New York, N. Y. Filed May 11, 1892.

Essential feature.—The representation of a sheep standing upon an eminence surrounded by water and carrying a flag. Used since January 9, 1891.

21,423. SOLID TABLE AND OTHER SILVERWARE. LUDWIG, REDLICH & CO., New York, N. Y. Filed May 16, 1892.

Essential feature.—The representation of an animal consisting of the head of a lion and tail of a fish. Used since April 17, 1892.

21,424. REMEDY FOR THE CURE OF RHEUMATISM. THE SWISS MEDICINE CO., San Francisco, Cal. Filed May 16, 1892.



Essential feature.—The representation of a forest scene, including an illustration of pine-like trees, a ravine, and a bridge-like structure thrown across the same, and the words "SWISS CURE FOR RHEUMATISM" below said representation. Used since June 20, 1891.

21,425. SOAP AND OTHER CLEANING AND DETERGENT PREPARATIONS. THE J. T. ROBERTSON SOAP COMPANY, Manchester Conn. Filed May 28, 1892.

BON AMI

Essential feature.—The words "BON AMI." Used since March 1, 1891.

21,426. COSMETIC. JULIUS GREYER, Cincinnati, Ohio. Filed June 3, 1892.

Essential feature.—The words "OPERA CREAM." Used since September, 1872.

21,427. COOKERS, BAKING-DISHES, AND COFFEE-MAKERS. THE BURTIS MANUFACTURING COMPANY, Jersey City, N. J., and New York, N. Y. Filed May 23, 1892.

PURITAN

Essential feature.—The word "PURITAN." Used since February, 1889.

THE NORRIS PETERS CO.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

EX PARTE FINCK.

Decided May 12, 1892.

DESIGN PATENTS—RANGE OR SCOPE OF CLAIM DETERMINED BY THE COURTS.

The range or scope of a Design patent is to be determined by the courts and not by the Patent Office. It is therefore not proper for the Office to issue a Design patent which on its face purports to cover an indefinite variety of modifications which may or may not be within the proper scope of the claim, as that matter shall be determined by the courts.

ON petition.

DESIGN FOR A SOCIETY BADGE.

Application of William C. Finck filed January 26, 1892, No. 419,355.

Messrs. Crane & Miller for the applicant.

SIMONDS, *Commissioner:*

This is a petition taken from the action of the Primary Examiner requiring the letters "J. L." to be erased from the face of the badge shown and described in the illustration and specification before the same can be allowed and passed to issue. This feature is referred to in the specification as follows:

> Each arm of the cross presents a smooth unbroken surface in contrast with a pattern which occupies the body *b* of the cross, and which is shown in the drawing formed of the roughened characters "J. L." formed upon the surface of the badge.

The claim is:

> The Design for a society badge, herein shown and described.

In the written argument submitted by petitioner he says:

> By reference to my specification it will be observed that I have not claimed the particular characters shown in the drawing as composing the central pattern applied to the face of the badge, but only a "pattern" upon the body portion of the cross to contrast such portion with the smooth unbroken surfaces of the arms. The same effect in appearance would result in the substitution of a motto or even a single figure to occupy the central portion, and without affecting the symmetry of the badge as a whole.

From these quotations it is apparent that the petitioner purposes to vary this "central portion" indefinitely and still have the Design covered in all these various modifications by the claim already quoted. It is not necessary in this case to decide whether the letters of the alphabet can properly form component parts of a Design, for applicant presents no such question. The letters he illustrates form only one variety of a great number of patterns which he desires to use and practically to claim. The claim in a Design patent covers the specific thing which applicant illustrates and describes, and it covers, also, all other things so near like that specific thing as to be liable to be mistaken the one for the other by the casual observer. What range or scope a claim in a Design patent has under this principle of law is a question to be determined by the courts and not by the Patent Office; and in view of this it is thought not to be proper for the Office to permit the issue of a Design patent which on its face purports to cover an indefinite variety of modifications which may or may not be within the proper scope of the claim, as that matter shall be determined by the courts.

The decision of the Primary Examiner is affirmed.

VANNESS *v.* SHETTLER.

Decided June 11, 1892.

INTERFERENCE—PRIORITY OF INVENTION.

Where it is found that the senior party conceived of the invention in the latter part of 1888, then made a model exhibiting the substance of it, and then disclosed the improvement to others, and that he used reasonable diligence in reducing to practice, *Held* that he is entitled to prevail over the junior party, who relies upon a conception and a reduction to practice in August or September, 1889.

APPEAL from Examiners-in-Chief.

FRICTION-CLUTCH.

Application of Elmer D. Vanness filed November 7, 1890, No. 370,674. Application of Reuben Shettler filed October 13, 1890, No. 367,980.

Messrs. Parker & Burton for Vanness.
Mr. James J. Sheehy for Shettler.

SIMONDS, *Commissioner:*

This is an appeal from the decision of the Examiners-in-Chief awarding priority of invention to Shettler. Shettler and Vanness were both in the employ of the Upton Manufacturing Company, of Port Huron, Mich., the former as a traveling salesman and the latter in the home factory.

Shettler claims to have made the invention in controversy—an improvement in clutches—in October, 1888; to have then made a model embodying the substance thereof, and also to have disclosed the invention to others. A reduction of the invention to practice was made at the factory under Vanness's immediate hand in August or September, 1889, and Vanness claims this as the date of his invention and his reduction to practice. Another reduction to practice, embodying the feature of wrought-iron arms for the clutch, was made in January, 1890. Vanness admits that this was done at the suggestion of Shettler. Shettler's application for patent, executed October 10, 1890, and filed in the Patent Office October 13, 1890, was prepared with the knowledge and, so far as appears, with the assent of the officers of the company.

On the 13th day of October, 1890, Vanness signed this paper:

OCTOBER 13, 1890.

I hereby state that to the best of my knowledge Reuben Shettler is the sole inventor of the friction-clutch now used on the Upton Mfg. Co. traction-engine.

E. D. VANNESS.

Vanness says that this concession refers only to the clutch with wrought-iron arms.

Soon after the filing of Shettler's application for patent he left the employ of the company because they would not, as he desired they should, raise his salary, his resignation being made October 28, 1890.

Vanness's application for patent was then prepared. It was filed in this Office November 7, 1890, assigned to the company.

It is found as a fact in this case that Shettler conceived of the invention in controversy the latter part of 1888, then made a model exhibiting the substance of it, and then disclosed the improvement to others.

It is also found, upon the facts stated, that he used reasonable diligence in reducing to practice. He is therefore held to be the prior inventor, and the decision of the Examiners-in-Chief is affirmed.

EX PARTE SHETTLER.

Decided June 14, 1892.

PUBLIC USE OR SALE—PROPER SHOWING BY AFFIDAVITS.

Affidavits alleging public use or sale of an invention should by machine, model, or drawing clearly show what the thing alleged to be in public use or on sale was, and the allegations should be as to specific acts, leaving the Office to determine the question whether they establish a public use or sale under the statute.

FRICTION CLUTCH.

Application of Reuben Shettler filed October 13, 1890, No. 367,980.

Mr. James J. Sheehy for the applicant.

SIMONDS, *Commissioner:*

June 11, 1892, the Commissioner awarded priority of invention to this applicant in an interference proceeding entitled *Vanness* v. *Shettler*. On this day Mr. L. S. Bacon, representing Vanness, and his act must be taken to be the act of Vanness, presents to the Office certain affidavits, which were duly executed on the 17th of November, 1891. The delay in presenting them induces and warrants the strictest criticism of the affidavits.

The two years of public use or sale which will bar an application for a patent is expressed in section 4886 of the Revised Statutes, thus:

not in public use or on sale for more than two years prior to his application, * * *

and thus expressed as a defense in section 4920 of the Revised Statutes:

that it has been in public use or on sale in this country for more than two years before his application for a patent.

The affidavits make no allegations of any sale whatever or of any offer of sale. They also fail to show that the use in question was a public use. Moreover, in order to be satisfactory, such affidavits should not simply define the improvement by the use of a formula which may embody propositions of law as well as statements of fact, but should by machine, model, or drawing clearly show what the thing alleged to be in public use was, and the allegations should be as to specific acts, leaving the Office to determine the question whether they establish a public use or sale under the statute.

For these reasons the affidavits are held to be insufficient to bar the issue of a patent to this applicant.

EDISON *v.* SWAN.

Decided June 22, 1892.

INTERFERENCE—RULE AS BETWEEN CONTESTANTS WHEN ONE IS A PATENTEE AND THE OTHER AN APPLICANT.

When one of the contestants for priority has a patent for the invention in dispute and the other is an applicant for a patent, the latter, in order to prevail, must present a case both as to conception and as to reasonable diligence which does not admit of a reasonable doubt.

APPEAL from Examiners-in-Chief.

ELECTRIC LAMP.

Application of Thomas A. Edison filed May 27, 1881, No. 34,395. Patent granted Joseph W. Swan October 19, 1880, No. 233,445.

Mr. R. N. Dyer for Edison.

Messrs. Witter & Kenyon for Swan.

SIMONDS, *Commissioner:*

This is an appeal from the decision of the Examiners-in-Chief awarding priority of invention to Edison upon both of the following interference issues:

1. A carbon formed from a straight strip of card-board, paper, or parchment-paper, and bent to the form of an arch, hoop, or loop, and carbonized by heat while in a bent condition, substantially as set forth.
2. A carbon for an electric lamp made of the carbonized parchment-paper.

The Examiner of Interferences awards priority of invention to Swan upon both issues. The three members of the Board of Examiners-in-Chief concur in making a finding for Edison upon the first issue; but one of them decides in favor of Swan upon the second issue.

It is conceded that Swan's date of his invention is practically March 1, 1880, that being the time at which a letter was received in this country, which was written by him abroad, disclosing the invention in controversy. He filed his application for patent April 12, 1880, and his patent issued October 19, 1880.

Edison's claim, according to his preliminary statement, is as follows:

That he conceived the inventions set out in both issues of this interference as early as August, 1879, and at that time disclosed them to others; that he put into actual use the invention set out in the first issue in August, 1879, and has used it continuously since; that he put into actual use the invention set out in the second issue in August, 1877, and has used it sufficiently since to determine its value; that said last-mentioned invention is also described in his caveat No. 93, filed in the Patent Office December 22, 1879.

In the testimony his claim is that he made the inventions in controversy in October and November, 1879. He filed his application for patent May 27, 1881. Edison's delay between the making of the invention and the application for patent, if October, 1879, be taken as the date of making the invention, is a year and seven months, and his delay in making such application after the issue of Swan's patent is seven months.

When one of the contestants for priority has a patent for the invention in dispute and the other is an applicant for a patent, the latter, in order to prevail, must present a case both as to conception and as to reasonable diligence which does not admit of a reasonable doubt. (*Parkhurst* v. *Kinsman*, 1 Blatchf., 488; *Ellithorpe* v. *Robertson*, 4 Blatchf., 307; *Coxe* v. *Griggs*, 1 Biss., 362; *Brodie* v. *Ophir Silver Mining Co.*, 5 Saw., 608; *Draper* v. *Potoska Mills Corporation*, 3 Ban. and Ard., 214; *U. S. Stamping Co.* v. *Jewett*, 18 Blatchf., 469; *Signal Co.* v. *Signal Co.*, 6 Fed. Rep., 603; *Cartridge Co.* v. *Cartridge Co.*, 7 Fed. Rep., 344; *Duffy* v. *Reynolds*, 24 Fed. Rep., 855, &c.)

The force of the foregoing proposition is intensified in this case by the existence of certain facts, to wit: Edison had the amplest financial means for developing and patenting his inventions. He was under an agreement to patent them promptly. He knew of the importance of keeping accurate records of his inventions and experiments and did keep them. During the nineteen months that he waited in this case he made more than a hundred applications for other patents.

The evidence offered by Edison in support of his contention that he made this invention in October and November, 1879, consists of the oral testimony of certain witnesses and of sketches and entries in books kept expressly for the purpose of making a record of his inventions and experiments. It is a fact to be considered in determining the weight of this testimony offered in Edison's behalf that by application for patent filed November 4, 1879, (eventuating in his well-known patent of January 27, 1880, No. 223,398,) by a publication occupying more than a page of the *New York Sunday Herald* of December 21, 1879, by a somewhat similar publication a few days later in the *London Times*, and by a fourteen-page article prepared by Edison's mathematician and contained in *Scribner's Monthly* for February, 1880, a great deal of disclosure was made as to what Edison had done in the invention and development of what is popularly known as the "incandescent light," no part of which disclosures makes any allusion to the features of improvement now in controversy.

Upon such a state of facts it is clear that Edison in order to prevail must present proof that is perfectly convincing. Speaking as to the first issue, an inspection of the sketches and entries offered in evidence taken by itself falls short of producing conviction that Edison in October and November, 1879, made use of or had a knowledge of the specific improvement recited in the first of the interference issues. If one is inclined to find this specific improvement disclosed in the sketches, he can do it. If he looks at them with the eye of keen criticism, he finds himself in doubt.

In addition to the sketches and entries, Edison offers the oral testimony of a number of witnesses, all of which is open to the suspicion that the witnesses' memories may be based upon and strengthened by a favorable construction of the sketches and entries in question.

Swan produces eight or nine witnesses for the purpose of rebutting the affirmative evidence offered by Edison, and their testimony is entitled to some, though not great, weight in the premises.

The practical conclusion is this: Edison *may* have made the invention in October and November, 1879; but strong probabilities are against him. His sketches and entries do not carry conviction. His case rests at last upon oral testimony open to the suspicion just stated and contradicted in some degree by the oral testimony offered by Swan. Edison's case as a whole fails of affording that high degree of proof which the law and the surrounding facts call for.

The second issue requires the use of "parchment-paper." Parchment-paper as generally known at the time in question was paper, preferably unsized, which had been immersed in a bath of dilute sulphuric acid and the acid afterward washed out. For the purposes of this case it was that kind of paper or some other kind of paper having equivalent qualities. Edison never used paper which had been dipped in dilute sulphuric acid and the acid afterward washed out. He did use Crane's parchment-paper and vulcanized fiber. The burden of proof is upon Edison, therefore, to show that Crane's parchment-paper or the vulcanized fiber had the equivalent qualities of what was known as "parchment-paper." Not only does he fail to show that the things he used had the equivalent qualities, but the preponderance of evidence is to the effect that they did not have equivalent qualities. Therefore Edison cannot prevail upon the second issue.

As regards the question whether Edison has produced that degree of proof which the law and the surrounding facts call for in order to enable him to prevail, it is a fact not without significance that the Examiner of Interferences has found one way and the Examiners-in-Chief the other.

The decision of the Examiners-in-Chief is reversed and priority of invention is awarded to Swan.

EX PARTE NASH.

Decided June 6, 1892.

WITHDRAWAL OF APPLICATIONS FROM ISSUE—MORE THAN TWO YEARS' DISCLOSURE IN A PRIOR PATENT TO SAME INVENTOR—NEW APPLICATION FOR SAME INVENTION.

An application will not be withdrawn from issue for the purpose of adding claims to a feature described and reserved but not claimed in a prior patent to the same inventor, because of the fact that more than two years have elapsed since said prior patent was issued, when it appears that a new application can be filed in such a manner that the two applications may be considered continuous.

ON petition.

WATER-METER.

Application of Lewis Hallock Nash filed February 10, 1890, No. 339,811.

Messrs. Johnson & Johnson for the applicant.

FROTHINGHAM, *Assistant Commissioner:*

This is a petition requesting that the above-entitled application be withdrawn from the issue for the purpose of adding a new claim.

It is alleged, among other things, in the petition that on March 20, 1888, a patent was granted to applicant for certain improvements in water-meters, No. 379,805; that Figures 8 to 14 of the drawings of said patent show a water-meter having a cone-shaped piston; that it is related in the specification of said patent as follows:

I do not herein claim the specific construction shown in Figs. 8 to 14, as such matter will form the subject of a separate application for a patent;

that on February 10, 1890, pursuant to the intention intimated in said reservation clause, applicant filed the present application, in which is shown and described a structure having the characteristic features illus-

trated by Figs. 8 to 14 of the drawings of said patent; that this application was intended to cover, among other things, the features described but not claimed in said patent and referred to in said reservation clause, and that applicant had instructed his attorneys to embody in it claims to such features, but that, after the application had been passed to issue, he discovered that his attorneys had omitted to claim such features.

Applicant therefore requests that the application be withdrawn from the issue for the purpose of adding a claim for such features.

It is contended on behalf of the applicant that—

to file an application now for the feature described and reserved but not claimed in said prior patent would be attended with grave risks in view of the fact that more than two years have elapsed since said prior patent was issued.

It is apparent that applicant considers the subject-matter covered by the proposed new claim the same as that which is the subject-matter of the present application. Otherwise it would be for new matter, and therefore could not properly be claimed in the present application.

Assuming, therefore, that the subject-matter of the new claim is the same as that of the present application, I see no good reason why applicant may not file a new application, containing the claims allowed as well as the proposed new claim, in such a manner that the two applications may be considered continuous.

The second application would merely take the place of the present application, which latter was filed within two years after the granting of the patent.

The case is not different in principle from the following cases: *Godfrey* v. *Eames*, (1 Wall., 317;) *Smith* v. *Goodyear Dental Vulcanite Co. et al.*, (93 U. S., 486, 500;) *Graham* v. *Geneva Lake Crawford Mfg. Co.*, (11 Fed. Rep., 138;) *International Tooth Crown Co.* v. *Richmore et al.*, (30 Fed. Rep., 775.)

It is not, however, herein intended to hold that the subject-matter of the proposed claim is for the same invention as that set forth in the present application.

The petition is denied.

EX PARTE SCHILLING.

Decided June 6, 1892.

WITHDRAWAL OF APPLICATIONS FROM ISSUE—MORE THAN TWO YEARS' PUBLIC USE—NEW APPLICATION FOR SAME INVENTION.

An application will not be withdrawn from issue because of more than two years' public use of the invention when it appears that a second application for the same invention may be filed as a continuation of the first application, such first application having been filed before the expiration of the two years.

ON petition.

WRAPPING-MACHINE.

Application of Charles R. Schilling filed March 1, 1890, No. 342,287.

Messrs. Higdon & Higdon for the applicant.

FROTHINGHAM, *Acting Commissioner:*

This is a petition in the nature of a renewal of a former petition for the purpose of withdrawing the above-entitled application from the issue for the purpose of adding a new claim.

The application was filed March 1, 1890, and passed to issue February 6, 1892.

The present petition is accompanied by an affidavit, made by the inventor, setting forth in substance that the invention described and claimed in said application has been in public use for more than two years prior to April 30, 1892. It is contended under this state of facts that applicant is debarred from filing a second application for the same invention, and that, therefore, irreparable injury will result unless the application be withdrawn from issue for the purpose above stated.

It is well settled that the same applicant may file a second application for the same invention and the two will be considered continuous when there is nothing to indicate an abandonment of the first application, and the period of two years within which the invention could be publicly used without invalidating a patent granted upon the second application is the period immediately preceding the date of the first application. (*Godfrey* v. *Eames*, 1 Wall., 317; *Smith* v. *Goodyear Dental Vulcanite Co. et al.*, 93 U. S., 486, 500; *Graham* v. *Geneva Lake Crawford Mfg. Co.*, 11 Fed. Rep., 138; *International Tooth Crown Co.* v. *Richmore et al.*, 30 Fed. Rep., 775.)

Upon examination of the record in the present case nothing is found to indicate an abandonment of the application. I am of the opinion, therefore, that applicant may properly file a new application for the same invention as that contained in the present, in such a manner that the two will be considered continuous, and that the period of two years within which the invention could be publicly used without invalidating a patent granted upon the new application is the period immediately preceding the date of the first application.

The petition is denied.

DECISIONS OF THE U. S. COURTS.

U. S. Circuit Court—District of Iowa, Eastern Division.

BOYD *v.* CHERRY.

Decided January, 1883.

1. ANTICIPATION—PRIOR USE—MILK-CANS.

The Cooley patent of September, 1879, covers "a new process of raising cream from milk," and, as stated by the specification, "consists, mainly, in water-sealing the milk within the vessel containing it, and also in submerging such vessel in water, and in apparatus hereinafter described," the object being not only to exclude dust and dirt, but also to prevent the absorption of deleterious gases or odors from the air and the exposure to sudden changes—electric, thermal, and otherwise—of the atmosphere. *Held* that the patent is valid, although other persons had been in the habit of occasionally submerging vessels containing milk, as they never proceeded so far as to discover the importance of the method or the valuable results achieved by the patentee.

2. SAME—INFRINGEMENT.

The patent is infringed by a milk-can manufactured under the Cherry patent, which describes a substantially similar apparatus and purports to accomplish the same ends in substantially the same way, and infringement cannot be avoided on the theory that the Cherry patent is for a device while the Cooley patent is for a process, especially when it appears that the Cherry apparatus was sold with directions for using it according to the Cooley process.

3. SAME—PATENTABLE PROCESS.

By "process" is meant the application or operation of some element or power of nature, or of one subject to another—as, for example, the art of tanning, dyeing, smelting ores, and the like. In such cases the invention consists in the application of old and well-known principles to new and useful purposes.

STATEMENT OF THE CASE.

The complainant by his bill charges respondent with the infringement of a patent granted to William Cooley and duly assigned to him. The said patent bears date February 20, 1877, and is for an improvement in obtaining cream from milk. It is described in the opinion. The defense is twofold: (1) That Cooley was not the original and first discoverer of the process described in his patent, or, in other words, prior use by other persons; (2) that even if complainant's patent is valid defendant has not infringed. Proofs have been taken and the case has been twice argued. Upon the first hearing the court found that the defense of prior use was sustained, but granted a rehearing.

Messrs. Munday, Evarts & Adcock, Messrs. Wishard & Read, and *Messrs. Phillips, Goode & Phillips* for the complainant.

Messrs. Stoneman, Rickel & Eastman for the defendant.

MCCRARY, *J.:*

As it is admitted that the respondent has manufactured and sold a milk-can constructed according to the patent issued to him on the 23d of September, 1879, known as the "Hawkeye patent," our first inquiry will be as to whether this is an infringement of the earlier patent under which the complainant claims. An examination of the two patents will clearly show that they are substantially for the same invention. For convenience I will designate the older patent as the "Cooley patent" and the later one as the "Cherry patent." The Cooley patent is described as "a new process of raising cream from milk," and the specification declares that—

it consists, mainly, in water-sealing the milk within the vessel containing it, and also in submerging such vessel in water, and in apparatus hereinafter described.

The Cherry patent is described as—

an improved means of raising cream from milk and for driving off the animal heat or vapor contained in the same in the shortest and best possible manner;

and the specification further declares that—

the invention consists, essentially, in water-sealing the milk within the vessel containing it by means of a cover of novel construction and submerging such vessel and cover in a tank of water.

In both patents one main purpose is declared to be the excluding of the milk from the outer atmosphere during the process of raising the cream. Thus the specification in the Cooley patent declares:

By my present invention I water-seal the can or other vessel containing the milk to be treated, whereby all possibility of the entrance into it of foreign matter, gases, or odors is prevented, etc.;

and the specification in the Cherry patent declares that—

the vessel containing the milk is submerged in a tank of water and the milk not only excluded from the outer atmosphere, but an equality in the temperature is established and maintained throughout the entire vessel and the animal heat or vapor driven out into the surrounding water.

In both patents the utility of the invention is declared to consist in substantially the same thing. Thus the specification in the Cooley patent says:

The ordinary mode of raising cream is with open cans, either shallow or deep, and then by hand-labor skimming the cream from the surface after the milk has stood from, say, thirty-six to forty-eight hours. This mode is open to several serious objections, among which may be named the exposure of the milk to the atmosphere, from which it attracts insects and absorbs gases and odors, often very deleterious, and from which it collects and retains dust and dirt floating in the air; the agitation of its surface from winds and other causes; the great length of time required to raise the cream; the unavoidable lack of uniformity in the quality of the cream, and consequently in the butter made from it, because of the various subtile and invisible atmospheric causes which tend to taint, acidify, or otherwise vitiate it; the positive and direct exposure to all the sudden changes—electrical, thermal, and otherwise—of the atmosphere; and the necessity of having pans enough to hold the milk of two or more days' milking.

On the same subject the specification in the Cherry patent states:

It will be observed that by the old method of raising cream in open shallow pans the milk absorbs deleterious odors and gases and collects dust and dirt floating in the air, and is also subject to various changes of atmosphere, and rendering a lack of uniformity in the quality and quantity of the cream produced, and consequently lessening the value of the butter made from it. By means of the present improvement these objections are entirely obviated, inasmuch as the vessel containing the milk is submerged in a tank of water and the milk not only excluded from the outer atmosphere, but an equality in the temperature is established and maintained throughout the entire vessel and the animal heat or vapor driven out into the surrounding water.

The similarity in the two patents becomes still more apparent when we come to compare the description of the invention and the milk-cans actually constructed under them, some of which are in evidence before us. In both there is a cylindrical receptacle or pan for holding the milk. In both there is a tank or vessel for holding water, into which the milk-can is placed. In both there is a movable cover for the can, shaped somewhat like an ordinary tin pan and placed upside down on the top of the can, the overlapping or flaring sides of the cover leaving an annular space between such sides and the can. Both are rendered air-tight by water-sealing—that is, by being submerged in water, or so nearly submerged that the air is excluded from the can. In both the process contemplates that the can shall stand in the water until the cream is gathered at the top, and in both an outlet is provided at the bottom by which to draw off the milk, leaving the cream only in the can. True, there are some differences; but they are immaterial, and my conclusion is that the two patents are substantially identical.

But the counsel for the respondent insists that he has not infringed the Cooley patent, and their argument is that said patent is for a process and not for a mechanical device, while respondent's invention is for the latter and not for the former. It is impossible to maintain this distinction between the two patents. What one is in this respect the other is. They are alike. In my judgment both patents cover a process to be accomplished by a combination of mechanical devices. A process is patentable provided that it is new and useful. By "process" is meant the application or operation of some element or power of nature or of one subject to another. As examples of patentable processes, the art of tanning, dyeing, smelting ores, and the like may be mentioned. In these and in other similar cases the merit of the invention consists not in the discovery of any new law of nature or principle of science or natural philosophy, but in the application of old and well-known principles to new and useful purposes. There can be no patent upon an abstract philosophical principle. The laws of nature and properties of matter are presumed to be known to and subject to be utilized by all alike; but the application of any one or more of these laws or principles to a practical object and so as to secure a useful result not previously attained is patentable. (*Neilson* v. *Harford*, 1 Webst. Pat. Cas., 295; *Corning* v. *Burden*, 15 How., 267; *Cochrane* v. *Deener*, 11 O. G., 687; 94 U. S., 780; *Rubber Co.* v. *Goodyear*, 9 Wall., 788.)

I doubt very much whether the mechanical appli-

ances described in each of the patents is patentable aside from the process. Considered merely as cans or milk-vessels there would seem to be little, if any, novelty in them; but however this may be, it appears from an inspection of the Cherry patent itself that it is intended to cover the process and that the cans are to be used only for the purpose of raising cream in the manner described. Besides, the evidence discloses the fact beyond question that the respondent manufactures the "Hawkeye pan" and sells it to customers to be used by them in raising cream from milk according to the process described in the Cooley patent. He advertises and sells the can for this very purpose. They are especially adapted to it and to no other, and the inference arising from their sale that they are to be used would be very strong. When it is added that they are generally, if not always, accompanied by directions to purchasers as to the mode of using them, which directions require the adoption and use of the Cooley process, it becomes very clear that the fact of infringement is established. (*Bowker* v. *Dows*, 15 O. G., 510; 3 Ban. & A., 518; *Rumford Chemical Works* v. *Hecker*, 10 O. G., 259; 2 Ban. & A., 351; *Wallace* v. *Holmes*, 1 O. G.; 117, 9 Blatchf., 65.)

It only remains to consider the defense of prior use. The proof undoubtedly shows that before the date of Cooley's invention several other persons had been in the habit of occasionally submerging vessels containing milk during the process of raising cream therefrom, and in some instances, at least, such use was public; but it also clearly appears that none of these persons proceeded so far as to discover the utility of the process or were aware of the fact that by it the important and valuable results since achieved by Cooley could be secured. It is beyond doubt that Cooley was the first to discover and to make known to the public the fact that by this process the cream could be raised in a much shorter period of time than by any other known means, and that by it a better quality of butter was to be secured at a reduced cost. The others doubtless came very near to this discovery; but they overlooked it, as is apparent from the fact that no other one of them thought enough of the process to permanently adopt it or to apply for a patent upon it until after the Cooley patent had come into use and its great utility had been demonstrated. It follows that the controlling question upon this branch of the case is whether it is necessary for the defendant, in order to sustain the defense of prior use, to show not only that the process was publicly used before Cooley's discovery, but that it was so used by some person or persons who perceived the fact of its utility and who knew what could be accomplished by it and who communicated this information to the public.

But, upon authority and upon principle, I am constrained to answer this question in the affirmative. In *Tilghman* v. *Proctor* (19 O. G., 859; 102 U. S., 711) the Supreme Court, through Mr. Justice Bradley, held an alleged prior use not sufficiently proved, for the reason, among others, that the result had been accidentally and unwittingly produced, while the operators were in pursuit of other and different results, without exciting attention and without its even being known what was done or how it had been done. In *Pelton* v. *Waters* (7 O. G., 425) the rule is distinctly recognized that the prior discoverer or inventor must have had such a conception of the invention as would enable him to give it to the public. Said Emmons, speaking of the alleged prior inventor in that case—

> he not only did not give and could not give it [the invention] to the public, but he did not possess it himself.

The same rule is recognized in *Andrews* v. *Carman*, (9 O. G., 1011,) where it is declared in effect that the person—

> who first discovers the principle and by putting it into practical and intelligent use first makes it available to man—

is the first inventor.

If the alleged prior use of the process was under such circumstances that the public obtained no knowledge of the mode of its operation or of the results to be attained by it, there is no prior use within the meaning of the patent law.

> In other words, if the parties who made the combination, although seeing with the eye perceived not, and hearing with the ear understood not, * * * they added nothing to their own stock of knowledge; and the fact, if observed by other men, (if they understood it not,) added nothing to the science on that subject. Therefore the invention was not made until the parties contriving, or others observing, the existing combination saw that it could be made available for the purpose of producing a result similar to the one which the plaintiffs have mentioned in their specification. (*Ransom* v. *Mayor*, 1 Fish. Pat. Cas., 267.)

These adjudications are based upon a sound principle. The rights of a patentee are granted to him upon the consideration of the giving by him to the public of a new and useful discovery. If some one before him had already given the same invention or discovery to the public, this consideration falls and he has no basis for his claim of exclusive right. Hence it is that the alleged prior invention must have been made public. If kept secret by the first inventor until the second has discovered it and given it to the public, the latter will be protected, for it is to him that the public is indebted. It is from him that the public has received value; and as no one can impart that which he does not possess it must appear that the alleged prior inventor was aware not only of his discovery, but also of its utility. These considerations lead to the conclusion that complainant is entitled to a decree in accordance with the prayer of the bill for an injunction and accounting.

Let a decree be entered accordingly.

World's Columbian Exposition.

To the inventors and manufacturers of the United States:

It is the intention of the Patent Office to make at the World's Columbian Exposition at Chicago in 1893 an exhibit which will show that great advance in the several arts which is due, in large measure, to the encouragement and support afforded by our patent system. This exhibit is to consist of models of patented inventions, which will be carefully selected, to show as far as is possible the inception of each art, the stages through which the art has advanced, and the final development reached at the present time. This display of typical inventions, embodied in concrete form and properly arranged, will, it is believed, constitute a grand historical exhibit of the progress of the useful arts and one which will be of great interest not only to inventors and manufacturers, but to the public generally.

The Office collection of models has been seriously impaired by fire, and is further incomplete by reason of the fact that models have not generally been required or received during the last ten years. The Office is not, therefore, in possession of the models of many valuable inventions which might properly be included in such an exhibit, and without which, indeed, the exhibit would be incomplete. The limited appropriation for this exhibit will not permit the Office to make such models. An urgent appeal is therefore made to all inventors and manufacturers to come to the assistance of the Office in this matter, either by loans of models already built or by the construction of such models not in the possession of the Office as should properly be placed in such a collection. Of course, where models are loaned to the Office all proper credit will be given both in labels and catalogues to the parties by whom the loans are made, and such disposition will be made of the models after the close of the exhibit as the owners shall direct. Many inventors and manufacturers have already indicated a willingness to co-operate with the Office in this matter, and it is confidently expected that such a response will be made to this general appeal as will assure the unparalleled success of this attempt to graphically and concretely show the developement of American invention.

W. E. SIMONDS,
Commissioner.

Copies of Decisions Furnished.

Hereafter an uncertified copy of every decision or action by any tribunal in this Office will be furnished by such tribunal to the interested party or parties without charge.

This order does not include the written statements of the grounds of decisions made by Examiners, to the appellate tribunal in *ex parte* cases.

Withdrawal of Cases from Issue.

Hereafter all amendments proposed to allowed applications which involve a withdrawal from issue, and all petitions and requests relating thereto, shall be filed with the docket clerk, Mr. J. M. Emory, and transmitted by him to the Primary Examiner for report. If the Examiner shall report favorably to the admission of such amendment, the matter will be laid before the Commissioner for immediate determination. If the Examiner shall report unfavorably, the case will be docketed and will be heard and decided by the Commissioner in regular course, unless good reasons shall appear for immediate action.

Indexes to Foreign Patents.

The following indexes to foreign patents have been translated, compiled, and published under the authority of the Commissioner of Patents, and may be obtained as a Patent Office publication at the prices given below:

INDEX TO FRENCH PATENTS, 1791 to 1879, inclusive, (subject-matter,) one volume, 935 pages, bound in cloth $10 00

INDEX TO ITALIAN PATENTS, 1848 to May 1, 1882, (subject-matter,) one volume, 120 pages—

Bound half-turkey	2 50
Bound in cloth	1 25
Paper covers	1 00

Indexes to Patents on Electricity.

Indexes to patents relating to electricity, covering the period of time from July 1, 1882, to June 30, 1890, have been issued, and are for sale. These indexes, arranged alphabetically, numerically, and by classes, comprise the following volumes, the prices of which are given below:

Vol. 1. Index to patents relating to electricity granted by the United States prior to June 30, 1881, with an appendix, July 1, 1881, to June 30, 1882. One volume, 250 pages. In paper covers, $3; bound, $5.

Vol. 2. Appendix No. 2, July 1, 1882, to June 30, 1883. One volume, 50 pages. In paper covers, $1.50.

Vol. 3. Appendix No. 3, July 1, 1883, to June 30, 1884. One volume, 60 pages. In paper covers, $1.50.

Vol. 4. Appendix No. 4, July 1, 1884, to June 30, 1885. One volume, 60 pages. In paper covers, $1.50.

Vol. 5. Appendix No. 5, July 1, 1885, to June 30, 1886. One volume, 54 pages In paper covers, $1.50.

Vol. 6. Appendix No. 6, July 1, 1886, to June 30, 1887. One volume, 52 pages. In paper covers, $1.50.

Vol. 7. Appendix No. 7, July 1, 1887, to June 30, 1888. One volume, 68 pages. In paper covers, $1.50.

Vol. 8. Appendix No. 8, July 1, 1888, to June 30, 1889. One volume, 72 pages. In paper covers, $1.50.

Vol. 9. Appendix No. 9, July 1, 1889, to June 30, 1890. One volume, 84 pages. In paper covers, $1.50.

Notice.

All solicitors, agents, or attorneys who, in circulars or advertisements or otherwise, refer to the Commissioner of Patents, or to any other official of the Patent Office, for evidence of their professional standing, do so without authority.

Names of Applicants.

When the full first name of the applicant does not appear either in his signature or in the preamble to the specification, the Examiner will, in his first official letter, require an amendment supplying the omission, and he will not pass the application to issue until the omission has been supplied, unless an affidavit shall have been filed setting forth that the full first name of the applicant is the one originally given by him.

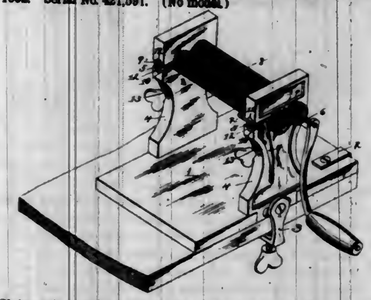
PATENTS

GRANTED JULY 12, 1892.



478,546. CLOCK-CASE. WILLIAM T. AMES, New York, N. Y., assignor to the Seth Thomas Clock Company, same place. Filed Mar. 28, 1892. Serial No. 426,639. (No model.)

Claim.—1. The combined clock and easel described, having the frame B, adapted to slide in grooves in the back of the clock-case A and provided with the hinged flap D, connected by hinges C, all combined and arranged to serve substantially as herein specified.

2. The clock-case A, having a till *a* and cover E therefor, and guiding means A', grooved to receive the frame B, in combination with such frame and with the flap D and ledge D', all arranged for joint operation, as herein specified.

478,547. MEAT-TENDERER. OSCAR M. ARNOLD, Searcy, Ark., assignor of one-third to Albert T. Sherrod, same place. Filed Feb. 16, 1892. Serial No. 421,591. (No model.)

Claim.—In a meat-tenderer, the combination of a base, standards rising from opposite sides of the base and provided at their upper ends with horizontal grooved bearing-slots, shafts geared together and journaled in the slots, the corrugated rolls mounted on the shafts, the bearing-blocks arranged in the bearing-slots and provided on their upper and lower faces with lugs fitting in the grooves thereof and having lateral extensions projecting outward beyond the standards, the springs arranged on the outer faces of the standards and engaging the lateral extensions of the bearing-blocks, and the adjusting-screws engaging the springs, substantially as described.

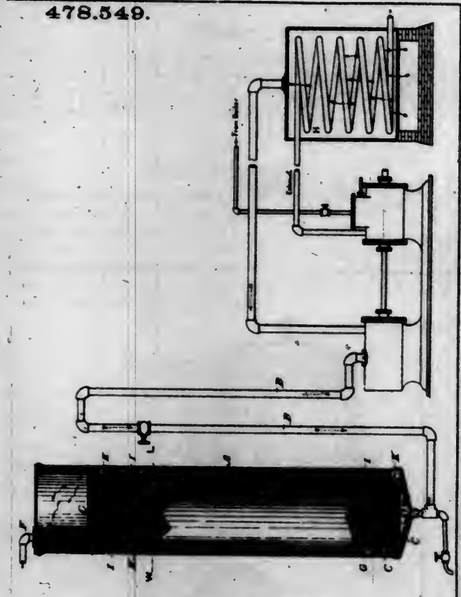
478,548. TEA OR COFFEE FILTER. ERNEST R. AUSTIN, Norwalk, Conn. Filed Mar. 5, 1892. Serial No. 423,818. (No model.)

Claim.—1. A filter for the purpose described, consisting of a bag

478,548.

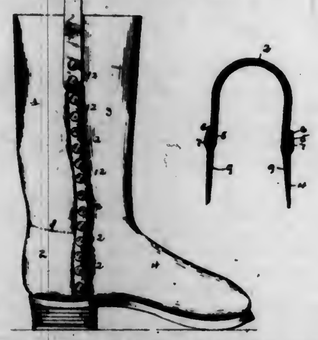
having at its upper end a ring provided with inwardly-turned lugs, and a holding device consisting of a loop adapted to engage the top of the pot, a loop extending downward within the bag to hold it in position in use, and a ring adapted to fit within the ring upon the bag and having an inward curvature permitting it to pass one of the lugs, the holding device being locked within the bag by turning one of the rings slightly.

2. A tea or coffee filter consisting of a bag having a ring and lugs at the top, and a holding device consisting of a ring engaging within the ring in the bag, a loop extending downward within the bag, and a loop adapted to engage the top of the pot.



3. A tea or coffee filter consisting of a bag having a ring and lugs at the top, and a holding device consisting of a ring engaging within the ring in the bag, a loop extending downward within the bag, and a sheet metal loop secured to said ring and downwardly-extending loop and adapted to engage the top of a pot, said sheet-metal loop having a band-piece 5 and being cut away at the top, so as not to interfere with the lid of the pot.

478,549. FUEL-GAS APPARATUS. JOHN M. BAILEY, Bristol, Va. Filed Feb. 14, 1891. Serial No. 381,457. (No model.)

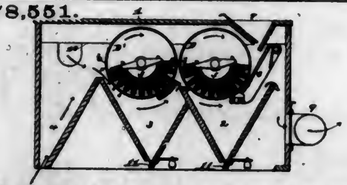


Claim.—1. A fuel-gas apparatus consisting of a cylinder or vessel filled nearly to the top with loose broken stone or analogous granular non-absorbent material and crude oil, the oil submerging the non-absorbent material, an air-inlet pipe at or near the bottom of said cylinder, and carbureted-air-exit pipe at or near the top of said vessel, all substantially as described.

2. In a fuel-gas apparatus, the combination, with a cylinder or vessel filled nearly to the top with loose broken stone or other analogous non-absorbent material and crude oil, the oil submerging the non-absorbent material, of a series of loose diaphragms horizontally disposed one above the other and separated a few inches from each other, forming a series of chambers for said non-absorbent material, each of said diaphragms having an aperture on one side and arranged in said cylinder or vessel, whereby the aperture of each alternating diaphragm shall be on the opposite side of the cylinder or vessel from that of the preceding one, an air-inlet pipe at or near the bottom of the cylinder or vessel, and a carbureted-air-exit pipe at or near the top of said cylinder or vessel, all substantially as described.

478,549.

478,550. BOOT-UPPER. OSCAR BAKER, Weatherford, Tex. Filed Mar. 30, 1891. Serial No. 387,755. (No model.)



Claim.—The herein-described improved boot-upper, consisting of a front and rear section, each of said sections being made in one piece and the edges of the rear section doubled over upon themselves and having their edges secured to the edges of the front section by edge stitches passing through said edges of the front section and said edges of the doubled edges of the rear section, said doubled edges of the rear section and edges of the front section being arranged relatively to each other and the edges of the front section extended over the beads of said doubled edges of the rear section to form a broad connecting-seam, and rivets inserted through and through the center of all the thicknesses of said broad connecting-seam to form a water-tight and strong seam, the straps and counter being also adapted to be held by said rivets, as set forth.

478,551. MAGNETIC SEPARATOR. CLINTON M. BALL, Troy, N. Y., and SHELDON HORTON, Hokendauqua, Pa. Filed Oct. 12, 1891. Serial No. 408,594. (No model.)

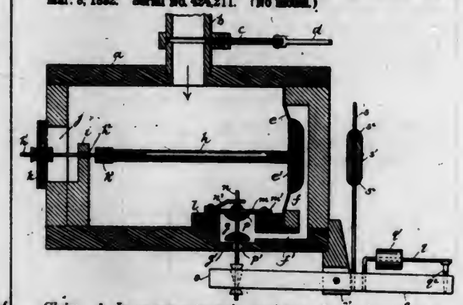
Claim.—1. An ore-separator comprising a plurality of separating-surfaces and a magnetic field or fields in operative relation thereto, respectively, said field extending between adjacent separating-surfaces and assisting magnetically in the transfer of partially-separated ore from one surface to the other.

2. An ore-separator comprising two or more magnetic surfaces for withdrawing the iron from the gangue and means for effecting a

478,551.

transfer of the iron from one surface to the other, the magnetic polarities near the point of transfer being dissimilar.

3. An ore-separator comprising two or more traveling surfaces upon which the ore is held magnetically, said surfaces approaching each other and provided with co-operating magnetic poles of unlike sign, whereby the transfer of ore from one surface to the other is facilitated and a continuous operation with two or more separating devices may be conducted.



4. An ore-separator comprising two or more rotating surfaces arranged in series and magnetic fields for causing the adherence of ore to said surfaces while the gangue is expelled, the magnetic poles at adjoining points being of unlike sign to facilitate transfer of the ore.

5. An ore-separator comprising two or more magnetic fields and two or more non-magnetic screens moving in said fields, one screen adjoining another, so as to transfer ore thereto, the poles of the fields at the point of transfer being of unlike sign.

6. An ore-separator comprising two or more magnetic fields and two or more non-magnetic screens moving in said fields, one screen adjoining another, so as to transfer ore thereto, the poles of the fields at the point of transfer being of unlike sign and the receiving-pole being in advance of the delivery-pole.

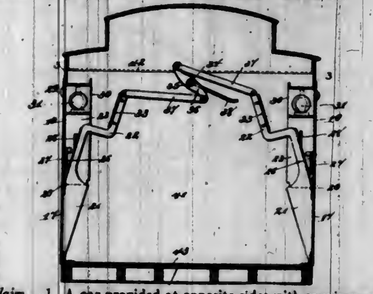
7. An ore-separator comprising two or more groups of magnets arranged in succession, means for forcibly conveying the ore past the magnets and permitting the gangue to fall away, and means for effecting the transfer of ore from one group of magnets to the next, the groups of magnets being co-operatively placed to assist magnetically in the transfer of the partially-separated ore.

478,552. ORGAN-TREMOLO. IRA BARRETT, Chicago, Ill. Filed Mar. 8, 1892. Serial No. 424,211. (No model.)

Claim.—1. In an organ-tremolo consisting of a box having its interior divided into two chambers by means of a flexible diaphragm, means for connecting the main chamber of said box with the wind-chest of the organ, means for controlling the admission of air from said wind-chest to the main chamber of said box, an opening between the main chamber of said box and the outer atmosphere, a valve of less area than said diaphragm and in operative connection therewith for normally closing said opening, a channel and openings between said secondary chamber and said main chamber and between said secondary chamber and the outer atmosphere, a valve for normally closing the opening to said main chamber, a secondary valve mounted upon the same stem for closing the opening to said outer atmosphere when said primary valve is open, and a weighted vibratory lever in operative connection with said valve-stem, substantially as shown and described.

2. The combination, with an organ, of the box *a*, means for communication between the same and the main wind-chest, a slide for controlling said communication, diaphragm *e*, valve *k*, said diaphragm being of larger area than said valve *k* and connected therewith, opening *j*, chamber *f*, channel *f'*, communicating with the interior of the box and with the outer atmosphere, respectively, valves for alternately closing one and opening the other of the openings communicating with said channel, and a weighted pivoted lever in operative connection with said valves, substantially as shown and described.

3. The combination, with an organ wind chest, of a box in operative communication therewith, a movable diaphragm within said



box and positively connected with a valve arranged to close an opening to the outer atmosphere, chamber *f*, channel *f'*, valves *p p'*, the former having a yielding seat, and weighted lever *o*, the preponderance of weight being so adjusted as to cause it to normally close the valve *p*, substantially as shown and described.

4. The combination, with an organ wind-chest, of the box *a*, having valve-openings therein, diaphragm *e*, valves *k* and *p p'*, chamber *f*, in operative connection with the openings of said valves *p p'*, and pivoted lever *o*, having one or more adjustable weights attached thereto, substantially as shown and described.

478,553. COMPOUND FOR FILLING COB PIPES. ALBERT C. RAUSCHER, Lanark, Ill., assignor of one-half to Harry Hepler, same place. Filed Dec. 24, 1891. Serial No. 416,067. (No specimens.)

Claim.—A pipe-filler compound or paste composed of syrup, soap, oil, and whiting, combined in substantially the proportions specified.

478,554. BURGLAR-PROOF CAR. JOHN BEERMAKER, Wahoo, Nebr. Filed Feb. 19, 1892. Serial No. 422,115. (No model.)

Claim.—1. A car provided at opposite sides with openings, combined with swells hinged at their lower edges to the openings and provided at their upper corners with light-openings and lamp-supports, of means for opening and closing the swells, a reflecting-plate located at the inner side of each light-lamp support, and means for throwing the same toward or away from the light-supports, substantially as specified.

2. The combination, with the car, the opposite walls of which are provided with openings, of opposite swells hinged at their lower edges to the openings, an intermediate rock-shaft provided with rock-arms, and links connecting the rock-arms with the swells, substantially as specified.

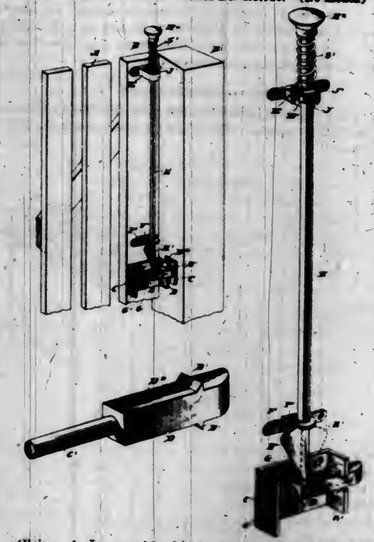
3. The combination, with the car having the opposite openings, the hinged swell-sections having the side strips bent to engage the edges of the openings and terminating at their upper ends in arms, the upper sections hinged to the lower sections and provided at their inner edges with the U-shaped frames, having their inner edges bent to engage the opening in the car, of the intermediate rock-shaft, the rock-arms on the same, and the links connecting the rock-arms with the side strips of the lower swell-sections, substantially as specified.

4. The combination, with the car having the opposite openings in its side walls, of the lower swell-sections hinged at their lower edges to the openings and provided with the side strips, terminating at their upper ends in inwardly-disposed L-shaped arms, the upper swell-sections having the U-shaped frames at their inner faces, embracing the side strips, the light supports and openings at the upper corners of the frames, the transverse reflecting-plates mounted on the L-shaped arms, the intermediate rock-shaft, the lever for operating the same, the rock-arms extending from the shaft, and the pivoted links connecting the outer ends of the rock-arms with the upper ends of the L-shaped arms of the side strips, substantially as specified.

5. The car having the opening in its side wall, combined with the lower swell-section hinged to the bottom of the opening, the upper swell-section hinged to the lower section, the side pieces for the two sections terminating at their inner edges in stops, and means for opening and closing the section, substantially as specified.

6. A car one end of which is provided with port-holes and in front of the same with a transverse partition-frame, the door-sections adapted to fold and hinged to the frame, the reversely-disposed keepers, and the intermediate locking-bar pivoted to one of the sections substantially as specified.

478,555. GARMENT HOOK AND EYE. FRANCIS E. BENNETT, Philadelphia, Pa. Filed June 16, 1891. Serial No. 396,660. (No model.)

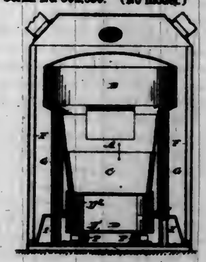


Claim.—A fastening device consisting of an eye formed of a single piece of wire with attaching-loops at its rear end and provided with an elastic shank, and a coiled spring between said shank, and a hook

478,555.

having a laterally-extended head wider than the shank of the eye, and a neck connected with the said head and the shank of the hook at an angle to the same, said parts being combined substantially as described.

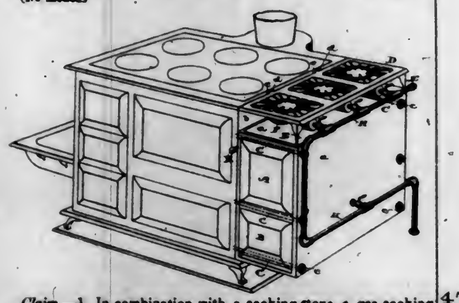
478,556. GATE-LATCH. CHARLES F. BOTTMANN, Jr., New Albany, Ind. Filed Mar. 5, 1892. Serial No. 423,925. (No model.)



Claim.—1. In a combined lock, the combination of a spring-actuated bolt or latch having a slot extending therethrough, a rod or bar with a head thereon movably engaging said bolt or latch and passing through said slot therein and operating the same, and a sleeve on said rod or bar for locking the latter in either one of its adjusted positions against rotatable movement, substantially as described.

2. In a combined latch and lock, the combination of a bolt or latch having a slot extending therethrough, a square rod or bar arranged at right angles to said bolt or latch and having a head engaging said bolt or latch, and a square sleeve having a square opening therein through which said rod or bar extends and adjustably fitted to a square seat, the said sleeve being adjustably mounted in a temporary fixed position, substantially as described.

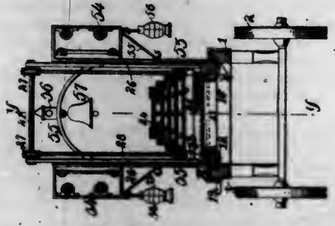
3. In a combined latch and lock, the combination of a sliding bolt or latch having a slot therein and extending therethrough, an operating rod or bar arranged at right angles thereto and of square form, the said bar being provided with a cam-head with a vertical wall, a square sleeve movably surrounding said bar or rod and having a square opening therein and a flanged head, and a bracket with a square opening therein to receive said square sleeve, said bolt or latch and operating rod or bar having springs in connection therewith, substantially as described.



478,557. HEATER. RICHARD BIGLEY, Toronto, Canada. Filed May 8, 1891. Serial No. 392,059. (No model.)

Claim.—1. In combination, the fire-chamber and ash-pit, the projecting dome and base-chamber, the said ash-pit being formed by a depression in the upper wall of the base-chamber, which thus extends under the same and about its sides, the pipes G, leading from the dome to the base-chamber, the inclosing casing, and the pipes I, leading from the space beneath the heater through the base-chamber alongside the depending ash-pit and into the space inclosed by the outer casing, substantially as described.

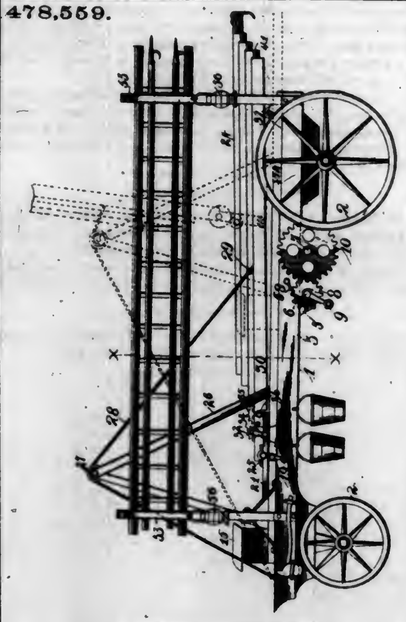
2. In combination, the combustion-chamber having the enlarged dome, the base-chamber, pipes connecting said dome and base chamber, the casing surrounding the whole and forming a hot-air chamber between the dome and base-chamber, pipes connecting the hot-air chamber with the space beneath the base-chamber, and the smoke-flue having a valved connection with the dome and with the ash-pit, the said flue being continued below the ash-pit and valve into the base-chamber, substantially as described.



478,558. GAS ATTACHMENT FOR COOKING-STOVES. RICHARD BIGLEY, Toronto, Canada. Filed June 26, 1891. Serial No. 397,576. (No model.)

Claim.—1. In combination with a cooking-stove, a gas cooking attachment consisting of ovens and gas cooking-table connected directly to the side of the stove next the oven, the supplemental oven being held close to the stove-oven and provided with a damper at one side connecting with the smoke flue or pipe of the cooking-stove, as and for the purpose specified.

2. In combination with a cooking-stove, the supplemental ovens A and B, connected by bolts C directly to the side *b* of the stove next the oven, the table D, supported by lugs *d* in the slots *e*, and legs E on the top of the oven A, as specified.



478,559. FIRE-ESCAPE LADDER. AUGUST J. BODEN, Litchfield, Ill. Filed Jan. 16, 1892. Serial No. 418,343. (No model.)

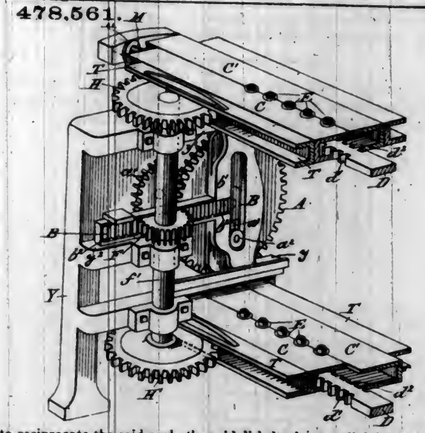
Claim.—1. In a fire-escape ladder, the combination, with a truck, of a carriage movable thereon, a series of extensible ladders, the lower one of which being pivotally and revolubly mounted on said carriage, a support mounted on the carriage in advance of the ladders, and a rope passing over said support and attached at its respective ends to the truck and ladders, substantially as and for the purpose set forth.

2. A fire-escape ladder consisting of a truck-frame, a carriage movable upon the same and provided with rack-bars, a shaft, such as 7, provided with gear-wheels 11, which are adapted to mesh with the said rack-bars for moving said carriage, a revolving plate, such as 21, mounted upon said carriage and provided with gear-teeth, pinions adapted to mesh with said teeth for revolving said plate, a series of ladders, one of which is movably mounted upon said plate, a cord or rope, such as 28, one end of which is secured to the said ladders and the opposite end to the truck-frame, supports, such as 26, carried by the said carriage and supporting suitable rollers 27, over which the said ropes are adapted to run, and means whereby the said ladders are moved upon one another and simultaneously, substantially as described.

478,559.

478,560. GAGE FOR DETERMINING THE AGE OF HORSES. ANDREW BOLINGER, Speedwell, Tenn. Filed Jan. 28, 1892. Serial No. 419,584. (No model.)

Claim.—1. In a device for ascertaining the approximate age of a horse, a gage A, having a tapered body portion, one of the longitudinal edges thereof having longitudinal parallel lines adjacent thereto, transverse lines or marks, and figures adapted to be used in connection with the gage-lines, substantially as and for the purpose set forth.

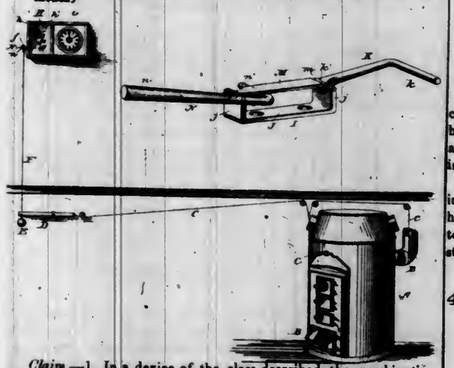


2. A gage or device for ascertaining the approximate age of a horse, consisting of a plate A, of gradually-decreasing width, spaced progressively from end to end by transverse gage-lines, and indicating-figures adjacent to the transverse lines, the plate adjacent to one of its longitudinal edges having lines parallel with said edge, substantially as shown, and for the purpose set forth.

478,561. WIRE-NETTING MACHINE. EDWARD S. BOND, Birmingham, England. Filed July 10, 1891. Serial No. 399,027. (No model.) Patented in England Oct. 8, 1890, No. 15,943.

Claim.—1. In machinery for manufacturing wire-netting, the pinions E for twisting the wire, in combination with the main racks D, engaging the said pinions, the gear-wheels H H', which engage and drive the said racks, a pinion on the shaft of said pair of gear-wheels, a rack b^3, engaging the said pinion and provided with a slotted part, a disk provided with an eccentric stud which engages the said slot, and plates C C', containing the main racks and wire-twisting pinions, substantially as set forth.

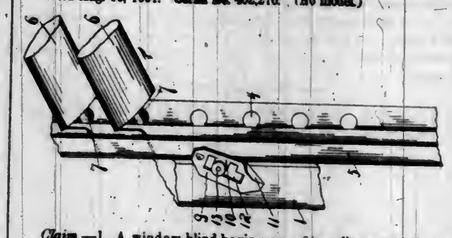
2. In machinery for manufacturing wire-netting, the pinions E for twisting the wire, in combination with the main racks D, engaging the said pinions, the gear-wheels H H', which engage and drive the said racks, a pinion on the shaft of each pair of gear-wheels, a rack b^3, engaging the said pinion and provided with a slotted part, a rotary disk provided with a stud or roller which works in the slot of said part



478,561.

to reciprocate the said rack, the said disk having a radial slot formed in it and the said stud being adjustable therein, and the plates C C', containing the main racks and wire-twisting pinions, substantially as set forth.

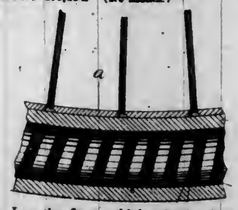
3. In machinery for manufacturing wire-netting, reciprocating plates C and C', in combination with buffers arranged between their opposing parts, and consisting of plungers M, attached to one set of plates and cylinders K, attached to the other set thereof, the wire-twisting pinions and racks engaging said pinions within the said plates, and mechanism for reciprocating the said racks, for the purpose set forth.



478,562. TIME-DAMPER-OPERATING MECHANISM. OTIS BRIGGS, Jr., Nevada, Iowa. Filed Apr. 5, 1892. Serial No. 427,858. (No model.)

Claim.—1. In a device of the class described, the combination, with a weight-controlled draft-regulating lever, of the clock-casing having an extended portion, the alarm-striking mechanism mounted in said casing and carrying a vibrating lever, and a releasing attachment mounted in said extended portion of the casing and comprising a base-plate, a drop-lever pivoted at one end of said base-plate and lying in the path of said alarm-lever, a releasing-plate pivoted to the other end of said base-plate and normally engaging the pivotal end of said drop-lever, and a releasing-lever pivoted within the casing, normally bearing under said releasing-plate and connected with said weighted lever, substantially as set forth.

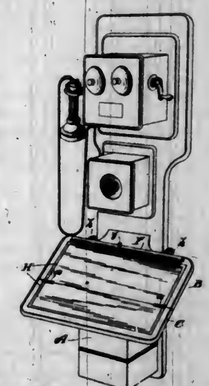
2. In a device of the class described, the combination, with a weight-controlled regulating-draft lever, and an alarm-striking mechanism carrying a lever, of a releasing attachment located adjacent to said striking mechanism and comprising a base-plate having opposite upwardly-extending arms, a drop-lever pivoted to one of said arms and provided at one end with an offstanding arm lying in the path of said alarm-lever and a notch at its opposite end, a releasing-plate pivoted to the other base-plate arm and normally engaging the notch of said drop-lever, and a releasing-lever pivoted adjacent to the base-plate and provided with a bearing-arm normally bearing under said releasing-plate, and a supporting-chain connected with said weight-controlled lever and loosely to the other end of said releasing lever, substantially as set forth.



478,563. WINDOW-BLIND. WILLIAM Z. BROWN, Hannibal, Mo. Filed Aug. 10, 1891. Serial No. 402,270. (No model.)

Claim.—1. A window-blind having one of its stiles provided with a right-angular recess and bearings for the tenons of the slats, opening into the recess, and a slat-worker 5, located and movable in said recess, the same answering as a device for operating the slats and also as a means for holding the tenons of the slats in their bearings, substantially as set forth.

2. A window-blind having one of its stiles provided with a right-angular recess and bearings for the tenons of the slats, opening into the recess, a slat-worker 5, located and movable in said recess, the same answering as a device for operating the slats and also as a means for holding the tenons of the slats in their appropriate bearings, and a connecting-link 14 for connecting the slats to the slat-worker, substantially as set forth.

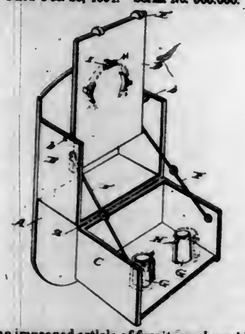


478,564. ELASTIC TIRE FOR VEHICLE-WHEELS. FREDERICK H. BULLARD and FRANK HARRINGTON, Chicopee, Mass. Filed Sept. 9, 1891. Serial No. 405,154. (No model.)

Claim.—1. In a tire for a vehicle-wheel, a hollow ring of elastic compressible material, substantially as set forth, and a spiral spring having the convolutions thereof separated and inclosed and extending around within the tire-ring and the said convolutions having a winding of suitable fabric, substantially as described.

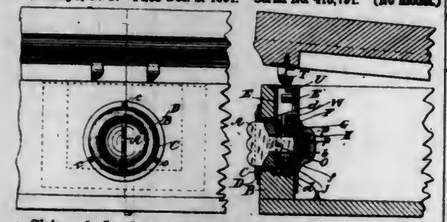
2. In a tire for a vehicle-wheel, in combination, the ring of elastic india-rubber, the spring formed of separated convolutions of metal having the wrapping, and the annular inclosure composed of textile material for the coils which also constitutes lining for the tire-ring, substantially as described.

478,565. DESK ATTACHMENT FOR TELEPHONES. LEWIS C. BUTLER, West Bay City, Mich. Filed Feb. 9, 1891. Serial No. 380,807. (No model.)



Claim.—1. In combination with the battery-box of a telephone, the desk attachment comprising the body having the extension-leaf hinged thereto, the brackets and lugs attached to the under face of

the body, the bail slidingly mounted on said brackets and lugs, and screws passing through said brackets.



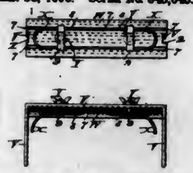
2. In combination with the body having the hinged extension, the brackets and lugs on the under face of the body, the bail slidingly mounted on said brackets and lugs, and the thumb-screws in said brackets.

478,566. COLLAR AND CUFF CABINET. HENRY CASPAR, New Orleans, La. Filed Feb. 26, 1891. Serial No. 383,000. (No model.)

Claim.—As an improved article of furniture, the cabinet described, comprising the vertically-disposed stationary section adapted to receive a hat or the like, the movable section carrying means for holding a collar and cuffs, the top adapted to close both the stationary and movable section on the upper side and swing into a vertical position within the cabinet when the latter has been opened, said top being pivoted in the opposite side walls of the stationary section and arranged to engage and hold the movable section in front of the stationary section in a closed position, and links or levers pivotally connected together and the outer end of one link connected to the inner end of the pivoted top and the outer end of the other link connected to the hinged or movable section, substantially as specified.

478,567. PERMUTATION-LOCK. WINFIELD S. CHEDISTER, Newark, N. J., assignor, by mesne assignments, to William Schloussner, Brooklyn, N. Y. Filed Dec. 2, 1891. Serial No. 413,791. (No model.)

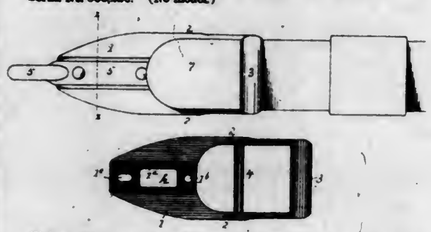
Claim.—1. In a permutation-lock, a permanently-attached key and a click-wheel operated thereby, in combination with a series of permutation-rings and a tumbler controlled by the said rings, the said rings being held within a suitable box and being operatively connected with a click-wheel, as and for the purpose set forth.



2. In a permutation-lock, a click-wheel and an operating-key, one or more permutation-rings operatively connected with the click-wheel, a disk connected with the last ring of the series and pressed outward against the key by a suitable spring, a catch on the said disk, and a detent normally out of the path of movement of the said catch but within its path when the disk is pressed inward by the key, as and for the purpose set forth.

3. In a permutation-lock, an operating-key joined by suitable intermediate apparatus, with a device, as O, carrying a catch, as *o'*, which engages with a detent, as *r'*, when the parts are operated under pressure, the said detent being held in an adjustable cap, whereby the movement of the key is susceptible of adjustable limitation, as and for the purpose set forth.

4. In a permutation lock, a cap attached to the inner case thereof on the outside, the said cap carrying a detent for fixing the starting-point for the combination and being capable of adjustment, in combination with a scale or dial on said inner case, as and for the purpose set forth.



5. In a permutation-lock, a series of co-operating rings held within a box by suitable springs, in combination with a click-wheel carrying a ring capable of entering the said box and connected with the operating lock key, and a disk carrying engaging devices, the said disk being normally held out against the key by a spring and the said key having a reciprocating play, as and for the purpose set forth.

478,568. FOOT-REST FOR EMBALMING-TABLES. WILLIAM CLOUSER, Greenfield, Ohio, assignor of one-half to James A. Porter, same place. Filed Mar. 28, 1890. Serial No. 345,645. (No model.)

Claim.—The combination, in an embalming-table, of a foot-rest body part having a flat foot-bearing surface and grooves in the surfaces, a continuous wire support held in a groove in the rear of the body part, side foot-guards held in grooves in the front of the body part, and bolts securing both sets of wires to the body part by means of projecting head and nut parts, substantially as set forth.

478,569. HAME-CLIP SECTION. EDWARD D. COLE, Macon, assignor of one-half to William H. Starr, Decatur, Ill. Filed Feb. 4, 1891. Serial No. 380,228. (No model.)

Claim.—The combination, with a hame-clip, of a section-plate having a recessed central portion 1^a in two of its sides, an opening *k* in the recesses, and a rivet-hole at each end of said opening with rivets to secure the clip in the two recesses of the plate, a loop at one end of the section-plate, and a removable bolt for the hame tug, as set forth.

478,570. CHROMATIC PITCH-PIPE. CHARLES H. CONGDON, St. Paul, Minn. Filed Nov. 12, 1891. Serial No. 411,655. (No model.)

Claim.—1. In a device of the class described, the combination of the base having a series of parallel transverse grooves, the adjacent grooves opening to different sides of the base, series of reeds arranged above said grooves, and an inclosing cap above said reeds provided with a suitable vent, substantially as described.

2. In a device of the class described, the combination of the base having a series of recesses, series of reeds arranged, respectively, above said recesses, a cover above said reeds, and notches or outlets respectively connecting said recesses with the different sides of the base in such manner that the outlets of adjacent recesses are upon different sides of the instrument, substantially as described.

3. In a device of the class described, the combination of the recessed base, a reed-plate arranged thereon having a bottom and a top series of reeds, one of each series standing above each of the recesses in the base, a cover fitted upon said plate above said reeds and provided with a suitable vent, and notches or outlets in the sides of the base communicating severally with said recesses and serving as ports for said reeds, so that the outlets of adjacent recesses are upon different sides of the instrument, substantially as described.

478,571. APPARATUS FOR THE MANUFACTURE OF GAS. ANDRÉ COZE, Rheims, and ALEXANDRE LENGLACHEZ, Paris, France, assignors, by direct and mesne assignments, to Socrates Newman and James Green, St. Louis, Mo. Filed Mar. 28, 1890. Serial No. 345,384. (No model.) Patented in France Aug. 30, 1889, No. 200,501.

Claim.—1. A gas-retort bench having a centrally-disposed furnace provided with an inclined vault or arch and two sets of inclined retorts on opposite sides of said furnace in passages between the side walls of the furnace and the adjacent side walls of the bench, substantially as described.

2. A gas-retort bench having a vaulted furnace, retorts located at the side of the furnace, an uptake at the rear end of the vaulted furnace, a distributing-chamber located above the furnace-vault and connected with the uptake and having discharge-openings above the retorts, and air-supply flues also opening above the retorts, substantially as described.

3. A gas-retort bench having inclined retorts whose charging-mouths are arranged at substantially the same level above the bench and having the furnace thereof provided with a charging-chute whose mouth is at substantially the same level with the charging-mouths of the retorts, whereby the furnace can be charged at the same level as the retorts, substantially as described.

4. A gas-retort bench having a centrally-disposed furnace, inclined retorts at each side thereof, and a regenerator in the rear of each of the substantially triangular spaces comprised between the lower retorts and the back wall and base of the bench, substantially as described.

5. A gas-retort bench having a centrally-disposed furnace provided with an inclined vault or arch, inclined retorts at each side thereof, and a regenerator in the rear of each of the substantially triangular spaces comprised between the lower retorts and the back wall and base of the bench, substantially as described.

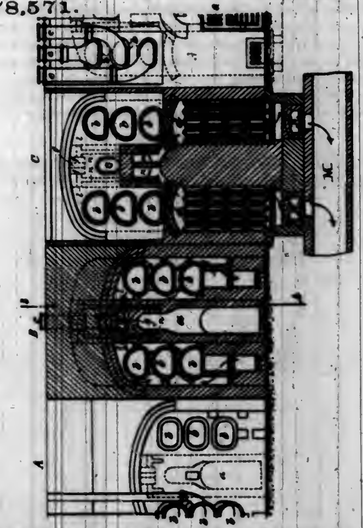
478,572. GRAIN-BINDER. HENRY P. CRANDALL, Milwaukee, Wis., assignor to the Milwaukee Harvester Company, same place. Filed Dec. 29, 1890. Serial No. 376,136. (No model.)

Claim.—1. In a grain-binder, the combination of a continuously-rotating driving-shaft, a knotter-shaft provided with a crank-arm, a wheel loosely mounted upon the knotter-shaft and provided with a stop adapted to engage with said crank-arm, and through it drive the knotter-shaft, a pinion loosely mounted upon the continuously-rotating shaft, an intermediate gear connecting the pinion with said wheel, a clutch for connecting the driving mechanism with said pinion, a trip-arm connected with the knotter-shaft crank and controlling said clutch, and a yielding part exposed to the pressure of the grain in the binder and arranged to turn the knotter-shaft and through it operate said trip, substantially as and for the purpose set forth.

2. In a grain-binder, the combination of the knotter-shaft provided with a crank-arm, a continuously-rotating driver, a wheel loosely mounted on the knotter-shaft and provided on opposite sides of its crank-arm with stops, permitting a limited independent movement of the knotter-shaft, one stop serving to drive the knotter-shaft and the other to limit its independent advance movement, a clutch for connecting said wheel with the driver, a trip connected with the knotter-shaft and controlling said clutch, and a yielding part exposed to the pressure of grain accumulating in the binder and arranged to turn the knotter-shaft and through it operate said trip, substantially as and for the purposes set forth.

3. In a grain-binder, the combination, with the binding mechanism, of a yielding breast-plate, a driving-pinion mounted upon a driving-shaft and held out of engagement with its motor by means of a trip-arm, a knotter-shaft having a crank-and-pitman connection with said trip-arm, and an arm projecting from the knotter-shaft and overhanging the breast-plate, whereby the pressure of the grain against the breast-plate imparts a partial rotation to the knotter-shaft and trips the machine into action, substantially as and for the purposes set forth.

4. In a grain-binder, the combination of a breast-plate arranged to yield by the pressure of the grain in the binder and thereby actuate the knotter-shaft by means of an arm projecting therefrom, the knotter-shaft provided with a crank having a pitman connection with the needle-crank and trip-arm, a gear-wheel loosely mounted upon the knotter-shaft and provided with a stop engaging the crank and operating said knotter-shaft, a spring for holding the crank in engagement with said stop, whereby the knotter-shaft crank is permitted to move a limited distance in advance of the gear-wheel when actuated by the yielding of the breast-plate, and a stop for limiting the independent advance movement of said crank, substantially as and for the purposes set forth.



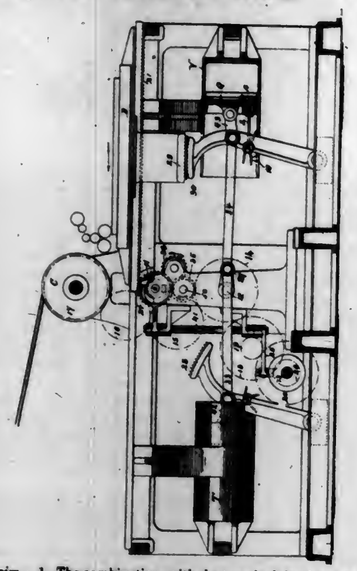
5. In a grain-binder, the combination of the knotter and needle shafts provided with cranks, a pitman connecting said cranks, a continuously-rotating driver, a wheel loosely mounted on the knotter-shaft and provided with stops on opposite sides of the knotter-shaft crank, one stop serving to drive the knotter-shaft and the other to limit its independent advance movement, a spring holding said crank normally in engagement with the driving-stop, a projection on the pitman-head arranged to engage with the limiting-stop and hold the crank during the operation of compressing and binding the bundle in engagement with the driving stop and prevent the backward yielding of the needle, a clutch for connecting the driver with the binding mechanism, a trip connected with the knotter-shaft and controlling said clutch, and a yielding part exposed to the pressure of grain in the binder and arranged to turn the knotter-shaft and through it to operate the clutch-trip, substantially as and for the purposes set forth.

6. In a grain-binder, the combination of the knotter-shaft, provided with an arm, a continuously-rotating driver, a clutch for connecting the driver with the binding mechanism, a trip connected with the knotter-shaft and controlling said clutch, and a yielding breast-plate provided with a projection in the path of the arm on the knotter-shaft, whereby the movement of said breast-plate produced by the pressure of grain in the binder is imparted to the arm on the knotter-shaft, which operates the clutch-trip, substantially as and for the purposes set forth.

7. In a grain-binder, the combination of the knotter-shaft having an arm provided with a friction-roller, a continuously-rotating driver, a clutch for connecting the driver with the binding mechanism, a trip connected with the knotter-shaft and controlling said clutch, and a yielding breast-plate provided in the path of said friction-roller with an incline or camway by which the breast-plate is returned to its normal position by the revolution of the knotter-shaft in discharging a bundle, substantially as and for the purposes set forth.

8. In a grain-binder, the combination of a yielding breast-plate pivoted to the frame of the machine and having an adjustable connection with the knotter-frame, a discharge-arm secured to the knotter-shaft and provided with a roller which normally overhangs the breast-plate, whereby the upward movement of the breast-plate raises the

478,571.



478,572.

discharge-arm, which actuates the knotter-shaft to trip the binder-driving mechanism into action, and whereby the revolution of the discharge-arm returns the breast-plate to its normal position, substantially as and for the purposes set forth.

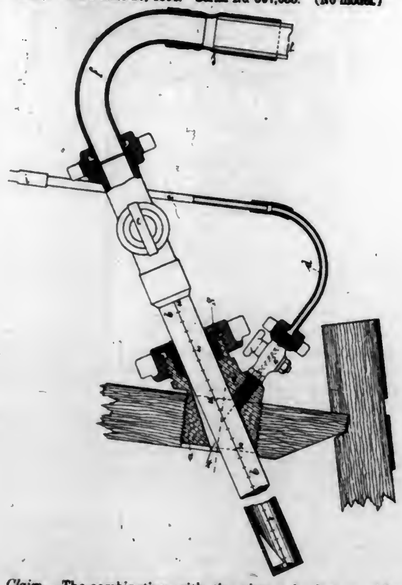
9. In a grain-binder, the combination, with the needle, of a compressor hinged to a suitable support, so as to be swung into and out of the path of the grain in the binder, a locking pawl or arm adapted to engage with and hold said compressor in working position, and a tripping-pawl pivoted to and moving with the needle and arranged when the needle descends to engage with said locking pawl or arm and throw the same out of engagement with the compressor, substantially as and for the purposes set forth.

478,578. BED-MOTION FOR CYLINDER PRINTING-MACHINES. LUTHER C. CROWELL, Brooklyn, assignor to Robert Hoe, Stephen D. Tucker, Theodore H. Mead, and Charles W. Carpenter, New York, N. Y. Filed Apr. 1, 1892. Serial No. 427,317. (No model.)

Claim.—1. The combination, with the type-bed, its single driving-rack, and single driving-pinion constantly geared therewith and mounted loosely upon its shaft, of two clutches running in opposite directions and operated to be alternately coupled to said pinion to actuate the same, substantially as described.

2. The combination, with the type-bed, its single driving-rack and single co-operating driving-pinion constantly geared therewith and turning freely upon a shaft, two actuating-pinions driven in opposite directions, and clutches alternately coupling said actuating-pinions to the driving-pinion for moving the bed during the major part of its run in both directions, of a reversing mechanism moving in harmony with said actuating-pinions and operating to slow down and stop the bed in one direction and start and accelerate the bed in a contrary direction at each end of its run, substantially as described.

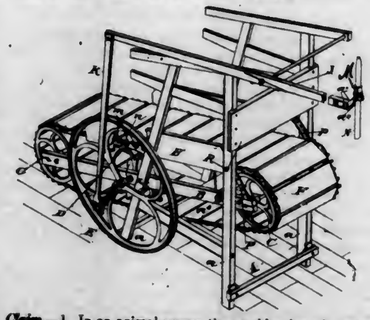
3. The combination, with the type-bed, its single driving-rack, a loosely-running single driving-pinion therefor, two oppositely-rotating actuating-pinions, clutches for alternately coupling said actuating-pinions to the single driving-pinion and uncoupling them therefrom to produce the major portion of the reciprocation of the bed, and a reversing mechanism consisting of a crank revolved in harmony with and disconnected from the bed to control the end or reversing movements of the bed, substantially as described.



4. The combination, with the type-bed, its single driving-rack, single freely-moving driving-pinion, two actuating-pinions turning in opposite directions, and clutches for coupling said pinions, of crank-actuated controlling-arms alternately engaged with and disengaged from said bed, whereby the movement of the bed in each direction is begun by one of the controlling-arms, is continued throughout its major part by the single driving-pinion, and completed to a state of rest by the other of the controlling-arms, substantially as described.

5. The combination of the bed, its single driving-rack, and single freely-moving driving-pinion, two actuating-pinions driven in contrary directions from the crank-shaft, clutches for connecting said actuating and driving pinions, rocking arms 28 30, connected with the crank 27, and a socket for said arms in the bed, substantially as described.

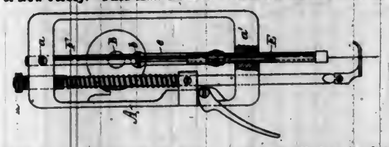
6. The combination, with the bed, its controlling-arms, and air-cushions, of the valve 4, its operating-stem 3, and the rotating cam 7, substantially as described.



7. The combination, with the bed and its rack or lug 29, of controlling-arms 28 30, having segment-heads, substantially as described.

478,574. COCK FOR CASKS. EDUARD CREMER, Münster, Germany. Filed June 26, 1891. Serial No. 397,635. (No model.)

Claim.—The combination, with the plug *a*, having an oblique conical bore *k*, of the stop-cock *c*, having a long tube *b*, adapted to slide in said plug *a* in a straight line and to move upward and downward as well as to the sides of the stuffing-box *s*, the bend *f*, connecting the stop-cock *c* to the main piping *l*, the gage-glass *g*, the cock *c'*, secured to the plug *a* and having a passage inclined downward, the bend *d*, the gage-glass *e*, the secondary pipe *i*, and the wind-cock *h*, substantially and for the purpose as described.

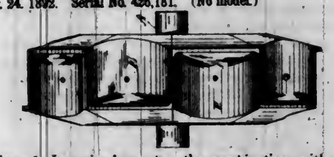


478,575. ANIMAL-POWER. JOSEPH DICK, Canton, Ohio. Filed June 29, 1891. Serial No. 397,804. (No model.)

Claim.—1. In an animal-power, the combination of a supporting-frame having a girder on each side near the lower edge thereof, which girders also serve as tracks, a platform carrying frame suspended in said supporting-frame and provided with devices at one end thereof to engage the girder, whereby the platform may be tilted from an inclined or horizontal to a vertical position and the devices caused to travel on the girders, a pair of wheels at each end of the platform-carrying frame, and an endless platform having sprocket-chains carried by said wheels, and a sprocket-wheel journaled centrally to said platform-carrying frame and in engagement with one of said sprocket-chains.

2. In an animal-power, the combination of a supporting-frame, a platform-frame provided at its end with wheels, and an endless platform consisting of slats, plates secured to each end thereof, and each plate provided with lugs *j' j' j'*, projecting inwardly therefrom, studs *m*, pins *k*, and links H, substantially as set forth.

478,576. NEEDLE-BAR FOR SEWING-MACHINES. PHILIP DIEHL, Elizabeth, N. J., assignor to The Singer Manufacturing Company of New Jersey. Filed Mar. 16, 1892. Serial No. 425,065. (No model.)



Claim.—1. In a sewing-machine, a hollow needle-bar having internal and external longitudinal bearings, substantially as and for the purposes set forth.

2. In a sewing-machine, the combination, with a hollow needle-bar and a rod forming an internal longitudinal bearing for said bar, of an external longitudinal bearing for said hollow needle-bar.

3. In a sewing-machine, the combination, with a hollow needle-bar and a rod forming an internal longitudinal bearing for the same, of an external longitudinal bearing for the said hollow needle-bar, which coincides with or overlaps a portion of the said rod forming the internal bearing.

4. In a sewing-machine, the combination, with a hollow needle-bar and a rod forming an internal longitudinal bearing for the same, said rod being provided with a longitudinal groove for the passage of air, of an external longitudinal bearing for said hollow needle-bar.

478,577. WHEEL. ROBERT W. DIXON, Springfield, Ohio. Filed Mar. 24, 1892. Serial No. 426,181. (No model.)

Claim.—1. In a rice-harvester, the combination, with a wheel-center, of a rim mounted thereon, consisting of cup-shaped indentations, open at alternate sides and representing a continuous circular contour by the remaining side walls of said cups.

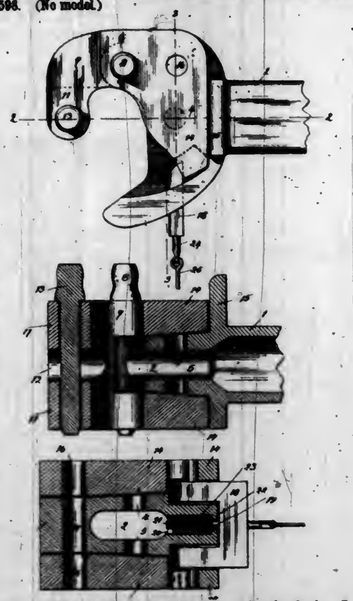
2. In a wheel, the combination, with a wheel-center, of a rim therefor, having cup-shaped indentations open at alternate sides and alternately arranged, the other side of each cup constituting a circular contour for rolling on hard ground.

3. In a wheel, the combination, with a wheel-center, of a wheel-rim having cup-shaped indentations or recesses open at alternate sides and alternately arranged on said rim, the other side of each recess forming a circular contour for the wheel and connected by the edges of said cup-shaped indentations or recesses to constitute a zigzag tread.

4. In a wheel, the combination, with a wheel-center, of a rim therefor having cup-shaped indentations open at the sides, the opposing side being flared outward toward the center to give clearance to the rim.

5. In a wheel, the combination, with a wheel-center, of a rim therefor having indentations or recesses open at alternate sides and closed by a wall at the other side and regularly disposed on said wheel, the said walls of the wheel-rim having an incline or flare outwardly as they approach the center, whereby a draw or clearance is given to said rim.

6. In a wheel, a rim having an outward flare on the sides thereof as it approaches the center to give a clearance or draw thereto, for the purpose described.



7. In a wheel, a rim having cup-shaped recesses open at alternate sides and closed at the other to facilitate the withdrawal of mud forced therein as the wheel travels along the soft ground.

8. In a wheel, a rim formed in segments, each segment provided with one or more cup-shaped recesses open at one side and closed at the other, substantially as shown and described.

9. In a wheel, a rim formed in segments, each segment having one or more cup-shaped recesses open at one side and provided with inclined side walls constituting the rim proper to afford clearance to the wheel.

10. In a wheel, a rim formed in segments, each segment being provided with a recess open at one side and closed by the said wall of the rim at the other side and adapted to be secured to adjacent segments to constitute an alternate or uniform arrangement of recesses, respectively.

478,578. CAR-COUPLING. WILLIAM DONCHUE, Chicago, Ill., assignor to Anderson Fowler, same place. Filed Mar. 11, 1892. Serial No. 424,598. (No model.)

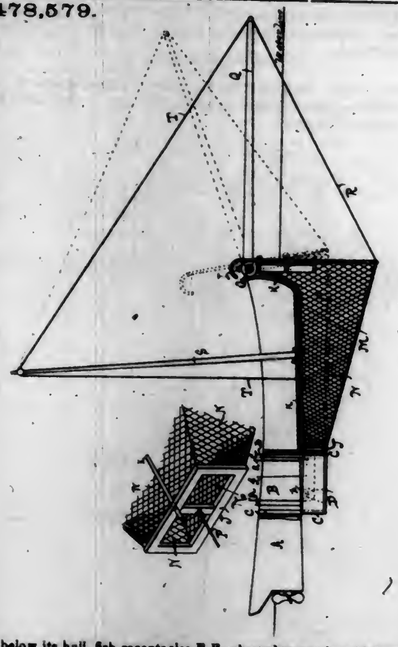
Claim.—1. The combination, with a draw-head, of a jaw 7, a pin 8, pivotally connecting said jaw to the draw-head, projections 11 and 14 on said jaw, and a dog 18, adapted to engage said projection 14, substantially as and for the purpose specified.

2. The combination, with the draw-head, of a jaw 7, having the projections 14, a pin 8, pivotally connecting the jaw to the draw-head, a bifurcated dog 18, mounted transversely in the draw-head and adapted to slide therein, and a spring 23, acting to press the dog inward, so that its bifurcations engage the projections on the pivoted jaw, substantially as described.

3. The combination, with a draw-head having a recess 20, of a jaw 7, having the outer and inner projections 11 and 14, a pin 8, pivotally connecting the jaw to the draw-head, a bifurcated dog 18, having a pin 19, extending into the recess of the draw-head, and a spring 23, located on the said pin and acting to press the dog inward, so that its bifurcations engage the inner projections on the pivoted jaw, substantially as described.

478,579. FISHING APPARATUS. IRA DURHAM, Detroit, Mich. Filed Apr. 9, 1892. Serial No. 428,434. (No model.)

Claim.—1. In a fishing apparatus, the combination of a vessel, a net secured near the bow and extending toward the stern of said vessel, and one or more receptacles for fish located at the rear end of said net and accessible from said vessel, substantially as shown and described.



2. In a fishing apparatus, the combination of the vessel A, a net N, secured at the bow of said vessel to a frame-work G H and extending toward the stern of said vessel, said frame-work being pivoted to said vessel, and means for turning said frame-work and holding it in its various positions, substantially as shown and described.

3. In a fishing apparatus, the combination of the vessel A, provided with a well B through its hull, a net N, secured at one end at the bow of said vessel and extending to said well, and one or more receptacles for fish located at the lower end of said well, substantially as shown and described.

4. In a fishing apparatus, the combination of the vessel A, a net N, secured at the bow of said vessel to a frame-work G H and extending toward the stern of said vessel, said frame-work being pivoted to said vessel and being adapted to be contracted and expanded, and means for rotating said frame and holding it in its various positions, substantially as shown and described.

5. The combination of the vessel A, provided with a frame-work

478,579.

C D below its hull, fish-receptacles E E, adapted to rest in said frame-work, a frame-work G H, pivoted toward the bow of said vessel, a net secured to the frame-work G H at one end and adapted to extend to the frame-work C D at the other end, a rope P, secured to the last-mentioned end of said net and extending through said frame-work C D, a spar Q, secured to the frame-work G H, and means for raising and lowering said spar, substantially as shown and described.

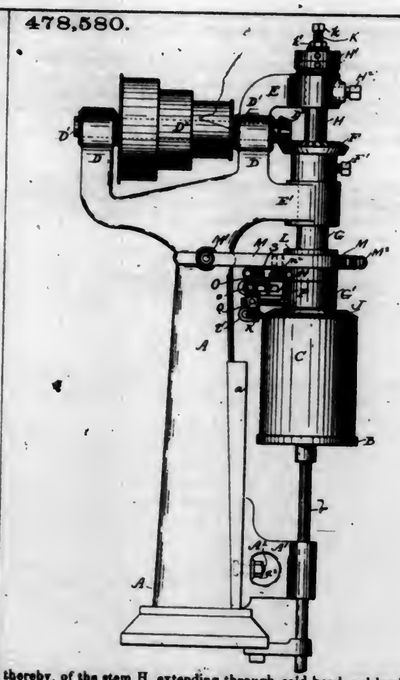
478,580. MACHINE FOR SEAMING CANS. CHARLES W. ELLSWORTH, Chicago, Ill., assignor to the Chicago Stamping Company, same place. Filed Dec. 28, 1891. Serial No. 416,331. (No model.)

Claim.—1. The combination, with a rotary head and a tool carried thereby, of the chuck J, movable toward and from said head, a stem by which said chuck is carried, and means for rigidly holding said stem against rotation, substantially as set forth.

2. The combination, with a rotary head and a tool carried thereby, of the chuck J, movable toward and from said head, an adjustable stop for limiting their approach, a stem supporting the chuck, and means rigidly holding said stem against rotation, substantially as set forth.

3. The combination, with a rotary head and a tool carried thereby, of the stem H, having the bore *h'*, means rigidly holding said stem against rotation, the chuck J, having stem *j* fitting in said bore, and means for limiting the downward movement of the stem *j*, substantially as set forth.

4. The combination, with a rotary head and a tool carried thereby, of the stem H, having the bore *h'*, and means rigidly holding said stem against rotation, the chuck J, having stem *j* fitting in said bore, and means for limiting the movement of the stem *j* either upward or downward, substantially as set forth.



5. The combination, with a rotary head and a tool carried thereby, of the stem H, having the bore *h'*, the chuck J, having stem *j* fitting in said bore, means for limiting the downward movement of the stem *j*, and the adjustable rod K for limiting its upward movement, substantially as set forth.

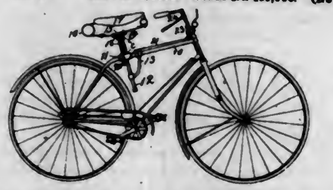
6. The combination, with a rotary head and a tool carried thereby, of the stem H, having the bore *h'*, the chuck J, having stem *j* fitting in said bore, the spring I, situated in said bore and bearing against the stem *j*, and means for limiting the downward movement of said stem, substantially as set forth.

7. The combination, with the frame having arms E and E', of the hollow shaft G, journaled in the arm E', the tool carried by said shaft, the stem H, supported by the arm E and extending downward through said shaft G, and the chuck supported by said stem, substantially as set forth.

8. The combination, with a hollow rotary head and a tool carried

478,580.

thereby, of the stem H, extending through said head and having the flange *h* bearing against its under side, and a chuck supported by said stem, substantially as set forth.



9. The combination, with the frame having the arms E and E', of the hollow shaft G, journaled in the arm E', the gear-wheel F, fixed with relation to said shaft and resting upon the arm E', a tool carried by the shaft, the stem H, fixed to the arm E and extending downward through said shaft, and a chuck supported by said stem, substantially as set forth.

10. The combination, with a rotary head, of a stud projecting therefrom, a lever located in a plane parallel with the axis of said head, fulcrumed to said stud, a tool controlled by the lever, and means for operating the lever, substantially as set forth.

11. The combination, with a rotary head, of the studs N and P, projecting therefrom, the block O, mounted to slide on stud P, the tool carried by said block, the lever O, fulcrumed to stud N and engaging block Q, and means for operating said lever, substantially as set forth.

12. The combination, with a rotary head, of the stud N, projecting therefrom, a lever fulcrumed thereto and adjustable on said stud toward or from the head, a tool controlled by the lever, and means for controlling the lever, substantially as set forth.

478,581. SEAT-SUPPORT FOR BICYCLES. WILLIAM A. ELMORE, New York, N. Y. Filed Feb. 1, 1892. Serial No. 419,900. (No model.)

Claim.—1. The combination, with the seat-standard, of a spring and a rotative pin, which is adapted to bind the standard in one position and free it in another position, as described.

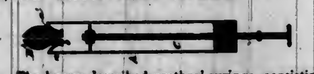
2. The combination, with a seat-standard formed with a notch, of a rotative locking-pin formed with a surface adapted to enter said notch and bind said standard and also with another surface adapted to withdraw from said notch and free said standard, as described.

3. The combination, with a seat-standard formed with a notch, of a rotative locking-pin formed with a surface adapted to enter said notch and bind said standard and with another surface adapted to withdraw from said notch and free said standard, a lever on said locking-pin, and means for reciprocating said lever, substantially as described.

4. The combination, with a seat supporting standard formed with a notch, of a spring coiled around said standard and adapted to actuate the same, a guide-block on the frame of the machine for said standard, a rotative pin housed in said guide-block and having a surface adapted to enter the notch in said standard and also having another surface adapted to withdraw from said notch, and devices for rotating said pin, as described.

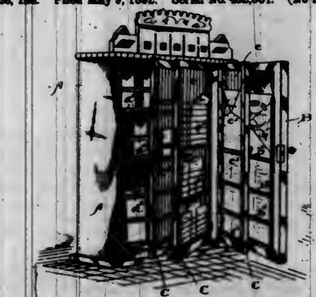
5. The combination, with a seat and its supporting-standard formed with a notch, of a guide-block for said standard, a rotative pin housed in said guide-block and having a surface adapted to enter said notch and also another surface adapted to withdraw from said notch, a lever on said pin, a cord adapted to operate said lever, and retaining-hooks for said cord, substantially as described.

6. The combination, with the seat-supporting standard, of a main spring, an auxiliary spring that is coiled about the standard, a plate formed with tongues that engage the coils of the auxiliary spring, the standard passing through the plate, and a standard-locking attachment, substantially as described.



478,582. LARYNX-TUBE. GEORGE ERNOLD, New York, N. Y. Filed May 16, 1891. Renewed Dec. 10, 1891. Serial No. 414,650. (No model.)

Claim.—1. The process herein described of making intubation-tubes, which consists in placing a tube or core of sheet metal of greater length than the intubation-tube to be produced into a mold; secondly, casting the metal body of the intubation-tube around the interior tube or core; thirdly, cutting off the projecting ends of the tube or core, and, lastly, finishing the tube, substantially as set forth.



2. An intubation-tube for the larynx, consisting of an interior tube or core of sheet metal having an obtusely-bent upper end and an exterior body of cast metal around said core, substantially as set forth.

478,583. SYRINGE. JACOB A. FLEXNER, Louisville, Ky. Filed Sept. 25, 1891. Serial No. 406,962. (No model.)

Claim.—The herein-described urethral syringe, consisting of the cylindrical barrel having an opening in its forward end adapted to admit medicinal tablets or powders into the barrel, an elastic tip having a conical forward end and a longitudinal passage through it, said tip being removable from said barrel to permit of the insertion of the tablets or powders and held therein by its inherent elasticity, and a piston operating within said barrel, all substantially as described.

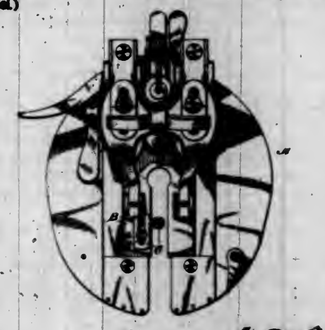
478,584. FILING AND SUPPLY CASE. PERRY FRAZIER, New Castle, Ind. Filed May 9, 1892. Serial No. 432,901. (No model.)

Claim.—1. The combination, in a filing-case, of the outer structure or casing A, the door B, and the several swinging racks C, having wires, strips, or netting extending over their sides, and thereby forming receptacles for blanks, stationery, &c., substantially as shown and described.

2. The combination, in a filing-case, of the outer structure or casing A, having the stepped strip or strips A', and the racks C, hinged thereto, as shown, whereby said racks are enabled to be swung out to a position at right angles with the body of the case without interfering with each other, substantially as shown and described.

3. In a filing-case, the hinged rack C, consisting of a frame, wires or strips extending down through the center thereof vertically, thus dividing said rack into two parts, and wires or strips extending over the outside also, whereby the contents are held in upright position, where they may be easily observed, substantially as shown and described.

4. The combination, with the casing of a filing-case, of racks hinged within said casing and provided with transverse divisions and retaining wires or strips covering the sides, substantially as and for the purpose set forth.

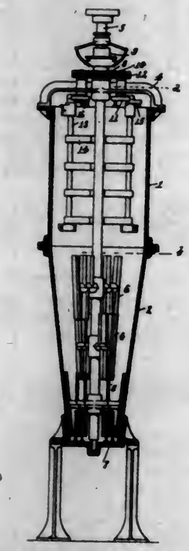


478,585. FENDER FOR VEHICLES. CLAUS FREESE, St. Louis, Mo., assignor of one-half to Henry Gissenbier, same place. Filed Feb. 1, 1892. Serial No. 419,961. (No model.)

Claim.—1. As an improvement in adjustable fenders of the class described, the combination, with a standard provided in its upper portion with a slot extending from side to side thereof and forming two parallel extensions 11, formed with bolt-apertures 12 near their upper and lower ends, of a flat plate 13, fitting within said slot and provided with two longitudinal slots 19, registering with the apertures 12, said plate carrying the fender, and bolts 20, passing through said apertures and slots 19 and provided upon one end with thumb-nuts 21, substantially as and for the purpose set forth.

2. A fender of the class described, consisting of a standard adapted to be attached to the vehicle-axle and provided at its upper end with two parallel extensions, a plate fitting between said extensions and provided with longitudinal slots registering with bolt-apertures in the extensions, a fender provided with a flange forming a guard-plate and connected with the adjustable plate, and bolts passing through said apertures and slots and provided at one end with thumb-nuts, all arranged and adapted to operate substantially as and for the purpose set forth.

478,586. CLAMP FOR BUTTONHOLE SEWING-MACHINES. CHAS. A. FREDON, Boston, Mass., assignor to The Singer Manufacturing Company of New Jersey. Filed Jan. 29, 1892. Serial No. 419,669. (No model.)



Claim.—1. The combination, with a clamping-jaw of a buttonhole-clamp, of a presser pad or finger attached thereto and thus movable therewith and arranged to press upon the material at the end of the buttonhole-slit between the jaws of the clamp.

2. The combination, with a clamping-jaw of a buttonhole-clamp, of a presser pad or finger attached thereto and provided with a slotted shank by which it is adapted to be adjusted lengthwise of said jaw.

3. A buttonhole-clamp provided with a presser pad or finger arranged between the open or separated jaws of the clamp in such position as to press on the material at or near the end of the buttonhole-slit, said pad or finger being attached to and thus movable with one of the jaws of the clamp.

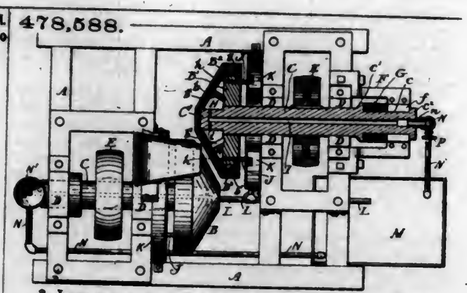
478,587. MIXING OR SEPARATING MACHINE. HENRY M. GARIS, Avondale, Ohio. Filed Mar. 21, 1892. Serial No. 425,704. (No model.)

Claim.—1. The combination, substantially as set forth, of a fixed shell, a circumferential series of shafts therein at the inner surface of the shell, agitator-arms secured upon the shafts and reaching to near the center of the shell and adapted for vibration to and from the shell, and mechanism, substantially as described, for giving to said shafts in unison motions of partial rotation, whereby said agitator-arm may be continuously oscillated.

2. The combination, substantially as set forth, of a fixed shell, a circumferential series of shafts therein at the inner surface of the shell, agitator-arms secured upon said shafts and reaching to near the center of the shell and adapted for vibration to and from the shell, crank-arms on said shafts, a central shaft, a gear thereon, crank-shafts provided with cranks and with gears engaging said central gear, and links connecting the cranks and crank-arms.

3. The combination, substantially as set forth, of a shell, a central shaft therein, rakes secured to a portion of said shaft in the lower portion of the shell, a circumferential series of agitator-shafts mounted in fixed bearings in the upper portion of the shell and provided with agitator-arms adapted to vibrate to and from the shell, and mechanism, substantially as described, for rotating the central shaft and oscillating the agitator-arms.

4. The combination, substantially as set forth, of a vertical shell cylindrical in its upper portion and tapering in its lower portion to form a contracted base, a circumferential series of agitators in the cylindrical portion of the shell, and a rake-shaft and rake concentrically disposed in the tapering portion of the shell, whereby the agitators act on a large body of material and the rake acts on a smaller but denser body of the material.



5. The combination, substantially as set forth, of a shell, a central shaft therein, a horizontal diametrically-disposed rake-arm secured to the shaft and provided with vertical teeth, and a similar rake-arm secured to the shaft over the first one and set at an angular advance thereto and provided with teeth projecting below the upper ends of the teeth of the lower rake.

478,588. ORE-CRUSHER. EDWARD R. GALE, Chicago, Ill. Filed Dec. 12, 1891. Serial No. 414,786. (No model.)

Claim.—1. In an ore-crusher, the combination, with a hollow horizontal roll having a water-outlet, of a horizontal shaft having an internal conduit communicating with the interior of the roll, a water-supply pipe, and an air-tight slip-joint between said pipe and shaft, permitting the latter to revolve, substantially as set forth.

2. In an ore-crusher, the combination, with a hollow roll having a water-outlet located some distance from its center and a water-tank, of an air-tight conduit connecting the tank with the center of the roll, whereby the centrifugal impulse imparted by the rotation of the roll draws the water from the tank into the roll and discharges it again, substantially as set forth.

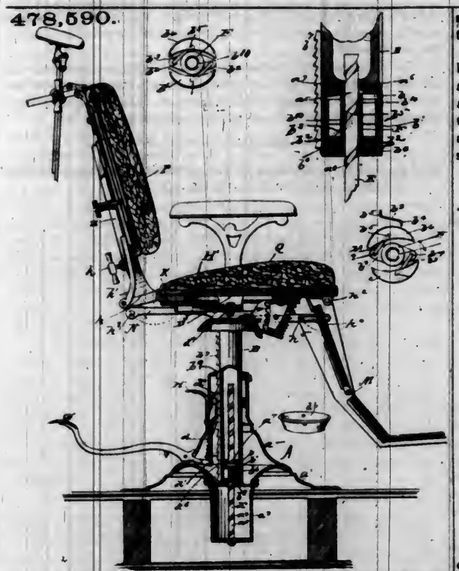
478,588.

3. In an ore-crusher, the combination of a hollow roll having a water-outlet located some distance from its center, a tank located below the level of the roll, and an air-tight conduit connecting the tank with the interior of the roll, substantially as set forth.

4. In an ore-crusher, the combination, with the roll and a hollow shaft opening inside thereof, of the tank M, the pipe N, having branch *n*, communicating with the bore of the shaft, and the valves O and P, located in said pipe above and below the branch *n*, substantially as set forth.

5. In an ore-crusher, the combination of a hollow roll, a hollow shaft, said shaft and roll having internal communication, a tank situated at a lower level than said roll, a pipe communicating therewith and with the bore of the shaft, an air-tight joint between said shaft and pipe, an outlet for water situated some distance from the center of the roll, an annular shield for catching water discharged from said outlet, and a pipe for conveying the water from said shield back to the tank, substantially as set forth.

478,589. DENTAL CHAIR. WILLIAM H. GILBERT, Philadelphia, Pa., assignor to the S. S. White Dental Manufacturing Company, same place. Filed Mar. 24, 1890. Serial No. 345,094. (No model.)

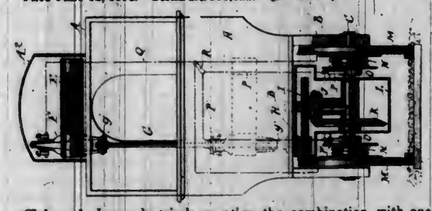


Claim.—The combination of the chair-back frame provided with the detent-rack extending lengthwise thereof, the vertically-adjustable back-pad carrier having guideway connection with the back-frame, and the combined pivoted adjusting-handle and pawl-carrier of the back-pad carrier, the pawl of which engages with the detent-rack, substantially as and for the purpose set forth.

478,590. DENTAL CHAIR. AARON P. GOULD, Canton, Ohio. Filed June 5, 1890. Serial No. 354,400. (No model.)

Claim.—1. The combination, in a chair with a base and a body and means for raising said body, of an intermediate portion secured to the

478,590.



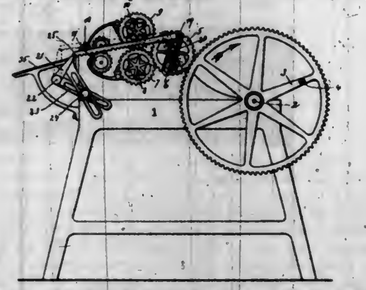
body and adapted for vertical adjustment in the base, said intermediate portion having within its limits a traveling rotary nut, having brake-shoes attached thereto to engage said intermediate portion, and a screw secured to the base portion to rotate said nut, substantially as set forth.

2. The combination, in a chair, with a base and a body and means for raising said body, of a supporting-stem having therein a cylinder portion *b*, a traveling rotary nut F, having brake-shoes attached thereto to rotate therewith and to engage the wall of the cylindrical portion *b*, the cap b^5, and a non-rotative screw E, secured to said base and engaging said nut, substantially as set forth.

3. The combination, in a chair, of a base and a body and means for raising said body of the extension a^3 of the chamber portion of said base to a point below the floor or base support, a non-rotative screw E, secured to said extension, a vertically-adjustable stem B, having therein a rotary nut adapted to rotate about and travel up and down said screw from point to point above and below said floor or base support, and brake-shoes carried by said nut, substantially as set forth.

4. The combination, with a base-support, of a seat mounted thereon, a leg-rest section and a back-section pivoted to said seat, a pin projecting from one of these sections and a link having one end pivoted to one of these sections, and its opposite end provided with an elongated aperture through which the said pin projects, substantially as set forth.

478,591. ELECTRIC LOCOMOTIVE. JOSHUA GRAY, Medford, Mass. Filed June 12, 1891. Serial No. 396,022. (No model.)



Claim.—1. In an electric locomotive, the combination, with one of the axles of the car located near the end thereof, of a bevel-gear mounted on the car-axle, a vertical bearing extending from the axle, a bevel-gear mounted thereon and engaging the bevel-gear on the car-axle, a spur-gear also mounted on the vertical bearing, a pinion engaging the spur-wheel, and a vertical shaft extending to the top of the car, and a motor mounted on the front end of the car and connected to said vertical shaft, substantially as described.

2. The combination, with an axle of a car, of a bolt or bearing extending vertically from the axle, a bevel-gear mounted on the axle, a bevel-pinion mounted on the bolt, a gear-wheel also mounted on the bolt, an electric motor mounted on the top portion of the car, and a vertical shaft connecting the armature of the motor with the gear-wheel on the bolt, substantially as described.

3. The combination, with the forward axle of a car, of a vertical bolt mounted on the axle and having a bearing on the floor of the car, a bevel-gear connected to the axle, a bevel-pinion on the bolt, a gear also mounted on the bolt, an electric motor mounted on the car above the forward axle, and a vertical shaft connected to the armature by a flexible joint and having a broad pinion on its lower end engaging said gear-wheel, substantially as described.

478,592. HOP-PICKING MACHINE. CHARLES C. GREEN, Utica, N. Y., assignor to Martha Elizabeth Green, same place. Filed Sept. 9, 1891. Serial No. 405,238. (No model.)

Claim.—1. In a hop-picking machine, the combination of a pair of feed-rollers, mechanism for giving the rollers an alternate backward and forward movement, a pair of picker-bars located at the entrance to the feed-rollers, and mechanism for opening and closing the picker-bars on the vines fed into the rollers, substantially as set forth.

2. The combination, in a hop picking machine, of a pair of feeding-rollers, a hop-engaging device located at the entrance to the feed-rollers, and mechanism for giving the rollers a forward and backward movement, substantially as set forth.

3. The combination, in a hop-picking machine, of feed-rollers, a hop-engaging device located at the entrance to the feed-rollers, a pinion on the feed-roller shafts, a rack, a crank on which the rack is mounted, and a dog for throwing the rack out of engagement with the pinion, substantially as set forth.

4. The combination, in a hop-picking machine, of a pair of feed-rollers, a hop-engaging device located at the entrance of the feed-rollers, a pinion attached to the feed-rollers, a rack adapted to engage the pinion, an adjustable crank on which the rack is mounted, and an adjustable dog for engaging the rack and throwing it out of engagement with the pinion, substantially as set forth.

5. In a hop-picking machine, the combination of a pair of feed-rollers, mechanism for operating the rollers, a pair of picker-bars mounted at the entrance of the rollers, pivoted lever-arms carrying the picker-bars and pivoted back of the feed-rollers, and mechanism for vibrating the arm, substantially as set forth.

6. The combination, in a hop-picking machine, of a pair of feed-rollers, concave picker-bars located at the entrance to the rollers, pivoted levers on which the picker-bars are mounted, and tripping devices for actuating the said levers and closing and separating the picker-bars, substantially as set forth.

7. The combination, in a hop-picking machine, of a pair of feed-rollers, and a pair of concave picker-bars located at the entrance to the rollers, pivoted levers carrying the picker-bars and pivoted to the rear of the rollers and above and below the horizontal line through the rollers, tripper-disks for closing the picker-bars together, and springs for holding the picker-arms to the pickers, substantially as set forth.

8. The combination, in a hop-picking machine, of the feed-rollers, the concave picker-bars located at the entrance to the feed-rollers, the pivoted levers carrying the picker-bars and pivoted to the rear of the feed-rollers, the rotating tripper-disks, and projection on the lever-arms for engaging the tripper-disks, and the spring for separating the picker-bars, substantially as set forth.

9. The combination, in a hop-picking machine, of feed-rollers, mechanism for intermittingly rotating the rollers, picker-bars located at the entrance to the rollers, and mechanism for vibrating the picker-bars, substantially as set forth.

10. The combination, in a hop-picking machine, of the feed-rollers 11 and 12, the pinion 17, the rack 18, mounted on an adjustable crank, and the dog 21, adapted to engage the rack, substantially as set forth.

11. The combination, in a hop-picking machine, of the feed-rollers 11 and 12, pinion 17, rack 18, mounted on an adjustable crank, spring-actuated dog 21, mounted on an adjustable hanger, and an adjustable stop for the dog, substantially as set forth.

12. The combination, in a hop-picking machine, of a pair of feed-rollers, mechanism for rocking the rollers in feeding, and mechanism for rocking the rollers out a less distance than the distance they fed in, and a hop-engaging device at the entrance to the feed-rollers, substantially as set forth.

13. The combination, in a hop-picking machine, of a pair of feed-rollers, mechanism for rotating the rollers ahead in feeding and rotating the rollers in a reverse direction a less distance in discharging the hops, and a hop engaging and picking device at the entrance to the rollers, substantially as set forth.

478,593. WINDOW-FRAME. WILLIAM T. GREGG, Lakeport, Cal. Filed July 18, 1891. Serial No. 399,933. (No model.)

Claim.—The combination of a window-frame having the usual sash, a stop-molding forming the inner bead for the upper sash, secured to the window-frame and having grooves formed therein, a like molding on the opposite side of the window-frame, having stationary strips or beads projecting therefrom, removable strips adapted to be mounted in the grooved molding and cut on oblique lines into halves and fitting said grooves, and a series of removable sash, each half the height of said molding and having a groove at one side adapted to receive said movable strip and a groove on the opposite side to engage the strips or beads of the opposite molding, substantially as described.

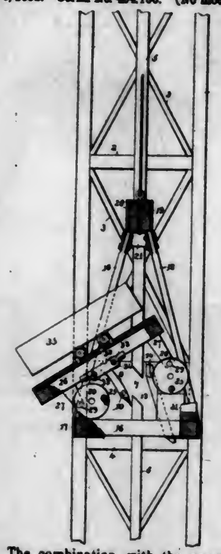
478,594. DESK. MAGNUS J. HAFGAR, Chicago, Ill. Filed Apr. 24, 1891. Serial No. 390,233. (No model.)

Claim.—1. In a desk, the combination, with a horizontally-swinging cabinet, of top and bottom sliding hinge-plates for carrying the wing, substantially as described, and for the purposes set forth.

2. The combination, with a desk, of a swinging and sliding cabinet, sliding hinge-plates, as H and H′, above and below the cabinet, segmental and diagonal slots, as *d* and *e*, in each of said plates, and pintles, as *f* and *g*, fixed in the top and bottom of the cabinet and adapted to engage in said slots, substantially as described, and for the purposes set forth.

3. The combination, with a desk, of a swinging cabinet, sliding hinge-plates, as H and H′, above and below the cabinet, segmental and diagonal slots, as *d* and *e*, in each of said plates, and pintles, as *f* and *g*, fixed in the top and bottom of the cabinet and adapted to engage in said slots, substantially as described, and for the purposes set forth.

4. In a desk, the combination, with a swinging cabinet and with sliding hinge-plates for carrying said cabinet, of a weighted latch or pawl pivoted upon said plate and a recess in the desk-frame for engaging said pawl, the cabinet being adapted when closed to disengage the pawl from the recess, substantially as described, and for the purposes set forth.



5. In a desk, the combination, with a swinging cabinet and with sliding hinge-plates for carrying the cabinet, of a spring-actuated bolt carried by the hinge-plate, a lateral lug upon the bolt and having its forward side oblique to the bolt, a pin fixed in the cabinet and adapted to bear against the oblique side of the lug as the cabinet is closed, and a recess in the desk-frame for receiving the bolt, substantially as described, and for the purposes set forth.

6. In a desk, the combination, with a swinging cabinet, of sliding hinge-plates having guideways or channels for the hinge-pins of the cabinet, latches for automatically locking the hinge-plates when the cabinet is swung open, and striker bosses or studs carried by the cabinet for disengaging the latches when the cabinet is swung into position for closing, substantially as described.

7. In a desk having a swinging cabinet, the combination, with sliding hinge-plates and with a supporting-caster, of guide-flanges, as *j* and *l*, along the path of the caster, substantially as described, and for the purposes set forth.

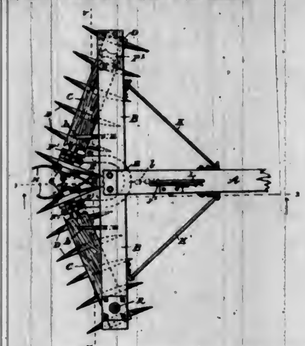
8. In a desk, the combination, with a sliding and swinging cabinet, of a forwardly-projecting hook *r* upon the standard of the desk and a socket R for engaging said hook upon the front of the cabinet, substantially as described, and for the purposes set forth.

478,595. MINE-ELEVATOR. STEWART HAMILTON, Weir, Kans. Filed Mar. 3, 1892. Serial No. 424,186. (No model.)

Claim.—1. The combination, with the opposite vertical guide-ribs 5 and 6, having the spaces 7 between their adjacent ends, the frame-work for supporting the ribs, and the front and rear deflecting-ribs 8 and 13, respectively, the former leading from the upper ends of the lower ribs 6 and extending forward from the same away from the general line of the ribs and the latter extending from a point near the lower ends of the upper ribs 5, disposed rearward therefrom and declining away from the general line of the ribs, of the cage having U-shaped shoes for embracing the ribs 5 and 6, the rocking frame mounted upon the cage and adapted to support a car, and the pairs of opposite rollers projecting from the sides of the rocking frame, adapted to embrace the ribs 5 and 6 and be deflected by the deflecting-ribs, and means for swinging the locking-ribs into and out of their described operative position, substantially as specified.

2. The combination, with the vertical guides and the frame-work for supporting the same, of the main frame of the cage mounted for vertical movement therein, the superimposed rocking frame, intermediate eccentrics or disks pivoted to the main frame and eccentrically and differentially to the superimposed rocking frame, and means for rocking said frame upon the disks, substantially as specified.

3. The combination, with the opposite guides 5 and 6, spaced apart, as at 7, of the frame for supporting the guides, the inclined guides 8, leading from the upper ends of the guides 6, pivot-bolts passed through the upper ends of the inclined guide-sections, means for locking their lower ends out of position with relation to the guides 6, the rear guide-sections 13, pivoted at their lower ends to the frame-work and inclining from the lower ends of the guides 5, means for locking them adjacent to or away from the guides 5 of the main frame of the cage, the rocking frame located thereon, shoes extending from the cage and adapted to pass between the guides 5 and 6 and the inclined sections, a pair of shafts located upon and extending from the rocking frame, and loose rollers mounted on the shafts, embracing the guides 6 and adapted to embrace the guide-sections 8, substantially as specified.

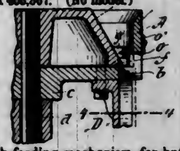


4. The combination, with the vertically-opposite guides 5 and 6, having their adjacent ends forming the intervening spaces 7 and beveled at opposite corners, of the curved guide-sections 8, pivoted at their upper ends to the frame-work, bolts passed through their lower ends in a removable manner and adapted to engage holes adjacent to or removed from the guides 6, the guide-sections 13, located in rear of the recesses 7, bolts passed through their lower ends and removably through their upper ends, the latter bolts being removable and adapted to engage openings adjacent to or remote from the lower ends of the

sections 5 of the main frame of the cage, the rocking frame located thereon, shoes extending from the cage and adapted to pass between the guides 5 and 6 and the inclined sections, a pair of shafts located upon and extending from the rocking frame, and loose rollers mounted on the shafts, embracing the guides 6 and adapted to embrace the guide-sections 8, substantially as specified.

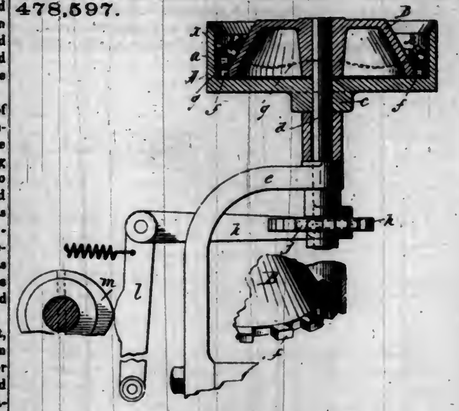
5. The combination, with the opposite guides, the upper ends of which are inclined, as at 8, the superimposed guides 5, and the inclining guides 13, of the main frame provided with shoes engaging the lower guides, the transverse beam terminating in shoes, also engaging the guides, the hangers depending from the beam and connected to the main frame, front and rear standards, the latter being elevated above the former, mounted on the main frame, transverse rock-shafts mounted in the standards, disks eccentrically pivoted to the rock-shafts, a superimposed frame, hangers depending therefrom and likewise eccentrically pivoted to the disks, the opposite transverse shafts secured to the superimposed frame and extending beyond the sides thereof, and the opposite pairs of rollers embracing the guides and mounted on the shafts, substantially as specified.

6. The combination, with the vertical guides 5 and 6, spaced apart, and the front and rear inclined guide-sections 8 and 13, of the main frame of the cage, the superimposed frame, intermediate eccentrics or disks pivoted to the main frame and to the superimposed frame, said superimposed frame being differentially pivoted to the disks with relation to its front and rear ends, means for raising and lowering the cage, and opposite loose guide-rollers extending from the superimposed frame and embracing the opposite vertical sides of the guides 6, substantially as specified.



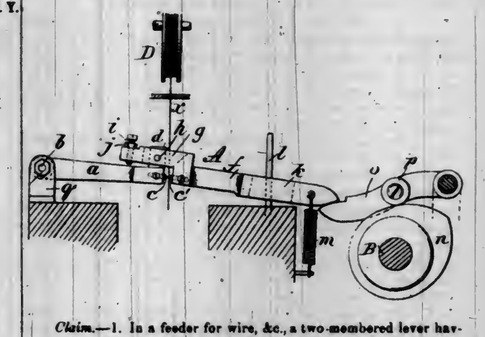
478,596. DISK HARROW. ROBERT W. HARDIE, Albany, N. Y. Filed Sept. 2, 1891. Serial No. 404,560. (No model.)

Claim.—1. In a disk harrow, the combination, with a main frame, of disk gangs pivotally connected to said frame and spring mechanism secured between the inner ends of the gangs, substantially as shown and described.



2. In a disk harrow, the combination, with a main frame, of disk gangs pivoted to said frame and resilient bars secured to the inner end of each disk gang, arranged alternately with those of the opposing gang and adapted to bear against the inner disk of said opposing gang when arranged obliquely to the line of draft, substantially as shown and described.

478,597. BLANK-FEEDING MECHANISM. FREDERICK H. HARDMAN, Beverly, assignor to Walter E. Bennett, Boston, Mass. Filed Aug. 21, 1891. Serial No. 403,367. (No model.)

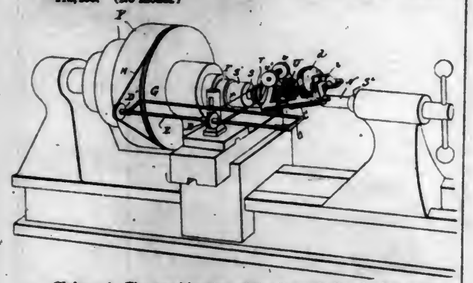


Claim.—In a blank-feeding mechanism for button-machines, the combination, with a cylindrical hopper provided through its bottom with the discharge-opening and having at the lower portion of its internal circular wall the ledge *g*, with its upper surface undulating, of an upwardly-tapering conical body rotatable within said hopper and provided at its base, which is in a plane below the undulating upper surface of said ledge, with the series of teeth having intermediate pockets to be brought successively over said discharge-opening, and means for rotating the said conical body, substantially as described and shown, for the purpose set forth.

478,597.

478,598. WIRE-FEEDING MECHANISM. FREDERICK H. HARDMAN, Beverly, assignor to Walter E. Bennett, Boston, Mass. Filed Aug. 21, 1891. Serial No. 403,368. (No model.)

Claim.—1. In a feeder for wire, &c., a two-membered lever having one member thereof pivotally mounted, whereby the said lever may have a swinging movement, and the second member thereof pivoted upon the other and adapted to have relative thereto a limited swing, said members at proximate portions thereof being provided with nipping-jaws, and a cam for imparting a backward and forward swinging movement to said lever, substantially as described.



2. In a feeder for wire, &c., a two-membered lever mounted for a swinging movement and the one member thereof pivoted upon the other and one provided with an adjustable stop device whereby its swinging movement with relation to the other member may be adjustably limited, and said members at proximate portions thereof provided with nipping-jaws, and devices for imparting swinging movements to said two-membered lever, for operation in the manner set forth.

3. In a feeder of the character indicated, a lever consisting of two members, the one pivotally mounted on a suitable support and having tension or friction devices for the purpose set forth and the other member pivotally hung on the first one, and said members at proximate portions thereof provided with nipping-jaws, and means for swinging the said two-membered lever, substantially as described.

4. A feed device for wire, &c., consisting of a lever composed of two members *a* and *f*, the one *a* being pivotally mounted and provided with a lug *d* and the other *f* provided with an offset-arm pivotally mounted on said lug and having a stop, said members having the nipping-jaws, and means for swinging the parts, substantially as described.

5. In a feed device for wire, &c., in combination, the member *a*, pivotally mounted, and said member having the lug *d* and jaws *c*, and the friction-washers and confining devices at the pivotal support for said member, the member *f*, provided with the offset yoke-shaped arm *g*, pivotally hung on said lug, and the stop-screw *i*, and the jaw *c'*, the spring *m*, applied for downwardly swinging said member *f*, the cam-lever *o*, pivoted adjacent to and having an engagement with the member *f*, and the cam *n*, mounted to actuate the said lever *o*, substantially as described.

478,599. MACHINE FOR GRINDING OR TRUING LATHE-CENTERS. HERBERT R. HAWES, Brooklyn, N. Y., assignor of one-half to Charles H. Edgar, trustee, same place. Filed Nov. 20, 1891. Serial No. 412,483. (No model.)

Claim.—1. The combination of the live-spindle of a lathe with a grinding-wheel revolving in an orbit concentric with the axes of rotation of said live-spindle, substantially as and for the purpose described.

2. The combination of the live-spindle of a lathe with a rotating grinding-wheel revolving in an orbit concentric with the axes of rotation of said live-spindle, substantially as and for the purpose described.

3. The combination of the live-spindle of a lathe with a rotating and simultaneously reciprocating grinding-wheel revolving simultaneously in an orbit concentric with the axes of rotation of said live-spindle, substantially as and for the purpose described.

4. The combination, with the live-spindle, of revolving and rotating grinding-wheel thereby revolved in orbit concentric with said spindle's axis of rotation, substantially as and for the purpose described.

5. The combination of live lathe-spindle and actuating-pulley T, both having same axis of rotation, and rotating and revolving grinding-wheel revolving in orbit concentric with said axis, substantially as and for the purpose described.

6. The combination of live lathe-spindle and actuating-pulley T, both having same axis of rotation, and rotating, revolving, and reciprocating grinding-wheel revolving in orbit concentric with said axis, substantially as and for the purpose described.

7. The combination of plug S, pulley T, frame *b*, shaft *e*, wheel *d*, pulleys *v v'*, and pulley U, all connected together substantially as and for the purpose described.

8. The combination of plug S, pulley T, frame *b*, shaft *e*, wheel *d*, pulleys *v v'*, pulley U, and arbor R, all connected together substantially as and for the purpose described.

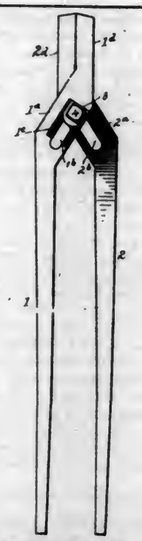
9. The combination of plug S, pulley T, frame *b*, shaft *e*, wheel *d*, pulleys *v v'*, pulley U, arbor R, bearings 1 1', worm *k*, worm-wheel *f*, connecting-rod *g*, sliding frame C, spline *m*, and feather *l*, all connected together substantially as and for the purpose described.

10. The combination of plug S, pulley T, frame *b*, shaft *e*, wheel *d*, pulleys *v v'*, pulley U, arbor R, bearings 1 1', worm *k*, worm-wheel *f*, and guide-rods *n o*, all connected together substantially as and for the purpose described.

11. The combination of plug S, pulley T, frame *b*, shaft *e*, worm *k*, worm-wheel *f*, connecting-rod *g*, sliding frame C, and wheel *d*, and pulleys *v*, *v'*, and U, substantially as and for the purpose described.

12. The combination of plug S, pulley T, frame *b*, base-plate *a*, shaft *e*, pulleys *v v'* U, and wheel *d*, substantially as and for the purpose described.

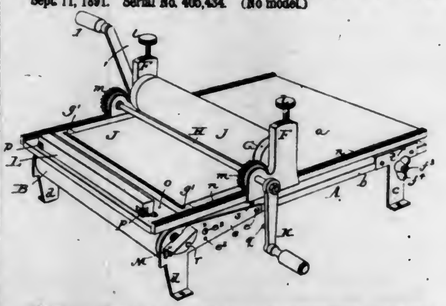
13. The combination of lathe cone-pulley Y, counter-shaft E, pulleys D D', live-spindle S', plug S, pulley T, frame *b*, shaft *e*, and wheel *d*, all connected together substantially as and for the purpose described.



14. The combination of lathe cone-pulley Y, counter-shaft E, pulleys D D', live-spindle S', plug S, pulley T, frame *b*, shaft *e*, wheel *d*, worm *k*, worm-wheel *f*, connecting-rod *g*, sliding frame C, and guides *n o*, all connected together substantially as and for the purpose described.

478,600. BLACKSMITH'S TONGS. WILLIAM M. HAWORTH, Decatur, Ill. Filed Apr. 14, 1892. Serial No. 429,177. (No model.)

Claim.—1. In tongs or similar tools, the combination of the bars having oblique slots and corrugations contiguous to the slots, the pivot-blocks having ribs adapted to the corrugations, and a bolt extending through the slots and the blocks and adapted to hold the blocks in close contact with the corrugated surfaces, as set forth.



2. In tongs or similar tools, the combination of the bars having each a deflected and slotted portion intermediate its ends, with corrugations contiguous to the slots, the pivot-blocks having ribs adapted to the corrugations, the pivot-bolt adapted to the slots and to the blocks and having a shoulder distant from the head something more than the combined thickness of the bars and block, and also having a

478,600.

threaded end beyond the shoulder, and the nut adapted to the threaded end of the bolt, as set forth.

478,601. COPYING-PRESS. DORUS HEALY, Dansville, N. Y. Filed Sept. 11, 1891. Serial No. 405,434. (No model.)

Claim.—1. In a letter-copying press, the combination, with a bed, table, or other device, of a pressure-roller, a copying-apron adapted to wind upon and unwind from the roller as the roller moves back and forth over the table, and means, substantially such as shown and described, for thus moving the roller back and forth over the bed or table.

2. In a copying-press, the combination, with a bed, table, or other device, of a pressure-roller and means for moving it over the table, a water-trough, a spring-roller mounted therein, and an apron secured at one end to the spring-roller and at the other end to the pressure-roller, substantially as shown and described.

3. In a copying-press, the combination, with a bed or table having a depression *o*, of a pressure-roller and means for moving it over the table, a water-trough, a spring-roller, and an apron secured at one end to the spring-roller.

4. In a copying-press, a bed comprising fixed leaf *b* and hinged leaf *a*, in combination with the pressure-roller and apron.

5. In a copying-press, a bed or table comprising the fixed leaf *b*, the hinged leaf *a*, having the toothed bars, in combination with the shaft having the pawls, substantially as shown and described.

6. In combination with the leaves *a* and *b* and the legs *c*, the legs *d*, provided each with an arm *e* and with a pin or screw adapted to enter one of a series of holes in the arm.

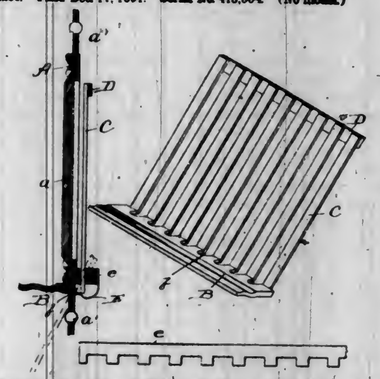
7. In combination with leaf *b*, hinged leaf *a*, having a slot, a water-trough secured under the mouth of the latter, the spring-roller, the pressure-roller, and the apron, substantially as shown and described.

8. In combination with a bed or table having rack-bars *n*, the carriage having a shaft H, pinions *m m*, and handle or crank K, a pressure-roller, and an apron secured to the roller.

9. In combination with a bed or table and a carriage, the crank K, provided with a pin *q*, and the locking-catch having a notch *r*.

10. In combination with a bed or table, the carriage provided with a pressure-roller, an apron, a spring-roller, and a brake block or bar, substantially as shown and described.

11. In a letter-copying press, the combination, with a bed or table, of a pressure-roller mounted thereon, and means for moving the roller over the table, and an impermeable copying-apron secured to the roller and adapted to wind upon and to unwind therefrom as the roller moves back and forth over the table, substantially as shown and described.



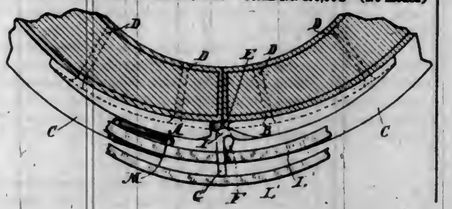
12. In a copying-press, the combination, with a bed or table, of a roller and means for turning the same and moving it back and forth over the table, a copying-apron adapted to wind upon and unwind from said roller, and thereby effect the copying, substantially as shown and described.

13. In a copying-press, the combination, with a water-trough and a spring-roller therein, of a copying-apron secured at one end to such roller and winding upon and unwinding therefrom, and a pressure-roller to which the apron is also secured, all substantially as shown and described.

14. In a copying-press, the combination of a bed or table, a pressure-roller, a copying-pad made in the form of an apron and adapted to wind upon and to unwind from a suitable pressure-roller, and means for turning the roller, whereby the moistening and copying are effected simultaneously by the turning of the roller and the winding or unwinding of the apron-pad.

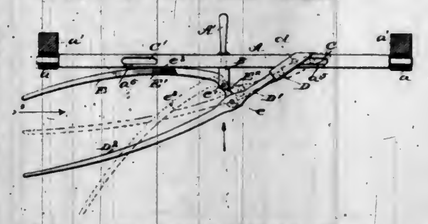
15. In a portable copying-press, the combination, with a bed or table having a water-trough, of a pressure-roller and the set-screws adapted to force the said pressure-roller firmly upon the mouth or throat of the water-trough to prevent the water from escaping therefrom.

478,602. RACK FOR MUSICAL INSTRUMENTS. FREDERICK W. HEDGELAND, Chicago, Ill., assignor to The W. W. Kimball Company, same place. Filed Dec. 17, 1891. Serial No. 415,334. (No model.)



Claim.—1. The combination, with the musical-instrument case having spindles *a'* forming part of the front thereof, of a music-rack the body whereof is formed of vertical slats positioned and adapted to slide between said spindles, substantially as set forth.

2. The combination, with a musical-instrument case having spindles *a'* forming part of the front thereof, of a music-rack consisting of vertical slats C, a cross-bar uniting the slats at the top, and a bottom connection B, recessed to give room to the spindles, substantially as specified.

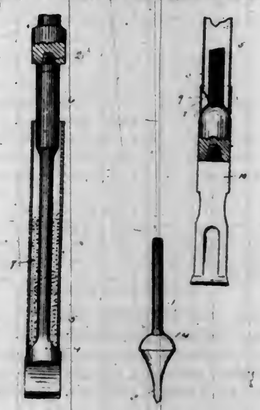


3. The music-rack, the body whereof is formed of vertical slats C, in combination with an organ-case having a series of openings through which the slats may move when the rack is pushed into or drawn out of the case, substantially as set forth.

478,603. HORSE-COLLAR FASTENER. JOHN HIMMELSTEIN, Milwaukee, Wis. Filed Sept. 21, 1891. Serial No. 406,364. (No model.)

Claim.—The collar-fastener, substantially as hereinbefore described, consisting of two body parts secured severally permanently to abutting sections of a collar, one part of the fastener including a projecting outwardly-curved and elongated neck and a cross-head at the extremity thereof and the other part of the fastener including forwardly-projecting and outwardly-turned hooks, the hooks having a space or longitudinal slot between them to receive the neck of the other part of the fastener, which slot extends rearwardly back of their outward curve into the body of the fastener to permit of a hinge movement of the neck of the other part therein, the hooks having also transverse or laterally-extending opposite slots or recesses in their inner edges outside of the cross-head of the other part when seated in the curve of the hooks to receive a hame-strap therein to secure the parts movably together.

478,604. MAIL-BAG CATCHER. JAMES W. HORTON, Madison, Ind. Filed Aug. 31, 1891. Serial No. 404,292. (No model.)



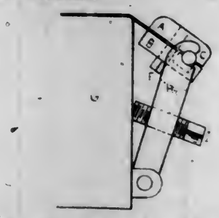
Claim.—1. A mail-bag catcher consisting of a main bar A, a rigid catcher member D', having its inner end D adapted for longitudinal movement on said bar A, such end being connected to such bar and arranged when extended to become detached therefrom, the block B, swirelly connected with the bar A, and the catcher-arm E, pivoted at its inner end to the member D' and to the swivel-block B at a point in advance of its pivotal connection with the bar A, substantially as and for the purpose described.

2. The combination, with the bar A, formed with a lateral bearing B, and the rigid hook or catch member D', having a sliding connection D with the said bar A, of the arm E, pivoted at its inner end to the rigid member D' and at a point in advance of such end to the bearing B, substantially as shown and described.

3. The combination of the main bar A, formed with elongated slots C C' in its ends, the swivel-bearing B, the sliding head D, having studs *d d*, fitting either of the slots C C' and the rigid catch member D', and the forked catcher-arm E, pivoted near its end into the swivel-bearing and at its end to the rigid arm D', as and for the purpose described.

4. In a mail-bag catcher, the combination, with the main frame having the opposite elongated slots C C', formed with notches a^6 a^6 in their outer ends, and the swivel-bearing B, of the rigid catcher-arm D', having a head portion D, formed with lateral studs *d d*, arranged to fit in either of the slots C C', and the catcher-arm E, pivoted near its end in the bearing B and at its end to the arm D', all arranged substantially as and for the purpose described.

478,605. COMBINED DRILLING-TOOL AND SAND-BAILER. LEWIS N. IRELAND, Pittsburg, Pa. Filed Sept. 28, 1891. Serial No. 407,059. (No model.)



Claim.—The herein-described combined drilling-tool and sand-bailer, comprising the rod or stem 1, having near its top the enlargement 6 and at its bottom a drilling-bit, said drilling-bit having an enlarged head, a tube 5, encircling said rod or stem and movable automatically, as described, said tube being of less diameter than said bit-head and adapted to seat itself thereon when the same is raised, guided by said enlargement 6 and formed near its bottom with an opening 8, and means for closing said opening.

478,606. DINNER-BUCKET. WILLIAM F. JANEWAY, Columbus, Ohio. Filed Aug. 28, 1891. Serial No. 403,970. (No model.)

Claim.—In a dinner-bucket, the combination, with the bucket-body and a lid therefor, a staple projection g' and keeper f', an external conduit or way formed of a tubular segment, as described, the edges of the latter united with the body of the bucket, an opening d^3 in the lower portion of said bucket-body through which said conduit or way communicates with the interior of the bucket, and a suitable mouth-piece projecting from the upper end of said conduit, of a locking bail or yoke f, embracing said lid and the upper portion of said bucket, as described, one arm of said bail being provided with a hook which engages said keeper f' and the remaining arm thereof being provided with a slotted opening adapted to receive the outer edge of the staple projection g', substantially as and for the purpose specified.

478,607. DEVICE FOR STRAINING ZINC PLATES TO THEIR BEDS. EDWARD S. JONES, Providence, R. I. Filed Nov. 17, 1891. Serial No. 412,214. (No model.)

Claim.—1. In a straining device for lithographic plates, the combination of a lever H, having a hook J at its upper end, a clamp detachably secured in said hook, the screw I, and the bed G, the whole constructed and operating together in a manner and for the purposes described.

2. The combination of a clamp composed of two parts, one of which parts is provided with a trunnion at each end, a straining-lever having hooks at its upper end adapted to receive the trunnions of the clamp, and means for operating the lever, the whole constructed and arranged to permit of the detachment of the plate from its bed without removing the clamps, as and for the purposes specified.

3. In combination, a bed-plate having a straining-lever permanently secured thereto and a clamp detachably secured to the lever, means for operating the clamp independently of the connection between the clamp and the lever, whereby the clamp may be detached from the lever without releasing its hold upon the plate and without detaching the lever from the bed-plate, and means for operating the lever, substantially as and for the purpose set forth.

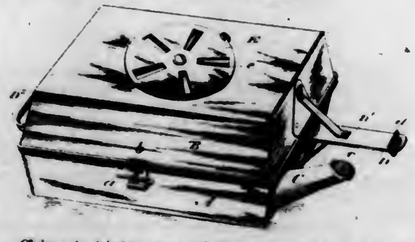
4. The clamps A B, constructed with trunnions C C, in combination with the hooked lever H and screw I, the whole constructed and arranged to operate and permit the detachment of the plate from its bed, as described.

478,608. TOOL-SHARPENING DEVICE. GEORGE A. KENT, Auburn, Me. Filed Feb. 10, 1892. Serial No. 421,011. (No model.)

Claim.—1. In a tool-sharpener, the combination, with suitable supports, of a strap of leather embracing the edges of stones and means, substantially such as described, for tightening the leather upon the

478,608.

stones, thereby holding them in place, substantially as and for the purpose set forth.



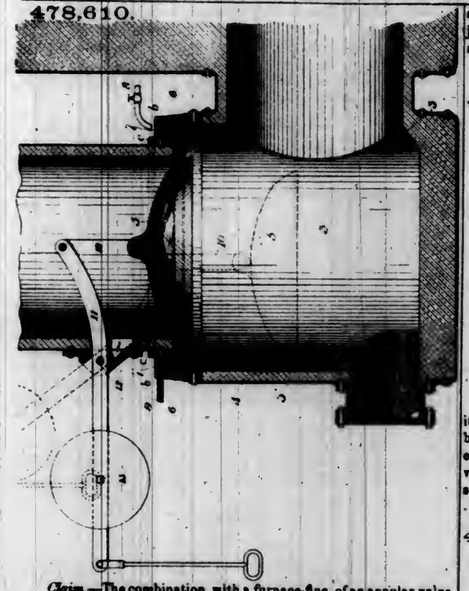
2. In a tool-sharpener, the combination, with a base, of standards secured thereto, a shaft or axis journaled between the standards, a rest placed upon said shaft, a band of leather surrounding said rest, stones adapted to fit within the edges of the leather and upon the rest, and means, substantially such as described, for holding the leather and the stones in place, all substantially as and for the purpose set forth.

3. In a tool-sharpening device, the combination, with the standards B B', the standard B having the spring-pressed pin b^3, of the shaft or axis c, mounted between these standards, a support c^3, arranged upon the axis c, a band of leather c^4, surrounding the said support, a plate c^5, secured to the axis c near one end thereof, the said plate having depressions to receive the inner end of the pin b^3, stones adapted to fit within the edges of the leather band, a plate or washer c^7, loose upon the axis c, and a screw for holding the leather to the stones, all substantially as set forth.

4. In a tool-sharpening device, the combination, with the holder C, having an axis c and a plate c^8 fast thereon, the said plate being provided with openings or recesses in the face of the plate, arranged in a circle about the axis c, of a pin b^3, mounted longitudinally in one of the supports for the holder, the said pin being normally pressed forward by a spring b^3, attached to the said support and engaging one of the recesses of the plate c^8, all substantially as and for the purpose set forth.

5. In a tool-sharpening device, the combination, with the platform A and the standards B B', the standard B having a tubular projection b' at its upper end and having a spring-pressed pin b^3, adapted to move longitudinally within said tubular projection, of a shaft or axis c, having one of its ends screw-threaded and having upon its other end fast thereto the plate c^8, provided with holes c^9, a support or rest c^3, arranged longitudinally upon the axis c, a band of leather c^4, surrounding the edges of the said support, stones c^5, fitting within the outer edges of the leather and resting upon the support c^3, a plate c^7, loose upon the axis c, and a thumb-screw c', journaled in the standard B' and engaging the threads upon the axis c, the inner end of the thumb-screw pressing upon the plate c^7, all substantially as and for the purpose set forth.

478,609. BAKING-PAN. SOPHIA L. KELLY, Clarksdale, Mo. Filed Dec. 10, 1891. Serial No. 414,620. (No model.)



Claim.—1. A baking or roasting pan comprising a lower section A, having an upwardly-inclined spout secured adjacent to one corner thereof, said section having a looped handle at one end and a handle D at the opposite end, which projects beyond the spout, a section B, connected to the lower section and provided with similarly-constructed registering handles, the handles D D', having a loop for holding them in engagement with each other, and brace-bars which are connected to the handles and to the sides of the pan, substantially as shown, and for the purpose set forth.

2. A tray for baking-pans, consisting of side pieces bent substantially as shown and adapted to serve as a support and hold in engagement therewith cross-strips g, having upwardly-bent ends, said cross-strips being bent at their central portions longitudinally to form central troughs and flat outer ends, which form with the side pieces a channel when the tray is inclined, substantially as set forth.

478,610. VALVE FOR HOT-BLAST STOVES. JULIAN KENNEDY, Latrobe, Pa. Filed Dec. 17, 1891. Serial No. 415,366. (No model.)

478,610.

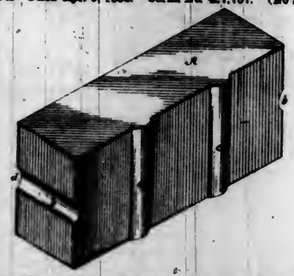
Claim.—The combination, with a furnace-flue, of an annular valve-seat casting having flanges affording an outer water-gutter fixed to the sections of the flue, substantially as and for the purposes described.

2. The combination, with a furnace-flue, of an annular valve-seat casting fixed to one of the flue-sections and having upright flanges b c, forming an outer water-gutter, the flange c encircling and fixed to a second narrower section of the flue, substantially as and for the purposes described.

478,611. DRUM. JOHN KNITTEL, St. Louis, Mo., assignor of one-half to George T. Kollas, same place. Filed Dec. 8, 1891. Serial No. 414,354. (No model.)

Claim.—1. A drum or drum-head for musical instruments having external screw-threads formed on the body of the instrument and a rim having internal screw-threads formed upon the same for receiving the said external threads, substantially as set forth.

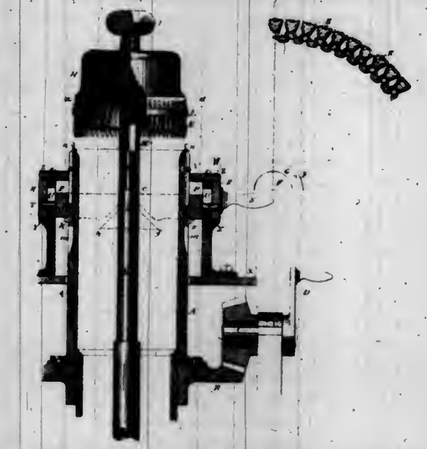
2. A drum or drum-head for musical instruments, consisting of a body, external screw-threads formed on the same, a rim provided with internal screw-threads for receiving the screw-threads formed upon the said body, and a head adapted to be clamped between said rim and body, substantially as set forth.



3. A drum or drum-head for musical instruments, consisting of a body, external screw-threads formed upon the same, a rim having internal screw-threads adapted to receive the said external screw-threads, a head adapted to be clamped by said rim, and means for tuning said rim, substantially as set forth.

4. A drum or drum-head for musical instruments, consisting of a body 1, having an annular flange formed thereon, external screw-threads formed on the said flange, a rim, such as 4, provided with internal screw-threads adapted to receive the said external threads, an annular flange internally arranged upon said rim, a groove formed in the said flange for receiving a ring, a head, such as 10, adapted to be stretched over a ring 9, and the same interposed between the first-named ring and the upper edge of the body 1, substantially as set forth.

5. A drum or drum-head for musical instruments, consisting of a body, external screw-threads formed upon the same, a rim having internal screw-threads adapted to receive said external threads, holes formed in the said rim, within which a suitable tool is adapted to be inserted, and a head adapted to be interposed between said rim and body, substantially as set forth.



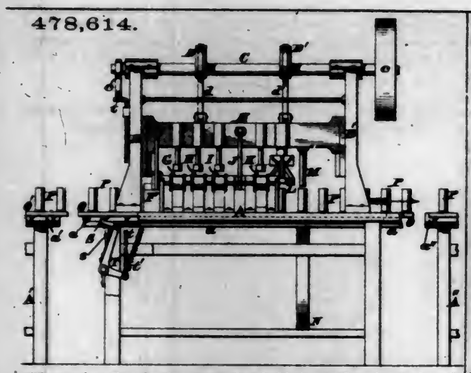
6. A snare for drums, consisting of a series of spring-wires rigidly secured at one end within the drum, a plate overlying said wires, an adjustable screw carried by the drum, a washer loosely mounted thereon, and wires connecting said plate and washer, substantially as set forth.

478,612. PAVING-BRICK. DE HAVEN LARGE, New Cumberland, W. Va. Filed Apr. 5, 1892. Serial No. 427,787. (No model.)

Claim.—The within-described paving-brick, having upon one of its vertical sides a rib or ribs extending from top to bottom of the brick and in its other vertical side a longitudinal groove or channel extending from end to end of the brick and communicating with transverse grooves or channels formed in the opposite ends of the brick, substantially as specified.

478,613. DEVICE FOR TRANSFERRING STOCKING-RIBS. FRANK LASHER, Bennington, Vt., assignor to the Lasher Stocking Company, same place. Filed Apr. 8, 1889. Renewed Dec. 30, 1891. Serial No. 416,566. (No model.)

Claim.—1. The combination of the needle-cylinder provided with needles and with an axial supporting-stud, as shown, with the cylindrical transferring device provided with transfer-quills corresponding in number with the needles of the cylinder arranged concentrically around a central socket, which is adapted to slip onto said axial stud, substantially as described, and for the purposes set forth.



2. The combination, with the needle-cylinder provided with needles and an axial stud and the cylindrical transfer device provided with quills and central socket, substantially as shown, of the draw-down ring and means, substantially as shown, for imparting to it a vertical movement, substantially as described, and for the purposes set forth.

3. The combination, with the needle-cylinder and needles, of the draw-down ring provided with guide-pins, the concentric stationary stand with vertical slots in which said pins move, and the surrounding ring having cam-slots which coact with said pins and having a limited rotary movement, substantially as described, and for the purposes set forth.

478,614. CARTRIDGE-LOADING MACHINE. JAMES H. LAYMAN, Cincinnati, Ohio. Filed Jan. 28, 1892. Serial No. 419,507. (No model.)

Claim.—1. In a cartridge-loading machine, the combination, with shell-charging devices, of a bodily-removable bar or plate provided

478,614.

with a series of projecting tubes that hold the shells and a feed appliance for advancing said bar, substantially as herein described.

2. In a cartridge-loading machine, the combination, with shell-charging devices, of a bodily-removable bar or plate provided with a series of projecting integral tubes that hold the shells and a feed appliance for advancing said bar, substantially as herein described.

3. In a cartridge-loading machine, the combination, with shell-charging devices, of a bodily-removable bar or plate provided with a series of projecting shell-holders and having on its under side teeth adapted to be caught by the pawl of a reciprocating feed appliance, substantially as herein described.

4. The combination, in a cartridge-loading machine, of the table A, having a longitudinal groove *a* and eccentric clamps U U', and the bodily-removable bar O, provided with projecting shell-holders P, said bar being inserted within said groove and having said eccentrics in contact with its edges, for the purpose described.

5. In a cartridge-loading machine, the bodily-removable bar O, provided with projecting shell-holders P, each of said holders being furnished with an internal spring-ring R near its lower end, for the purpose described.

478,615. WATCHMAKER'S TOOL. FRANK E. LINDAHL, Chicago, Ill. Filed Aug. 14, 1891. Serial No. 402,690. (No model.)

Claim.—As a new article of manufacture, the within-described improved watchmaker's tool, consisting of the handle B, carrying the steel plate A, provided with the wedge-shaped edges *c* and *d*, substantially as and for the purpose set forth.

478,616. EYEGLASSES. JOHN LIMING, Mount Alverno, Pa. Filed Mar. 28, 1892. Serial No. 426,722. (No model.)

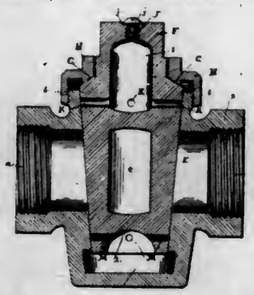
Claim.—1. The combination of the lens of a pair of spectacles or eyeglasses with a mirror mounted so as to reflect objects in the rear of the wearer of the glasses, but offering no obstacle to direct forward vision through the lens, substantially as specified.

2. The combination of each of the lenses of a pair of spectacles or eyeglasses with a mirror mounted so as to reflect objects in the rear of the wearer of the glasses, but offering no obstacle to direct forward vision through the lenses, substantially as specified.

3. A pair of spectacles or eyeglasses having a mirror mounted beyond the periphery of either lens and facing rearward or toward the wearer of the glasses, substantially as specified.

4. The combination of a pair of spectacles or eyeglasses having a lens pivoted to the nose-piece so as to be reversed thereon with a mirror movable with said lens in its reversal, substantially as specified.

5. The combination of a pair of spectacles or eyeglasses having a lens pivoted to the nose-piece so as to be reversed thereon with a double-faced mirror movable with said lens in its reversal and showing a rearward-reflecting face in either of its positions, substantially as specified.



6. The combination of a pair of spectacles or eyeglasses having a lens pivoted to the nose-piece with a mirror upon the said lens and a retaining-finger for engagement with the lens to hold it in either of its positions, substantially as specified.

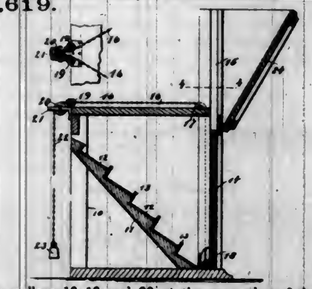
478,617. INDEX AND MAIL-ASSORTER. WILLIAM H. LODWICK, Cincinnati, Ohio. Filed June 8, 1891. Serial No. 395,545. (No model.)

Claim.—An assorting-book provided with a series of leaves, each leaf having an exposed index on the outer end and provided at the opposite end with an integral inturned double stub, and having a cover one of the leaves of which is shorter than the other, as shown and described.

478,618. STOP-COCK. CYRUS F. LOGAN, Lock Haven, Pa. Filed Nov. 24, 1891. Serial No. 412,910. (No model.)

Claim.—1. In a stop-cock, the combination of the casing having a conical seat and bearing, a series of open V-shaped vertical oil-grooves arranged in a series around in the face of said bearing, and a rotating plug provided with an upper and lower inclosed oil-reservoir, and a series of distributing-passages communicating with said reservoirs and extending through the body of the plug, substantially as set forth.

2. In a stop-cock, the combination of the casing having a conical seat and bearing and an oil-chamber located beneath said bearing, a series of vertical V-shaped oil-grooves formed in the face of said bearing, and a rotating plug provided with an inclosed reservoir at its upper end, a series of distributing-passages communicating with said reservoir and extending through the body of the plug, and a series of supplemental distributing-passages in the bottom end of said plug and communicating radially with the oil-chamber located beneath said plug and bearing, substantially as set forth.

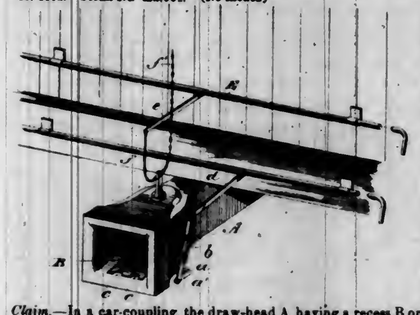


3. In a stop-cock, the combination of the casing having a conical seat and bearing and an oil-chamber located beneath said bearing, a series of vertical oil-grooves formed in the face of said bearing, a rotating plug mounted within said seat and provided with a lower concaved end inclosing said casing oil-chamber, an inclosed reservoir within the top end of said plug, a series of radially-extending distributing-passages communicating with said reservoir and extending through the body of the plug, and a supplemental series of radially-extending distributing-passages in the bottom end of said plug and communicating with the space inclosed by the concaved bottom thereof, substantially as set forth.

4. In a stop-cock, the casing having the bottom reservoir C, combined with the rotating plug E, provided with the concaved bottom F, which when the plug is seated within the casing incloses the bottom reservoir, and the series of oil-passages communicating with the concaved bottom, substantially as set forth.

478,619. SHOW-CASE. JAMES C. LOUGHRY, Greensburg, Pa. Filed Sept. 24, 1891. Serial No. 406,642. (No model.)

Claim.—1. A show-case having a vertically-sliding glazed front, ways or guides therefor, guide-pulleys 17 at the front edge of the top



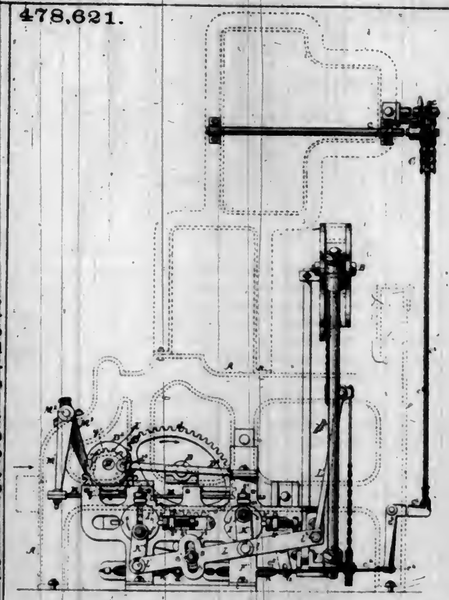
478,619.

of the case, pulleys 19 19 and 20 at the rear edge of the case-top, cords or chains extending from the lower part of the sliding front upward and rearward over pulleys 17, thence rearwardly across the top of the case between pulleys 19, and there merged into a single cord or chain extending downward over pulley 20 behind the case for operation by the salesman and provided with a weight, substantially as set forth.

2. A show-case having a vertically-sliding glazed front, ways or guides 15 therefor projecting above the top of the case, operating chains or cords connected to said front and extended over guide-pulleys to the rear of the case and there weighted for operation by the salesman, and shield or mirror in front of the upper projecting ends of the ways 15 to conceal the same, substantially as set forth.

478,620. CAR-COUPLING. ARGUS R. LUTHER, Tennessee City, Tenn., assignor of one-half to James C. Foster, same place. Filed Feb. 18, 1892. Serial No. 422,001. (No model.)

Claim.—In a car-coupling, the draw-head A, having a recess B on the inner side of its base, a plate C, having recesses *c c* in its front end, a shaft *a*, to which said plate is rigidly secured, said shaft having a forwardly-projecting arm *a'*, and a link *b*, pivoted to said arm and to a forwardly-projecting arm *d*, carried by a rock-shaft D, attached to the car-body, substantially as shown and for the purpose set forth.



478,621. DROP-BOX MECHANISM FOR LOOMS. HARVEY P. MALLISON, Philadelphia, Pa. Filed July 15, 1891. Serial No. 399,592. (No model.)

Claim.—1. The combination, in drop-box mechanism for looms, of the drop-box bar, shafts, cranked pins on said shafts, connections between said cranked pins and the bar, pinions on the shafts, a slide, mechanism for reciprocating the same, a rack-frame engaging with the pinion on each shaft, said rack-frames being pivoted to the slide, and mechanism for throwing said rack-frames into engagement with the pinions, substantially as described.

2. The combination, in drop-box mechanism for looms, of the drop-box bar, cranked shafts, connections between the cranked shafts and the bar, pinions on said shafts, a slide, mechanism for reciprocating the same, rack-frames on said slide adapted to engage with the pinions, mechanism for raising and lowering said rack-frames, and the bar for holding the rack-frames in either the raised or lowered positions, substantially as described.

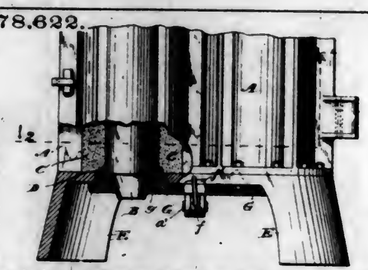
3. The combination, in drop-box mechanism for looms, of the slide, mechanism for reciprocating said slide, rack-frames on the slide, having upper and lower sets of teeth, shafts, pinions on said shafts, with which the teeth of the said rack-frames engage, with mechanism for raising and lowering said rack-frames, and connections between said shafts and the drop-boxes, whereby when the shafts are revolved they will raise or lower the drop-boxes, substantially as described.

478,621.

4. The combination, in drop-boxes, of a bar connected thereto, shafts having cranked pins, links connecting the said pins to the bar, pinions on said shafts, a slide, mechanism for reciprocating the same, rack-frames pivoted to said slide and having teeth which engage with the pinions, a lever adapted to be operated by the pattern-chains, bell-crank levers which act upon the said rack-frames at the dictation of the pattern-chain, and connections between the two sets of levers, substantially as described.

5. The combination of the drop-boxes, the bar connected thereto, cranked shafts, connections between the cranked shafts and the bar, pinions on said shafts, a slide, mechanism for reciprocating the same, rack-frames pivoted to said slide and having upper and lower teeth which engage with the pinions, a locking-bar, mechanism for reciprocating the same, and pins on the rack-frames bearing upon said bar, substantially as described.

6. The combination of the drop-boxes, the bar connected thereto, cranked shafts, connections between the cranked shafts and the bar, pinions on said shafts, a slide, mechanism for reciprocating the same, rack-frames pivoted to said slide, mechanism for raising and lowering said pivoted rack-frames, pins on the rack-frames, and a locking-bar having openings for the passage of the pins with mechanism for reciprocating said bar, substantially as described.

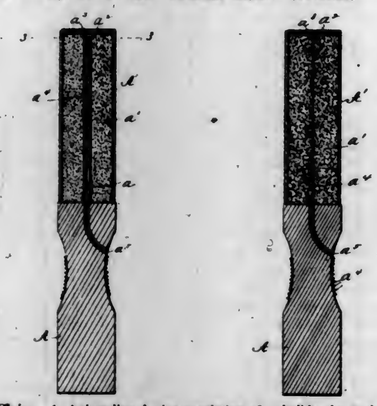


7. The combination of the drop-boxes, the bar connected thereto, cranked shafts, connections between the cranked shafts and the bar pinions on said shafts, a slide, pivoted rack-frames on said slide, having upper and lower sets of teeth engaging with the pinions, mechanism for raising and lowering the rack-frames, a driving-shaft, a crank thereon, a connecting-rod connecting the crank to the slide, a locking-bar for locking the rack-frames in either the raised or lowered positions, a rock-shaft having an arm engaging with the locking-bar and having a second arm, and a driving-cam engaging with said arm, substantially as and for the purpose set forth.

8. The combination, in drop-boxes, of a bar connected thereto, shafts having cranked portions and pinions, links connecting the cranked portions to the bar, a slide, mechanism for reciprocating the same, rack-bars on said slide, having upper and lower sets of teeth engaging with the pinions, bell-crank levers, springs connected to said levers and tending to raise the rack-bars, pattern-chain, and levers connected to said bell-crank levers and adapted to be operated by the pattern-chain, substantially as described.

478,622. CHILL-PLATE FOR FLASKS. FRANK MASKY, Anniston, Ala., assignor of two-thirds to Lewis E. Morrell, Columbus, Ohio, and Jacob K. Dimmick, Newport, Ky. Filed June 6, 1891. Serial No. 395,361. (No model.)

Claim.—1. In combination with a pipe-flask A A', the base-plate E, provided with openings to receive the core-seats, the pivoted bar F, and the plate G, carried by the bar F and provided with the cors-



478,622.

seats *g*, the internal diameter of the flasks being greater than that of the openings in the base-plate, whereby a fixed ledge or support is provided for the sand, all substantially as shown and described.

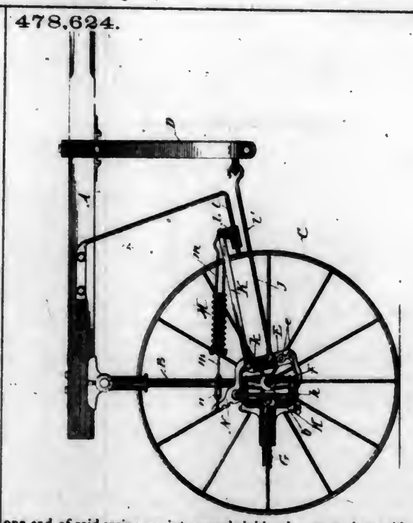
2. In combination with a pipe-flask, a base-plate attached thereto and provided with openings, a bar F, and means for locking it in position, and a plate G, pivotally mounted upon the bar and provided with core-seats, substantially as and for the purpose specified.

478,623. SIGNAL-TORCH. FRANK DU PONT MARSTON, Toms River, N. J. Filed Mar. 24, 1892. Serial No. 426,265. (No model.)

Claim.—1. A signaling device consisting of a shell having a charge of signaling material and an explosive friction-primer, a wad covering the contents of said shell, and a wire passing through said friction-primer and said shell, for the purpose set forth.

2. A signaling device consisting of a handle, a shell having an explosive friction-primer above the signaling material and closed at the top by a wad, and a wire passing through said friction-primer and down through the shell and handle to the outside of the handle.

3. A signaling device consisting of a shell having a tube extending from its bottom, signaling material around said tube, a friction-primer upon said tube, a wad for closing the top of the shell, and a wire passing through said friction-primer and extending through said tube to a point outside the shell.

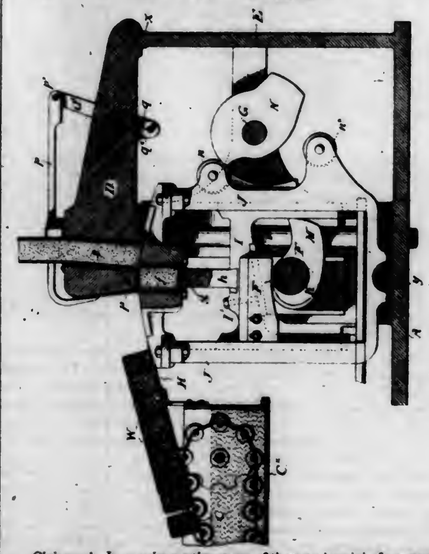


478,624. CULTIVATOR. GILPIN MOORE, Moline, Ill., assignor to the Deere & Company, same place. Filed Nov. 11, 1890. Serial No. 371,106. (No model.)

Claim.—1. In a cultivator, the combination, with a vertically-swinging beam and a swinging or oscillating coupling, of a spring connected at one end to the coupling, a guide connected to the other end of said spring, and an interposed rod pivoted at one end to said guide and at the other end pivoted to the coupling at a different distance from the center of oscillation or swinging than the point of attachment of the spring thereto, substantially as and for the purpose specified.

2. In a cultivator, the combination, with a vertically-swinging beam and a lever or hook connected with the swinging beam, of a lifting-spring connected at one end to said lever, a guide connected to the other end of said spring, and a rigid rod connected to said guide and at the other end pivotally connected to the swinging beam, whereby the variations in the tension of the spring and in the leverage compensate each other, substantially as described.

3. In a cultivator, the combination, with a vertically-swinging beam and coupling, of a lifting-spring therefor, a guide connected to

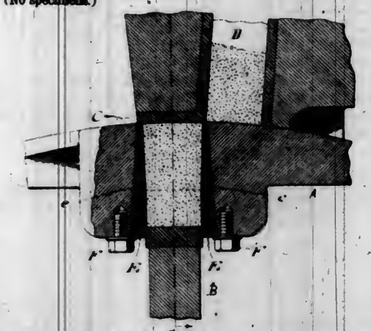


478,624.

one end of said spring, an interposed rigid rod connected to said guide and to the coupling, and means for adjusting the leverage and tension of the spring, substantially as specified.

4. In a cultivator, the combination, with a vertically-swinging beam and coupling E, having a lever N, of a spring M, sleeve L, connected to the rear end of the spring M, guide *l*, and rod K, connected to the sleeve L and to the coupling E at a different distance from the center of oscillation than the point of attachment of the spring M to the lever N, substantially as and for the purpose specified.

478,625. BRICK-PRESS. SAMUEL MCCARTER, Norristown, Pa., assignor to the International Pavement Company, Hartford, Conn. Filed Mar. 27, 1890. Serial No. 345,471. (No model.)



Claim.—1. In a reciprocating press of the type hereinbefore specified, in combination with the top of the fixed frame, with the upper portion of the reciprocating mold-frame and with the chute, the push-plate P, and mechanism for operating said push-plate relatively to the aforesaid elements, substantially in the manner and for the purpose specified.

2. In combination, a fixed frame, a charging-opening and a press-block formed in said frame, a mold-frame having a mold and adapted to be reciprocated with respect to said fixed frame, a plunger carried

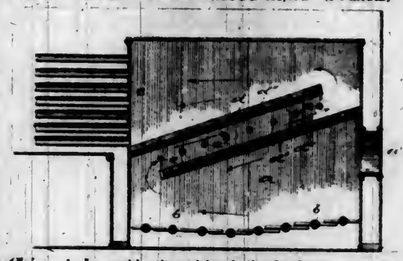
by the mold-frame, means for operating said plunger with respect to the mold, means for reciprocating the mold-frame, a chute leading from the mold-frame, a push-plate, and operative mechanism for moving said push-plate toward and from the mold and toward and from the chute, substantially as set forth.

3. In combination with the fixed frame, the mold-frame, the plunger and its operative devices, the devices for reciprocating the mold-frame, the chute, the push-plate having the rearwardly-extended arms, the rock-arms, the downwardly-extending lever, the stud-provided wheel, and the spring, substantially as set forth.

478,626. METHOD OF FORMING ASPHALT BLOCKS. SAMUEL MCCARTER, Norristown, Pa., assignor to the International Pavement Company, Hartford, Conn. Filed Mar. 27, 1890. Serial No. 345,472. (No specimens.)

Claim.—1. The method of forming plastic material into blocks of a given form, which consists in molding or compressing such material to a form the diametric measurements of the base of which are as much less or narrower than the reqeired ultimate measurements as will be compensated for by the subsequent spreading of the material in the settling and setting of the block after removal from the mold, substantially as set forth.

2. The method of forming plastic material into quadrangular blocks, which consists in, first, molding or compressing such material in a mold the interior faces of which are flared or inclined outwardly away from each each other, in then expelling the material so molded or compressed from the mold, and in then permitting the molded block to settle and set into quadrangular form by causing it during such action to rest upon its base or that end which within the mold possessed the lesser diametric dimensions, substantially as set forth.

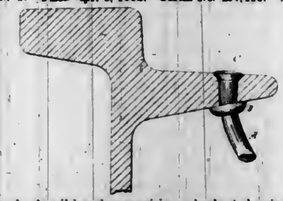


478,627. COMBINED SULKY PLOW AND HARROW. MICHAEL A. MCCLELLAN, Chicago, Ill. Filed Jan. 13, 1891. Serial No. 377,592. (No model.)

Claim.—1. In combination with a sulky-plow or similar implement, the harrow provided with the forward and rear side extending arms attached thereto, the clip provided with the side eye-lug for hinging the forward harrow-arm to the plow-frame, the hinge connection for connecting the rear harrow-arm to the plow-spindle, and the lever, pulley, and rope mechanism for raising and lowering the harrow, substantially as set forth.

2. In combination with a sulky-plow, the harrow attachment provided with a forward and a rear side extending arm, said arms being respectively hinged to the plow-frame and spindle, the lever and pulleys attached to the plow-frame, and the rope arranged about said pulleys and connecting said harrow and lever, substantially as and for the purpose set forth.

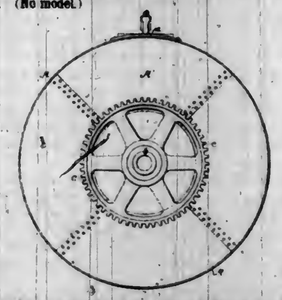
478,628. FIRE-BOX FOR BOILERS. WILLIAM MCCOMBIE, Chicago, Ill. Filed Nov. 12, 1891. Serial No. 411,704. (No model.)



Claim.—1. In combination with a boiler fire-box, transverse portions therein forming a flue through which the products of combustion must pass on their way to the fire-flues, and gas-pipes entering the flue from the side thereof, as and for the purpose described.

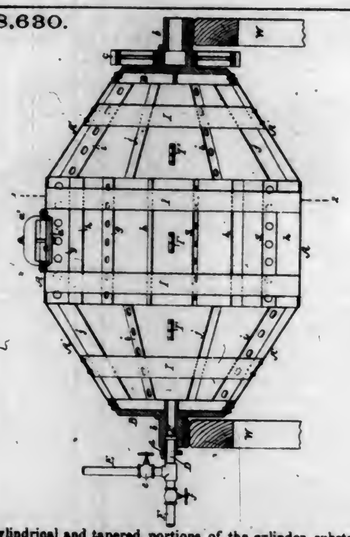
2. The combination of a fire-box, a refractory wall *d'* therein extending forwardly from the rear wall and terminating near the front wall, another wall *d* above the wall *d'* and projecting rearwardly from the forward wall to near the rear wall of the fire-box, and gas-pipes leading into the flue formed by the two walls, as and for the purpose described.

3. The combination of a fire-box, a downwardly and forwardly projecting transverse refractory wall therein, this wall terminating near the front wall of the fire-box and composed of removable bricks, another wall above said wall, this latter wall being constructed of removable refractory bricks, and extending rearwardly from the front wall to near the rear wall of fire-box, and a series of gas-nozzles entering the flue formed by the walls above mentioned, as and for the purpose described.



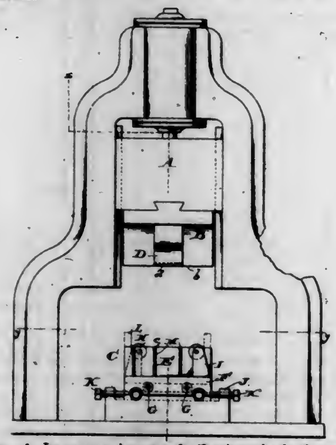
478,629. ELECTRIC RAIL-BOND. THOMAS J. MCTIGHE, New York, N. Y. Filed Apr. 1, 1892. Serial No. 427,410. (No model.)

Claim.—1. A rail-bond comprising a body A, having curved ends, with shoulders B B and pins or rivets C C, all in one integral piece.



2. The combination, with a girder-rail joint, of a rail bond having its ends inserted upwardly through holes in the trams of the adjoining rails and within the lengths of the fish-plates and riveted on top.

478,630. BLACK-ASH DISSOLVER. GEORGE M. NEWHALL and CHARLES L. HAMILTON, Philadelphia, Pa. Filed Jan. 21, 1890. Serial No. 337,641. (No model.)



Claim.—The combination, in a black-ash dissolver, of the cylinder, comprising the central cylindrical portion A, the tapered end portions A', heads B B, secured thereto, supporting-trunnions on said heads, a pipe D, adapted to one of said trunnions, a manhole in the central cylindrical portion through which the material is fed into the dissolver, cutting and mixing blades extending transversely across the cylinder and having their opposite ends secured thereto, and alternate plain and perforated lifting-blades secured longitudinally to the inner periphery

478,630.

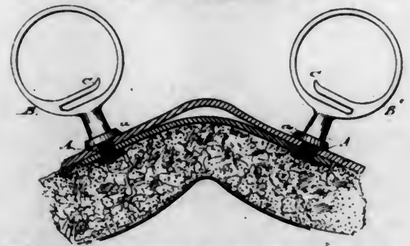
of the cylindrical and tapered portions of the cylinder, substantially as specified.

478,631. HAMMER FOR FORGING CAR-WHEELS. JOHN PARKINSON, Philadelphia, Pa. Filed June 20, 1891. Serial No. 396,897. (No model.)

Claim.—1. In a power-hammer for forging wheels, the combination of a hammer-die having a projection upon one side, and an anvil-die consisting of sections, one of which sections has a supporting-face for the wheel-blank located under the projection of the hammer-die and at a lower level than the die-face of the adjacent section, whereby one of said sections may be removed and replaced by another of different size for a different diameter of wheel.

2. In a power-hammer for forging wheels, the combination of an anvil-die consisting of sections movable with reference to one another, whereby one section may be adjusted with reference to the adjacent section, one of said sections having a supporting-face for the wheel-blank at a lower level than the level of the die-face of the adjacent section, and a hammer-die having a projection over the section of the anvil-die of less altitude.

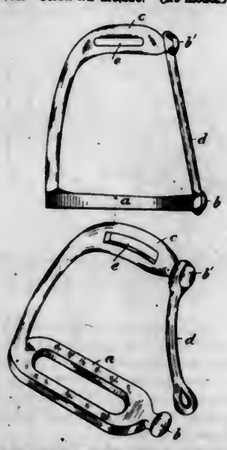
3. In a power-hammer for forging wheels, an anvil-die formed in sections of different altitudes, whereby the wheel-blank may be supported in the direction of the movement of the hammer upon the section of less altitude against the adjacent face of the section of greater altitude, said sections being provided with a guideway between their adjacent surfaces, whereby they may be moved relatively to one another or removed, and a hammer-die having a projection arranged in line with the section of the anvil-die of less altitude.



4. In a power-hammer for forging steel wheels, the combination of an anvil-die, consisting of the section E and the section F, having the surface *f* at a lower level than the face of the section E and provided with a groove *g* adjacent to its inner edge, said section F being removable from the section E, and the hammer-die A, having the grooved projection D.

5. In a power-hammer for forging steel wheels, the combination of a hammer-die having a lateral projection, an anvil-die having a lateral support for the tread of the wheel-blank to support it in an upright position against the side of the anvil-die and under the projection of the hammer-die, and an anti-friction-roller above said lateral support of the anvil-die to assist the turning of the wheel-blank.

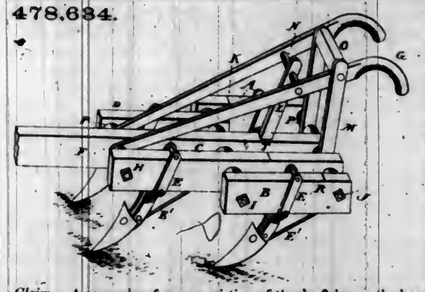
6. In a power-hammer, the combination of an anvil-die having a lateral supporting-surface *f* for the tread of the wheel extending from the side of the anvil-die and at a lower altitude than the upper face thereof, said lateral supporting-surface *f* being provided with the upright I and the roller H, adapted to bear against the tread of the wheel-blank carried by said upright I adjacent to the upper face of the anvil-die, and a hammer-die having a projection in line with the lateral supporting-surface *f* of the anvil-die.



7. In a power-hammer, the combination of a hammer-die, a frame J, an anvil-die made in sections movable with reference one to another and arranged within the frame J, and adjusting and clamping screws K, carried by frame J and bearing upon the sections of the anvil-die.

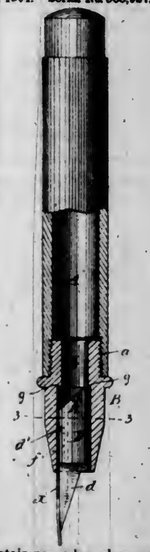
478,632. HARNESS-TERRET. FRANCIS PARK, Montague City, assignor of one-half to Warren M. King, Orange, Mass. Filed Apr. 12, 1892. Serial No. 428,904. (No model.)

Claim.—A terret to combine the functions of a guide and check for the reins, which consists of a ring or loop, a lip curving within the same to form between the latter and the base of said loop a slot to receive and hold the reins, and a holding means by which the terret may be attached to the saddle, as set forth.



748,633. STIRRUP. ERNEST A. PEACOCK, London, England. Filed Mar. 24, 1892. Serial No. 426,236. (No model.)

Claim.—A stirrup having the tread, arch, and one side of metal and the remaining side formed of an elastic band *d*, looped at each end and passing over studs *b b'* at the ends of the tread and arch.

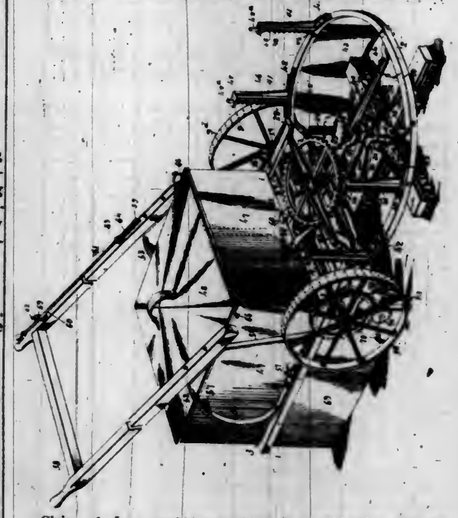


478,634. GANG-PLOW. RICHARD L. PEEK, Basham's Gap, Ala. Filed Mar. 7, 1892. Serial No. 424,025. (No model.)

478,634.

Claim.—A gang-plow frame consisting of the draft-beam, the long plow-beam C, and the short plow-beams A B D, said beams being connected by bolts with spacers thereon, and said plow-beams carrying adjustable plow-standards and having the beams A B C, marked, respectively, at K R T, as shown and described, whereby said frame may carry a single gang of four turn-plows or two similar gangs of shovel-plows, as shown and described.

478,635. FOUNTAIN-PEN. DUANE T. PERKINS, Springfield, Mass., assignor to himself, Frederick Zuchtmann, and Paul A. Knappe, same place. Filed Mar. 21, 1891. Serial No. 385,927. (No model.)



Claim.—1. In a fountain-pen, a barrel or reservoir, a closing-stopper portion or plug in the forward section of said barrel and at one side and adjacent to the inner wall of said section reduced so as to receive between it and said inner wall the pen-shank, and a feed-bar in forward extension of said plug and adapted to lie along the under side of the pen, in combination with two ducts lengthwise of and at said reduced side of said plug and at one end open to the barrel and at the other end to the under side of the pen back of the forward end of said feed-bar, substantially as and for the purposes described.

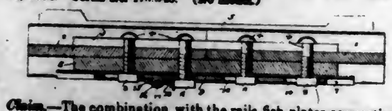
2. In a fountain-pen, the combination, with the barrel and a forward tubular section of it which interiorly is of different diameter, making an intermediate seat *g*, of a solid plug or stopper D to close said section, adapted at its inner or rear end to rest on said seat *g* and having between it and the inner wall of said section an open space suitable to receive the shank of a pen, and also two ducts, each extending from end to end of it and both open to said pen-receiving space and at one end to the barrel and at the other end to the under side of the pen, substantially as described, for the purposes specified.

3. In a fountain-pen, the combination, with the barrel and a forward tubular section of it which interiorly is of different diameter, making an intermediate seat *g*, of a solid plug or stopper D to close said section and at its inner or rear end beveled on one side and adapted to rest on said seat *g* and having between it and the inner wall of said section an open space suitable to receive the shank of a pen, and also two ducts, each extending from end to end of it and both open to said pen-receiving space and at one end and the beveled side of the plug open to the barrel and at the other end to the other side of the pen, substantially as described, for the purposes specified.

478,686. SCRUBBING-MACHINE. HECTOR PRUD'HOMME, Marinette, Wis. Filed Sept. 18, 1891. Serial No. 406,145. (No model.)

Claim.—1. In a scrubbing-machine, the combination, with the frame, of a V-shaped bearing-bracket depending from said frame, a vertical brush-shaft journaled in said bracket and frame and provided with an adjusting-collar secured thereon above the bearing in the frame and with radially-extending lugs having under squared recesses, brush-arms pivotally secured at one end within said recesses, springs secured to said lugs above the recesses therein and normally bearing upon the outer ends of said arms, clamping-plates pivotally secured at their centers to the outer ends of said arms and having opposite depending flanges adapted to removably engage the backs and edges of the brushes, and means for rotating the shaft, substantially as set forth.

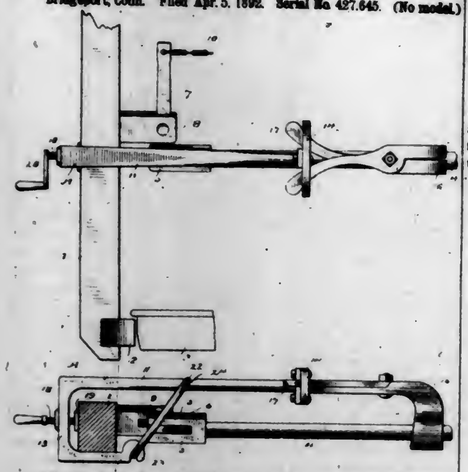
2. In a scrubbing-machine, the combination, with the frame and the axle having the beveled gear, of a single double-T-headed casting secured to the top of said frame, a brush-shaft journaled vertically in the tail of said casting and provided with a pinion secured to the upper end of the same, a short stub-shaft carrying bevel-gear at each end, journaled in the outer head of said casting, and an intermediate parallel bearing between the same and the inner head, a horizontal gear-wheel and small bevel-gear carried therebeneath, located above the inner T-head, and provided with opposite conical recesses, a transverse brace secured to the frame parallel with said inner T-head and directly over said gear-wheel and beveled gear, and pointed bearing-screws passing from beneath said inner T-head and through said transverse bar and engaging said conical bearings, substantially as set forth.



3. In a scrubbing-machine, the combination, with the frame, a brush-shaft journaled in the front end of the same, and a water-supply tank located at the rear end of the machine, of handle-adjusting springs located on opposite sides of said tank and secured to said frame, said springs comprising a vertical portion and semicircular overlapping sections having elongated slots, bolts engaging said slots and adjustably connecting said sections together, and the operating-handles secured to the top of one of said adjustable spring-sections, substantially as set forth.

4. In a scrubbing-machine, the combination, with the frame and a vertical brush-shaft in the front end of the same, of a pair of handles adjustably located at the rear end of the machine, a water-supply tank mounted between the handles and provided with discharge-openings, a transverse shaft journaled in said tank and provided with a crank-arm and a valve having the projecting plugs or teats adapted to fit said discharge-openings, and a spring-actuated operating-rod slidingly mounted upon one of the handles and provided at one end with a series of engaging-notches and loosely connected at the other end with the upper end of said crank-arm, substantially as set forth.

5. The combination, with the revolving axle having ratchet-teeth upon one end, of a sleeve or collar suitably secured over the notched end of said axle and provided with a transverse perforation therein,

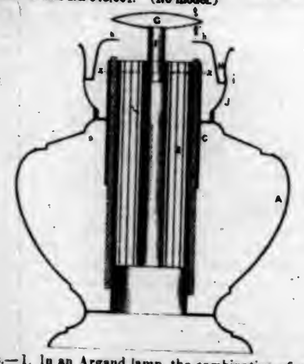


an inverted-U-shaped leaf-spring rigidly secured at one end to said collar, and a beveled pawl pin or stop secured to the free end of said spring, projecting through the perforation in said collar and adapted to engage the ratchet-teeth in said axle, substantially as set forth.

478,637. NUT-LOCK. JOHN PUTNAM, Cerro Gordo, Ill. Filed Nov. 30, 1891. Serial No. 413,548. (No model.)

Claim.—The combination, with the rails, fish-plates connecting the rails, bolts securing the fish-plates to the rails, and nuts arranged on the bolts, of the locking-plate provided with a bolt-opening, a slot communicating with the opening, and an integral perforated lug, said locking-plate having a series of nut-openings, a supplemental plate having a shoulder and provided with a lug adapted to enter said slot, said supplemental plate being bifurcated to receive the perforated lug and provided with recesses, and a key arranged in the perforation of the lug and in the recesses of the supplemental plate, substantially as described.

478,638. DEVICE FOR ADJUSTING BRAKES. ANDREW RAUB, Bridgeport, Conn. Filed Apr. 5, 1892. Serial No. 427,645. (No model.)



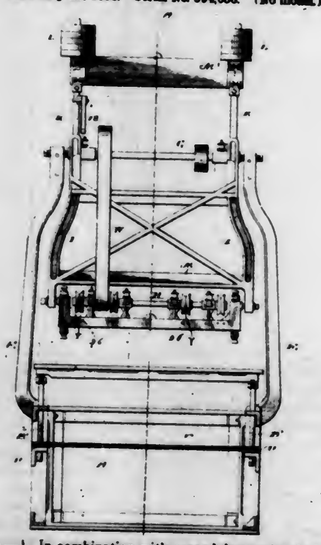
Claim.—1. A device for adjusting brakes, consisting, essentially, of a yoke, a screw in said yoke adapted to bear against a brake-beam, a swiveled head upon the arm of the yoke, having openings through it, and clamping-jaws adapted to engage a brake-rod and having curved shanks which pass through said openings, so that when the screw is turned the clamping-arms are caused to engage the brake-rod and the brake-beam is moved forward, as and for the purpose set forth.

2. A device for adjusting brakes, consisting of a yoke adapted to partially inclose a brake-beam, a screw in said yoke having a swiveled head adapted to bear against the brake-beam, a swiveled head upon one arm of the yoke, having openings through it, and clamping-jaws adapted to engage the brake-rod and having curved shanks which pass through the openings in the head upon the arm of the yoke, so that when the screw is turned in the brake-rod is clamped firmly and the brake-beam moved forward.

3. A device for adjusting brakes, consisting of a yoke, a screw in said yoke adapted to bear on the brake-beam, a head on one arm of the yoke, having openings 15 through it, and clamping-jaws suitably curved to engage the brake-rod and having serrated engaging-surfaces and curved shanks which extend through the openings in the head.

4. A device for adjusting brakes, consisting of a yoke, said yoke consisting of arms 11 and 12 and an end piece 13, said arm 11 having a depression 24 and said arm 12 having a hook 23, a link engaging said depression and hook for the purpose set forth, a screw in said end piece adapted to bear against a brake-beam, a swiveled head on arm 11, having openings 15 through it, and clamping-jaws adapted to engage a brake-rod and having curved shanks passing through the openings in said head.

478,639. ARGAND LAMP. FRANK REIND, Meriden, Conn., assignor of one-half to the Edward Miller & Company, same place. Filed Nov. 20, 1890. Serial No. 373,061. (No model.)



Claim.—1. In an Argand lamp, the combination of an inner air-supply tube and a vertically-convolute partition within said tube, the spiral space between the convolutions of said partition being clear and unobstructed, substantially as described.

2. In an Argand lamp, the combination of an inner air-supply tube and a vertically-convolute foraminous partition within said tube, the spiral space between the convolutions of said partition being clear and unobstructed, substantially as described.

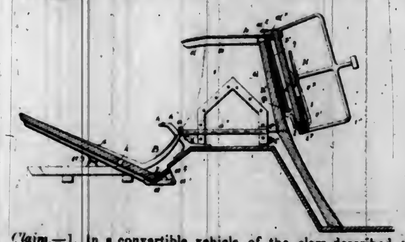
3. An inner air-deflector of an Argand lamp, consisting of two foraminous disks connected at their outer edges, so that a portion of the air which strikes against the lower side of said deflector may be deflected outwardly and another portion permitted to pass upward through said deflector, substantially as described.

478,640. CARVING-MACHINE. JOSEPH ROHLMANN, St. Joseph, Mo. Filed May 25, 1891. Serial No. 394,058. (No model.)

Claim.—1. In combination with a pendulous swing-frame carrying at its lower end bracket-arms and a set or system of carving-tools, the rearward-projecting arms O and 3, and their adjustable weights N and 4, the combination being and operating as set forth.

2. In combination with the swing-frame and with the spindle-carrying frame, the slotted cross-bar 5 on the latter, provided with the sliding pulleys and spiral springs, substantially as and for the purpose set forth.

3. In combination with the tracing-tool, an adjustable stop-gage composed of two parts, each adapted to be laterally slid and secured and bearing on opposite sides of the stock of the tracing-spindle to hold it firmly in its supports to any position to which it may be set laterally.



4. In combination with the pendulous frame and with the bracket-arms supported on its lower end, adjustable sliding and slotted gages 14, applied as set forth and serving to adjust the tool-stock at any desired forward or backward inclination.

5. In combination with the standards E E, the open or oval-shaped cross-piece on frame F, connecting the tops of these standards, the swing-frame I, uprights K, and the piece 18, secured thereon and serving to limit the swinging movement of the swing-frame by coming into contact with frame F.

6. In combination with arms E and with swing-frame I and uprights K thereon, the arched piece 18, serving to limit the swing of said frame, and the sets of removable adjusting-weights on said uprights, all substantially as shown and described.

7. In combination with the tool-spindle and its stock, the sleeve *x*, beyond which the stock projects, the removable oil-cup 21, fitted upon and secured to such projecting part of the stock and abutting at its upper end closely against the lower end of such sleeve and having the described upward-extending central tube, and the tool-chuck holder fitting closely within such tube, all as set forth.

478,641. CONVERTIBLE VICTORIA. ALFRED C. SAGE, Clifton Hill, near Melbourne, assignor of one-half to Daniel White, Parkville, near Melbourne, Victoria. Filed Mar. 10, 1892. Serial No. 424,405. (No model.)

Claim.—1. In a convertible vehicle of the class described, the combination, with the foot-board, of movable boot-sides operated and controlled by said foot-board, substantially as and for the purpose set forth.

2. In a convertible vehicle of the class described, the combination, with two hinged boot-sides, each provided with a looped guide-rail, of a hinged foot-board provided with a projecting arm on either side thereof, the ends of which engage with said looped guide-rails to operate and control said boot-sides, substantially as described.

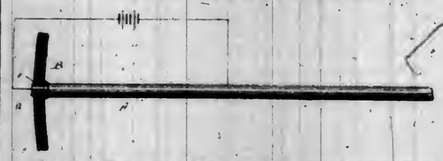
3. In a convertible vehicle of the class described, the combination, with the front seat, and a hinged foot-board having a slot formed therein, of the bracket *k*, adapted to project through said slot, a locking-rod on the foot-board, adapted to engage the bracket, and a rein-rail l^3, pivoted to the bolt and adapted to impart motion thereto, whereby said rein-rail can be turned under the foot-board when the latter is used as such, substantially as and for the purpose specified.

4. In a convertible vehicle of the class described, the combination, with two hinged boot-sides having on their upper edges an inwardly-projecting guide-bar provided with a downwardly-inclined portion in front, of a seat having a hook on each side adapted to engage with said guide-bars, substantially as and for the purpose described.

5. In a convertible vehicle of the class described, the combination, with the seat F, having a slotted guide-rail G on either side thereof, and a downwardly-projecting pin H, of the boot-sides provided with a recess in the upper end adapted to be engaged by the pin H, and outwardly-projecting pins g^3 on the back of the boot extending into the slot of said guide-rails, substantially as and for the purpose set forth.

6. In a convertible vehicle of the class described, the combination, with the movable seat F, of a bolt I, sliding in bearings on said seat, the rear frame E, having a loop which projects through the bottom thereof and engaged by said bolt, and a pivoted back-rail for said seat, having a projecting lug to engage with and operate said sliding bolt, substantially as described.

7. In a convertible vehicle of the class described, the combination, with the seat F and slotted guide-rails G, secured to the under side thereof, of the back panel of the boot, having outwardly-projecting pins g^3, on which said guide-rails slide, whereby said seat may be hung down against said rear panel of the boot, substantially as and for the purpose set forth.



478,642. ROOFING-TOOL. LOWLEY L. SACHSDORFF, Philadelphia, Pa., assignor of one-half to Charles N. Harder, Philmont, N. Y. Filed Apr. 2, 1892. Serial No. 427,446. (No model.)

Claim.—A roofing-tool consisting of jaws A, B, and C, suitably pivoted and connected together, the jaws B and C having the contiguous concave and convex portions 2 and 3, respectively, with grooves 4 and 5 formed along the inner top of the contiguous faces of jaws A and B, respectively, substantially as and for the purpose specified.

478,642.

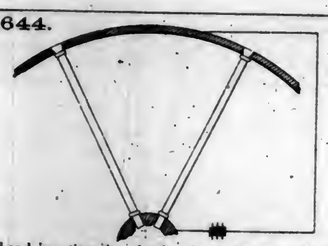
478,643. METHOD OF WELDING METAL WHEELS. ERNST H. SCOTT, La Porte, Ind., assignor to the Niles & Scott Company, same place. Filed Jan. 23, 1889. Serial No. 297,781. (No model.)

Claim.—1. The process of securing metal spokes in the rims of metal wheels, consisting in, first, inserting the spokes in place in the rim, and, secondly, heating the end of a spoke by an electric current, and, finally, riveting or upsetting the end of the spoke and securing it to the tire, substantially as specified.

2. The process of securing metal spokes in the rims of metal wheels consisting in first putting the spoke in place within the rim, then heating the end of the spoke in contact with the rim to a welding heat and holding the rim and the spoke together under pressure, and thus welding them together, substantially as specified.

3. The process of securing metal spokes in the rims of metal wheels, consisting in, first, inserting the spokes in place in the rim; secondly, heating the ends of the spokes and the contiguous portion of the metal rim, and, finally, subjecting the same to force or pressure and welding or uniting the spokes and rim together, substantially as specified.

4. The improvement in the art of attaching metal spokes to metal wheel-tires, consisting in introducing the end of the spoke into the other member, heating the contiguous portion of the two members to a welding temperature by directing an electric current therethrough, and finally upsetting the spokes to complete the welding operation.



5. The improvement in the art of manufacturing metal wheels, which consists in passing the end of the spoke through a hole in the tire, directing an electric current through the contiguous portions of said parts, and thereby raising their temperature to a welding heat, and finally upsetting the end of the spoke, and thereby welding the parts together.

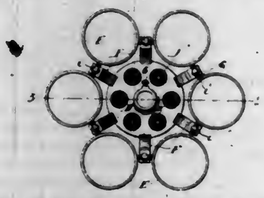
478,644. METHOD OF MAKING METAL WHEELS. ERNST H. SCOTT, La Porte, Ind., assignor to the Niles & Scott Company, same place. Filed Jan. 23, 1889. Serial No. 297,782. (No specimens.)

Claim.—1. The improvement in the art or process of making metallic wheels, consisting in first securing the spokes rigidly in the metal rim of the wheel and inserting them in place in the hub, then forcing or clamping the rim of the wheel to a true circle about the axis of the hub, then heating the hub end of the spokes by an electric current, and, finally, while the spokes are so heated riveting, bending, upsetting, or otherwise manipulating the ends of the spokes and securing them rigidly in or to the hub, substantially as specified.

2. The improvement in the art or process of making metallic wheels, consisting in first securing the spokes rigidly in the metal rim

478,644.

of the wheel and inserting them in place in the hub, then forcing or clamping the rim of the wheel to a true circle about the axis of the hub, then heating the ends of the spokes by an electric current to the fusing or welding point, and, finally, subjecting the ends of the spokes to force or pressure while so heated to unite them with the hub, substantially as specified.



3. The improvement in the art or process of manufacturing metal wheels, consisting in heating the ends of the spokes after they are inserted in the hub by an electric current and then subjecting the same to force or pressure to bend, rivet, or unite the same while so heated to the hub, substantially as specified.

4. The improvement in the art or process of making metallic wheels, consisting in first securing the spokes rigidly in the metal rim of the wheel and inserting them in place in the hub, then forcing or clamping the rim of the wheel to a true circle about the axis of the hub, then heating the hub ends of the spokes, and, finally, while the spokes are so heated riveting, bending, upsetting, or otherwise manipulating the ends of the spokes and securing them in or to the hub, substantially as specified.

5. The improvement in the art of attaching metal spokes to metal wheel-hubs, consisting in introducing the end of the spoke into the other member, heating the contiguous portions of the two members to a welding temperature by directing an electric current therethrough, and, finally, upsetting the spoke to complete the welding operation.

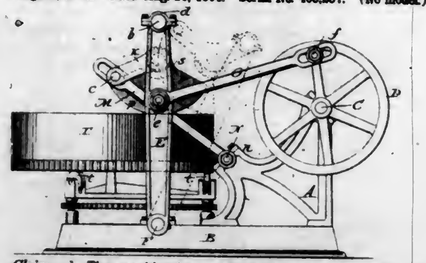
6. The improvement in the art of manufacturing metal wheels, consisting in introducing the ends of the spokes into mortises in the hub, heating the contiguous parts to a welding temperature by directing an electric current therethrough, and, finally, forcing the parts into contact while thus heated to effect a welded union between them.

478,645. UMBRELLA-STAND. SAMUEL S. SENCENBAUGH and ALBERT J. IVES, Aurora, Ill. Filed Aug. 8, 1891. Serial No. 402,173. (No model.)

Claim.—1. An umbrella-stand consisting of an upright rod and horizontal bracket secured thereupon and each composed of a central disk D, and a series of swinging rings E, pivotally mounted on the disk and supported in an approximately horizontal position to receive the umbrellas or canes, substantially as described.

2. An umbrella-stand consisting of an upright rod and horizontal brackets secured thereupon and each composed of a central disk having a series of sockets, and a series of rings pivotally mounted on the disk and supported in an approximately horizontal position to receive the umbrellas or canes, said rings of an upper bracket holding the umbrellas or canes, while the sockets in the disk of a lower bracket receive and retain the ferruled ends of the umbrellas or canes, substantially as described.

3. In an umbrella-stand, the combination, with a rod and a disk adapted to be secured upon said rod, said disk having radial arms F, having sockets near their outer ends, of rings E, having trunnions G, adapted to fit into the sockets in the arms F, substantially as and for the purpose specified.

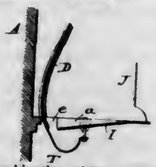


4. In an umbrella-stand, the combination, with a rod B, disk D, adapted to be secured upon said rod, radial arms F, said arms having sockets near their outer ends, and holes H in said arms, of rings E, having trunnions G, adapted to fit into the sockets in the arms F, and pins I, having caps *i*, said pins being adapted to be inserted into the holes H in such position that the caps *i* will overlap the trunnions G, substantially as and for the purpose specified.

478,646. UMBRELLA-STAND. SAMUEL S. SENCENBAUGH and ALBERT J. IVES, Aurora, Ill. Filed Aug. 13, 1891. Serial No. 402,591. (No model.)

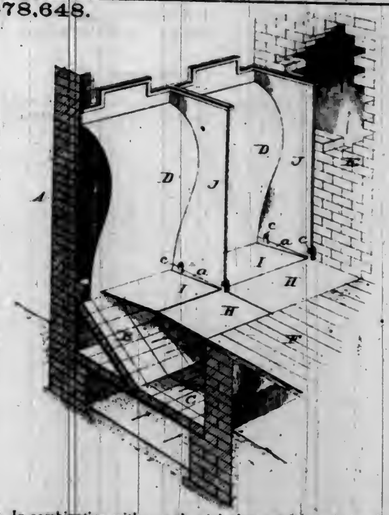
Claim.—The combination, with a base A and an upright supporting-rod B, of a series of brackets C, arranged on the rod one above the other and each composed of a disk D, formed with sockets I, and a central tubular portion G, through which the supporting-rod extends, and a series of rings E, connected with and arranged round the socketed disk, said sockets of one disk serving to receive and retain the ends of umbrellas or canes held by the rings of an upper bracket, substantially as described.

478,647. MEAT-CHOPPING MACHINE. JOHN SHEARBURN, Burlington, Iowa. Filed Aug. 20, 1891. Serial No. 403,257. (No model.)



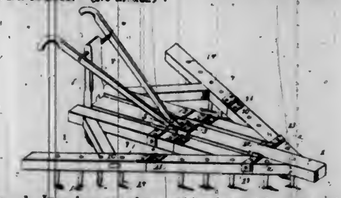
Claim.—1. The combination, substantially as hereinbefore set forth, of a chopping-block, a bed-plate or frame, radius-bars pivoted at their lower ends to the bed-plate and rocking in parallel vertical planes, a knife-carrying sleeve, a rod extending through the sleeve, connections between said rod and the upper ends of the radius-bars, a crank-wheel, pitmen connected to the crank-wheel and connected to the radius-bars between their pivotal connections with the main frame and their connection with the knife-carrying sleeve, and connections between the knife-carrying sleeve and a stationary part of the main frame.

2. The combination, substantially as hereinbefore set forth, of a rotary chopping-block, a bed-plate or frame, radius-bars pivoted to the bed-plate at their lower ends and rocking in parallel vertical planes, a knife-carrying sleeve, a rod extending through the sleeve, elbow-levers secured to the rod and pivotally connected with the radius-bars at their upper ends, links pivotally connected with the rearwardly-extending arms of the elbow-levers and pivotally connected with a stationary part of the frame, a crank-wheel, and pitmen connecting the crank-wheel with the rocking radius-bars between their upper and their lower ends.



3. The meat-chopping machine hereinbefore described, consisting of the combination of a bed-plate, a standard or supporting-frame, a crank-shaft mounted therein, crank-wheels fixed on opposite ends thereof, radius-bars vibrating in parallel planes on pivots on the main frame, pitmen connecting the crank-wheels and radius-bars, elbow-levers connected with the latter at one end, links connecting the frame and elbow-levers, a rod connecting these levers with each other, a knife-carrying sleeve mounted on the rod, knives carried thereby, a chopping-block traversed by the knives, and mechanism for rotating the chopping-block, the combination being and operating substantially as hereinbefore set forth.

478,648. URINAL. ISAAC D. SMEAD, Toledo, Ohio. Filed Dec. 5, 1891. Serial No. 414,160. (No model.)

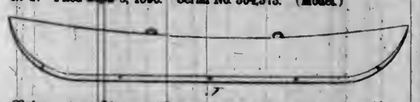


Claim.—1. In combination with a vault having a current of air passing through it, a urinal consisting of an inclined or curved back plate extending downward to the floor and the inclined floor-plate I, with a narrow space or slot between said floor and back plates opening direct into the vault below, substantially as shown and described.

478,648.

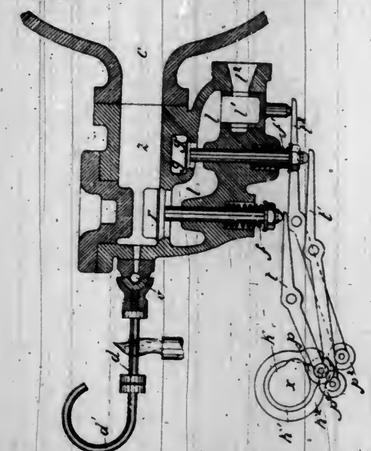
2. In combination with a vault or air-duct, an inclined absorbent partition or wall B, and a urinal constructed substantially as described and having an opening for the passage of the fluid arranged to deliver the same at or near the upper edge of said incline, substantially as shown and described.

478,649. HARROW. GORDON T. SONGER, Elizabethton, Tenn., assignor of one-half to William E. Carter, same place. Filed May 25, 1891. Serial No. 394,363. (No model.)



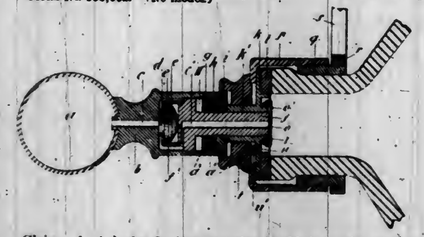
Claim.—1. In a harrow, the combination, with a central beam formed in sections terminating at its rear end in a plow-standard, of a pair of harrows consisting of a pair of converging side beams connected at their rear ends and formed in sections, hinges connecting the beam-sections, and hinges connecting the harrow-sections with the main beam, substantially as specified.

2. The combination, with the main beam formed in sections and terminating at its rear end in a cultivator-standard, said sections being hinged together and the front sections provided with triangular wings secured at opposite sides thereof, of a pair of triangular harrow-sections, the bars of which are formed in sections loosely and removably connected, hinge-straps mounted upon the inner bars of the harrow-sections, and inclined L-shaped pintles extending from the corners of the cultivator-beam for engaging the straps, substantially as specified.



3. In a harrow, the combination, with the two opposite harrow-sections, of a central beam consisting of two flexibly-connected sections, the rear one of which terminates at its rear end in a shovel-carrying standard, and hinge connections between the front sections of the beam and the opposite harrow-sections, substantially as specified.

478,650. SAFETY SURF-BOAT. WELLING C. SOULE, Savannah, N. Y. Filed Sept. 3, 1890. Serial No. 364,373. (Model.)



Claim.—A surf-boat with deck, sides, bottom, stern, and keel all made from one piece of sheet metal, so constructed as to have but one seam and that running down the ends and along the bottom, substantially as shown and described.

478,651. GAS AND PETROLEUM MOTOR. BERNHARD STEIB, Berlin, Germany, assignor to the Berliner Maschinenbau Actien-Gesellschaft, vormals L. Schwartzkopff, same place. Filed Dec. 24, 1890. Serial No. 375,760. (No model.) Patented in England Nov. 25, 1890, No. 19,171.

Claim.—The combination of sleeve *z*, inserted between cylinder *c* and ignition-tube *d*, and valve *r*, closing or establishing communication between sleeve *z* and air-channel *l*, with valve *g'*, closing or establishing communication between gas-channel *g* and air-channel *l*, and with valve *f'*, lessening or enlarging communication between air-channel *l* and the open air, and operating means constructed, as described, so that said valves *r* and *g'* are opened at the beginning of the suction period and passage of valve *f* is reduced at or near the close of that period, for the purposes described.

478,652. APPARATUS FOR IMPREGNATING LIQUORS IN BOTTLES. EMIL STERN, Vienna, Austria-Hungary. Filed Dec. 12, 1889. Serial No. 333,682. (No model.)

Claim.—1. A device for impregnating liquids in bottles with gas, consisting of a receptacle for containing gas, detachably secured to the bottle-neck, and a passage controlled by a valve leading from said receptacle to the bottle, said valve being opened and closed by the upward and downward movement of the receptacle, as and for the purpose set forth.

2. A device for impregnating liquids in bottles with gas, consisting of a receptacle for containing gas, detachably secured to the bottle-neck, a passage controlled by a valve leading from said receptacle to the bottle, said valve being opened and closed by the upward and downward movement of the receptacle, and a port in an annulus, communicating with the interior of the bottle and controlled by a valve and a ring for the purpose of allowing the atmospheric air and superfluous gas to escape, substantially as described.

478,653. FOUNTAIN-PEN. WILLIAM W. STEWART, Brooklyn, N. Y. Filed Dec. 15, 1890. Serial No. 374,678. (No model.)

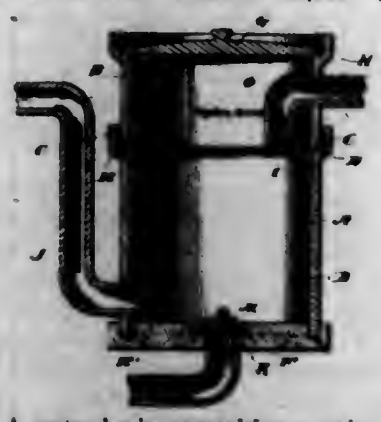
Claim.—1. In a fountain-pen, the combination, with a reservoir-holder having a throat or passage communicating with the pen, of a valve for controlling communication through said throat, and a stem

for operating said valve, passing through the throat, with its exterior surface in capillary proximity to the interior surface of the throat, whereby a capillary duct is formed for the flow of ink and the valve may be adjusted from the exterior of the holder.

2. In a fountain-pen, the combination, with a reservoir-holder having a throat or passage communicating with the pen, of a valve for controlling communication through said throat, having a tapering stem passing through the throat and emerging from the lower end of the holder, where it is accessible for operating the valve and with the exterior surface of said stem in capillary proximity to the interior surface of the throat to form a capillary duct, and the valve constructed to open by an upward movement, whereby as the valve is opened the movement of the tapering stem increases the capacity of said capillary duct.

3. In a fountain-pen, the combination, with a reservoir-holder having a throat or passage communicating with the pen, of a valve for controlling communication through said throat, and a stem for operating said valve, extending through the throat and terminating in an operating-handle at the lower end of the pen-holder, and the nozzle of the holder formed with provisions adapted to engage said handle and hold it in different positions.

4. In a fountain-pen, the combination, with a reservoir-holder having a throat or passage communicating with the pen, of a valve for controlling communication through said throat, a stem for operating it passing through the throat and having its lower end bent upwardly and adapted to pass outside of the nozzle, and the nozzle formed with provisions to engage said upturned end to hold the stems in different positions.



5. In a fountain-pen, the combination, with a reservoir-holder having a throat, of a valve for controlling communication therewith, and a stem for operating said valve, passing through the throat and having its lower end bent laterally and upwardly and adapted to pass outside of the nozzle, whereby the downward and upward branches of said stem pass on opposite sides of one edge or rim of the pen-nib.

6. In a fountain-pen, the combination, with a reservoir-holder having a throat, of a valve for controlling communication therewith, an operating-stem movable relatively to said valve, extending through the throat and terminating in an operating-handle formed with a stop adapted, when pushed upwardly, to encounter and unseat the valve, and a spring pressing downwardly against the valve, adapted to press the valve to its seat when the stem is lowered.

7. In a fountain-pen, the combination, with a reservoir-holder having a throat, of a valve for controlling communication therewith, and a stem for operating said valve, passing through the throat and having its lower end turned upwardly to form an operating-handle and said stem constructed to admit of its handle being entered within the lower end of the nozzle when drawn down to close said valve and moved exterior to said nozzle when elevated to open the valve.

8. In a fountain-pen, the combination, with a reservoir-holder having a throat, of a valve for controlling communication therewith, having a tubular stem passing through the throat, with its exterior surface in capillary proximity to the interior surface of the throat, and an operating-stem passing through said tubular stem and having an operating-handle at the lower end of the pen-holder.

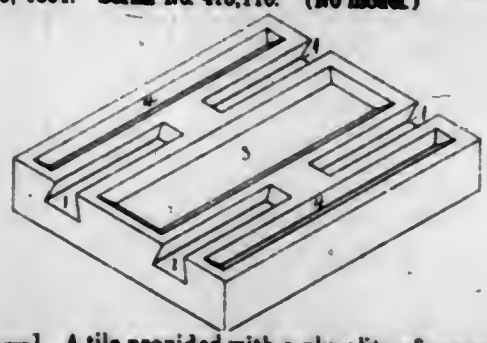
478,654. CATCH-BASIN. ELMER F. ST. JOHN, Colorado Springs, Colo. Filed Feb. 12, 1892. Serial No. 421,329. (No model.)

Claim.—1. A water-basin comprising a series of cylindrical sections adjusted together, an inlet-pipe extending through the uppermost section and provided with a bent projection projecting belo the water-line, and a gas-vent in said bend above the water-line, and an outlet-pipe connected with the lowermost section near the bottom, substantially as set forth.

2. A catch-basin comprising a series of cylindrical sections having upper off-standing flanges and inner shoulders, the lower ends of the upper sections resting upon the shoulders therebeneath, a filling-joint between said flanges and the lower ends of the upper sections, a cemented bottom inclosing the lowermost section, a vented inlet-pipe extending into the uppermost section and projecting below the water-line, an outlet-pipe near the bottom of the basin, a plugged drain-pipe connected with said cemented bottom, and a cap or cover inclosing said basin, substantially as set forth.

478,655. BOX-LID SUPPORT. CHARLES B. STRUBLE, Minneapolis, Minn. Filed Dec. 1, 1891. Serial No. 413,715. (No specimens.)

Claim.—1. An article of manufacture consisting of a bracket having a clasp portion to engage the lid and a prong or lug 6, arranged at an angle thereto and adapted to engage the back of the box.



2. An article of manufacture consisting in the bracket-clasp having prongs to engage the forward and rear sides of a box-lid and a prong 6, arranged at an angle thereto and strengthened by a rib 10, as described.

3. An article of manufacture made up of the prongs 2, 3, 4, 5, and 6 and the bridge portion 7, all arranged in the relations described, and for the purpose specified.

4. An article of manufacture consisting in the bridge 7, strengthened by the rib 8 and having the prongs 2 3 and 4 5, one set of prongs extending beyond the other, a lug or prong 6, and a lip arranged on the prong 4 to engage the box-lid, substantially as described.

5. As an article of manufacture, the bracket-clasp made up of the prongs 2, 3, 4, 5, and 6, the bridge 7, the strengthening-rib 8, and the toothed lip provided on one of said prongs, and said parts arranged in the relations described, as and for the purpose specified.

478,656. TILE. ANDERS M. STRUKSOLM, Woodbridge, N. J. Filed Dec. 15, 1891. Serial No. 415,110. (No model.)

Claim.—1. A tile provided with a plurality of grooves in its under surface, said grooves commencing at opposite edges thereof and terminating at such a distance therefrom as to leave a web between their approximate ends, the said grooves having beveled sides, substantially as set f· th.

2. A tile provided with a plurality of grooves in its under surface, said grooves commencing at opposite edges thereof and terminating at such a distance therefrom as to leave a web between their approximate ends, the said grooves having beveled side and recessed portions entirely within the edges of the tile and extending parallel with the said grooves, as set forth.

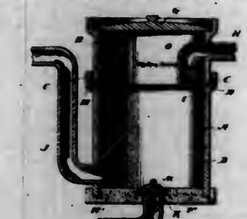
478,657. MOP-HOLDER. LIDA A. TARRING, Baltimore, Md. Filed July 24, 1890. Serial No. 359,735. (No model.)

for operating said valve, passing through the throat, with its exterior surface in capillary proximity to the interior surface of the throat, whereby a capillary duct is formed for the flow of ink and the valve may be adjusted from the exterior of the holder.

2. In a fountain-pen, the combination, with a reservoir-holder having a throat or passage communicating with the pen, of a valve for controlling communication through said throat, having a tapering stem passing through the throat and emerging from the lower end of the holder, where it is accessible for operating the valve and with the exterior surface of said stem in capillary proximity to the interior surface of the throat to form a capillary duct, and the valve constructed to open by an upward movement, whereby as the valve is opened the movement of the tapering stem increases the capacity of said capillary duct.

3. In a fountain-pen, the combination, with a reservoir-holder having a throat or passage communicating with the pen, of a valve for controlling communication through said throat, and a stem for operating said valve, extending through the throat and terminating in an operating-handle at the lower end of the pen-holder, and the nozzle of the holder formed with provisions adapted to engage said handle and hold it in different positions.

4. In a fountain-pen, the combination, with a reservoir-holder having a throat or passage communicating with the pen, of a valve for controlling communication through said throat, a stem for operating it passing through the throat and having its lower end bent upwardly and adapted to pass outside of the nozzle, and the nozzle formed with provisions to engage said upturned end to hold the stems in different positions.



5. In a fountain-pen, the combination, with a reservoir-holder having a throat, of a valve for controlling communication therewith, and a stem for operating said valve, passing through the throat and having its lower end bent laterally and upwardly and adapted to pass outside of the nozzle, whereby the downward and upward branches of said stem pass on opposite sides of one edge or rim of the pen-nib.

6. In a fountain-pen, the combination, with a reservoir-holder having a throat, of a valve for controlling communication therewith, an operating-stem movable relatively to said valve, extending through the throat and terminating in an operating-handle formed with a stop adapted, when pushed upwardly, to encounter and unseat the valve, and a spring pressing downwardly against the valve, adapted to press the valve to its seat when the stem is lowered.

7. In a fountain-pen, the combination, with a reservoir-holder having a throat, of a valve for controlling communication therewith, and a stem for operating said valve, passing through the throat and having its lower end turned upwardly to form an operating-handle and said stem constructed to admit of its handle being entered within the lower end of the nozzle when drawn down to close said valve and moved exterior to said nozzle when elevated to open the valve.

8. In a fountain-pen, the combination, with a reservoir-holder having a throat, of a valve for controlling communication therewith, having a tubular stem passing through the throat, with its exterior surface in capillary proximity to the interior surface of the throat, and an operating-stem passing through said tubular stem and having an operating-handle at the lower end of the pen-holder.

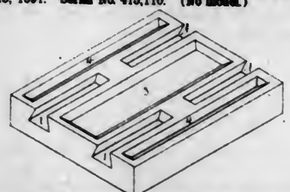
478,654. CATCH-BASIN. ELMER F. ST. JOHN, Colorado Springs, Colo. Filed Feb. 12, 1892. Serial No. 421,329. (No model.)

Claim.—1. A water-basin comprising a series of cylindrical sections adjusted together, an inlet-pipe extending through the uppermost section and provided with a bent projection projecting below the water-line, and a gas-vent in said bend above the water-line, and an outlet-pipe connected with the lowermost section near the bottom, substantially as set forth.

2. A catch-basin comprising a series of cylindrical sections having upper off-standing flanges and inner shoulders, the lower ends of the upper sections resting upon the shoulders therebeneath, a filling-joint between said flanges and the lower ends of the upper sections, a cemented bottom inclosing the lowermost section, a vented inlet-pipe extending into the uppermost section and projecting below the water-line, an outlet-pipe near the bottom of the basin, a plugged drain-pipe connected with said cemented bottom, and a cap or cover inclosing said basin, substantially as set forth.

478,655. BOX-LID SUPPORT. CHARLES B. STRUBLE, Minneapolis, Minn. Filed Dec. 1, 1891. Serial No. 413,715. (No specimens.)

Claim.—1. An article of manufacture consisting of a bracket having a clasp portion to engage the lid and a prong or lug 6, arranged at an angle thereto and adapted to engage the back of the box.



2. An article of manufacture consisting in the bracket-clasp having prongs to engage the forward and rear sides of a box-lid and a prong 6, arranged at an angle thereto and strengthened by a rib 10, as described.

3. An article of manufacture made up of the prongs 2, 3, 4, 5, and 6 and the bridge portion 7, all arranged in the relations described, and for the purpose specified.

4. An article of manufacture consisting in the bridge 7, strengthened by the rib 8 and having the prongs 2 3 and 4 5, one set of prongs extending beyond the other, a lug or prong 6, and a lip arranged on the prong 4 to engage the box-lid, substantially as described.

5. As an article of manufacture, the bracket-clasp made up of the prongs 2, 3, 4, 5, and 6, the bridge 7, the strengthening-rib 8, and the toothed lip provided on one of said prongs, and said parts arranged in the relations described, as and for the purpose specified.

478,656. TILE. ANDERS M. STRUNSOLM, Woodbridge, N. J. Filed Dec. 15, 1891. Serial No. 415,110. (No model.)

Claim.—1. A tile provided with a plurality of grooves in its under surface, said grooves commencing at opposite edges thereof and terminating at such a distance therefrom as to leave a web between their approximate ends, the said grooves having beveled sides, substantially as set forth.

2. A tile provided with a plurality of grooves in its under surface, said grooves commencing at opposite edges thereof and terminating at such a distance therefrom as to leave a web between their approximate ends, the said grooves having beveled side and recessed portions entirely within the edges of the tile and extending parallel with the said grooves, as set forth.

478,657. MOP-HOLDER. LIDA A. TARRING, Baltimore, Md. Filed July 24, 1890. Serial No. 359,735. (No model.)

Claim.—As an improved article of manufacture, the mop-holder described, which consists of a handle composed of three strands of wire twisted together and spreading at one end to form two straight and one hook-shaped prongs clamped by means of an adjustable ring, said strands of wire branching at their opposite ends, where they are united by a thin plate of metal, as set forth.

478,658. COMBINATION-LOCK. WILLIAM H. THOMPSON, Winnipeg, Canada. Filed June 23, 1891. Serial No. 397,243. (Model.)

Claim.—1. The combination, in a lock, of a rotary pull-shaft having one or more circumferential grooves, a series of notched slides playing therein transversely to the shaft, and means for adjusting them to the opening-combination, substantially as shown and described.

2. The combination, in a lock, of a rotary bolt having a locking-notch, a spring-bar having a tumbler on its end resting in said notch, a grooved pull-shaft arranged at right angles to the spring-bar and arranged to operate thereon, and one or more slides playing in the grooves of said shaft, and means for adjusting the same, substantially as shown and described.

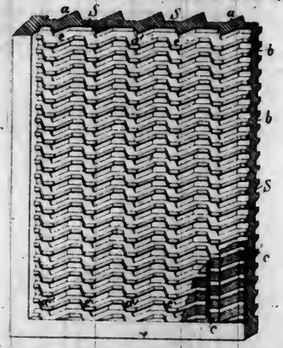
3. The combination, in a lock, of the spring-bar having a tumbler at its end, a grooved pull-shaft operating thereon at right angles, one or more slides arranged in the grooves of said shaft, means for operating said slides, teeth arranged upon the slides, and a detent operated upon by the pull-shaft to be thrown into engagement with the teeth of the slides, substantially as shown and described.

4. The combination of the outer case having longitudinal slits *f g h*, with graduations and figures, a series of slides arranged inside the case and provided with exteriorly-projecting thumb-pieces, and a pull-shaft arranged at right angles to the slides and having one or more grooves to receive said slides, substantially as shown and described.

5. The combination of the rotary bolt C, having notch *c*, the spring-bar D, having tumblers *d*, the housing E, having a slot *e*, and the pull-shaft F, passing through the housing and having a projecting toe upon the outside, substantially as shown and described.

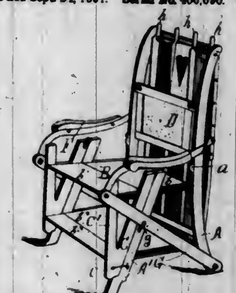
6. The lock consisting of the case A, with slits *f g h*, partition H, removable slide B, bearing spring-bar D, tumbler *d*, and housing E, the rotary bolt C, with notch *c*, the grooved pull-shaft F, and the notched and toothed slides G G', I, and J, substantially as shown and described.

478,659. FRUIT-JAR. CASSIUS D. THOMAS, Moberly, Mo. Filed Nov. 14, 1891. Serial No. 411,937. (No model.)



Claim.—As an improvement in fruit-jars of the class described, the combination, with the jar proper, provided at its mouth with two oppositely-located inclined ways 3, the opposing ends of which intersect each other, thereby forming shoulders 9, having reversely-beveled surfaces, of a cover 6 for said jar and a spring wire bail 10, turning centrally upon the cover and having its ends arranged to engage the beveled shoulders to automatically release the bail from engagement with the jar, substantially as and for the purpose set forth.

478,660. FEED-REGULATING ATTACHMENT FOR SEWING-MACHINES. RICHARD TODD, Manchester, England. Filed Aug. 11, 1891. Serial No. 402,343. (No model.)



Claim.—An improved feed-regulator, consisting of a removable plate *e*, having a recess *e'*, with a flange e^2 and e^3 at each side of said recess, and an adjusting-slot e^4, with the securing-screw *g*, in combination with the screw *a*, shifting-bar *b*, fulcrum *c*, and feeding-bar *d* of a sewing-machine, substantially as described and shown.

478,661. ELECTRODE FOR STORAGE-BATTERIES. HENRI TUDOR, Rosport, Luxemburg. Filed Jan. 8, 1892. Serial No. 417,602. (No model.) Patented in Belgium May 30, 1891, No. 94,869.

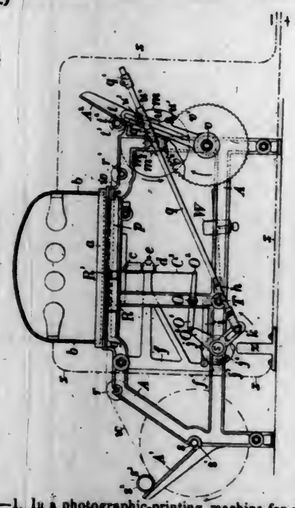
Claim.—An electrode for electric storage-batteries, consisting of a core composed of one or more bodies of metal having main ribs *a*, which are provided with secondary ribs *c*, forming between them grooves *b*, and operative substance embedded in the said grooves, substantially as described.

478,662. COMBINATION-CHAIR. WILLIAM H. TUTTLE, Detroit, Mich. Filed Sept. 24, 1891. Serial No. 406,690. (No model.)

Claim.—1. In a combination-chair, a frame having its front legs extending above the plane of the seat and supporting the inner half of the seat, and auxiliary frames hinged at the top of said legs and supporting the forward portion of the seat and adapted to swing said portion above the seat, substantially as and for the purposes described.

2. In a combination-chair, a frame having its front legs extending above the plane of the seat and supporting the inner half of the seat, and auxiliary frames hinged at the top to the top of said legs and supporting the forward portion of the seat and adapted to swing up and form a step-ladder, and brackets adapted to receive the thrust of the upper portion of the ladder, substantially as described.

3. The combination, with a chair-frame, of a table hinged at one end to the top of the frame of said chair, a link hinged to said chair-frame near the bottom, a chair-arm connected by short links to said table and to the said first-mentioned link, the said table being adapted to hang in a vertical position behind the chair-frame and to swing from such vertical position to a horizontal position over the chair-seat and the said arm being adapted to swing with said table from a horizontal to an upright position and to form in its upright position a support for the table, substantially as and for the purpose specified.



4. In combination with a chair, a table pivoted at one end to the top of the back of the frame of said chair, arms pivoted to said table at one end and to swinging bars at the opposite end and adapted to form vertical supports for said table when swung in a horizontal position, substantially as described.

5. In combination with a chair, a table pivoted at one end to the top of the frame of said chair, hanging normally back of said chair and adapted to be swung into a horizontal position above said chair,

fingers pivoted to said chair-frame and provided with extensions A, said fingers hanging normally parallel with said table, said extensions extending above the pivot of said table, whereby the said table is adapted when swung into its horizontal position above said chair to carry the said extensions into a horizontal position and to support said fingers in a horizontal position, substantially as described.

6. The combination, with a chair-frame, of a table hinged to said chair-frame, fingers pivoted to said chair-frame and adapted to hang normally in a vertical position between the chair-frame and the table, the said fingers being provided with upward-extending portions A, adapted to be brought under the table when the table assumes a horizontal position and to coact with the supporting-pivot and the table in forming a secure support for the said fingers, substantially as and for the purpose specified.

478,663. PHOTOGRAPHIC-PRINTING MACHINE. JOHN URIE, Jr., Jersey City, N. J. Filed July 17, 1891. Serial No. 399,819. (No model.)

Claim.—1. In a photographic-printing machine for making successive prints from a single negative upon a continuous web of sensitized paper, the combination, with the supply-roll, the printing-frame, and the power-shaft, of a measuring-roll, and means for rotating the same intermittingly through a given arc, ways extending upwardly from the said measuring-roll, and a take-up roll supported by the said measuring-roll in conjunction with the said ways, as and for the purpose set forth.

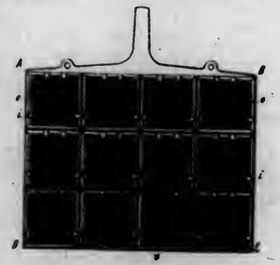
2. In a photographic-printing machine for making successive prints from a single negative upon a continuous web of sensitized paper, the combination, with the supply-roll, the printing-frame, and the power shaft, of a measuring roll, and means for rotating the same intermittingly through a given arc, upwardly-inclined ways extending radially from the said measuring-roll, and a take-up roll supported by the said measuring-roll in conjunction with the said inclined ways, as and for the purpose set forth.

3. In a photographic-printing machine for making successive prints from a single negative upon a continuous web of sensitized paper, the combination, with the supply-roll, the printing-frame, and the power-shaft, of a measuring-roll, and means for rotating the same intermittingly through a given arc, upwardly-inclined ways extending radially from the said measuring-roll, and a take-up roll consisting of the straight cylinder f, sustained upon the said measuring-roll, and the hubs f^2 at each end thereof, bearing against the said inclined ways, substantially as and for the purpose set forth.

4. In a photographic-printing machine for making successive prints from a single negative upon a continuous web of sensitized paper, the combination, with the main frame, the printing-frame mounted thereon and provided with the negative, and the power-shaft, of a cushion-platen secured by means of a flexible joint upon one arm of a bell-crank pivoted upon the main frame, means applied to the bell-crank for pressing the platen normally upward, and means connected with the other arm of the bell-crank and with the power-shaft for reciprocating the bell-crank at intervals to retract the cushion-platen, substantially as herein shown and described.

5. In a photographic-printing machine for making successive prints from a single negative upon a continuous web of sensitized paper, the combination, with the main frame, the printing-frame mounted thereon and provided with the negative, and the power-shaft, of a cushion-platen supported upon the lateral arm of a bell-crank pivoted upon the main frame, and a divided cam upon the power-shaft adjacent to the depending arm of the bell-crank, the said cam consisting of two similar flat plates having projecting hubs thereon and secured together by a clamp-bolt and adapted for circular adjustment upon each other, the whole arranged and operated as and for the purpose set forth.

6. In a photographic-printing machine for making successive prints from a single negative upon a continuous web of sensitized paper, the combination, with the main frame, the printing-frame mounted thereon and provided with the negative, and the power-shaft, of a cushion-platen supported upon the lateral arm of a bell-crank, pivoted upon the main frame and a divided cam constructed as described, fixed upon the power-shaft adjacent to the depending arm of the said bell-crank of an anti-friction roller applied to the said depending arm and adapted to engage the said cam, as and for the purpose set forth.

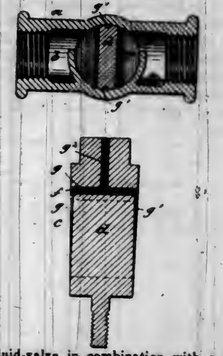


7. In a photographic-printing machine, the combination, with the main frame, the printing-frame mounted thereon and provided with the negative, and the power-shaft, of a cushion-platen supported upon the lateral arm of a bell-crank, pivoted upon the main frame, an adjustable cam fixed upon the power-shaft adjacent to the depending arm of the bell-crank for moving the said arm in one direction, and means for applying a yielding pressure to the said arm in opposition to the cam, as and for the purpose set forth.

8. In a photographic-printing machine, the combination, with the main frame, the printing-frame mounted thereon and provided with the negative, and the power-shaft, of a cushion-platen supported upon the lateral arm of a bell-crank, pivoted upon the main frame, an adjustable cam, constructed as described, fixed upon the power-shaft adjacent to the depending arm of the said bell-crank, a second bell-crank having a laterally-projecting arm provided with a counterbalance-weight W, and a link connecting the upwardly-projecting arm of latter to the depending arm of the bell-crank sustaining the platen, the whole arranged and operated substantially as herein set forth.

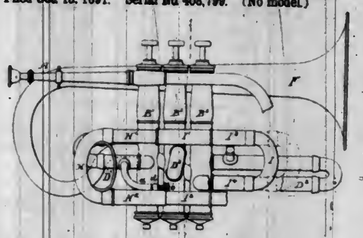
9. In a photographic-printing machine, the combination, with the printing-frame provided with the negative, a box applied thereto containing incandescent electric lamps and open on the side adjacent to the printing-frame, and the power-shaft of the machine, of two adjacent spring-contacts having flat faces opposed to each other located in the electric circuit supplying the said incandescent lamps, and a segmental plate mounted upon the power-shaft adjacent to the said opposed spring-contacts and rotated between the same to establish electrical connection intermittingly between the same, thereby alternately making and breaking the circuit through the said electric lamps, substantially as and for the purpose set forth.

10. In a photographic-printing machine, the combination, with the printing-frame provided with the negative, a box applied thereto containing incandescent electric lamps and open on the side adjacent to the printing-frame, and the power-shaft of the machine, of the adjacent spring-contacts having flat faces opposed to each other located in the electric circuit supplying the said incandescent lamps, and a segmental plate divided into two flat sections adjustable upon each other and provided with a clamp-screw for securing them together, as described, the said plate being mounted upon the power-shaft adjacent to the said opposed spring-contacts and rotated between the same to establish electrical connections intermittingly between the same and thereby alternately making and breaking the circuit through the said electric lamps, the whole arranged and operated as and for the purpose set forth.



478,664. ELECTRODE. ARMAND VANDEN-KERCKHOVE, Brussels, Belgium. Filed Feb. 12, 1892. Serial No. 421,351. (No model.) Patented in Belgium Dec. 9, 1891, No. 73,568; in France Dec. 10, 1891, No. 204,802; in England Dec. 11, 1891, No. 21,702, and in Italy Jan. 5, 1892, No. 470.

Claim.—The herein-described electrode-plate, consisting of a grating and electrodes each secured to said grating by soldering on one



of its sides and by lugs or projections on its other sides, thereby allowing a space on three of its sides for the expansion and contraction thereof, substantially as set forth.

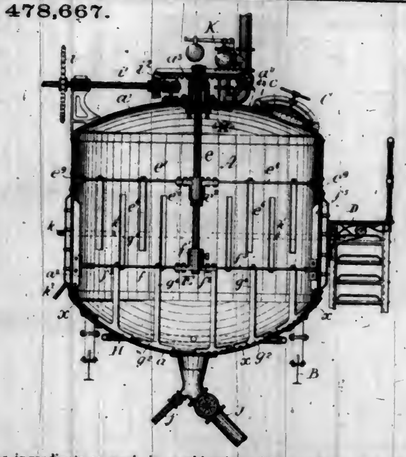
478,665. VALVE. GEORGE VINING, Hartford, Conn. Filed Aug. 18, 1890. Serial No. 362,353. (No model.)

Claim.—In a fluid-valve, in combination with a valve-body, a tapered rotary plug having a thin central portion, a transverse chamber extending through the plug, the grooves located in the edges of the thin central portion of the plug and extending downward from the transverse chamber, an opening from the transverse chamber to the top of the plug, and a fibrous packing located in the transverse chamber, all substantially as described.

478,666. CONVERTIBLE CORNET. JEAN VIVIEN, Philadelphia, Pa. Filed Oct. 15, 1891. Serial No. 408,799. (No model.)

Claim.—1. A cornet having the ordinary tuning-slide combined with a stop for limiting its outward movement, whereby it serves as a key-slide, substantially as specified.

2. A cornet having the ordinary tuning-slide combined with a stop for limiting its outward movement and having the third bend or elbow of the pipe-coil adjacent to the third valve-casing adjustable for the purpose of a tuning-slide, substantially as specified.

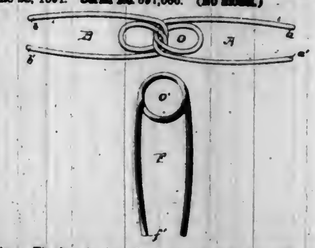


3. The combination of the adjustable key-slide of a cornet with a stop for limiting the outward movement of said key-slide, said stop consisting of a fixed projecting arm and a swinging arm carrying a set-screw for engagement with said fixed arm, one of said arms being carried by the slide and the other by a fixed portion of the instrument, and the swinging arm being adjustable out of line with the fixed arm, so as to permit of the removal of the slide, substantially as specified.

478,667. MASHING APPARATUS. ADAM C. WAGNER, Philadelphia, Pa. Filed Apr. 12, 1892. Serial No. 428,755. (No model.)

Claim.—1. In a mashing apparatus, a vessel having a concave bottom, in combination with an agitator comprising a driving-shaft journaled near one of its ends in a stationary cross-bar having arms and the other end of said shaft journaled outside said vessel, a revolving bar attached to said shaft and carrying at its respective extremities scrapers, and arms fastened on opposite sides to said revolving bar, certain of said arms carrying scrapers disposed adjacent to said concave bottom and having chains attached thereto, substantially as and for the purposes set forth.

2. In a mashing apparatus, a cylindrical vessel having concave bottom and cover, a steam-jacket around said vessel and located above said bottom, steam inlets and outlets provided on said vessel and jacket, and inlets and outlets provided in the concave bottom and cover for

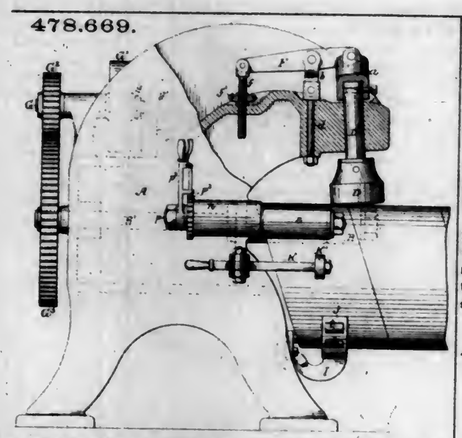


478,667.

the ingredients or mash, in combination with an agitator comprising a driving-shaft extending half-way into said vessel and having one of its ends journaled in a bearing located outside the vessel and the other journaled in a bearing formed in a cross-bar within said vessel, said cross-bar carrying arms, a revolving cross-bar adjustably attached to said shaft and having at its respective ends scrapers located adjacent to the side walls of the vessel, and arms attached to opposite faces of said revolving bar, the arms above said bar disposed between the arms of the said arms on the said stationary cross-bar, and the arms below said revolving bar provided with scrapers disposed adjacent to the concave bottom and having chains attached thereto, substantially as and for the purposes set forth.

3. In a mashing apparatus, a cylindrical vessel having a depressed bottom and cover, an adjustable stay-bar for said vessel provided with adjustable stationary arms disposed at an angle to their support, an agitator comprising a driving-shaft journaled in said bar and in a bearing located outside said vessel and carrying a revolving bar provided at its ends with scrapers located in close proximity to the walls of said vessel, and arms attached to said revolving arm and having at their lower extremities scrapers adjacent to the bottom of said vessel, said arms and scrapers disposed at angles with respect to their supports, substantially as and for the purposes set forth.

478,668. PUZZLE. WILLIAM T. WALKER, Clarksville, Tex. Filed June 22, 1891. Serial No. 397,066. (No model.)



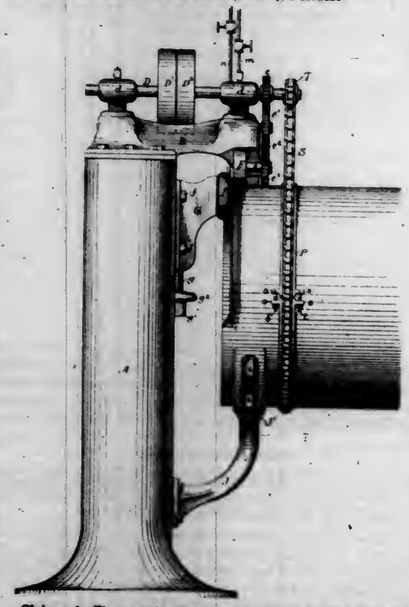
Claim.—The herein-described trick puzzle, the same consisting of one false and three true members, each of a stiff wire bent at its center into a loop or ring, with its ends extending therefrom and standing approximately parallel, the bends of the true members being in one direction and of the false member in the opposite direction, as herein-before set forth.

478,669. PIPE-WELDING MACHINE. ROBERT K. WELOR, Philadelphia, Pa., assignor of one-half to George E. Schlegelmilch, same place. Filed Aug. 5, 1891. Serial No. 401,737. (No model.)

Claim.—1. The combination, in a spiral-weld-pipe machine, of the inner roll, the periphery of which supports the pipe, with the outer pressing-roll turning on an upright axis and having a lower conical face pressing upon the pipe, so as to exert a wiping action upon the joint, substantially as specified.

2. The combination, in a pipe-welding machine, of the inner supporting-roll with the outer pressing-roll having a lower conical face and

478.669.



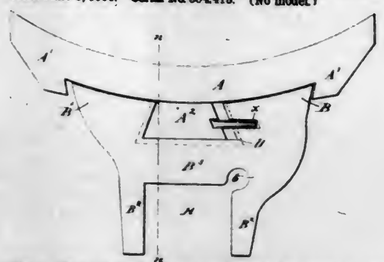
an upright shaft, and pressure devices to which said shaft is swiveled, substantially as specified.

3. The combination of the inner supporting-roll, the outer flat-faced and swiveled pressure-roll, a pressure-lever having a block carrying said swiveled roll, a threaded rod connected to said lever, a nut engaging with said rod, and gearing for turning said nut, substantially as specified.

4. The combination, in a pipe-welding machine, of the welding-rolls with a bearing-roll in advance of said welding-rolls and an eccentric carrier for said bearing-roll, whereby it can be adjusted nearer to or farther from the welding-rolls, substantially as specified.

5. The combination, in a pipe-welding machine, of the welding-rolls with two slotted heating-boxes, one facing in one direction and receiving the edge of the pipe and the other facing in the opposite direction and receiving the edge of the incoming strip, whereby said edges are heated before they reach the welding-rolls, substantially as specified.

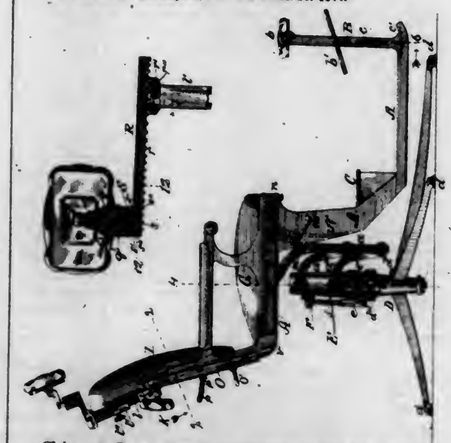
478,670. PIPE-FLANGING MACHINE. ROBERT K. WELCH, Philadelphia, Pa., assignor of one-half to George E. Schlegelmilch, same place. Filed June 24, 1891. Serial No. 397,279. (No model.)



Claim.—1. The combination, in a pipe-flanging machine, of the external bearing-roll and the right-angled flanging-roll with a heating-box through which the end of the pipe passes before reaching the rolls, said box being located in advance of the rolls and in close proximity thereto, substantially as specified.

2. The combination of the external bearing-roll, the right-angled flanging-roll, a support for the bottom of the pipe, and bearings for the upper portion of the pipe on each side of the external bearing-roll, said bearings being adjustable from and toward the pipe, substantially as specified.

3. The combination of the external bearing-roll and the flanging-roll with the heating-box in advance of the same, said box having a curved slot for the reception of a portion of the end of pipe, and valved air and gas supply pipes for said box, substantially as specified.



4. The combination of the external bearing-roll, the right-angled flanging-roll, the support for the pipe, and the detachable sprocket-wheel clamp for said pipe with a sprocket-chain engaging said clamp and serving to aid in supporting the pipe and to rotate the pipe so as to bring successive portions of the same under the action of the rolls, substantially as specified.

478,671. BRAKE-SHOE. JOSEPH G. WHARTON, Harrisburg, Pa. Filed June 3, 1890. Serial No. 354,418. (No model.)

Claim.—The sole A, having upon its ends the hooks A', situated upon the same side as the dovetail tenon A^2 thereon and equidistant therefrom, in combination with the shoe B B', adapted at its front as a bearing for the sole above to clutch either of said hooks, having centrally thereon the recess D, of a shape to correspond with the cross-section of said tenon, and having also the additional recess between the flanges B^5 B^6, and the locking-key X, substantially as set forth.

478,672. DENTAL CHAIR. BASIL M. WILKERSON, Baltimore, Md., assignor, by mesne assignments, to the S. S. White Dental Manufacturing Company, Philadelphia, Pa. Filed Dec. 21, 1877.

Claim.—1. The combination, substantially as set forth, of the main support, the chair-frame, its supporting-bar, the arms pivoted at their inner and outer ends at corresponding distances apart to the main support and supporting-bar, respectively, and means for operating the arms, whereby the chair-frame may be raised or lowered by rocking said arms about their pivotal connections with the main support.

2. The combination, substantially as set forth, of the main support, the chair-frame, its supporting-bar, the arms pivoted at their inner and outer ends at corresponding distances apart to the main support and supporting-bar, respectively, one of said arms being provided with gear-teeth at its inner end, the worm engaging said teeth, and the worm-

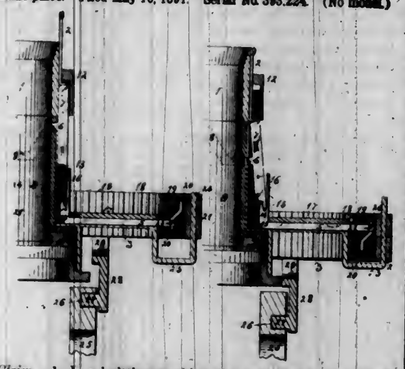
shaft mounted in bearings of the main support and projecting at one end therefrom to adapt it to be acted upon for turning the worm in either direction to raise or lower the chair-frame.

3. The combination, in a dental chair, of the main support, the worm, its shaft mounted in bearings of the main support, the reversely-toothed double ratchet on the worm-shaft, the lever fulcrumed on the main support eccentrically to said ratchet, and the reversible double pawl carried by the lever for actuating the ratchet to rotate it in either direction by downward movement of the lever, substantially as and for the purpose set forth.

4. The combination of the worm, its shaft, the support, in bearings of which the shaft is mounted, the two-part ratchet of said shaft, the reversible pawl having the point at top, the lever pivoted to said support eccentrically to the ratchet and to which the pawl is pivoted, the adjustable arm of the lever acting on the pawl-point, and a spring for elevating the lever, substantially as and for the purpose set forth.

5. The combination of the tilting chair-frame, the vertically-adjustable supporting-bar to which it is pivoted and by way of which it is entirely supported, the separable gearing connecting the chair-frame, and supporting-bar for tilting said chair-frame about its pivotal connection with the supporting-bar, and means for disconnecting said gearing, whereby the chair-frame may be tilted gradually by the gearing when in mesh or rapidly by direct application of force when the gearing is disconnected, substantially as set forth.

6. The combination of the chair-frame platform provided at its extremities on either side with racks and above said racks with slotted bearings and the foot-rest standards engaging at their lower ends with said racks and having pivots adapted to rock in and move lengthwise of said slotted bearings, substantially as and for the purpose set forth.

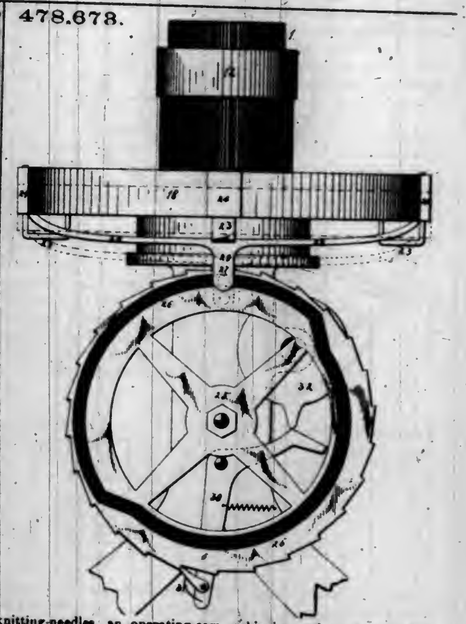


7. The combination, in a dental chair, of the chair-seat frame, the upholstered seat, and the plate pivoted to the lower front portion of the seat-frame, shaped to correspond with the front and upper surfaces of the upholstered seat, and adapted to fold over upon said seat, substantially as and for the purpose set forth.

8. The combination of the head-rest supporting-bar having the disk-like head at top provided upon its upper surface with the circularly-arranged perforations, the guide-piece turning about the supporting-bar, and the two-part sliding and turning link, one member of which is movable vertically relatively to the other and is provided with teeth for engaging the holes in the head of the supporting-bar, substantially as and for the purpose set forth.

9. The combination of the vertically-movable head-rest column provided with teeth on its under side, and the link in which the column is fitted to turn, provided upon the upper surface of its outer end with the circular row of holes for engagement with the teeth on the under side of the column, substantially as and for the purpose set forth.

10. The combination of the head-rest, the arm at one end of which it is mounted, the curved toothed lug at the opposite end of said arm, the column having the lug-seat curved at bottom and provided with a tooth, and the pivotal connection between said lug and column permitting of vertical and rocking movement of the lug in its seat in the column, substantially as and for the purpose set forth.



478,673. KNITTING-MACHINE. NICHOLAS J. WIBLUND, Rockford, Ill., assignor of two-thirds to Edward McSherry and Henry W. Price, same place. Filed May 16, 1891. Serial No. 393,224. (No model.)

Claim.—1. In a knitting-machine, the combination of a needle-cylinder, knitting-needles, jacks, subjacks, and an operating-cam, the subjacks being provided with an extension which forms a guide for the jacks and holds them in engagement with the cam during the process of knitting.

2. In a knitting-machine, the combination of a needle-cylinder,

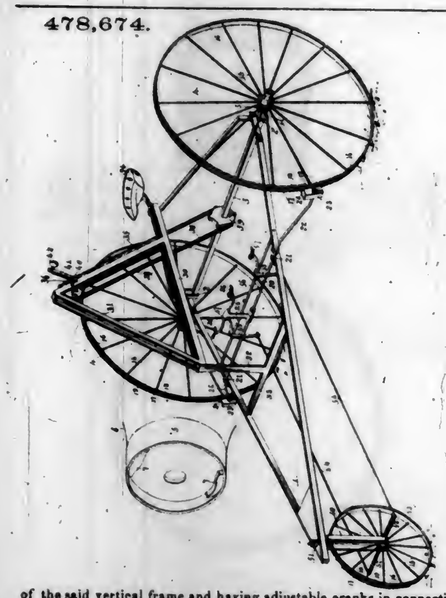
478.678.

knitting-needles, an operating-cam, subjacks, and a pattern-wheel located outside of the needle-cylinder and capable of a vertical movement and operating upon the subjacks to hold the needles in or out of engagement with the cam.

3. In a knitting-machine, the combination of a needle-cylinder, a series of knitting-needles, a series of subjacks, and a pattern-wheel located outside of the needle-cylinder and capable of a vertical movement, and means for moving the pattern-wheel, each of the subjacks having an independent connection with the pattern-wheel.

4. In a knitting-machine, the combination of a needle-cylinder, needles located therein, an annular base extending from the cylinder, said base being provided with radial grooves, subjacks located in said grooves, and a top plate holding the subjacks in position.

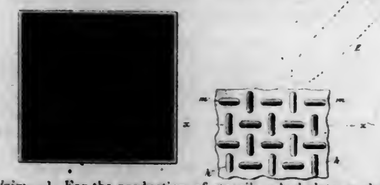
478,674. VELOCIPEDE. JOHN R. WRIGHT, Morocco, Ind. Filed Dec. 26, 1891. Serial No. 416,224. (No model.)



Claim.—1. In a tricycle, the combination, with an A-shaped frame-work, a main axle across its face, driving-wheels thereon, and means for rotating the axle, of a fork pivoted in the apex of the frame-work, a shaft through the fork, a steering-wheel journaled thereon, a cross-rod in the frame, bell-crank levers pivoted at their angles on said rod, and a rod connecting one arm of each lever with one end of said shaft, as set forth.

2. In a velocipede, the combination of an A-shaped frame-work, a main axle extending across the rear portion thereof, a vertical frame supported at the rear of and above the central portion of said A-shaped frame and having a sprocket-wheel and cranks for operating the same, a sprocket-wheel on the said axle, a chain belt connecting said sprocket-wheels, said vertical frame being slotted for the passage of the chain belt therethrough, and steering and brake mechanism, substantially as described.

3. In a velocipede, the combination of a frame located horizontally, a vertically-disposed frame on the rear portion of the aforesaid frame and supported in elevated position, a seat secured to said vertically-disposed frame, brake and steering mechanism, an axle connected to the rear portion of the said horizontal frame and having the ends thereof enlarged in the form of heads with two diametrically-opposed pawls on the outer faces of each of the same, and two diametrically-disposed teeth secured to the hubs of the wheels and located in the sand-bands thereof and adapted to be engaged by said pawls, said axle being operated by sprocket-wheels and a connecting chain belt, substantially as described.



4. In a velocipede, a horizontally-disposed A-shaped frame having a steering-wheel at the front end thereof and an axle at the rear of the same, brake and steering mechanism, a vertically-disposed frame supported by and above the rear portion of the aforesaid horizontally-disposed frame and composed of slotted bars, to the rearmost of one of which is secured a seat, a sprocket-wheel mounted in the upper portion

478,674.

of the said vertical frame and having adjustable cranks in connection therewith, composed of two sections sliding upon each other and controlled by a set-screw and nut, a sprocket-wheel on the axle, a chain belt connecting said sprocket-wheels, and clutch mechanisms on the ends of the axle and within the sand-boxes of the hubs of the wheel and consisting of two diametrically-opposed pawls engaging similarly-situated teeth in order to prevent backward movement of the rear wheels and of the machine entire, substantially as described.

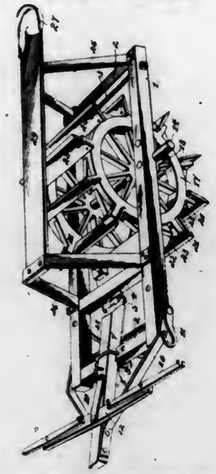
478,675. METHOD OF AND APPARATUS FOR PRODUCING STENCILS. JOSIAH L. YOUNG, Buffalo, N. Y., assignor of one-half to Charles H. Edgar, trustee. Filed Mar. 18, 1892. Serial No. 425,446. (No model.)

Claim.—1. For the production of stencils, a bed-plate or platen having projections of greater length than width and arranged so that each projection extends longitudinally in a direction substantially at right angles to the longitudinal direction of the surrounding projections which are nearest, substantially as and for the purpose described.

2. For the production of stencils, a bed-plate or platen having projections extending longitudinally in directions opposite to each other and presenting curved surfaces to contact with a stylus, substantially as and for the purpose described.

3. For the production of stencils, a bed-plate or platen having longitudinal projections, all the surfaces of which are curved and the longitudinal axes of which projections are alternately substantially at right angles to each other, substantially as and for the purpose described.

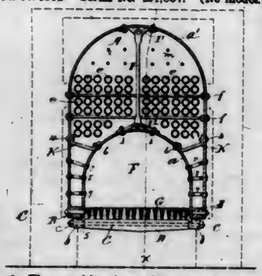
4. For the production of stencils, the combination of a sheet or fabric of interwoven wires of threads with a backing B, substantially as and for the purpose described.



5. For the production of stencils, the combination of a sheet or fabric of interwoven wires or threads with a backing B and interstitial filling D, substantially as and for the purpose described.

6. The aforesaid method of producing a platen or bed-plate for the production of stencils, consisting in first interweaving strands or wires into a woven cloth or fabric, next stretching same into a single flat plane or surface, next combining same with a backing or interstitial filling, next taking an electrotype thereof, and next providing the said electrotype with a backing, all substantially as and for the purpose described.

7. The aforesaid method of producing a platen or bed-plate for the production of stencils, consisting in first interweaving threads into a woven cloth or fabric, next stretching and retaining same in a flat plane or surface, next combining same with a backing or interstitial filling, next covering with plumbago the surface composed of said backing or interstitial filling and portions of woven fabric therefrom projecting, next exposing same to an electrotype-bath and making an electrotype upon said plumbagoed surface, and next removing and permanently backing the said electrotype, substantially as and for the purpose described.

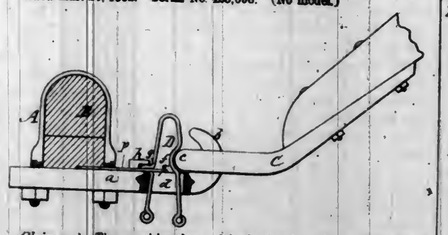


8. The aforesaid method of producing a platen or bed-plate for the production of stencils, consisting in first interweaving wires into a woven cloth or fabric, next stretching and retaining same in a flat plane or surface, next combining same with a backing or interstitial filling, next impressing upon a WAX or other plastic surface the said surface composed of said backing or interstitial filling and the portions of said wire fabric therefrom projecting, next taking an electrotype from said impression, and next providing said electrotype with a permanent backing, substantially as and for the purpose described.

478,676. STALK-CUTTER. HEROD W. ALLEN, Latta, S. C. Filed Aug. 18, 1891. Serial No. 403,041. (No model.)

Claim.—In a machine of the class described, the combination, with the oblong framework comprising the opposite side and the front and intermediate transverse bars, of a staple located at the center of the intermediate bar, a draft-beam terminating at its rear end in a hook detachably engaging the staple and at its front end loosely fitting a notch formed in the front bar, a staple mounted on the front bar and bridging the beam, opposite hounds bolted to the beam in advance of the framework and having their rear ends bent to loosely embrace the outer corners of the framework, and a tie-bolt passed through the opposite side bars and the hounds to pivot and secure the same to such frame and provided with a clamping-nut, substantially as specified.

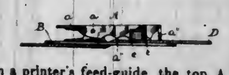
478,677. STEAM-BOILER. GEORGE I. ALLEN, Worcester, Mass. Filed Feb. 17, 1892. Serial No. 421,887. (No model.)



Claim.—1. The combination, with the boiler having its shell composed of the upwardly-arched sheets *a* and *a'*, with downwardly-extending sides joined along their lower horizontal edges with the joint-bars B, constructed as shown, of the transversely-disposed tie-rods C, connecting the opposite sides of the boiler across the space beneath the fire-chamber, substantially as and for the purpose set forth.

2. The combination, with the boiler having its shell composed of the two upwardly-arched sheets *a* and *a'*, with downwardly-extending sides joined at their lower horizontal edges, of the joint-plates B, provided with perforated ears *b*, having inwardly offset ledges *b*, the transverse stay-rods C, arranged through said ears and connecting the two opposite sides of the boiler, and the under channeled transom-bars D, overlying said rods and supported in conjunction with said offset ledges for sustaining the grate-bars, all substantially as set forth.

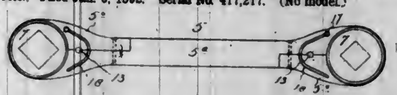
3. A boiler constructed substantially as herein shown and described, comprising the upwardly-arched sheets *a* and *a'*, the series of longitudinal tubes *e* above the lower arched sheet, the transverse stays *f*, fixed in the sheet *a'* below its arch and passing horizontally between groups of tubes, the crown-connectors I, passing vertically between the tubes, the haunch-supporters K, the side stays, and the transverse rods C, connecting the opposite sides of the boiler at their lower edges, all of said parts being combined in the manner and for the purpose set forth.



478,678. THILL-COUPLING. GEORGE H. ALLEN, Brookport, N. Y. Filed Mar. 21, 1892. Serial No. 425,693. (No model.)

Claim.—1. The combination, with the hook-and-eye coupling, of the U-shaped spring-wire provided in front with a concave or bend which fits the eye and in the rear with a nib or shoulder that rests under a lug of the cross-bar, said spring-wire resting removably in a slot of the cross-bar, as shown and described, and for the purpose specified.

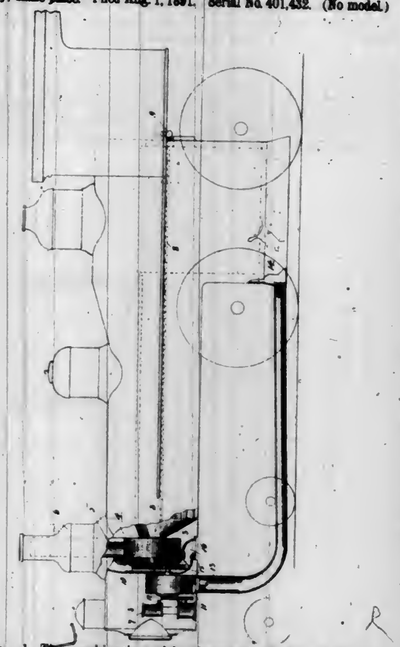
2. The combination, with the hook-and-eye coupling, of the U-shaped spring provided with a bend in front that fits the eye and a nib in the rear that rests under a lug of the cross-bar, said spring resting in a slot of the cross bar, and a safety device attached to the clip and crossing the slot under the closed end of the spring, as and for the purpose specified.



478,679. PRINTER'S PRESS-GUIDE. JOSEPH A. BOEHRINGER and FRANK X. MÜLLER, Buffalo, N. Y. Filed Mar. 10, 1892. Serial No. 424,369. (No model.)

Claim.—1. In a printer's feed-guide, the top A and bottom B, hinged together, the spring-rod *a a'*, the top part A being provided with teeth *a''* *a''* *a''*, formed from the downwardly-projecting sides and front, and the part B being provided with prongs at one end, and the adjusting-screw C, having the flat guide *c*, provided with the lug *d* and bottom teeth *e e*, all substantially as and for the purpose specified.

2. In a printer's feed-guide, the combination of the spring-actuated top and bottom pieces, the top piece being formed with teeth and the bottom piece being provided with prongs, and a short screw through the top piece at right angles to the length thereof, one end of which screw is provided with a stop or head, substantially as set forth.



478,680. RATCHET-WRENCH. JOSEPH F. BRENDLINGER, Denver, Colo. Filed Jan. 6, 1892. Serial No. 417,217. (No model.)

Claim.—1. The combination in a wrench, of an integral head provided with a suitable socket, two circumferential grooves, and a ratchet-zone between these grooves, a sectional recessed handle adapted to fit the head, a pivoted locking-arm located in the recess of the handle and having its extremities fastened to engage the teeth of the ratchet-zone and provided with shoulders or stops, one on each side of the pivot, a pawl or dog also located within the recess of the handle and provided with a shouldered head, and a coil-spring surrounding the stem of the pawl and engaging the shouldered head at one extremity, a socket formed in the handle at the bottom of the recess and adapted to receive the opposite extremity of the spring, and suitable means for adjusting the pawl or dog, whereby it is made to engage either shoulder of the locking-arm at will, substantially as described.

2. The combination, in a wrench, of an integral head provided with a suitable socket, two circumferential grooves, and a ratchet-zone between these grooves, a sectional recessed handle adapted to fit the head, a pivoted locking-arm located in the recess of the handle and having its extremities fashioned to engage the teeth of the ratchet-zone and provided with shoulders or stops, one on each side of the pivot, a pawl or dog also located within the recess of the handle and provided with a shouldered head, and a coil-spring surrounding the stem of the pawl and engaging the shouldered head at one extremity, a socket formed in the handle at the bottom of the recess and adapted to receive the opposite extremity of the spring, and suitable means for adjusting the dog, consisting of a pin made fast to the head of the pawl, and a slot formed in the handle and forming a way for the pin, whereby the pawl is made to engage either shoulder of the locking-arm at will, substantially as described.

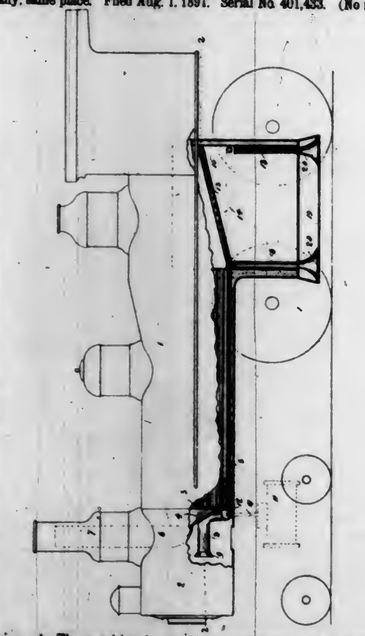
478,681. LOCOMOTIVE-ENGINE. ALEXANDER R. CAVNER, Chicago, Ill.; Edward E. Holman, administrator of said Alexander R. Cavner, deceased, assignor to the Cavner Locomotive Improvement Company, same place. Filed Aug. 1, 1891. Serial No. 401,432. (No model.)

Claim.—1. The combination, with a locomotive-boiler, of a compartment arranged at the forward end of the boiler, a hood arranged in said compartment and which cuts off communication between all of the boiler-flues and the compartment, but permits the passage of the products of combustion to the smoke-stack, and devices located in the compartment and acting to force fresh air therefrom through a pipe directly into the furnace, substantially as described.

2. The combination, with a locomotive-boiler having an air-compartment arranged at its front end and closed against communication with all the boiler-flues, of a pipe leading from said compartment to the furnace for conducting fresh air into the latter from the compartment and air-suction mechanism located in the said compartment and acting to draw fresh air thereinto and force the same through the said pipe to the locomotive-furnace, substantially as described.

3. The combination, with a locomotive-boiler, of an air-compartment arranged at the forward end thereof, a hood which cuts off communication between all the boiler-flues and the air-compartment, but permits the passage of the products of combustion into the smoke-stack, and mechanism located in the said compartment and having a

pipe connected with the ash-box of the furnace for supplying fresh air thereinto from the air-compartment, substantially as described.



4. In a locomotive, the combination, with a boiler having a compartment at its forward end, said compartment having no communication with the flues of the boiler, of a blower located in said compartment, tube 13, adapted to conduct air from the blower to the ash-box of the furnace, and mechanism for operating said blower, said mechanism being adapted to be controlled from the cab of the locomotive, substantially as described.

5. In a locomotive, the combination, with a boiler having a compartment 2 at its forward end, an exhaust-fan located in said compartment, and a hood connecting said exhaust-fan with the flues of the boiler and preventing communication between said compartment and the flues of the boiler, of a tube 5 for conducting the gases from the boiler to the upper part of the smoke-stack of the engine, and mechanism for operating said exhaust-fan, substantially as described.

6. In a locomotive, the combiuation, with a boiler having a compartment 2 at its forward end, of fans located in said compartment, one of said fans being adapted to draw the gases from the flues of the boiler and to discharge them into the smoke-stack of the locomotive and the other fan being adapted to feed the furnace of the boiler with a supply of fresh air, and mechanism for operating said fans, substantially as described.

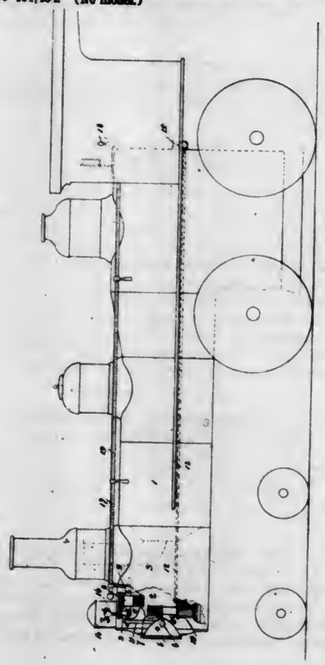
7. In a locomotive, the combination, with a boiler having a compartment 2 at its forward end, of fans located in said compartment, one of said fans being adapted to draw the gases from the flues of the boiler and to discharge them into the smoke-stack of the locomotive and the other fan being adapted to feed the furnace of the boiler with a supply of fresh air, said two fans being geared together, and mechanism for operating said fans, substantially as described.

478,682. LOCOMOTIVE-ENGINE. ALEXANDER R. CAVNER, Chicago, Ill.; Edward E. Holman, administrator of said Alexander R. Cavner, deceased, assignor to the Cavner Locomotive Improvement Company, same place. Filed Aug. 1, 1891. Serial No. 401,433. (No model.)

Claim.—1. The combination, with a locomotive, of a boiler, a hood connecting some of the flues of said boiler with the smoke-stack, and devices for causing a current of fresh air to pass through the remaining flues of the boiler into the furnace, substantially as and for the purpose specified.

2. The combination, with a locomotive having a compartment at its front end, of a boiler having a hood which cuts off some of its flues from communication with said compartment and leaves other flues in communication therewith, tubes connected with the locomotive-cylinder for conducting exhaust-steam therefrom into those boiler flues which communicate with the front compartment for the purpose of causing a current of air to flow through such flues into the locomotive-furnace, and means for supplying fresh air to the front compartment, substantially as described.

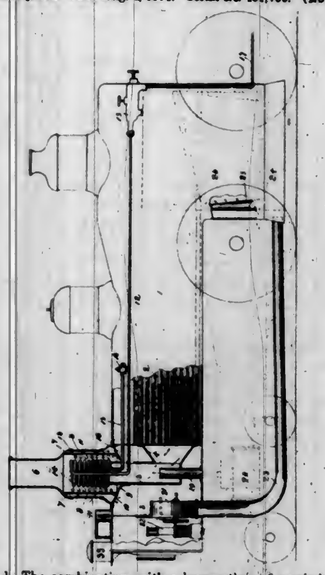
3. In a locomotive, the combination, with a boiler and a hood 4, adapted to deliver gases from the boiler into the smoke-stack, of a compartment 2 in front of the boiler, a tube 8, opening into said compartment and being connected to the lowermost flues of the boiler, and devices for causing a current of air to flow through said lowermost flues of the boiler into the furnace of the locomotive, substantially as and for the purpose specified.



4. The combination, with a locomotive-boiler, of an air-compartment arranged at the front end of the boiler in advance of the boiler-flues, a hood which places some of the flues in communication with the smoke-stack and cuts them off from communication with the air-compartment, the remaining flues communicating with said compartment, and means whereby fresh air is conveyed to the furnace from the compartment through the flues which communicate therewith, substantially as described.

5. In a locomotive, the combination, with a boiler and a hood 4, adapted to deliver gases from the boiler into the smoke-stack, of a compartment 2 in front of the boiler, a tube 8, opening into said compartment and being connected to the lowermost flues of the boiler, and a tube leading from the cylinder of the locomotive, said tube having jets 12, substantially as and for the purpose specified.

6. The combination, with a locomotive boiler, of an air compartment arranged at the front end of the compartment in advance of the boiler-flues, a hood which places some of the flues in communication with the smoke-stack and cuts them off from communication with the air compartment, the remaining flues communicating with said compartment, a tube arranged in the air-compartment to conduct air therefrom into some of the boiler-flues, and a steam-pipe for conducting exhaust-steam from one of the locomotive-cylinders into the tube in the air-compartment for causing a current of air to flow into the locomotive-furnace, substantially as described.



7. The combination, with a locomotive, of a boiler having an air-compartment at its front ends, tubes arranged to convey fresh air from said compartment to the locomotive-furnace, the inclined tubes 13, having a transverse perforated portion, the tube 14, having a transverse perforated portion, and upright tubes 18, arranged in the fire-box and having their lower ends in direct communication with the external atmosphere, substantially as described.

478,683. APPARATUS FOR LIGHTING LOCOMOTIVE-ENGINES. ALEXANDER R. CAVNER, Chicago, Ill.; Edward E. Holman, administrator of said Alexander R. Cavner, deceased, assignor to the Cavner Locomotive Improvement Company, same place. Filed Aug. 1, 1891. Serial No. 401,434. (No model.)

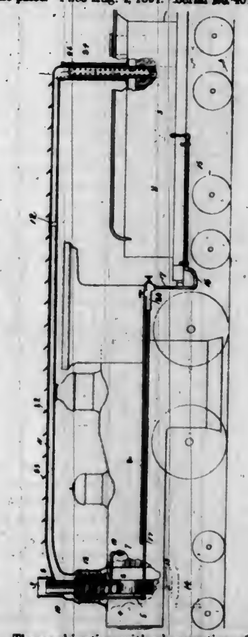
Claim.—1. The combination, with a locomotive-engine, the combination, with a boiler having a compartment at its forward end, of a reflector secured in the front of said compartment, an electric lamp mounted in said reflector, and mechanism adapted to furnish a current of electricity to said lamp, substantially as and for the purpose specified.

478,684. LOCOMOTIVE-ENGINE. ALEXANDER R. CAVNER, Chicago, Ill.; Edward E. Holman, administrator of said Alexander R. Cavner, deceased, assignor to the Cavner Locomotive Improvement Company, same place. Filed Aug. 4, 1891. Serial No. 401,709. (No model.)

Claim.—1. The combination, with a locomotive, of an air-heater arranged in the forward portion thereof, an air-heating compartment arranged in juxtaposition to the heater and wherein the air is heated by such heater, a compartment arranged at the forward portion of the locomotive and having communication with the air-heating compartment, a hood located in said compartment and connecting the boiler-flues with the smoke-stack, and mechanism which operates to draw external atmosphere into the air-heating compartment and force the same to the locomotive-furnace, substantially as described.

2. The combination, with a locomotive, of an air-heater at the forward portion thereof, an air-compartment separated from the air-heater by a perforated partition and in communication with the external atmosphere, a compartment having communication with the air-heating compartment through the said perforated partition, a hood located in said compartment and connecting the boiler-flues with the smoke-stack, and mechanism which operates to draw air into the air-compartment and force the same to the locomotive-furnace, substantially as described.

3. The combination, with a locomotive, of an air-heater arranged in the forward portion thereof, an air-heating compartment arranged in juxtaposition to the heater and wherein the air is heated by such heater, a compartment arranged at the forward portion of the locomotive and having communication with the air-heating compartment, a hood arranged in said compartment and connecting the boiler flues with a smoke-stack, and an exhaust-fan having a pipe connection with the locomotive-furnace and operating to draw external atmosphere into the air-heating compartment and force the same to the locomotive-furnace through said pipe, substantially as described.



4. The combination, with a locomotive, of a feed-water and air heater arranged in the forward portion thereof, an air-heating compartment arranged in juxtaposition to the water and air heater and wherein the air is heated by such water, a pipe for conducting water to the heater, a pipe for conducting water from the heater to the locomotive-boiler, a compartment arranged at the forward portion of the locomotive and having communication with the air-heating compartment, and mechanism which operates to draw external atmosphere into the air-heating compartment and force the same to the locomotive, substantially as described.

5. The combination, with a locomotive having a boiler 2 and forward compartment 3, having no communication with the boiler, of a smoke-stack 6, having partition 7, exterior compartment 8, said exterior compartment 8 having apertures 11, plate 9, separating the compartment 3 from the interior of the smoke-stack, apertures 10 in said plate 9, pipe 23, adapted to conduct air from the compartment 3 to the ash-box of the locomotive, and apparatus located in said compartment 3, adapted to exhaust the air from said compartment and deliver it into the pipe 23, substantially as described.

6. The combination, with a locomotive having a forward compartment, said compartment having no communication with the flues of the locomotive-boiler, and a smoke-stack having an interior compartment in communication with the flues of the boiler and an exterior compartment having apertures adapted to permit of the access of air into said compartment, said exterior compartment being in communication with the forward compartment of the locomotive, of a coil 18 in the interior of the smoke-stack and apparatus for causing a current of air to flow through the compartment 8 into the forward compartment of the locomotive, substantially as and for the purpose specified.

7. The combination, with a locomotive having a boiler 2 and a forward compartment 3, having no communication with the boiler, of a smoke-stack 6, having an exterior compartment 8, the exterior compartment being in communication with the forward compartment of the locomotive and with the open air and the interior of the smoke-stack being in communication with the flues of the boiler, a coil 14, located in said smoke-stack, pipes for conducting water into said coil and for delivering it into the boiler of the locomotive, coil 18 around said coil 14, tube 19 for delivering exhaust-steam into the smoke-stack, exhaust-fan 21, tube 23 for conveying air from the compartment 3 to the ash-box of the locomotive, and pipes 25, adapted to deliver air from the ash-box into the fire-box of the locomotive, substantially as described.

478,685. LOCOMOTIVE-ENGINE. ALEXANDER R. CAVNER, Chicago, Ill.; Edward E. Holman, administrator of said Alexander R. Cavner, deceased, assignor to the Cavner Locomotive Improvement Company, same place. Filed Aug. 4, 1891. Serial No. 401,710. (No model.)

Claim.—1. The combination, with a locomotive, of a compartment in front of the boiler-flues, an exhaust-fan arranged in the compartment, connected with the boiler-flues, and having a delivery-tube communicating with the smoke-stack, and a feed-water pipe coiled round the tube of the exhaust-fan and connected with the boiler, substantially as described.

2. The combination, with a locomotive having a compartment at its forward end, apparatus located in said forward compartment adapted to conduct the hot gases from the furnace to the upper part of the smoke-stack of the locomotive, and a pipe adapted to conduct exhaust-steam from the cylinder to said compartment, of a pipe adapted to supply water to the boiler of the locomotive, said pipe

being so arranged as to expose the water to the heat of the exhaust-steam and the hot gases from the boiler, substantially as and for the purpose specified.

3. The combination, with a locomotive and a tender carrying a water-tank, of a tube arranged to conduct exhaust-steam from the locomotive-cylinder to the water-tank and means by which cool air is admitted into such tube for condensing the exhaust-steam as it passes through said tube in transit to the water-tank, substantially as described.

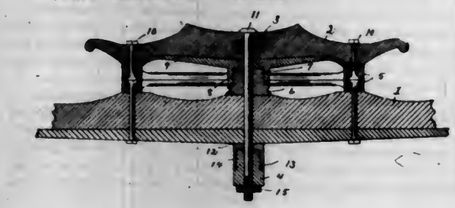
4. The combination, with a locomotive and a tender carrying a water-tank, of a tube for conveying exhaust-steam from the cylinders of the locomotive to said water-tank, said tube having apertures adapted to admit air into said tube, substantially as and for the purpose specified.

5. The combination, with a locomotive and a tender carrying a water-tank, of a tube for conveying exhaust-steam from the cylinders of the locomotive to the water-tank, apertures in said tube for the admission of air, and deflectors, substantially as and for the purpose specified.

6. The combination, with a locomotive having a compartment at its forward end, said compartment having no communication with the flues of the boiler, and a tender carrying a water-tank, of tubes for conducting exhaust-steam from the cylinders of the locomotive into said compartment and a tube opening into said compartment adapted to convey steam from said compartment to the water-tank, substantially as and for the purpose specified.

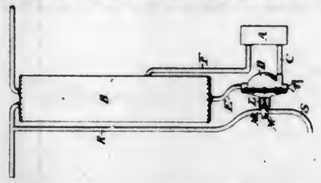
7. The combination, with a locomotive having a compartment at its forward end, said compartment having no communication with the flues of the boiler, a tender, and a water-tank carried thereby, of tubes adapted to convey exhaust-steam from the cylinders of the locomotive to said forward compartment and a tube opening into said compartment and adapted to convey said steam into the water-tank, said tube having apertures for the admission of air, substantially as and for the purpose specified.

8. The combination, with a locomotive having a compartment at its forward end, said compartment having no communication with the flues of the boiler, a tender, and a water-tank carried thereby, of tubes adapted to conduct exhaust-steam from the cylinders of the locomotive into said forward compartment and a tube 11, opening into said compartment and adapted to conduct the steam from said compartment to the water-tank, said tube having apertures 22, deflectors 23, and apertures 25, substantially as and for the purpose specified.



9. The combination, with a locomotive having a compartment at its forward end, an exhaust-fan in said compartment connected with the flues of the boiler and adapted to draw the gases from the boiler, and a tube 8, adapted to conduct said gases and deliver them into the upper end of the smoke-stack of the locomotive, of tubes adapted to conduct exhaust steam from the cylinders of the locomotive into said forward compartment, a tube adapted to conduct said exhaust-steam to the water-tank, and pipes for conducting the water from the water-tank around the tube 8 and to empty it into the boiler, substantially as described.

478,686. RAILROAD-TRACK NUT-LOCK. JOHN D. CAY, Tallahassee, Fla. Filed Nov. 21, 1891. Serial No. 412,692. (No model.)



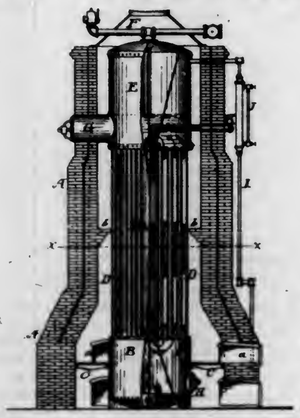
Claim.—A nut-lock made of a single resilient rod A, passed around two bolts, forming a washer for the nuts thereon and crossing itself midway between the bolts, its ends pressing against the sides of the nuts and being backed up by the rod itself passing along beside and behind them and providing a continuous resilient pressure, by which the nuts are held firmly against unscrewing, substantially as disclosed.

478,687. CARRIAGE-COUPLING. NORTON D. CHAPMAN, Toledo, Ohio, assignor of one-half to Alpheus Chapman, same place. Filed Apr. 6, 1891. Serial No. 387,794. (No model.)

Claim.—In a carriage-coupling, a head-block plate formed with an annular recess, a clip having a recessed circular boss engaging the said recess, a clip-plate secured to the clip and having an annular recess, a brace having a recessed boss engaging the latter recess, and bushings located in the recesses of the two bosses, in combination with a king-bolt for assembling the several parts of the coupling.

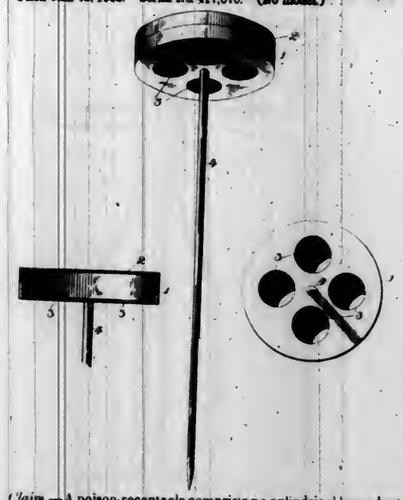
478,688. RANGE-BOILER ATTACHMENT. WILLIAM S. CLARK, Philadelphia, Pa. Filed Apr. 18, 1890. Serial No. 348,476. (No model.)

Claim.—The combination, with the boiler B and its connecting-tubes E, F, and R, of the water-back A, the vessel D, the bowl G, the diaphragm H, the plunger N, and the connected valve P, all arranged substantially as shown and described, and for the purpose set forth.



478,689. CUT-OUT SWITCH. WILLIAM R. CLEVELAND, Geneva, Ohio. Filed Sept. 21, 1891. Serial No. 406,413. (No model.)

Claim.—1. The combination of stationary contacts, a switch-lever, contacts upon the same and insulated from each other, a fuse connected to said contacts, and a prop supporting said fuse away from the lever, substantially as set forth.

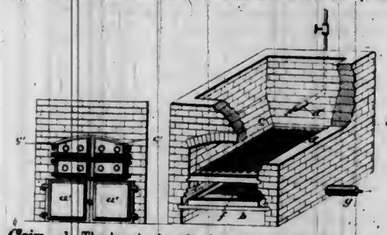


2. The combination of stationary contacts, a pivot projecting from one of said contacts, a lever provided with registering contacts and having an eye projecting from the end of one of said contacts and detachably pivoted upon said pivot, and a fuse connected to the lever-contacts, substantially as set forth.

478,690. STEAM-BOILER. HERBERT F. COOK, Cleveland, Ohio, assignor to L. W. Bingham, Chas. L. Douglass, and C. B. Squire, all of same place. Filed Dec. 28, 1891. Serial No. 416,382. (No model.)

Claim.—In a tubular steam-boiler, the combination of a boiler consisting of a chamber B, located partly below the fire grates of a furnace, an upper chamber E, the upper tube sheet of chamber B and the lower tube-sheet of chamber E, connected by a central large flue D^2 and by surrounding vertical water-tubes D D, and a circular inclosing casing A, having the walls reduced in diameter above the fire-grates, and a deflecting rim or ridge *b* on its inner surface midway in the space between the two chambers B and E of the boiler, and covered with a suitable crown leading into a smoke-stack, constructed to operate substantially as specified.

478,691. POISON-RECEPTACLE. ALLEN L. DE SHON, Steele, N. D. Filed Jan. 12, 1892. Serial No. 417,870. (No model.)



Claim.—A poison-receptacle comprising a cylindrical box adapted to contain a cake of poison and provided in its bottom with openings through which the poison may be eaten, but which prevents the entire cake being taken from the receptacle at once, and a depending pointed stem or spindle having its upper end secured to the bottom of the box and having its lower end adapted to be inserted in the ground to support the box a short distance above the same, substantially as described.

478,692. TELEPHONE. PAUL H. D'UNGER, Chicago, Ill., assignor to the D'Unger Long Distance Telephone Company, same place. Filed Mar. 29, 1892. Serial No. 426,931. (No model.)

Claim.—The combination, substantially as set forth, in a telephone, of the diaphragm, an arm projecting over the diaphragm, a screw in said arm, and a buffer actuated by said screw and adapted to bear against the diaphragm.

478,693. PROCESS FOR TOTAL COMBUSTION. EMIL A. ERB, Appleton, Wis. Filed Feb. 12, 1891. Serial No. 381,233. (No specimens.)

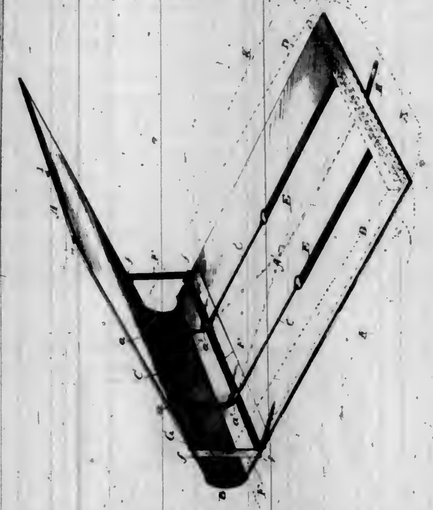
Claim.—1. The herein-described improvement in the combustion of carbonaceous fuel, the same consisting in mixing the fuel with perforated iron cubes or other forms of perforated iron, so as to facilitate the running off of the generated carbonic-acid gas by its own gravity, substantially as described.

2. The improvement herein described in the combustion of carbonaceous fuel, the same consisting in running off the generated carbonic-acid gas by its own gravity assisted by an exhaust-fan or other exhaust-pump devices, and further assisted by feeding fuel mixed with perforated iron cubes or other forms of perforated iron, substantially as specified.

3. The improvement herein described in the combustion of carbonaceous fuel, the same consisting in running off the generated carbonic-acid gas by its own gravity assisted by an exhaust-fan or other exhaust-pump devices, and further assisted by feeding the fuel mixed with perforated iron cubes or other forms of perforated iron, and further assisted by injecting steam in the fuel-chamber, substantially as specified

---

478,694. GAME-MARKER. ROBERT F. FOSTER, New York, N. Y., assignor to Charles Goodall & Son, London, England. Filed Apr. 8, 1892. Serial No. 428,335. (No model.)



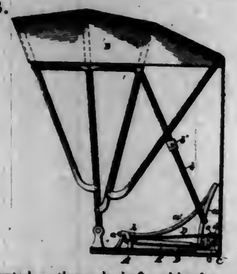
Claim.—1. In a card-game marker, the combination, with a base-piece, of revoluble marking-pieces, each having two indicating-faces, which when indicating are level with the top of the base-piece, substantially as described.

2. In a card game marker, the combination, with a base-piece, of revoluble marking-pieces, each having two indicating-faces, which when indicating are level with the face of the base-piece, and springs for retaining each said marking-piece in one or other of its two positions, substantially as described.

3. A card-game marker comprising, in combination with each other, the base A, furnished with recesses A', the revoluble blocks B, pivoted in the said recesses, each block having two indicating-faces, one of which is distinguished from the other, and the springs D, adapted to keep the said blocks in one or other of two positions, in both of which the faces of the said blocks are level with the top face of the base, substantially as and for the purpose specified.

4. In a card-game marker, the combination of the base A, revoluble blocks B, pivoted in recesses in the same, and the springs D, adapted to keep the said blocks in one or other of two positions, in both of which the faces of the said blocks are level with the top face of the base, substantially as set forth.

478,695. FILE FOR LETTERS AND PAPERS. GEORGE HARVEY and WILLIAM R. GRUNDY, Winnipeg, Canada. Filed Nov. 25, 1891. Serial No. 413,046. (No model.)



Claim.—In combination, the two backs or covers, a cord secured to one and passed through guiding-eyes in the other, an elastic device connected to the last-named cover and to each end of said cord, the supplementary elastic band, and the loops on the covers for securing it thereto, one of said covers being hinged in advance of said supplementary band, substantially as and for the purpose described.

478,696. TOP-JOINT FOR VEHICLES. AMOS M. HESS, Martinsville, Pa. Filed Feb. 20, 1892. Serial No. 422,187. (No model.)

Claim.—1. The combination, with the rock-shaft and braces, of a lever-head loosely mounted on the rock-shaft and having a shoulder formed on the face thereof, a detent passing through an opening in the shaft and adapted to engage said shoulder, and a lever-arm connected with the head, substantially as and for the purpose specified.

2. The combination, with the rock-shaft and braces, of a lever-

478,696.

head loosely mounted on the rock-shaft and having a shoulder formed on the face thereof, a screw passing through the rock-shaft back of said shoulder, and a lever-arm connected with the head, substantially as and for the purpose specified.

3. The combination, with the rock-shaft and braces, of a lever-head loosely mounted on the rock-shaft and having a shoulder formed on the face thereof, a detent passing through the rock-shaft back of said shoulder, and a lever-arm detachably connected with the head, substantially as and for the purpose specified.

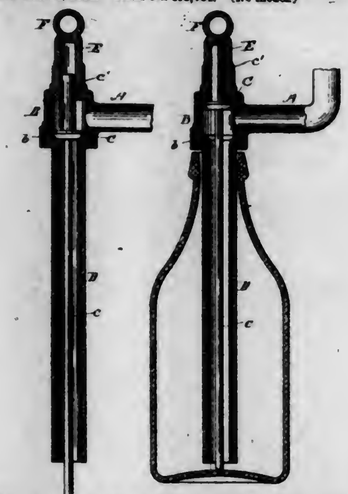
4. The combination, with the rock-shaft and a lever for operating the same, of a spring-actuated plunger having a pivotal connection at one end with the frame of the vehicle and pivoted at the other end to an arm on the rock-shaft, substantially as and for the purpose specified.

5. The combination, with the rock-shaft and a lever for operating the same, of a cylinder pivoted to the front of the seat, and a spring-actuated plunger located in the cylinder and having the outer end pivoted to an arm on the rock-shaft, substantially as and for the purpose specified.

6. The combination, with the rock-shaft and braces, of a lever-head loosely mounted on the rock-shaft and having a shoulder formed on the face thereof, a detent passing through the rock-shaft back of said shoulder, a lever-arm connected with the head, and a spring-actuated plunger having a pivotal connection at one end with the frame of the vehicle and pivoted at the other end to an arm on the rock-shaft, substantially as and for the purpose specified.

7. The combination, with the rock-shaft and braces, of a lever-head loosely mounted on the rock-shaft and having a shoulder formed on the face thereof, a detent passing through the rock-shaft back of said shoulder, a lever-arm detachably connected with the head, a cylinder pivoted to the front of the seat, and a spring-actuated plunger located in the cylinder and having the outer end pivoted to an arm on the rock-shaft, substantially as and for the purpose specified.

8. The combination, with the rock-shaft and braces, of means for operating said shaft and a spring connection between the ends of the shaft, substantially as and for the purpose specified.

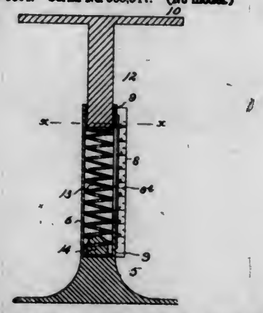


9. The combination, with the braces, of a rock-shaft having a reduced portion between its ends, said reduced portion being tempered to form a spring, and a lever secured to the shaft, substantially as and for the purpose specified.

478,697. DISINFECTING APPARATUS. CHARLES B. HYSLIP, Bradford, Pa. Filed Mar. 22, 1892. Serial No. 425,891. (No model.)

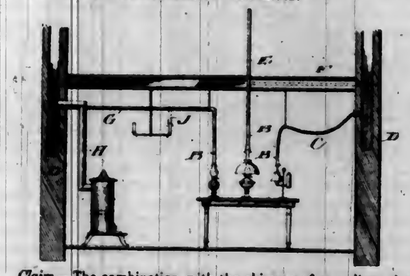
Claim.—A disinfecting device consisting of a lower receptacle, a casing supported above the same leaving air-openings between the two, a supply-tank inclosed and supported by the receptacle and provided on its lower side with a tapering discharge-tube, an absorbent pad located in the lower receptacle provided with two absorbent vertical wings I I, rising from the said pad at a short distance from both tube and casing and permitting access of air to both sides of said wings, as set forth.

478,698. AUTOMATIC NOZZLE. CHARLES A. KING, Boston, Mass. Filed Dec. 21, 1891. Serial No. 415,701. (No model.)



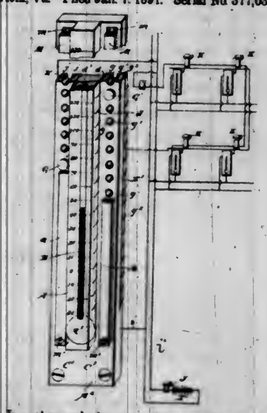
Claim.—1. The nozzle above described, containing a valve-chamber provided with an inlet-pipe and a delivery-tube and having a valve-seat at the entrance of said delivery-tube, in combination with a valve provided on its under side with a spindle of a greater length than said delivery tube, said valve being adapted to fit said valve-seat and also to be lifted clear of the entrance to the delivery-tube and leave an uninterrupted passage therein for the escape of the liquid, all as set forth.

2. In a bottle-filling nozzle containing a valve-chamber having a cover provided with a socket, said valve-chamber being also provided with a valve-seat and delivery-tube, a valve adapted to fit said valve-seat and provided with guide-rod extending from its upper side into the socket in the cover to said chamber and having a spindle projecting from its lower surface down through and beyond the farther end of said delivery-tube, as set forth.



3. In a nozzle of the kind described, a valve-chamber provided with a delivery-tube having a valve-seat at its entrance, an automatically-closing valve, and means, substantially as described, whereby it may be automatically opened, in combination with an inlet-pipe connected with said valve chamber above the valve-seat and located to discharge its contents on the under side of the valve when the valve is opened, whereby when said valve is opened an unobstructed passage will be provided for the liquid from the inlet to the delivery tube through the valve chamber, all as set forth.

478,699. SPRING-SCALE. LOUISA E. A. KOVSKY, Denver, Colo. Filed Feb. 26, 1891. Serial No. 383,317. (No model.)



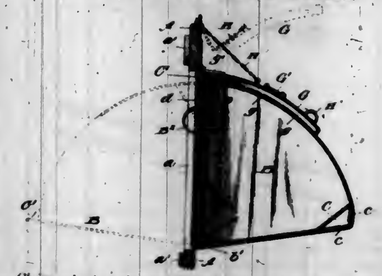
Claim.—The weighing-scales consisting of a base having the upwardly-projecting vertically-slotted sleeve or tube provided with the plate located in front of the slot attached to the tube at points above and below the slot and having two graduated faces, a coil-spring located within the tube or sleeve, a top plate provided with a depending arm adapted to telescope within the tube of the base, its lower extremity engaging the spring, said arm being provided with a double pointer, the shank of which is adapted to travel within the slot of the tube while one of the pointer-arms moves over each graduated face of the adjacent plate, substantially as described.

478,700. LAMP-PIPE. ALEXANDER T. LOYD, Chicago, Ill. Filed Feb. 19, 1891. Serial No. 382,026. (No model.)

Claim.—The combination, with the chimney of an ordinary lamp, of a flexible uptake terminating a telescoping section A, having a damper B, the lower section terminating in the cone *a*, and a non-conducting cone-shaped packing adapted to fit the chimney of the lamp, substantially as specified.

478,701. THERMAL ALARM. HOSEA F. MAXIM and JESSE M. PRICE, Norfolk, Va. Filed Jan. 7, 1891. Serial No. 377,030. (No model.)

Claim.—1. In a thermal-alarm mechanism, the combination, with a mercury-tube having a contact or conductor permanently connected with the mercury and a series of contacts normally above the mercury and extending from the mercury-chamber to the outside surface, and a non-conducting back or support A^3, of a series of pairs of terminals carried by said back or support extending along the tube, the terminals of each pair being insulated from each other and one being connected to a tube-contact and the other to a battery-wire, and a removable pin, as at G, adapted to be clamped between the terminals of one of said pairs, substantially as set forth.



2. In a thermal-alarm mechanism, the combination of a mercury-tube having a conductor permanently connected with the mercury and a series of contacts normally above the mercury but adapted to touch it when it rises, a series of pairs of terminals insulated from each other and having one of each pair connected to one of said tube contacts and the other connected to a battery-wire, and two adjustable contacts, each adapted to be connected to one of the said pairs of terminals, substantially as set forth.

3. The combination of the mercury-tube A, having contacts D D', the non-conducting back A^3, having sockets extending from the front to the rear, the insulated terminals in said sockets, the conductors *g*, *g'*, and E, and the contact-pin G, substantially as set forth.

4. The combination of the mercury-tube having the contacts D D', the terminals *g g'*, the contact G, and the guard for said contact, substantially as set forth.

5. In a thermal-alarm mechanism, the combination of the mercury-tube, the insulating back or support A^3, the two independent series of pairs of terminals supported on said backs, the series of contacts or conductors extending from the mercury-chamber out through the tube and respectively connected to one of the terminals in each of said pairs, the other terminal of each pair being connected to a battery, and the two independently-adjustable contacts, each adapted to be connected with the terminals of one of said pairs, substantially as and for the purposes set forth.

478,702. GARBAGE-RECEPTACLE. EDWARD B. MERRITT, Chicago, Ill. Filed Mar. 3, 1892. Serial No. 423,622. (No model.)

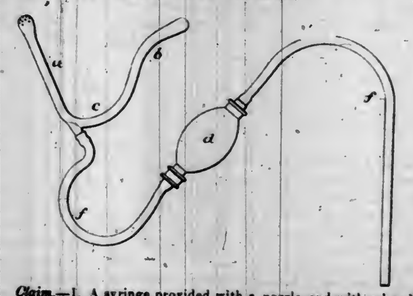
Claim.—1. A garbage-receptacle provided with a co-operating disinfectant-chamber at a distance from its pivot and constructed, located, and arranged to receive from the ordinary movements in the use of the receptacle a disinfectant-ejecting force, as set forth.

2. A pivotally-mounted garbage-receptacle having a hinged cover provided with a disinfectant-chamber, as set forth.

3. A pivotally-mounted garbage-receptacle having a disinfectant-chamber located with relation to the pivot of the receptacle to scatter the disinfectant over the area covered by the receptacle in its movements, substantially as specified.

4. A pivotally-mounted garbage-receptacle having disinfectant compartment, combined with a cover having disinfectant-chamber, as set forth.

5. A pivotally-mounted garbage-receptacle and an independently-mounted cover having disinfectant-chamber, combined and operating as set forth.

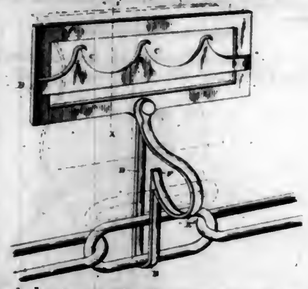


6. The combination, with a pivotally-mounted garbage-receptacle, of a pivotally-mounted cover having chamber for disinfectant, said receptacle being movable independent of the cover, substantially as specified.

7. A pivoted garbage-receptacle provided with a disinfectant-chamber located at a distance from the support of the receptacle, substantially as specified.

8. A pivoted garbage-receptacle provided with a cover having a disinfectant-chamber, said chamber being mounted with relation to the receptacle so as to be shocked or jarred by the contact of one with the other, substantially as specified.

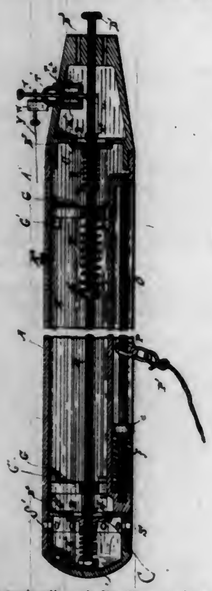
9. A pivoted garbage-receptacle, combined with a hinged cover having disinfectant-chamber, said chamber being mounted to distribute its contents both into and outside of the receptacle and arranged to be actuated by the contact of one with the other, as set forth.



478,703. SYRINGE. GEORGIANA F. MILES, New York, N. Y. Filed Jan. 27, 1892. Serial No. 419,466. (No model.)

Claim.—1. A syringe provided with a nozzle and with a handle attached to the nozzle by an intermediate connection *c*, supporting the handle at a distance from the nozzle, said handle extending upward from its junction with the connection *c*, approximately parallel to the nozzle, substantially as described.

2. The combination, with the nozzle of a syringe, of a projecting handle clamped to the nozzle, substantially as set forth.



478,704. TRACE-CARRIER. AMANUEL M. MILLER, Fairfield, Tex. Filed Mar. 11, 1892. Serial No. 424,568. (No model.)

Claim.—1. In a trace-carrier, the combination, with an attaching-frame, of a carrier proper depending therefrom and consisting of an elongated loop with closely-arranged parallel sides and an upper eye overhanging and depending below the upper portion of said loop, the juncture of the upper portion of said loop and eye being extended in the form of a projection, which narrows the opening between said loop and eye, said eye and loop being integral and rigid, substantially as described.

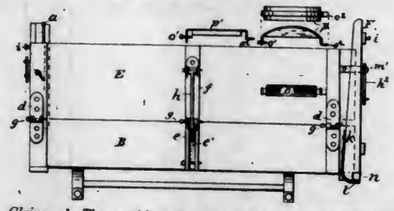
2. The combination of a frame having a bar extending thereacross with integral arms at right angles thereto, having outwardly-turned sharpened ends to form a means of attachment, and a carrier proper depending from said frame and consisting of an elongated loop and an upper eye having the juncture of the two extended inward to form a projection to narrow the opening between said loop and eye, the parts of said carrier proper being of integral rigid structure, substantially as described.

478,705. OIL-PROJECTILE. EVERETT D. MOORE, Baltimore, Md., assignor, by direct and mesne assignments, to the American Oil Projectile Company, same place. Filed June 11, 1891. Serial No. 395,847. (No model.)

Claim.—1. An oil projectile and distributer having an oil-chamber provided with water-inlet and oil-outlet ports, valves mounted on the valve-rod and closing said ports against pressure, a rod passing through said valve-rod for holding the valves closed and adapted to release the valve-rod as the projectile is fired, and a rope secured to said projectile and distributer for drawing it through the water after the projection, for the purpose set forth.

2. An oil projectile and distributer having an oil-chamber provided with water-inlet and oil-outlet ports, valves mounted on the valve-rod and closing said ports against pressure, means for holding said valves closed and adapted to release the valve-rod as the projectile is fired, and a rope secured to said projectile and distributer for drawing it through the water after the projection, for the purpose set forth.

3. An oil projectile and distributer having an oil-chamber provided with water-inlet and oil-outlet ports, valves mounted on the valve-rod and closing said ports against pressure, means for holding the valves closed and adapted to release the valve-rod as the projectile is fired, a perforated cap at the water-inlet port, and a rope secured to said projectile and distributer for drawing it through the water after the projection, for the purpose set forth.



4. An oil projectile and distributer having an oil-chamber provided with water-inlet and oil-outlet ports, valves mounted on the valve-rod and closing said ports against pressure, a rod passing through said valve-rod for holding the valves closed and adapted to release the valve-rod as the projectile is fired, a rope secured to said projectile and distributer, and means for taking up the tension of the rope as the projectile is thrown through the air, for the purpose set forth.

5. An oil projectile and distributer having an oil-chamber provided with water-inlet an oil-outlet ports, valves mounted on the valve-rod and closing said ports against pressure, a rod passing through said valve-rod for holding the valves closed and adapted to release the valve-rod as the projectile is fired, a rod secured to said projectile, a spring on said rod, and a rope secured to said projectile and distributer for drawing it through the water after the projection, the tension of said rope being taken up by said spring as the projectile is thrown through the air, for the purpose set forth.

6. A projectile having a recess in its side, a rod secured to said projectile and located in said recess, a rope traveling on said rod, and a cushion on said rod for taking up the tension of the rope as the projectile is thrown through the air, for the purpose set forth.

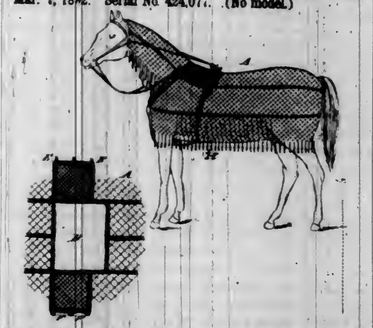
7. A projectile having a recess in its side, a rod secured to said projectile and located in said recess, a rope, rings to which said rope is secured traveling on said rod, and a spring-cushion on said rod for taking up the tension of the rope as the projectile is thrown through the air, for the purpose set forth.

478,706. WAGON-BOX. CHARLES NELSON, Axtell, Nebr. Filed Apr. 25, 1891. Serial No. 390,480. (No model.)

Claim.—1. The combination, with the fixed front and side pieces and end-gate of a wagon-box, of two side-boards hinged to said said pieces and hook-rods provided with perforations *m*, two of which rods are connected with the front and two with the rear ends of said side-boards, said hook-rods being constructed to secure said side-boards in their vertical or closed positions and also to adjust said side-boards in their inclined and level positions by connection with fixed pins *i* on the ends of the box, substantially as set forth and described.

2. The combination, with the front end piece of a wagon-box, of a standard made in two parts which are coupled together and provided with a hook for securing said standard in an upright position, substantially as set forth and described.

3. The combination, with the sides and floor of a wagon box provided with eyebolts *m'* and a cross-piece *n*, of a removable end-gate F, perforated to receive said eyebolts and provided with notched cleats and hooks for connection with said cross-piece, and hook-rods h^3, whereby said end-gate may be secured either in a vertical or a horizontal position, substantially as set forth and described.



4. The combination, with the fixed front and side pieces of a wagon-box, of the hinged side-boards E, tapering end-boards H and H', the latter being provided with a downward extension to fit in the rear end of said box, the side-boards K and K', corresponding, respectively, in width with the wide and narrow ends of the boards H H', hook-rods h' and h^3, and devices, substantially as described, for securing the parts in place, as herein specified.

478,707. WASHING-MACHINE. HARRISON OSBORN, Richmond, assignor of one-half to William J. Shinn, Indianapolis, Ind. Filed Oct. 12, 1891. Serial No. 408,527. (No model.)

Claim.—1. In a washing-machine, a tub centrally journaled upon a framework and adapted to be rotated thereon and provided with corrugated rubbing-bars on its sides and bottom, a corrugated rubber suspended within such tub by a spindle connected to a cross-bar detachably locked to the framework, such spindle having an adjustable spring for regulating the tension of the rubber upon the clothes, a crank connected to the top of such spindle and the upper end of the operating lever for rotating the rubber, and a link connected from the lower end of such lever to a projection at one side of the center of the bottom of the tub, whereby the tub may be simultaneously rotated in an opposite direction, in combination with a cover and means for supporting the cover in a vertical position, all combined substantially as shown and described.

2. In a washing-machine, a tub centrally journaled upon a framework and adapted to be rotated thereon, provided with corrugated rubbing-bars on its sides and bottom, a corrugated rubber suspended within such tub by a spindle connected to a cross bar detachably locked to the framework, a crank connected to the top of such spindle and the upper end of the operating-lever for rotating the rubbers, and a link connected from the lower end of such lever to a projection at one side of the center of the bottom of the tub, whereby the tub may be simultaneously rotated in an opposite direction, in combination with a stop of elastic material attached to the under side of the tub and adapted to come in contact with the framework at each half-rotation of the tub, all combined substantially as shown and described.

478,708. FLY-NET. WILLIAM H. OSHER, St. Louis, Mo. Filed Mar. 7, 1892. Serial No. 424,077. (No model.)

Claim.—1. A fly-net or like covering for horses, provided with an opening between the collar and gig-saddle and with flaps for closing said opening when in use, all substantially as set forth and described.

2. A fly-net or like covering for horses, provided with an opening between the collar and gig-saddle and with flaps for closing said opening, one edge of said flap having buckles or fastenings consisting of a fixed portion, and a tongue pivoted to said fixed portion and so arranged as to pass through a hole or slot in the opposite edge of said opening and fold back upon the fixed part, thus securing the edges of the opening together while the net is in use, all substantially as described.

3. The combination, with a fly-net for horses having an opening between the collar and gig-saddle, of a lower or under section of net arranged for connection with the top net by adjustably connecting its opposite edges to each side of the top net, the said edges being provided with suitable means for securing the parts together while in use, all substantially as set forth and described.

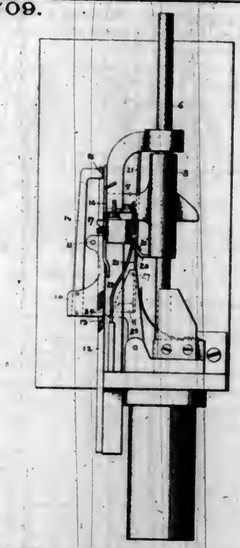
478,709. COIN-CONTROLLED DEVICE FOR PHONOGRAPHS. JOHN F. OTT, Orange, assignor to Thomas A. Edison, Llewellyn Park, N. J. Filed Apr. 24, 1891. Serial No. 390,287. (No model.)

Claim.—1. The combination of a tube forming a coin-passage and communicating with a coin-receiving slot, a movable door in one side of the tube and normally closing said side and being free to open, and an arm for locking the door, extending into the tube and adjusted to be moved by a predetermined weight, substantially as described.

2. The combination of a tube forming a coin-passage, a movable door in one side of the tube and normally closing said side, and a pivoted arm with an end extending into the tube above the bottom of the door for locking the door and adjusted to be moved by a predetermined weight, substantially as described.

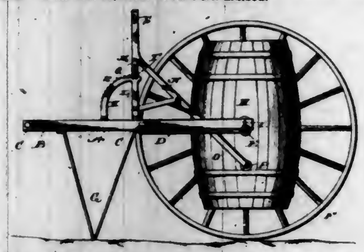
3. The combination of a tube forming a coin passage, a movable door in one side of the tube and normally closing said side, an arm carried by the door, and an arm for locking the door, extending into the tube and adjusted to be moved by a predetermined weight, the latter arm when moved coming into the path of movement of the first arm, substantially as described.

4. The combination of a tube forming a coin-passage and communicating with a coin-receiving slot, a movable door in one side of the tube and normally closing said side, an arm for locking the door, adjusted to be moved by a predetermined weight, and means for opening the door and throwing out light checks, substantially as described.



5. The combination of a tube forming a coin-passage and communicating with a coin-receiving slot, a movable door in one side of the tube and normally closing said side, an arm for locking the door, adjusted to be moved by a predetermined weight, a handle having an arm extending into the coin-passage, a spring tending to move toward the door, and a detent device carried by the handle normally restraining said spring, but allowing it to move toward the door when the handle is moved for throwing out light checks, substantially as described.

6. The combination of a tube forming a coin-passage, an arm having a beveled end extending into said passage and adapted to be moved back by a coin, causing it to act as a wedge to move said arm, a handle for pressing on the coin, a pin or stop moved by the handle, and a co-operating pin or stop on said arm and in position to arrest the handle before a smaller coin than that required will be pushed forward, substantially as described.



7. The combination of a coin tube or passage having a slot in a side thereof, a stop for the coin or check when deposited, a handle having a lug or arm passing through the slot into the coin-passage for pressing on the coin to force it by the stop, and a detent which arrests the handle if the check deposited is of too small diameter, said detent having one part on the movable handle and another part on a movable arm in position to be operated by or through the coin, said two parts of the detent being normally in line, whereby they will tend to engage with each other when the handle is moved, substantially as described.

8. The combination of a coin tube or passage and a pivoted stop for a deposited coin or check, one edge of said stop extending into the coin-tube, but terminating at a sufficient distance from the side of the passage to allow thin coins or checks to pass directly through to the coin-receptacle, but to arrest coins of proper thickness, substantially as described.

478,709.

478,710. BARREL-TRUCK. MARSHALL R. PARHAM, Butt Oak, Mich. Filed Feb. 20, 1892. Serial No. 422,262.

Claim.—1. The combination of a wheeled frame, a barrel pivotally supported on said frame, a lever mounted on the said frame, means for locking said lever, and a link having its upper end pivoted to the lever and its lower end pivoted to the barrel below the center thereof.

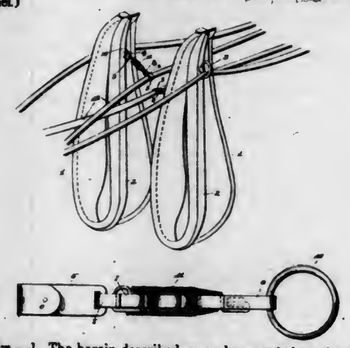
2. The combination of a frame having sockets in its ends, a barrel provided with trunnions engaging said sockets, means for tilting the barrel on the trunnions, a U-shaped bar secured to the under side of the frame and having its ends turned outward, and supporting-wheels loosely mounted on the said outturned ends.

3. The combination, with the frame and a barrel pivotally mounted thereon, of a rack-bar erected on the frame, a lever fulcrumed on the said rack-bar, connections between the lever and the barrel, a guide carried by the lever and fitting over the rack-bar, and a spring-locking rod carried by the lever and playing in the said guide to engage the rack-bar.

478,711. MACHINE FOR TAPPING MAINS. WALTER S. PAYNE, Fostoria, Ohio. Filed Aug. 28, 1891. Serial No. 403,998. (No model.)

Claim.—1. In a machine for tapping mains, the combination, with a casing and the tapping mechanism working therein, of a swinging threaded ring-crane adapted to be independently oscillated horizontally within said casing and carrying the cock, and means for removing said cock from the ring-crane by the tapping mechanism, substantially as set forth.

2. In a machine for tapping mains, a casing having an eccentrically-located bottom opening, an offstanding chamber and an upwardly-extending neck directly over said opening, the tapping mechanism working in said neck and carrying the threaded tap, an independent swinging ring-crane mounted in said offstanding chamber and adapted to work independently of the tapping mechanism below and away from said neck, and a cock-mandrel removably engaging and carried by said crane, said mandrel accommodating the cock and receiving the threaded tap, substantially as set forth.



3. In a machine for tapping mains, the combination, with the casing and the tapping mechanism carrying a threaded tap, of an oscillating stem or shaft secured within said casing and rotated entirely independent of the tapping mechanism, a threaded ring-crane connected with and swung within the casing by said shaft, and an interiorly and exteriorly threaded cock-mandrel removably engaging and carried by said crane, said mandrel accommodating the cock and receiving the threaded tap, substantially as set forth.

4. In a machine for tapping mains, a casing having a semicircular enlargement upon one side thereof, an oscillating shaft supported and journaled within said enlargement, a hinged handle or lever secured to the upper and outer end of said shaft, an interiorly-threaded ring-crane having an enlarged perforated lug adapted to engage said shaft within said enlargement, and an externally and interiorly threaded cock-carrying mandrel removably engaging said ring-crane and itself engaged by the tapping mechanism which removes the same from the crane and screws the cock into the main, substantially as set forth.

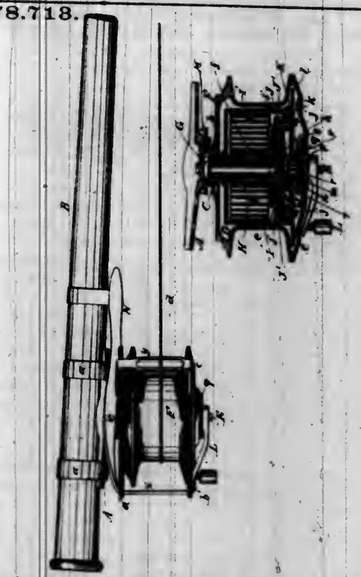
5. In a machine for tapping mains, a casing having an eccentrically-located bottom opening and an upwardly-extending neck directly over said opening, a clamp secured upon said neck and having opposite ribs and engaging-lugs, clevises pivoted to said ribs, chain harps adjustably connected with said pivoted clevises, a feeder-yoke having an upper curved threaded end adapted to receive the feeder-screw and an enlarged opening at its lower end adapted to removably engage said engaging-lugs, and a swinging threaded cock-carrying ring-crane located within said casing and adapted to work horizontally therein and be relieved of the cock by the tapping mechanism, substantially as set forth.

6. In a machine for tapping mains, the combination, with a casing and the tapping and drilling mechanism working therein, of the screw-threaded clevises pivotally secured to opposite sides of said casing, harp-shaped chain clamps having threaded perforations, and right-and-left screw-threaded adjusting-bolts adjustably engaging the threaded perforations of said clevises and harps, substantially as set forth.

478,712. SPREADER FOR REINS. JAMES H. PEW and FREDERICK S. PEW, Andover, S. D. Filed Jan. 2, 1892. Serial No. 416,851. (No model.)

Claim.—1. The herein-described spreader, consisting of a limiting-strap, a coiled spring connected at its ends with the strap, a rein-receiving clip at the outer end of the strap, and means for connecting the inner end of the strap to the hame or other suitable portion of the harness, substantially as specified.

2. The herein-described spreader, consisting of a coiled spring, a flexible strap longer than the spring located therein and terminating at its opposite ends in loops to which the terminals of the spring are connected, a ring loosely connected to the inner loop, and a metal clip perforated to engage with the outer loop and adapted for connection with the inner branch of the rein, substantially as specified.



478,713. FISHING-REEL. ELBERT B. PORTER, Penn Yan, N. Y. Filed Aug. 22, 1888. Serial No. 283,432. (No model.)

Claim.—1. In a reel of the character described, a device for disconnecting the winding and driving mechanism, consisting of the following elements, in combination: a reel-head provided with projections on its inner face, a sleeve journaled loosely on the winding-arbor and provided with the cam *r*, a disk carried by the reel-driving pinion and provided with a cam *p* and with radial arms or projections adapted to engage with the projections on the reel-head, a spring arranged to normally hold said arms in engagement with said projections, and a detent secured to the winding mechanism for engaging with and locking the driving-pinion when the projections on the disk are carried out of engagement with the projections on the reel-head, substantially as shown and described.

2. In a fishing-reel, the combination of the reel-driving pinion, a reel-head having a notched ring secured to its inner face, a disk carried by said pinion and provided with radial arms and inclined teeth, a sleeve having a notched end adapted to engage the inclined teeth of said disk, a spring arranged to press said disk outwardly so as to normally hold said radial arms in engagement with the notches in the ring on the inner face of the reel-head, and a rack carried by the driving mechanism of the reel and adapted to engage with and lock said pinion when the driving mechanism is disconnected from the reel-head, substantially as shown and described.

3. In a fishing-reel, the combination of the reel F, the stud C, the drum D, the spring-actuated sleeve H, mounted on the stud, the disk *s*, carried by said sleeve, the rack *t*, carried by the disk *s*, the spring *v*, the spur wheel or pinion *m* within the reel-head and pressed outwardly by said spring, the disk *n*, carried by the spur wheel or pinion *m* and provided with radial arms or notches and with the cam *p*, the notched ring *o*, secured to the inner face of the reel-head, and the sleeve *q*, extending above the reel-head and provided with the cam *r*, substantially as described.

478,718.

4. In a fishing-reel, the combination, with the reel F, the stud C, the drum D, the spring-actuated sleeve H, mounted on the stud, an internally-toothed ring secured to the drum, pinions meshing with said ring and spur-wheels carried by said pinions, of disk *s*, carried by said sleeve and provided with the rack *t*, the shaft E, journaled in the end of the stud and projecting through the reel-head, the pinion *m*, loosely mounted on the shaft, the disk *n*, carried by said pinion and provided with radial projections or notches and with the cam *p*, the spring *v* between the disk *s* and pinion *m*, the sleeve *q*, journaled loosely on the shaft E, extending above the reel-head and provided with cam *r*, substantially as shown and described.

5. In a fishing-reel, the combination of the reel F, the stud C, the drum D, the spring-actuated flanged sleeve H, mounted on the stud, said sleeve being provided with the disk *s*, the rack *t*, carried by the disk *s*, said disk being mounted on the flange J of the sleeve by means of the studs *u*, inserted in said flange, the four-armed spring *v*, the spur-wheel *m* within the reel-head and pressed outward by said spring, the notched disk *n*, carried by the spur-wheel and provided with the cam *p*, the notched ring *o*, secured to the inner face of the reel-head, and the notched disk *q* outside of the reel-head and provided with the cam *r*, substantially as described.

6. In a fishing-reel, the combination, with the reel F, the stud C, the drum D, the spring-actuated sleeve H, mounted on the stud, an internally-toothed ring secured to the drum, pinions meshing with the internally-toothed ring, and spur-wheels carried by said pinions, of disk *s*, carried by the said sleeve and provided with the rack *t*, the shaft E, journaled in the end of the stud and projecting through the reel-head, the spur-wheel *m*, loosely mounted on the shaft, the notched disk *n*, carried by the spur-wheel and provided with the cam *p*, the four-armed spring *v* between the disk *s* and the wheel *m*, the notched ring *o*, secured to the inner face of the reel-head, and the notched disk *q* on the shaft E outside of the reel-head and provided with the cam *r*, substantially as herein shown and described.

7. In a fishing-reel, the combination of a swinging lever N, mounted eccentrically with the center of the reel and having one end extended beyond the reel-body, a brake secured to said lever and adapted to be swung into and out of engagement with the reel-body by the movement of said lever on its axis, and a spring secured to said lever and adapted to normally hold the brake in contact with the reel-body, whereby the brake may be released from engagement with the reel-body by pressure on the extended end of the lever, substantially as shown and described.

8. The combination, with the reel F and stud C, of the eccentric G, secured to the upper part of the reel seat or plate and forming a portion of the same, the ring M, placed on the eccentric G, the ring or washer to hold the eccentric in place, and the brake-lever N, provided with the arms *x y*, substantially as specified.

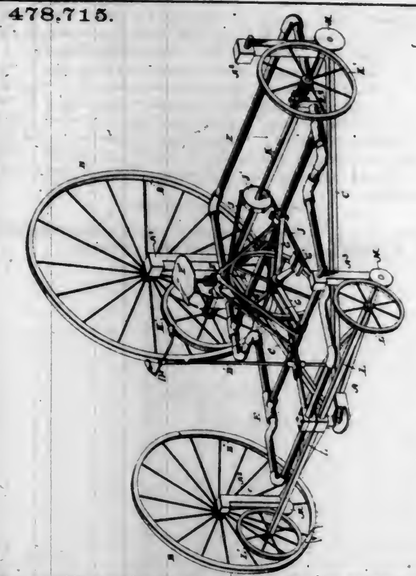
9. The combination, with the reel F and stud C, of the eccentric G, secured to the reel-plate and encircling the stud C, the ring M, placed on the eccentric G, the brake-lever N, provided with arms *x y*, and the guard-ring *a'* and curved wire *b'*, substantially as specified.

10. In a fishing-reel, the combination of the curved plate A, the stud C, the eccentric G, the ring M, the brake-lever N, the flanged sleeve H, carrying the toothed driving and friction rings J' K, the spring I, the friction-spring I', pressing against the inner side of a fixed spring-barrel, the pinions *k*, the spur-wheel *l*, spur-wheel *m*, and the shifting mechanism for moving the spur wheel *m*, and the disk *s*, with curved rack *t* attached thereto for locking spur-wheel *m*, substantially as specified.

478,714. VENDING APPARATUS. JOHN H. REFORD, Philadelphia, Pa. Filed Sept. 7, 1891. Serial No. 404,960. (No model.)

Claim.—1. In a vending apparatus, the combination of the supply-receptacle, the delivery-slide, the locking-bolt therefor, the vertically-sliding bolt-carrier, the casing having a coin-slot, said bolt-carrier being adapted to engage with the coin, and a pivoted operating-lever for forcing the coin past the bolt-carrier and at the same time moving said bolt-carrier and effecting the release of the delivery-slide, substantially as specified.

2. In a vending apparatus, the combination of the supply-receptacle, the delivery-slide, the locking-bolt therefor, the vertically-sliding bolt-carrier, the casing having a coin-slot, spring retaining-arms carried by the bolt-carrier and projecting into the path of the coin, and a pivoted lever L, adapted to be brought into contact with and force the bolt-carrier downward, substantially as specified.



3. In a vending apparatus, the combination of the supply-receptacle, the delivery-slide, the locking-bolt therefor, the vertically-sliding bolt-carrier, the casing having a coin-slot, said bolt-carrier being adapted to engage with the coin, and a pivoted lever for forcing the coin past the bolt-carrier, said lever being adapted to block the coin-slot and prevent the entrance of an additional coin to the bolt-operating mechanism during the operation of the apparatus, substantially as specified.

478,715. ROAD-VEHICLE. ELMER V. SAWTER, Easton, Pa. Filed Mar. 16, 1892. Serial No. 425,142. (No model.)

Claim.—1. In a road-vehicle, the combination of road-wheels having track-flanges on the inner peripheries thereof, grooved friction-wheels engaging said track-flanges, mechanism for operating said friction-wheels, and idlers engaging said friction-wheels to sustain them in position, all of which is supported on a suitable frame, substantially as described.

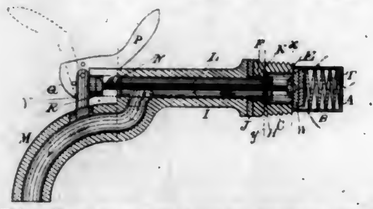
2. In a road-vehicle, the combination of a frame, road-wheels journaled on uprights rising from said frame, having track-flanges on the inner peripheries thereof, grooved friction-wheels engaging said track-flanges in advance of the central vertical plane of said road-wheels,

478,715.

idlers rotatably secured to the lower portions of the aforesaid uprights and engaging the lower rear portions of the said friction-wheels, and crank-driven sprocket-wheels and a chain belt for operating the rearmost of said sprocket-wheels and said friction-wheels, substantially as described.

3. In a road-vehicle, the combination of a frame, road-wheels journaled thereon having track-flanges on their inner peripheries and spokes connected to their outer faces, grooved frictional wheels engaging said track-flanges in advance of the central vertical planes of said road-wheels, and idlers engaging said frictional wheels below the central horizontal planes thereof, substantially as described.

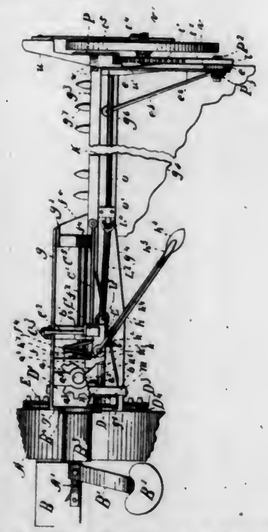
4. In a road-vehicle, the combination of the frame comprising upper and lower parts, road-wheels supported by the lower part of said frame and having track-flanges on the inner peripheries thereof, and friction-wheels carried by the upper part of said frame and engaging the track-flanges of said road-wheels, substantially as described.



5. In a road-vehicle, the combination of a frame comprising upper and lower parts, road-wheels supported by the lower part of said frame and having track-flanges on the inner peripheries thereof, frictional wheels carried by the upper part of said frame engaging said track-flanges, and idlers carried by the lower part of said frame and bearing against said frictional wheels, said parts being operated substantially as described.

6. In a road-vehicle, the combination of the frame comprising upper and lower parts, road-wheels journaled to the lower part of said frame and having track-flanges on the inner peripheries thereof, frictional wheels carried by the upper part of said frame, the forward pair of said frictional wheels being pivotally attached, idlers connected to the lower part of said frame and engaging said frictional wheels to hold them in position, and a chain-and-sprocket mechanism for operating the rear pair of said frictional wheels, substantially as described.

7. In a road-vehicle, the combination of the frame comprising an upper and a lower part, uprights or standards connected to the lower part of said frame, road-wheels journed to said uprights or standards and having flanges on their inner peripheries, frictional wheels carried by the upper part of said frame and engaging said flanges of said road-wheels, idlers carried by the lower part of said frame and engaging said frictional wheels, an upright bar or rod having sprocket-wheel and chain connection with the front pair of road-wheels, and a handle-bar for turning said road-wheels, a seat or saddle in rear of said handle-bar, a chain-wheel under said seat or saddle having driving-pedals, and a chain-wheel on the shaft of the rear pair of frictional wheels, connected with the aforesaid chain-wheel having the pedals, whereby the vehicle may be driven or propelled, substantially as described.



8. The combination of a suitable frame, wheels supported thereon having inner peripheral track-flanges or projections, and grooved wheels engaging said track-flanges or projections of the said wheels, the said wheels being also arranged in connected pairs and the rear-most pair thereof being driven by a suitable chain-belt and sprocket-wheel mechanism, substantially as described.

478,716. FAUCET AND CONNECTION. SIMON SCHLANGEN, Chicago, Ill. Filed Dec. 14, 1891. Serial No. 415,027. (No model.)

Claim.—In an improvement in two-part detachable faucets, the straight hollow portion I, with the curved discharge portion and neck portion as a part thereof, in combination with a fixed portion, a valve therein, a cylinder attached to the inner end of the fixed portion, and a spring therein operating against the valve, a notched internal flange on the fixed portion, and pins on said neck portion connecting the parts, a plunger-rod extending through the straight portion, with a bearing within the fixed portion and in a head at the outer end of said straight portion, and a cam-lever exterior to the faucet, operating against the said plunger-rod, as and for the purpose specified.

478,717. RAISING AND LOWERING MECHANISM FOR HARVESTERS. GEORGE SCHUBERT, Walnut, Tex. Filed Apr. 11, 1891. Serial No. 388,613. (No model.)

Claim.—1. In a raising and lowering device for binders and harvesters, the combination of a pinion *i* on the shaft *n* in position to be engaged or disengaged with the cogs *f*, in connection with a pinion *m* on the shaft *n*, a rack *d*, and a shaft O, connected to shaft *n* by a shaft L^3 and universal joints L^3 and L^4, the shaft O provided with a pinion o^3, in connection with a segment *t*, as shown, and for the purpose described.

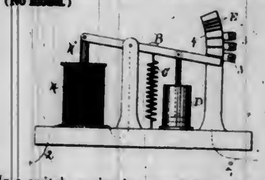
2. In a raising and lowering device for harvesters, the combination of a shaft *n*, provided with a key-seat n^3, a pinion *i*, provided with a key to engage said key-seat n^3 and in position to engage or disengage with the cogs *f*, a rod *h*, provided with a lever *h'* at its upper end and a bell crank *j'* at its lower end, provided with the studs j^3 and j^3, as shown, and for the purpose described, in connection with a dog J^3, as shown, a pinion *m* on the shaft *n*, a rack *d*, and a shaft O, connected to shaft *n* by the shaft L^3 and universal joints L^3 and L^4, the shaft O provided with a pinion o^3 in connection with a segment *t*, as shown, and for the purpose described.

3. In a raising and lowering device for harvesters, a bracket C^3, secured to the post C and provided with a forward projection C^3 to receive the dog J^3, with its horizontal arms J^4 J^4 projecting forward, with its other arms J' and J^3 projecting downward and connected by the bar J^3, for the purpose described, in connection with a pinion *i* on the shaft *n*, a pinion *m* on the shaft *n*, a rack *d*, a shaft O, connected

to the shaft *n* by a shaft L^3 and universal joints L^3 and L^4, a pinion o^3 on said shaft O, and a segment *t*, as shown and described.

4. In a raising and lowering device for harvesters, a bracket C^3, secured to the post C, and a locking-dog J^3, pivoted to said bracket, a rod A^7, secured to the free end of the arms J^4 J^4 and connected to the arm A^3 of the bell-crank, in connection with a rod A, provided with a lever *h'*, and a bell-crank *j'*, provided with the stud j^3, in connection with a pinion *i* on a shaft *n*, a pinion *m* on the shaft *n*, a rack *d*, a shaft O, connected to the shaft *n* by a shaft L^3 and universal joints L^3 and L^4, a pinion o^3 on said shaft O, and a segment *t*, as shown and described.

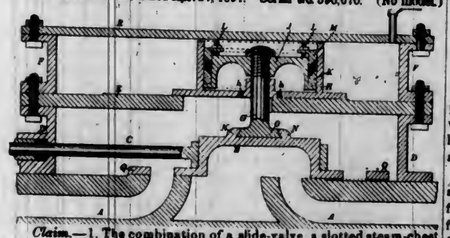
5. In a raising and lowering device for harvesters, the combination of a finger-bar K, having its vertical web projecting beyond the horizontal flanges and turned forward at P', and a bracket *w*, secured to the horizontal flange g^4, and a plate P, secured to said forward projection P' and the bracket *w* and projecting toward the rear and providing a support for the outer end of shaft O and a guide for the outer side of the segment *t*, as shown.



6. In a raising and lowering device for harvesters, the combination of a finger-bar K, provided with a bracket *w*, a plate P, secured to the bracket *w*, and projecting rearward and providing a support for the outer end of shaft O and formiug a guide for the outer side of the segment *t*, a grain-board *u*, secured to said bracket *w*, and the plate P, with its inner edge *u'* projecting rearward and projecting past the edge of the segment *t*, as shown, and for the purpose described.

7. In a raising and lowering device for harvesters, the combination of a bar *c*, secured to the flange g^4 of the finger-bar K and extending to the rear and secured by the braces c^3 and c^3, and a segment *t*, pivoted to the rear end of the bar *c* and projecting forward, in connection with a plate P, secured to the bracket *w* and projecting rearward and past the outer edge of said segment *t*, with the grain-board *u*, provided with a rearward-projecting flange *u'*, projecting past the inner edge of said segment *t*, as and for the purpose described.

8. In a raising and lowering device for harvesters, the combination of the bar g^4, extending to the vertical plate D and turned forward at g^6, and the bar g_1 extending from the shoe f^3 to the plate D and turned rearward at g', and a cross-bar *b* on the bars *g* and g^4 near the upright plate D, for the purpose described.



9. In a raising and lowering device for harvesters, the combination of a vertical plate D, secured to the axle A of the master-wheel and provided with a rack *d* and a bar D^3, the upper end of said plate D being turned grainward, forming the projection D', a post C, secured in an upright position, as shown, and a bracket a^3, secured to the projection D' and forming a guide on the post C, as shown, and for the purpose described.

478,718. ARC-EXTINGUISHER FOR ELECTRIC SWITCHES. SIDNEY H. SHORT, Cleveland, Ohio. Filed Mar. 10, 1891. Serial No. 384,446. (No model.)

Claim.—In a switch or circuit controller, the combination, with a switch lever and a series of contacts and resistances, of an arc-extinguisher consisting of a series of supplemental contacts, each being a good conductor of heat and electricity and arranged in the path of the switch-lever, substantially as set forth.

478,719. BALANCED SLIDE-VALVE. EDWIN R. SHEPHERD, Rochester, N. Y. Filed Apr. 27, 1891. Serial No. 390,670. (No model.)

Claim.—1. The combination of a slide-valve, a slotted steam-chest cover, a vertical cylinder sliding on said cover, a piston movable in said cylinder, and a stud passing through the slotted cover and connecting said piston to said slide-valve.

2. The combination of a slide-valve, a slotted steam-chest cover, a vertical cylinder sliding on said cover, a piston movable in said cylinder, a stud passing through the slotted cover and connecting said piston to said slide-valve, and the outer casing connected with a condenser or with other means of producing a diminished pressure.

3. The combination of a steam-chest, a slide-valve, a slotted steam-chest cover, a vertical-headed cylinder sliding on said cover, having perforations for admission of steam thereinto from the steam-chest and having a perforation through the head, a piston movable in said cylinder, and a stud passing through the slotted cover and through the perforation in the head and connecting said piston to said cylinder.

4. The combination of a steam-chest, a slide-valve, a slotted steam-chest cover, a vertical-headed cylinder sliding on said cover, having perforations for admission thereinto of steam from the steam-chest and having a perforation through the head, a piston movable in said cylinder, a stud passing through the slotted cover and through the perforation in the head and connecting said piston to said cylinder, and an outer casing connected with a condenser or with other means of producing a diminished pressure.

5. The combination of a slide-valve and a balancing device adapted to lift the slide-valve connected thereto by a stud removably dovetailed into the top of the slide-valve, arranged and operating as shown and described.

6. In a sliding balancing device for slide-valves, a series of longitudinal grooves in the face of the seat of said device from which the motive gas or vapor is excluded.

7. In a sliding balancing device for slide-valves, pairs of longitudinal grooves in the face of the seat of said device from which the motive gas or vapor is excluded.

8. In a sliding balancing device for slide-valves, pairs of longitudinal grooves in the face of the seat of said device from which the motive gas or vapor is excluded, each groove being longer than the balancing device.

9. In a sliding balancing device for slide-valves, a series of pairs of longitudinal grooves of increasing length in the face of the seat of said device from which the motive gas or vapor is excluded, each groove being longer than the balancing device.

10. In a balanced slide-valve having a balancing device sliding upon the top of the steam-chest cover, a series of longitudinal grooves in the face of the steam-chest cover, each groove being longer than the balancing device and of such length that when the grooves are uncovered at one end the balancing device covers them at the other end, and means for excluding the motive gas or vapor from said grooves.

11. The combination of a slide-valve, a slotted steam-chest cover, a vertical cylinder sliding on said cover, a piston movable in said cylinder, a stud passing through the slotted cover and connecting said piston to said slide-valve, and an extension on each end of said slide-valve, having a port therethrough, substantially as shown and described.

12. The combination of a slide-valve, a slotted steam-chest cover, a vertical cylinder sliding on said cover, a piston movable in said cylinder, a stud passing through the slotted cover and connecting said piston to said slide-valve, and an extension on each end of said slide-valve, having a port therethrough, together with a seat for said slide-valve smaller than the face thereof, substantially as shown and described.

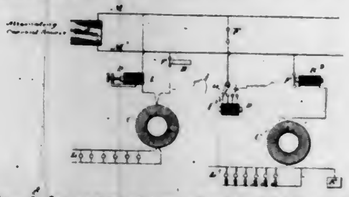
478,720. DEVICE FOR COOLING MILK, MEAT, VEGETABLES, &c. JOHN W. SMART and THOMAS C. CHEATHAM, Burnet, Tex. Filed Apr. 27, 1892. Serial No. 430,839. (No model.)

Claim.—1. A cooling device comprising a plate or base provided upon its under side with air-inlet grooves and upon its upper surface with a receptacle for the reception of a cooling medium and an outlet-flue projecting upwardly from said plate or base, substantially as and for the purpose set forth.

2. In a cooling device of the class described, the combination, with a plate or base provided with air-inlet openings and with a receptacle for the reception of a cooling medium, of an outlet-flue and a cap therefor and adjustable thereon, substantially as and for the purpose set forth.

3. A cooling device of the class described, comprising a plate or base provided with grooves or corrugations upon its under side for the passage of air, an annular flange projecting upwardly from said

plate or base and forming a receptacle, an outlet-flue projecting upwardly from the center of said receptacle and opening through the plate or base, and a cap for said flue consisting of the cap proper, arms depending therefrom, and a ring connecting the lower ends of said arms and encircling the flue, substantially as and for the purpose set forth.



4. The combination, with a vessel, of a cooling device consisting of a plate or base forming the cover for said vessel and provided with air-inlet openings, a receptacle upon the top of the plate or base and provided with inwardly-projecting pins, an outlet-flue, and a cloth adapted to inclose the vessel and receptacle and be secured at its edges to said pins, substantially as and for the purpose set forth.

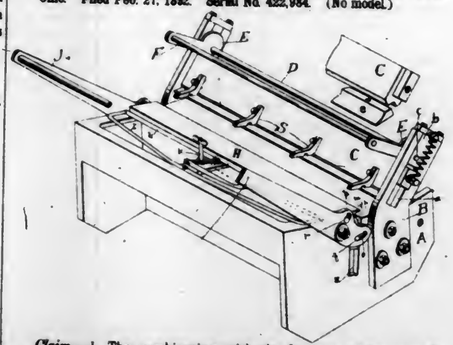
478,721. PEANUT-HEATER. EDWARD TAUHAY, New York, N. Y. Filed Apr. 1, 1892. Serial No. 427,322. (No model.)

Claim.—In a peanut-heater, the combination, with a heating-compartment, of a petroleum heating-stove in said compartment, a water bath supported on said compartment, a peanut-roasting vessel in said water bath, the bottom of the heating-compartment being provided with an opening for supporting the fount of the heating-stove and with air-supply openings alongside of said fount, and an upwardly-extending flue attached at the upper end of one of the side walls of the heating-compartment and extending alongside of the water bath, substantially as set forth.

478,722. DISTRIBUTION OF ELECTRIC CURRENTS. ELIHU THOMSON, Swampscott, Mass., assignor to the Thomson-Houston Electric Company, of Connecticut. Original application filed Dec. 6, 1886. Serial No. 220,850. Divided and this application filed July 26, 1890. Serial No. 360,012. (No model.)

Claim.—1. In a system of electric distribution wherein the translating devices are fed from main distributing-circuits through transformers or converting appliances, the combination, with such transformers, of automatic cut-out apparatus in the branches leading from the distributing-mains to said converters.

2. The combination of a main or principal circuit, a local or independent circuit, an induction apparatus between the two, and fusible plug in the connection from the main to the induction apparatus, as and for the purpose described.



3. The combination, substantially as described, of a main or principal circuit, two or more local independent circuits, induction apparatus between said local circuits and the main circuit and supplied in multiple arc from the latter, and fusible plugs in the multiple arc connections, as and for the purpose described.

4. The combination of a main or principal circuit carrying rapidly varying electric currents, induction apparatus fed in multiple arc from the same, local circuits fed by the induced currents set up by such induction apparatus, and fusible plugs in the connections from the main, as and for the purpose described.

5. The combination of a main or principal circuit supplied with current from a suitable source, local independent circuits containing incandescent lamps or other translating devices and supplied with current produced through the operation of the current flowing in the main or principal circuit independently of the local circuit, and fusible plugs in the main-circuit connections, as and for the purpose described.

6. In an alternating-current system as described, a safety wire or strip to cut off a primary branch when a great excess of current flows and a reactive coil or section of primary conductor whose parts are adjustable, as described, to compensate for moderate increase of potential between the two feeding-mains.

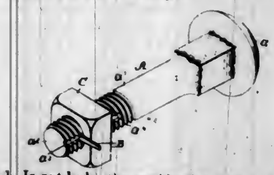
478,723. DOUBLE-SEAM FOLDER. HOMER L. TOTTEN, Canton, Ohio. Filed Feb. 27, 1892. Serial No. 422,984. (No model.)

Claim.—1. The combination, with the frame A, of the arms B, sheet-holder C, eccentrics E to force said holder down on the sheet *d*, the gage and folder G, having offset shoulders *h* and *j*, crimper H, and an actuating-lever J, by which the gage and crimper are alternately moved to bend and fold the edge of the sheet *d*, substantially as shown and described, and for the purpose set forth.

2. The combination of the main frame and the supporting-arms B secured thereto, a clamping-bar C, having a sliding engagement with said arms and provided at its lower edge with a toe *e*, the eccentric E for depressing the clamping-bar C, a folding-gage G, having a movement at an angle to that of the clamping-bar C, a crimper, a lever for advancing the same, a spring, tapering slides located between the edge of the crimper and the spring, and a key for reciprocating said slides.

3. In a double-seam folder, the combination, with a main frame, of a holder, a folder, a crimper, and mechanism for arresting the movement of the crimper, comprising a loop-spring, tapering slides located between the ends thereof and the edge of the slide, and means for reciprocating said slides.

478,724. BICYCLE. JOHN H. TUTTLE and FRANK D. CABLE, Toledo, Ohio. Filed Nov. 9, 1891. Serial No. 411,353. (No model.)

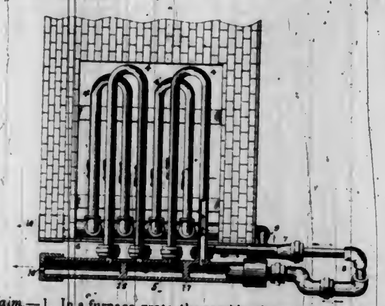


Claim.—1. In a bicycle, the forward fork and head thereof, connected by a hinged yoke and by springs having two terminal arms, one of which is attached pivotally and the other rigidly, substantially as shown and described, for the purpose specified.

2. In a bicycle, the head and forward fork thereof, in combination with a hinged yoke joining said head and fork, and springs having straight parallel terminal arms adjustably connected with said head and fork, substantially as shown and described, for the purpose specified.

3. In a bicycle, the head and forward fork thereof, in combination with springs rigidly connected to said fork and pivotally connected to said head and adjustably connected with both said head and said fork, substantially as and for the purpose specified.

4. In a bicycle, the head and forward fork thereof, in combination with a hinged yoke uniting said head and fork, springs connecting said head and fork, and a set-screw interposed between said head and fork, limiting the vertical play of said head, substantially as and for the purpose specified.



478,725. NUT-LOCK. LEWIS F. WARREY, Kansas City, Mo., assignor of one-half to James W. Fairman, same place. Filed Apr. 5, 1890. Serial No. 346,742. (No model.)

Claim.—1. In nut-locks, the combination, with a bolt having a suitable head and nut and a shank provided with a longitudinal recess and having the sides of said recess deflected at an angle to each other in the direction of the inner end of said recess and the bolt-head, of a tongue or key fitted within said recess, having its sides deflected at an angle to each other in the direction of the inner end of said recess and of the said bolt-head and adapted to resist compression upon the nut in degrees, substantially as described.

2. In nut locks, a bolt having a suitable head and a shank provided with a threaded end portion and a longitudinal recess, and the sides of said recess deflected at an angle to each other in the direction of the inner end of said recess and the head of the bolt, a nut on said shank, and a separable tongue having its sides deflected at an angle to each other in the direction of the inner end of said recess in said shank and also having a flexible outer end, substantially as and for the purpose described.

478,726. COMBINED GRATE-BAR AND FEED-WATER HEATER. HENRY D. WENDT, Hoboken, N. J. Filed Mar. 30, 1891. Serial No. 386,936. (No model.)

Claim.—1. In a furnace-grate, the combination of a series of tubular grate-bars, water inlet and outlet pipes connected to said bars by a yielding connection, and means for shifting said grate-bars back and forth, substantially as set forth.

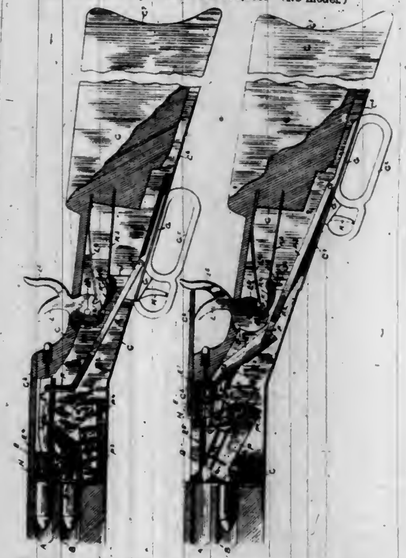
2. In a furnace-grate, the combination of a series of tubular grate-bars, water inlet and outlet pipes connected to said series of bars by a yielding connection, cross-bars supporting said tubular grate-bars, and means for shifting said grate bars back and forth upon said cross-bars, substantially as set forth.

3. In a furnace-grate, the combination of a series of tubular grate-bars, a cross-head or connecting tube connecting said grate-bars, water inlet and outlet pipes connected to said cross-head by a yielding connection, cross-bars supporting said grate-bars, and means for shifting said grate-bars back and forth upon said cross-bars, substantially as set forth.

4. In a furnace-grate, the combination of a series of tubular grate-bars, a cross-head or connecting-tube connecting said grate-bars, water inlet and outlet pipes connected to said cross-head, chambers arranged in said cross-head, whereby the water is caused to flow through said grate-bars successively, said inlet and outlet pipes being connected to said cross-head by a yielding connection, cross-bars supporting said grate-bars, and means for shifting said grate-bars back and forth upon said cross-bars, substantially as set forth.

5. In a furnace-grate, the combination of a series of tubular grate-bars arranged in two or more sections, a cross-head or connecting-tube connecting the bars of each section, water inlet and outlet pipes connected to said cross-heads by yielding connections, cross-bars supporting said grate-bars, and means for shifting said grate bars back and forth upon said cross-bars, substantially as set forth.

6. In a furnace-grate, the combination of a series of tubular grate-bars supported upon cross bars and arranged in one or more stationary sections and one or more movable sections, a cross head or connecting-tube connecting the bars of each section, water inlet and outlet pipes connected to the cross-heads of the stationary sections, water inlet and outlet pipes connected to the cross-heads of the movable sections by a yielding connection, and means for shifting said movable sections back and forth upon said cross-bars, substantially as set forth.



7. In a furnace grate, the combination of a series of tubular grate-bars supported upon cross-bars and arranged in one or more stationary sections and one or more movable sections, a cross-head or connecting-tube connecting the bars of each section, water inlet and outlet pipes connected to the cross-heads of the stationary sections, water inlet and outlet pipes connected to the cross-heads of the movable sections by a yielding connection, chambers arranged in said cross-heads, whereby the water is caused to flow through said grate-bars successively, and means for shifting said movable sections back and forth upon said cross-bars, substantially as set forth.

8. In a furnace-grate, the combination of the double tubes 4 and 4', constituting the grate-bars, cross-heads 5 and 6, connecting together the tubes 4 and 4', respectively, water-supply pipe 7, a yielding connection from said pipe 7 to the cross-head 5, a rigid connection from said pipe 7 to the cross-head 6, cross-bars 3, supporting the grate-bars, and means for shifting the grate-bars back and forth upon said cross-bars, substantially as set forth.

9. In a furnace grate, the combination of the double tubes 4 and 4', constituting the grate-bars, cross-heads 5 and 6, connecting together the tubes 4 and 4', respectively, chambers arranged in said cross-heads, water-supply pipe 7, a yielding connection from said pipe 7 to the cross-head 5, a rigid connection from said pipe 7 to the cross-head 6, cross-bars 3, supporting the grate-bars, and means for shifting the grate-bars back and forth upon said cross-bars, substantially as set forth.

10. The combination, with a steam-boiler, of a furnace-grate composed of the double tubes 4 and 4', cross-heads 5 and 6, having chambers formed therein, water-supply pipe 7, a swivel-jointed section 8, connecting the said pipe 7 with the cross-head 5, a rigid connection 9, connecting said pipe 7 with the cross-head 6, outlets 10 and 10', connecting said tubes 4 and 4' with the condenser or feed-water supply, and the lever 14, pivoted on the arm 13 and connected with the cross-head 5, whereby the tubes 4 are shifted back and forth upon the cross-bars 3, substantially as and for the purpose set forth.

478,727. BREECH-LOADING FIREARM. DERRICK S. WEST, Boston, Mass., assignor, by direct and mesne assignments, of three-fourths to John W. Drew, same place, and Charles H. Fish, Manchester, N. H. Filed June 20, 1891. Serial No. 396,965. (No model.)

Claim.—1. In a breech-loading firearm having a receiver in upper and lower communicating portions, and the upper in direct rearward extension from the breech of the barrel and terminating at a fixed wall of the receiver and the lower below and extending rearward of said upper portion, the combination of a breech-block located in and of the same length as said upper portion of said receiver and divided transversely into sections hinged and adapted to be butted end to end and placed at an angle to each other and butted to fill and at

an angle to open said upper portion of the receiver and in both positions to lie wholly within the receiver, and means connected to said breech-block and arranged and contained within and adapted to be operated at the outside of the receiver and to move said breech-block into and out of its said positions, substantially as described, for the purposes specified.

2. In a breech-loading firearm having a receiver in upper and lower communicating portions, and the upper in direct rearward extension from the breech of the barrel and terminating at a fixed wall of the receiver and the lower below and extending rearward of said upper portion, the combination of a breech-block located in and of the same length as said upper portion of said receiver and divided transversely into sections hinged and adapted to be butted end to end and to be placed at an angle to each other and butted to fill and at an angle to open said upper portion of the receiver and in both positions to lie wholly within the receiver, means connected to said breech-block and arranged and contained within and adapted to be operated at the outside of the receiver and to move said breech-block into and out of its said positions, and a slide located and adapted to be moved forward and backward on the outer and under sides of the receiver and connected to said operating means for the breech-block, substantially as described, for the purposes specified.

3. In a breech loading firearm, a breech-block located in its receiver and adapted to open and close the breech of the barrel, means adapted to operate, as stated, said breech-block, and a magazine-barrel under and lengthwise of the gun-barrel and adapted at its open breech to discharge cartridges from it into the receiver one after another, the combination of a cartridge-carrier below and in line with the breech-block and at its rear end fulcrumed on the receiver to be swung to place it either in line with or across the magazine-barrel, a vertical abutment-face at the rear end portion and above the fulcrum of said cartridge-carrier, and a dependent lug held on and moving with the said breech-block and adapted, normally, to stand across the breech of the magazine-barrel and on the backward movement of the breech-block to contact with said abutment-face of and thereby to swing the cartridge-carrier upward, substantially as described, for the purposes specified.

4. In a breech-loading firearm, a breech-block located in its receiver and adapted to open and close the breech of the barrel, means adapted to operate said breech-block, as stated, and a magazine-barrel under and lengthwise of the gun-barrel and adapted at its open breech to discharge cartridges from it into the receiver one after another, the combination of a cartridge-carrier below and in line with the breech-block and at its rear end fulcrumed on the receiver to be swung to place it either in line with or across the magazine-barrel, a vertical abutment-face at the rear end portion and above the fulcrum of said cartridge-carrier, a dependent lug held on and moving with the said breech-block and adapted, normally, to stand across the breech of the magazine-barrel and on the backward movement of the breech-block to contact with said abutment-face of and thereby to swing the cartridge-carrier upward, and a cartridge-ejector held and adapted for a limited swing in a vertical plane on said lug and adapted at its forward edge to contact with rim of cartridge shell and at its rearward edge to contact with said abutment-face of the cartridge-carrier, substantially as described, for the purposes specified.

5. In a breech-loading firearm having a receiver in upper and lower communicating portions, and the upper in direct rearward extension from the breech of the barrel and terminating at a fixed wall of the receiver and the lower below and extending rearward of said upper portion, the combination of a breech block located in and of the same length as said upper portion of said receiver and divided transversely into sections hinged and adapted to be butted end to end and placed at an angle to each other and butted to fill and at an angle to open said upper portion of the receiver and in both positions to lie wholly within the receiver, means consisting of links jointed end to end and one to said breech-block, a slide located and adapted to be moved forward and backward on the outer and under sides of the receiver and having one of said links jointed to it, and means held on said receiver and said links and adapted, relatively, to serve as guides to the movement of said links by the movement of said slide, substantially as described, for the purposes specified.

6. In a breech-loading firearm having a receiver in upper and lower communicating portions, and the upper in direct rearward extension from the breech of the barrel and terminating at a fixed wall of the receiver and the lower below and extending rearward of said upper portion, the combination of a breech-block located in and of the same length as said upper portion of said receiver and divided transversely into sections hinged and adapted to be butted end to end and placed at an angle to each other and butted to fill and at an angle to open said upper portion of the receiver and in both positions to lie wholly within the receiver, means consisting of links jointed end to end and one to said breech-block, a slide located and adapted to be moved forward and backward on the outer and under sides of the receiver and having one of said links jointed to it, and means held on said receiver and said links and adapted, relatively, to serve as guides to the movement of said links by the movement of said slide and as a rest or support for the links connected to the breech-block, substantially as described, for the purposes specified.

7. In a firearm, in combination, a hammer L, a fulcrumed sear K, adapted to hold and release the hammer, a fulcrumed angular trigger H H^3, and a vertical limited sliding arm J, having said sear pivoted on it and adapted to be acted on by the arm H^3 of said trigger, substantially as described, for the purpose specified.

8. In a breech loading firearm, a barrel, a receiver and stock, an abutment in the receiver to the rear of and in line with the barrel, and a breech-block resting, when in closed position, with one end against the abutment in the receiver and the other closing the breech of the barrel, said breech-block being divided transversely into fore and rear sections hinged together, and means for withdrawing both sections of the breech-block rearwardly within the receiver, substantially as described.

9. In a breech-loading firearm, a barrel, a receiver and stock, an abutment in the receiver to the rear of and in line with the barrel, and a breech-block resting, when in closed position, with one end against the abutment in the receiver and the other closing the breech of the barrel, said breech-block being divided transversely into fore and rear sections hinged together, a firing-pin extending through and divided into sections corresponding to the breech-block, a pin through said abutment in the receiver in alignment with said firing-pin, and a hammer pivoted in the rear thereof, substantially as described.

10. In a breech-loading firearm, a barrel, receiver and stock, an abutment in the receiver in line with and to the rear of the barrel, a breech block normally resting with one end closing the breech of the barrel and the other against said abutment, said breech-block being transversely divided into front and rear sections hinged to each other, a sliding handle on the under side of the receiver, and a link connecting said handle to the rear of the breech-block, substantially as described.

11. In a breech-loading firearm, a barrel and stock, a receiver having grooves in its inner faces, extending horizontally from the breech of the barrel to a point near an abutment in the receiver, then vertically downward for a short distance, and again obliquely downward and rearward, a breech-block normally resting with one end closing the breech of the barrel and the other against said abutment, said breech-block being divided into fore and rear sections hinged to each other, pins on each section of the breech-block, resting in the grooves in the receiver, and means for withdrawing the breech-block rearwardly within the receiver, all substantially as shown and described.

12. In a breech-loading firearm, a barrel and stock, a receiver having grooves in its inner faces, extending horizontally from the breech of the barrel to a point near an abutment in the receiver, then vertically downward for a short distance, and again obliquely downward and rearward, a breech-block normally resting with one end closing the breech of the barrel and the other against said abutment, said breech-block being divided into fore and rear sections hinged to each other, pins on each section of the breech block, resting in the grooves in the receiver, a link pivotally connected to the rear section of the breech-block, a rod pivoted to said link by a pin whose protruding ends rest, when the breech is closed, upon a shoulder at the base of the vertical part of the grooves in the receiver, and a sliding handle on the under side of the receiver, pivoted to said rod, all as shown and described.

478,728. MAGAZINE BREECH-LOADING GUN. DERRICK S. WEST, Boston, Mass., assignor, by direct and mesne assignments, of three-fourths to John W. Drew, same place, and Charles H. Fish, Manchester, N. H. Filed Sept. 11, 1891. Serial No. 405,425. (No model.)

Claim.—1. In a breech-loading firearm, in combination, a receiver having a guideway G^4 along its under side and said way having a side notch or notches G^7 G^7, a slide G, held on and adapted to move lengthwise of said way and suitably connected to the breech-block to move said block to open and close the breech of the gun, a chamber D^2 of and within the receiver and lengthwise of the rearward part of said guideway G^4, and a trigger H H^3 and a lever catch S S^3, both independently fulcrumed on the slide, the trigger in advance of the catch and with the slide closed, so as to have the trigger in position to release the hammer and the arm S^2 of said catch by side projections S^3, adapted to engage with and disengage from said notches and to lap over and travel on the receiver at the sides of said way, and also adapted to close said chamber D^2 and said way as the slide is moved forward and backward along said way, substantially as described, for the purposes specified.

2. In a breech-loading firearm, in combination, a breech-block in sections transversely of its length and said sections hinged and butted end to end and adapted placed end to end to close and placed at an angle with each other to open the breech of the gun, a link F, pivoted to the rear section of the breech-block and having an abutment F^2 and otherwise suitably connected to move said breech-block to place its

478,728.

sections as aforesaid, a hammer L, held on and adapted to slide in a suitable guideway to be cocked and to discharge the gun, and an abutment L^{13}, held on and moving with said link and the rear section of said breech block relatively adapted to contact in the movement of said breech-block to open the breech of the gun, substantially as described, for the purposes specified.

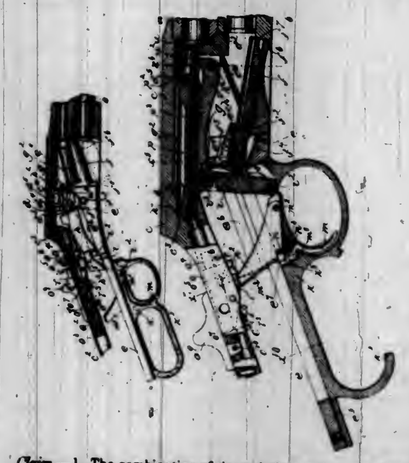
3. In a breech-loading firearm, in combination, a breech-block in sections transversely of its length and said sections hinged and abutted end to end and adapted placed end to end to close and placed at an angle with each other to open the breech of the gun, means adapted to move said breech-block to place its sections as stated, and a hammer, having its striking end and the rear end of the breech-block struck by it in the discharge of the arm relatively adapted to interlock or engage with each other, substantially as described, for the purpose specified.

4. In a breech-loading firearm, in combination, a breech-block in sections transversely of its length and said sections hinged and butted end to end and adapted placed end to end to close and placed at an angle with each other to open the breech of the gun, means adapted to move said breech-block to place its sections as stated, a firing-pin in sections, one to each section of and with the breech-block butted end to end in line with each other and the forward section having a lengthwise slot M^2, and an angular arm extension E^{11}, held on the section of the breech-block next to and pivoted on the forward breech-block section and entered into said slot of said section of the firing-pin, substantially as described, for the purpose specified.

5. In a breech-loading firearm, in combination, a breech-block in sections transversely of its length and said sections hinged and butted end to end and adapted placed end to end to close and placed at an angle with each other to open the breech of the gun, means adapted to move said breech-block to place its sections as stated, a cartridge-extractor and a cartridge-ejector both held on and moving with the forward section of said breech-block and the latter consisting, essentially, of a vertical plate at its lower end fulcrumed and at its upper end having a notch to contact with the cartridge-rim, and a spring held on the section next to the forward section of the breech-block and adapted to bear on the rear edge of said plate, substantially as described, for the purpose specified.

6. In a magazine breech-loading firearm having a magazine-barrel below the gun-barrel and open at its breech end, in combination, a breech-block adapted to open and close the breech of the gun-barrel, a dependent lug O, held on and moving with said breech-block and at its lower end portion having a side projecting pin or pins O^2, and a cartridge-carrier P, located below and in line with the breech-block and at its rear end fulcrumed to swing vertically and having a longitudinal slot P^2, with downward and rearwardly-inclined and cam edges P^7 P^8 for the travel of said lug O and its abutment on said cams, substantially as described, for the purpose specified.

7. In a breech-loading firearm, a barrel, a stock, and a receiver, an abutment in the receiver to the rear of and in line with the barrel, a breech-block resting when in position with one end against the abutment in the receiver and the other closing the breech of the barrel, said breech-block being divided transversely into front and rear sections hinged to each other, an undercut recess in the rear end of the rear section of the breech-bolt, and a spring-actuated bolt passing through the abutment in the receiver and entering said undercut recess, whereby the breech-bolt is locked in firing position, all substantially as described.



8. In a breech-loading gun, a barrel, a stock, and a receiver, an abutment in the receiver to the rear of and in line with the barrel, a breech-block resting when in closed position with one end against the abutment in the receiver and the other closing the breech of the barrel, said breech-block being divided transversely into front and rear sections hinged to each other, an undercut recess in the rear end of the rear section of the breech-bolt, a sectional firing-pin passing through the sections of said bolt and terminating in said recess, and a spring-actuated firing bolt passing through the abutment in the receiver and entering said undercut recess, whereby the breech-bolt is locked in firing position, all substantially as described.

9. In a breech-loading firearm, a breech-block moving horizontally rearward to open the breech, a lug depending from the front end of the breech-block across the mouth of the magazine, a cartridge-carrier hinged at its rear end in the receiver beneath the breech-block, a slot in said carrier, through which said depending lug passes on the opening of the breech-block, grooves in the side walls of said slot, terminating in a downwardly and rearwardly inclined cam-surface, and laterally-projecting pins on said lug traveling in said grooves and engaging said cam-surface, all substantially as described.

10. In a breech-loading firearm, a transversely-divided breech-block having its sections hinged together, the front section moving in guideways horizontally rearward and the rear section obliquely downward and rearward to open the breech, an ejector-lever pivoted in a slot in a lower depending portion of the front section of the breech-block, a spring attached to the rear section thereof and bearing against the rear face of the ejector, and an abutment in the receiver near the limit of the rearward throw of the breech-block and in the path of said ejector-lever, all substantially as described.

11. In a breech-loading firearm, a magazine, a barrel, a stock, and a receiver, a cartridge-carrier located in the receiver, means for moving it up and down in a vertical plane, curved levers pivoted to and projecting from the opposite sides of said carrier, the pivots being intermediate the ends of said levers, and grooves in the opposite sides of the receiver, within which said levers travel on the upward and downward movement of the carrier, said grooves terminating both at the top and bottom in inwardly-inclined cam surfaces, whereby the levers are opened by the lowering of the carrier and closed by the elevation thereof, all substantially as described.

478,729. MAGAZINE-FIREARM. DERRICK S. WEST, Boston, Mass., assignor of three-fourths to Charles H. Fish, Manchester, N. H., and John W. Drew, Boston, Mass. Filed May 20, 1892. Serial No. 433,670. (No model.)

Claim.—1. The combination of the main frame-piece constituting a receiver connected with the breech of the barrel and provided with an abutment at its rear end with the under frame piece and two-part jointed breech-block, and means for operating the same, connected

with said under frame-piece, as described, whereby said under frame-piece and the breech-block and its operating mechanism may be removed without separation from the main breech frame-piece, substantially as described.

2. The combination of the main breech frame-piece constituting a receiver communicating with the barrel and magazine and provided with an abutment at the rear of said receiver in line with the barrel with the under frame-piece and carrier pivotally connected therewith and the breech-block and its actuating mechanism connected with the said under frame-piece for removal without separation of its parts from said main breech frame-piece, substantially as and for the purpose described.

3. In a breech-loading firearm, the barrel and receiver connected therewith, having an abutment at its rear end in line with the barrel, and a two-part breech-block having its front and rear sections hinged together and adapted to be interposed in line with one another between the breech of the barrel and said abutment, combined with operating means for withdrawing the said breech-block from the breech of the gun and for moving it into position between the breech and the abutment, a lock for holding the said operating means, with the breech-block, in closed position, a firing-hammer, and releasing device for said lock, operated by said hammer, substantially as described.

4. The combination of the main breech frame-piece connected with the breech of the barrel and provided with an abutment at the rear thereof with the two-part jointed breech-block and sliding handpiece connected therewith, the trigger pivoted in said sliding handpiece, and a lock co-operating with the said trigger and handpiece, as described, to lock the trigger, except when the breech is closed, and to lock the handpiece and release the trigger when the breech is closed, substantially as described.

5. The combination of the main breech frame-piece connected with the breech of the barrel and provided with an abutment at the rear thereof, the breech-block and actuating handpiece connected therewith, the trigger connected with the said handpiece, and lock co-operating with said handpiece, as described, to lock the breech-block in closed position, and the releasing device for said lock operated by the hammer, substantially as described.

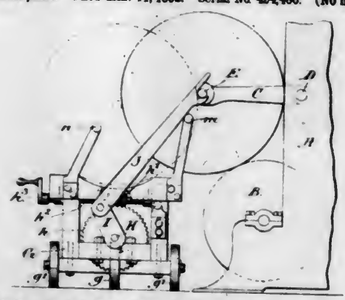
6. The combination of the hammer with the sear having a forked trigger-engaging end, the breech-block and mechanism for operating the same, the trigger and lock connected with the said breech-block-operating mechanism, said trigger having a forked sear-engaging end, and the releasing device for said lock, working in the forked engaging end of the sear and operated by the hammer, substantially as described.

7. The combination of the breech-block with the extractor, consisting of a forked spring having one branch of the fork in a longitudinal bore in the breech-block and the other branch of the fork extending along the side of the breech-block and projecting beyond the forward end thereof and provided with a shoulder and inclined at its forward end to engage with the rim of the cartridge-shell, substantially as described.

8. The combination of the breech-block *d* with the extractor for engaging the rim of the shell and the spring-pressed ejector-bolt in the forward end of said breech-block, provided with a central passage for the firing-pin, substantially as described.

9. The combination of the magazine and barrel and breech frame-piece constituting a receiver in which the cartridges are transferred from the magazine to the barrel, with the carrier *f*, pivoted at its rear end in said receiver, and the spring-retainer f^8, fastened at its rear end to the said carrier and having its forward spring end projecting below the forward end of the carrier to act as a stop to prevent escape of cartridges from the magazine when the carrier is in position to guide the cartridge above it into the gun-barrel, said projecting end being adapted to yield to permit cartridges to be introduced into the magazine below said carrier, substantially as described.

10. The breech frame-piece constituting a receiver and the barrel and magazine communicating therewith, said frame-piece being open at its under side, combined with the pivoted carrier *f*, having laterally-projecting ribs f^9 along the lower edges of its side, the said receiver having its lower portion widened to receive said ribs and being provided with shoulders c^9 to engage said ribs and limit the pivotal upward movement of the carrier, substantially as described.



11. The breech frame-piece constituting a receiver closed at the top and provided with an abutment at its rear end and having one of its side walls provided with an opening, combined with a sliding cover for said opening and a breech-block longitudinally movable in said receiver and engaged with said sliding cover, the top side and rear walls of said receiver being otherwise closed and continuous, substantially as described.

478,730. REVERSIBLE PLOW-POINT. CHARLES J. ABBOTT, Greenville, Mich., assignor to himself, Fairchild H. Wright, Cass T. Wright, Maryette Wright, Howell J. Moore, and Henry Watson, same place. Filed Mar. 21, 1892. Serial No. 425,665. (No model.)

Claim.—The combination, with the plowshare abruptly reduced in vertical section at its forward end and upon its upper and lower sides, said reduction extending but partially the width of said share, thereby forming shoulders J, a flange G, and a projection C, said flange extending beyond the forward end of said projection and said projection being wedge-shaped and formed with transverse tongues E, of the point having a wedge-shaped opening fitted to the projection C and recesses for engaging the tongues of said projection, all substantially as shown and described.

478,731. BEAM-TRUCK. JOSEPH B. BANCROFT and ALONZO E. REGADEN, Hopedale, Mass., assignors to The Hopedale Machine Company, same place. Filed Mar. 11, 1892. Serial No. 424,486. (No model.)

Claim.—1. In a beam-truck, lifting-arms adapted to engage the journals of the beam to be lifted, combined with actuating devices for said lifting-arms, substantially as described.

2. The truck, its crank-shaft, and connected lifting-arms, combined with devices to rotate the crank-shaft, substantially as described.

3. The truck, its crank-shaft, and connected lifting-arms, combined with devices to rotate the crank-shaft and with the fulcra over which the lifting-arms slide, substantially as described.

4. The truck, its crank-shaft, and connected lifting-arms, combined with devices to rotate the crank-shaft and with the fulcra over which the lifting-arms slide, and a back-stop for the arms, substantially as described.

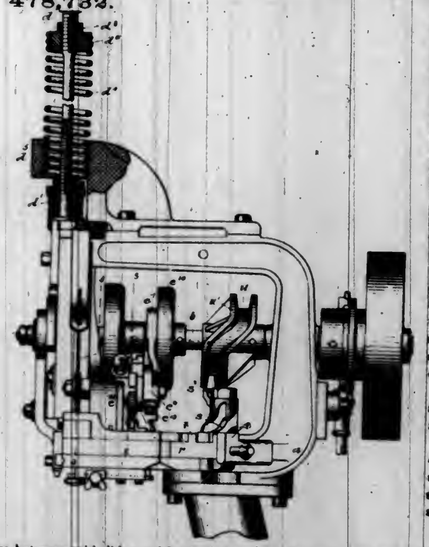
478,732. WIRE-PEGGING MACHINE. THOMAS BARRETT, Boston, Mass., assignor to Barrett Brothers, same place. Filed May 26, 1891. Serial No. 394,107. (No model.)

Claim.—1. In a nailing-machine, the combination, with a wire-feeding and nail-driving mechanism, of a pair of dies having flat beveled coacting faces arranged to act on the wire and form indentations in its opposite sides and having guide-faces at a substantial right angle to the indenting-faces, a reciprocating carrier arranged when at one end of its movement to receive the end of the wire below said dies, and means for reciprocating said carrier, whereby it is caused to sever said end from the body of the wire at the point of indentation by said dies, the severed end constituting a nail, and to carry said nail into position to be driven, as set forth.

2. In a nailing-machine, the combination, with wire-feeding and nail-driving mechanism, of a pair of dies having flat beveled coacting faces arranged to act on the wire and form indentations in its opposite sides and having guide-faces at a substantial right angle to the indenting-faces, mechanism for reciprocating said dies simultaneously in opposite directions, and thus cause the dies to alternately grasp and release the wire, and a reciprocating carrier which receives the end of the wire below said dies and by one of its movements severs said end from the wire as a completed nail and moves said nail laterally into position to be driven, as set forth.

3. In a nailing-machine, the combination, with wire-feeding and nail driving mechanism, of the two slides *h' i'*, arranged side by side in a guide or way in the supporting-frame, said slides having flat-faced indenting-dies arranged to act simultaneously on opposite sides of a wire between said slides and having, also, guide faces at a substantial right angle to the indenting-faces, a rock-shaft journaled in a fixed bearing and provided with two eccentrics, one of which is engaged with the slide *h'* and the other with the slide *i'*, said eccentrics being oppositely arranged, so that each movement of the rock-shaft causes the eccentrics to move the slides simultaneously in opposite directions, and means for rocking or oscillating said shaft, whereby the dies carried by said slides are caused to alternately approach and recede from each other, as set forth.

4. In a nailing-machine, the combination, with wire-feeding and nail driving mechanism, of the slides *h' i'*, having dies provided with flat indenting-faces and side faces for guiding the wire and relatively arranged as described, the rock-shaft journaled in a fixed bearing and provided with two oppositely-arranged eccentrics, one engaged with the slide *h'* and the other with the slide *i'*, an arm affixed to said rock-shaft, and means, substantially as described, for oscillating said arm, and thereby causing the rock-shaft and its eccentrics to reciprocate the slides and their dies simultaneously in opposite directions, as set forth.



5. In a nailing-machine, the combination, with wire-feeding and nail-driving mechanism, of the point-forming flat-faced indenting-dies adapted to simultaneously indent opposite sides of the wire and having lateral guides for the wire, the carrier *r*, movable in a guide or way in the supporting-frame and having a pocket formed to receive the end of the wire projecting below said dies, a lever pivoted to the frame of the machine and engaged at one end with shoulders or projections on said carrier, and a cam on the driving-shaft of the machine engaged with the other end of said lever, as set forth.

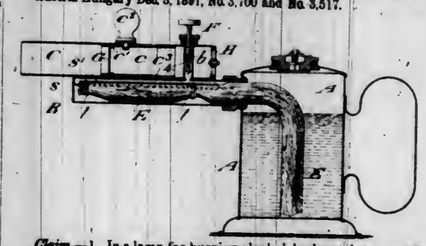
6. In a nailing-machine, the combination of the driver-bar, the supporting-frame having an internally-screw-threaded or helically-grooved orifice surrounding the driver bar, the normally-closed helical spring having the convolutions of its lower portion engaged with the thread or helical groove in said orifice, and connections between the free upper portion of said spring and the driver-bar, as set forth.

7. In a nailing-machine, the combination of the driver-bar, the supporting-frame having an internally-screw-threaded or helically-grooved orifice surrounding the driver-bar, the normally-closed helical spring having the convolutions of its lower portion engaged with the thread or helical groove in said orifice, a nut or plug affixed to the free upper end of said spring, and a screw adjustably engaged with said nut or plug and bearing on the driver-bar, as set forth.

8. In a nailing-machine, the combination, with a feed-roll, its shaft, and a ratchet on said shaft, of an arm loosely mounted on said shaft and provided with a pawl engaged with said ratchet, another arm loosely mounted on said shaft and positively oscillated by the power of the machine, a yielding connection between the pawl-carrying arm and the positively-oscillated arm, whereby the latter is enabled to move independently of the former, and a movable stop arranged to abut against a shoulder on the pawl-carrying arm during the backward movement of the latter, and thereby arrest said movement, so that the backward movement of the pawl may be arrested at any desired point, the pawl remaining in engagement with the ratchet, as set forth.

478,732.

9. In a nailing-machine, the combination, with a feed-roll, its shaft, and a ratchet on said shaft, of an arm loosely mounted on said shaft and provided with a pawl engaged with said ratchet, another arm loosely mounted on said shaft and positively oscillated by the power of the machine, a yielding connection between the pawl-carrying arm and the positively-oscillated arm, whereby the latter is enabled to move independently of the former, a movable stop arranged to abut against a shoulder on the pawl-carrying arm during the backward movement of the latter, a swinging arm carrying said stop, and means for locking said arm and stop in any position to which they may be adjusted, as set forth.



10. The combination, with the loosely-mounted pawl-carrying arm c^4, having the shoulder c^{17}, of the stop c^{13}, the swinging arm c^{16}, carrying said stop, the fixed segmental flange c^{21}, the movable gib c^{19} on the arm c^{16}, and the screw c^{20}, adapted to adjust said gib, as set forth.

11. The combination of the loosely-mounted pawl-carrying arm c^4, having the shoulders c^{17} and c^{18}, the positively-oscillated arm c^6, arranged to bear on the shoulder c^{18} during its forward movement, and thereby carry the pawl-carrying arm forward to a given position, the spring c^{15}, connecting the arms c^4 and c^6, and the adjustable stop c^{14}, arranged to strike the shoulder c^{17} and arrest the backward movement of the pawl carrying arm, as set forth.

12. In a nailing machine, the pointing-dies *h i*, having the acting shoulders h^2 i^2, and inclined faces 2 3, combined with means for closing and opening said dies, as set forth.

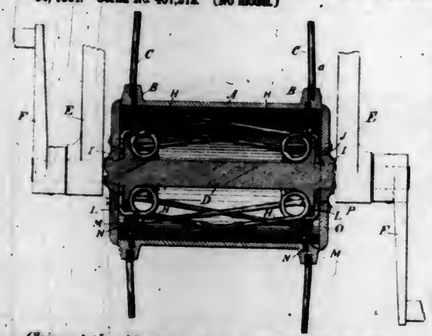
13. In a nailing-machine, the combination of the dies *h i*, the slides *h' i'*, holding said dies, the rock-shaft having the oppositely-arranged eccentrics engaged with said slides, and means, substantially as described, for adjusting said shaft to vary the thickness of the nail-point, as set forth.

478,733. LAMP FOR BURNING HYDROCARBONS. GUSTAV BARTHEL, Dresden, Germany. Filed Oct. 27, 1891. Serial No. 409,965. (No model.) Patented in Switzerland May 15, 1891, No. 3,541; in France June 15, 1891, No. 214,145; in Italy June 30, 1891, LVIII, 294, and in Austria-Hungary Dec. 3, 1891, No. 3,700 and No. 3,517.

Claim.—1. In a lamp for burning alcohol, hydrocarbons, and their derivatives, the combination, with a reservoir, of a wick-tube constituting an evaporator and a burner-tube open to the atmosphere at both ends, the said tubes being arranged side by side in close proximity to each other, and a nozzle projecting laterally from the said wick-tube directly across and in communication with the burner-tube, substantially as and for the purpose herein set forth.

2. In a lamp having a wick-tube B and a burner-tube C, both tubes being arranged parallel and in close proximity to each other outside the fuel-reservoir A, and a wick arranged in the tube B and extending into the reservoir A, the wick within the tube B being partly bound to form an evaporating-chamber in the tube B and partly forming a packing to prevent the vapors created in the tube B from escaping into the reservoir A, substantially as herein set forth.

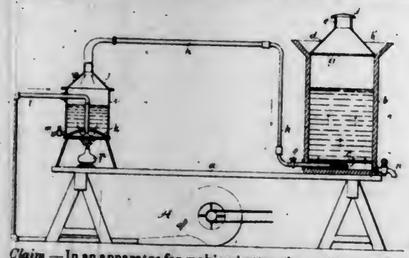
3. The combination, with the lamp-burner tube open at its outer end and having at its inner end inlet-openings for air and vapor, of a foraminous diaphragm G, adjustable longitudinally within said tube to vary its distance from said inlet-openings and from said open outer end, respectively, substantially as and for the purpose herein set forth.



478,734. WATCH-CASE. FRANCOIS BORGEL, Geneva, Switzerland. Filed Nov. 18, 1891. Serial No. 412,255. (No model.)

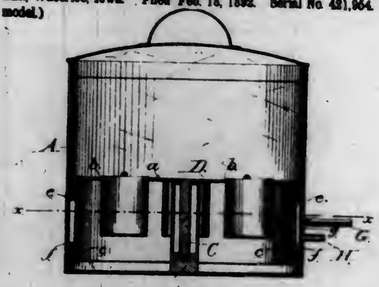
Claim.—The watch-case A, having the back rim and inturned flange *a* in one piece of metal and the surface of the inturned flange screw-threaded, in combination with the ring B, having a screw-threaded exterior to screw into the flange *a*, the inner edge of the ring B being adapted to set against the inner surface of the case at

the back, and a bezel for the glass having a flange that passes in between the case and outer edge of the screw-ring, substantially as set forth.



478,785. BICYCLE-WHEEL. George G. F. Boswell, Indianapolis, Ind., assignor of one-fifth to Joseph R. Boswell, same place. Filed Sept. 30, 1891. Serial No. 407,212. (No model.)

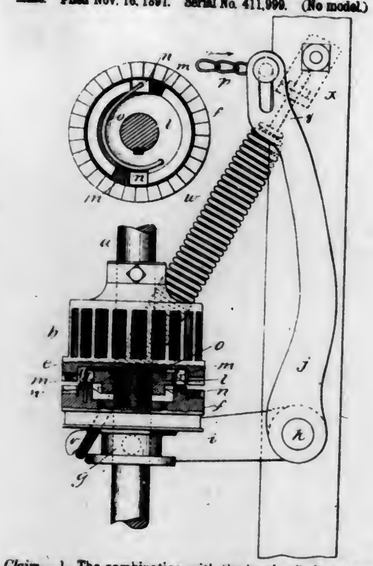
Claim.—1. In a bicycle-wheel, the combination of the hollow cylindrical hub, the driving-shaft extending axially through said hub, the two series of springs arranged at opposite ends of said shaft, one end of each of said springs being rigidly secured to the shaft and having its opposite end attached to the interior surface of the hub, whereby a yielding connection is formed between the driving-shaft and the wheel-hub, substantially as set forth.



2. In a bicycle-wheel, the combination of the hollow cylindrical hub, the shaft having collars L L, springs H, and clamping-plates I I, all arranged to co-operate in the manner and for the purpose set forth.

478,786. MANUFACTURE OF BUTTER. Walter Cole, London, England. Filed Sept. 3, 1889. Serial No. 322,872. (No model.) Patented in England Aug. 21, 1889, No. 13,197, and in Germany Sept. 1, 1889, No. 53,215.

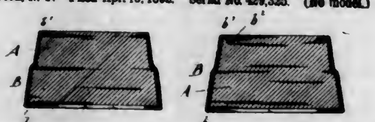
Claim.—In an apparatus for making butter, the combination, with the cream-receptacle, provided with a perforated diaphragm, the air filtering and tempering device, having a perforated diaphragm, and a connection from said air filtering and tempering device discharging into the cream-receptacle beneath its said diaphragm, of a continuous blast apparatus connected with the air filtering and tempering device and discharging beneath the diaphragm of the same, substantially as described.



478,787. APPARATUS FOR TESTING MILK. Modestus J. Cushman, Waterloo, Iowa. Filed Feb. 18, 1892. Serial No. 421,964. (No model.)

Claim.—1. In milk-testing apparatus, the inclosing case or exterior vessel having the steam and exhaust pipes, in combination with an inner vessel adapted to support the milk-receptacles and to rotate within the outer vessel, said inner vessel having a vertical surrounding flange provided with upper and lower horizontal flanges and connecting curved blades or buckets forming a turbine wheel, into which the steam-pipe discharges to rotate the inner vessel and raise the temperature of the milk, substantially as herein described.

2. In milk-testing apparatus, the outer vessel or case having the steam and exhaust pipes and the vertically-disposed post, an inner vessel having a shaft mounted in said post and having swinging milk-receptacles supported in openings in its top, said inner vessel having a deep surrounding vertical flange, the upper and lower flanges *e* and *f*, extending horizontally from the vertical flange and forming with the same and the inner wall of the outer vessel an inclosed chamber, and the curved vertical blades or buckets between the flanges *e* and *f* and adapted to receive the discharge of the steam-pipe, whereby the inner vessel is rotated and the temperature of the milk raised, substantially as herein described.

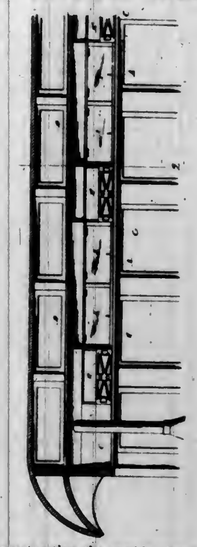


478,788. COTTON-SPINNING MULE. Charles A. Dan, Lowell, Mass. Filed Nov. 16, 1891. Serial No. 411,999. (No model.)

Claim.—1. The combination, with the band-cylinder, the gear *b*, and clutch part *c*, of the sliding clutch part, means to move it, the collar or disk intermediate the two clutch parts, dogs on the sliding clutch part engaged by the collar to cause it to rotate therewith and yet have a limited circumferential motion upon the shaft independent of the collar, and a spring engaged with the sliding clutch part and collar and operating to hold the former in a given position with respect to the latter, as set forth.

2. The combination, with the follower-leg, the band-cylinder, the gear *b*, and clutch part *c*, of the sliding clutch part *f*, the lever engaging the latter, the spring engaged at one end with said lever and at the other end with the square of the carriage and operating upon arm of said lever to move the sliding clutch part into engagement with the clutch part *e* and the chain connected with the opposite arm of said lever, and connections between the chain and follower-leg to move the lever and sliding clutch part in the opposite direction, as set forth.

478,789. ILLUMINATING-LENS. Louis K. Davenport, New York, N. Y. Filed Apr. 15, 1892. Serial No. 429,325. (No model.)



Claim.—1. An illuminating-lens composed of a glass body provided in its top with a rabbet along the edge and a sheet-metal band

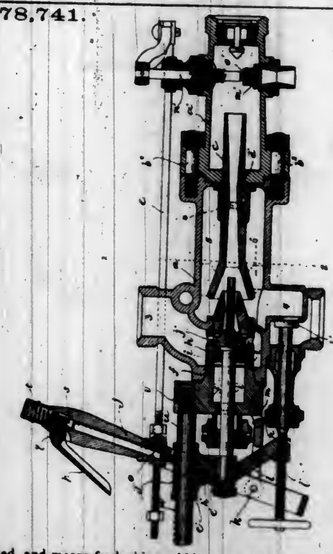
or thimble that is applied to the body of the lens and provided with inwardly-bent top and bottom flanges, the top flange resting in the rabbet and having its top surface flush with the top of the lens, substantially as set forth.

2. The combination, with an illuminating-lens provided in its top with a rabbet along the edge and with a vertical groove in the top along the inner edge of the rabbet, of a band or thimble surrounding the lens and provided with top and bottom flanges, the upper flange resting in the rabbet and the edge of said upper flange being inserted into the groove at the inner edge of the rabbet, substantially as set forth.

478,740. LOCKER FOR CARS. James E. Dempsey, Chicago, Ill. Filed Mar. 5, 1891. Serial No. 383,936. (No model.)

Claim.—In car construction, the combination, with the compartments or lockers formed in the sides of the structure, of a drop-partition dividing said compartments into two chambers, the catch or lock for retaining said partition in its upper position, and the door hinged to the front side and opening into the lower chamber below said partition, substantially as set forth.

478,741. INJECTOR. Walter R. Dodge, Everett, Mass. Filed Apr. 1, 1892. Serial No. 427,318. (Model.)



Claim.—1. In an injector for feeding boilers, the combination, with the casing and guide-rod, of a sleeve adapted to slide upon said guide-rod and an arm or extension formed upon said sleeve, provided with means for connecting the steam and water valves to said arm for the simultaneous operation of said valves, as set forth.

2. In an injector, the combination, with the notched guide-rod *u*, the sleeve *d'*, adapted to slide thereon, and the downwardly-projecting arm *e'*, formed upon said sleeve, as described, of the yoke-shaped lever adapted to operate said arm and sleeve and containing a holding-pawl in its interior, as set forth.

3. The combination, with the water-inlet of the casing and with the water-supply valve, of the threaded stem *f*, connected with the lower portion of the arm *e'*, whereby said valve may be regulated to open and close the water-supply opening, and the sliding sleeve supporting said arm, as set forth.

4. In a boiler-feeding injector, the combination, with the necessary operative parts, including the casing, the steam-valve, and the water-valve, of stems for said valves, located side by side and parallel with each other, an arm or yoke connecting the said stems, means for moving said arm or yoke to simultaneously adjust said valves, and means for locking the arm or yoke to hold the valves in any position to which they may be adjusted, as set forth.

5. In a boiler feeding injector, the combination, with the necessary operative parts, including the casing, the steam-valve, and the water-valve, of stems for said valves, located side by side and parallel with each other, an operating-lever, a connection between said lever and the stems of said valves, whereby the valves may be simultaneously

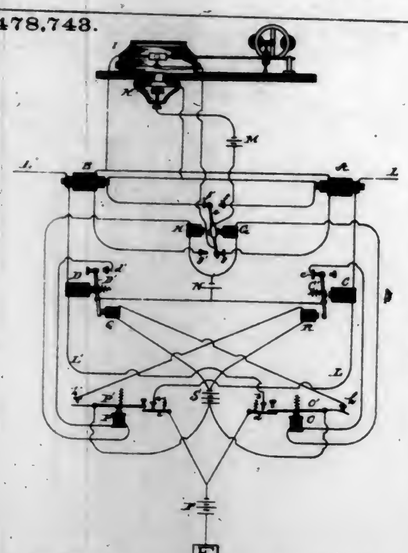
operated, and means for locking said lever to hold the valves in different positions, as set forth.

6. In a boiler-feeding injector, the combination, with the necessary operative parts, the casing having the steam-valve and the water-valve, of stems for said valves, located side by side and parallel with each other, the stem of the water-valve being screw-threaded at the exterior of the casing, an arm or yoke connecting the stems of said valves, said yoke having an internally-threaded socket engaged with said threaded stem, whereby the water-valve may be adjusted independently, means for moving said arm or yoke to simultaneously adjust the two valves, and means for locking the arm or yoke to hold the valves in any position to which they may be adjusted, as set forth.

478,742. LOCK-NUT. Victor R. Doremus, New York, N. Y., assignor of one-half to Paul P. Todd, same place. Filed Apr. 18, 1892. Serial No. 429,521. (No model.)

Claim.—The combination, with a screw-bolt having longitudinal channels across the screw-threads, of a nut having a recess and a spring secured within the recess, the spring standing nearly radially when the point is within either of the channels and the point of the spring can ride over the screw-threads as the nut is rotated in either direction, substantially as set forth.

478,748. TELEPHONE-REPEATER. Thomas A. Edison, Menlo Park, N. J. Filed Oct. 14, 1885. Renewed Mar. 1, 1892. Serial No. 423,411. (No model.)



Claim.—1. The combination, with a telephone-line, of two or more reciprocal telephone-repeaters connected therewith, each repeater comprising a receiving and a transmitting telephone, substantially as set forth.

2. The combination, with a telephone line, of two or more reciprocal telephone-repeaters connected therewith and switches at the telephone repeater controlling the direction of transmission and operated successively from either end of the line, and each repeater containing a switching-circuit controller in each line-section, substantially as set forth.

3. The combination, with a reciprocal telephone-repeater, of a switch controlling the direction of transmission and circuits for carrying the switching impulses around the telephone repeating-instruments, substantially as set forth.

4. The combination, with a telephone-line, of two or more reciprocal telephone-repeaters connected therewith and provided with switches controlling the direction of transmission and reciprocal repeaters for the switches, substantially as set forth.

478,743.

5. The combination, with a telephone-repeater, of signaling devices and circuits carrying the signaling impulses around the telephone repeating-instruments, substantially as set forth.

6. The combination, with a telephone-repeater, of signaling devices in the telephone-line and a repeater for the signaling impulses, substantially as set forth.

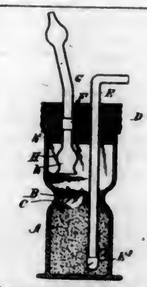
7. The combination, with a reciprocal telephone-repeater, of signaling devices in the telephone line and a reciprocal repeater for the signaling impulse, substantially as set forth.

8. The combination, with a telephone-line, of two or more reciprocal telephone-repeaters, signaling devices, and reciprocal signaling-repeaters, substantially as set forth.

9. In a telephone-repeater, the combination, with line connections and repeating telephone-instruments, of a switch controlling the direction of transmission and operated from the line on either side of the telephone-repeater by an electrical impulse and an electrically-operated circuit-controller for continuing the impulse to the other side of the repeater, substantially as set forth.

10. In a telephone-repeater, the combination, with line connections and repeating telephone-instruments, of a switch controlling the direction of transmission and operated from the line on either side of the repeater by an electrical impulse, electrically-operated circuit-controllers continuing the impulse to the line on the other side of the repeater, and locking-magnets preventing the reversal of the switch, substantially as set forth.

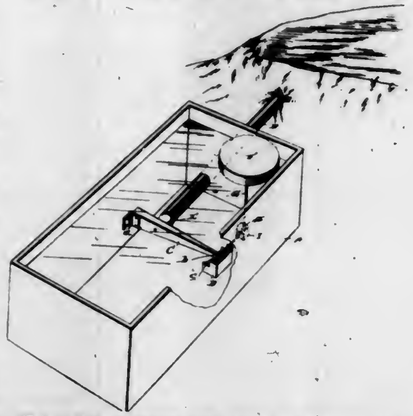
11. The combination, with telephone repeating-instruments and connected lines grounded thereat, of a centrally-located switching or signaling battery connected with both of said lines and a switching or signaling repeater transferring the impulse of said battery from one grounded line to the other, substantially as set forth.



12. The combination, with telephone repeating-instruments and connected lines grounded thereat, of a switch controlling the direction of transmission, a centrally-located switching-battery connected with both of said lines, and a switching-repeater, substantially as set forth.

13. The combination, with a reciprocal telephone-repeater and grounded lines grounded thereat, of a switch controlling the direction of transmission, switching-magnets in the lines controlling the switch for operation in opposite directions, repeating-line circuit-controlling magnets also worked by said line switching-magnets, and locking-magnets controlled by the repeating-line magnets, whereby the telephone-repeater switch can be worked from either line and the switching impulse continued to the other line for switching or signaling or both, substantially as set forth.

478,744. POWDER-BLOWER. WILLIAM J. EVANS, New York, N. Y., assignor to McKesson & Robbins, same place. Filed Mar. 11, 1892. Serial No. 424,559. (No model.)



Claim.—1. In a powder-blower, the combination, with a holder and its cap, of means for supplying air to the holder, a discharge-tube fitted to the cap, and an independently-removable sieve-piece in the cap, communicating with and detachable from the discharge-tube, substantially as described.

478,744.

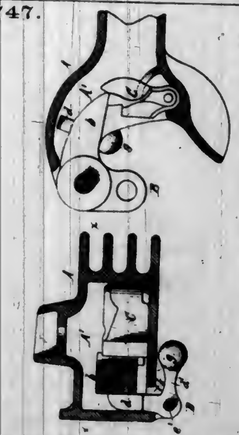
2. In a powder-blower, the combination, with a holder and its cap, of an air-supply, a discharge-tube, and a removable sieve-piece formed with an enlarged lower end having a reticulated diaphragm thereon and a reduced upper end fitted to the cap below the discharge, substantially as described.

478,745. DEVICE FOR WATERING STOCK. GEORGE W. FUNK, Sedalia, Mo. Filed Apr. 30, 1892. Serial No. 431,230. (No model.)

Claim.—The combination, with a pond or other water-supply, of the tank or trough and the pipe connecting the tank with said supply, the lever C, hinged at one end to one of the side walls of the tank a short distance above the bottom, so as to move horizontally, the recessed guide arranged in the floor of the trough and receiving the free end of said lever, so as to truly guide the same, the rubber ball-valve secured to the lever and adapted to enter and close the discharge end of the supply-pipe, the guide-pulley secured to the floor of the trough, the float F, and the rope G, secured at one end to the float and passing under the guide-pulley and secured at its opposite end to the free end of the lever, all adapted to operate substantially as and for the purposes specified.

478,746. PIANO-STRING. THOMAS GILL, Waltham, Mass. Filed Mar. 25, 1892. Serial No. 426,411. (No model.)

Claim.—1. A string for musical instruments, provided with a flat face at the point where the hammer acts thereagainst and having the portions thereboyond twisted, as described.

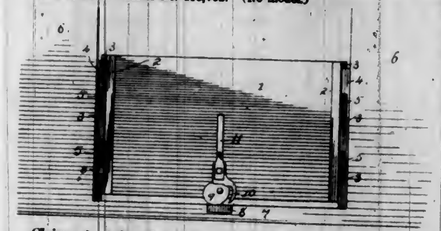


2. A string for musical instruments of angular form in cross-section, provided with a flat face at the point where the hammer acts thereagainst and having the portions thereboyond twisted, as described.

478,747. CAR-COUPLING. CHARLES A. GOULD, Buffalo, N. Y. Filed Dec. 23, 1891. Serial No. 415,963. (No model.)

Claim.—1. The combination, with the draw-head of the swinging coupling-hook and its locking device, of an independent gravity shifting device operating against the hook whereby the latter is automatically moved into its open position when unlocked, substantially as set forth.

2. The combination, with the head, the swinging coupling-hook and its locking device, of an overhanging arm or lever operating against

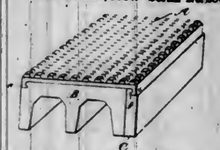


478,747.

the coupling-hook and whereby the same is automatically moved into its open position when unlocked, substantially as set forth.

3. The combination, with the head, the swinging coupling-hook and its locking device, of a bell-crank lever bearing with one of its arms against the arm of the coupling-hook and having its other arm weighted and arranged in an overhanging position, substantially as set forth.

478,748. GRAIN-CAR DOOR. SILAS W. GROSS, Decatur, Ill. Filed Nov. 3, 1891. Serial No. 410,762. (No model.)



Claim.—1. A door for grain-cars, having a set of wedge-like projections, grooved ways connected with the sides of the door-opening and having recesses adapted to receive the projections of the door, and a lever pivoted on the door at the lower edge thereof and having an eccentric bearing adapted to the sill, as set forth.

2. A door for grain-cars, having a set of wedge-like projections, grooved ways connected with the sides of the door and having recesses adapted to receive the projections of the door, and a lever connected pivotally with the door at the lower edge thereof and having an opening eccentric cam and a closing eccentric finger, as set forth.

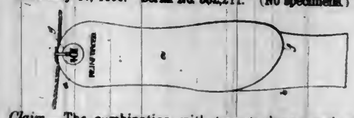
3. The combination of a door-opening, a door adapted to be moved vertically therein, a recess in the door-sill at or near the center thereof, such recess having a transverse pin or bearing, a raising-cam on the lower edge of the door, a cam-finger adapted to enter the recess and engage the pin, and a lever to operate the cams, whereby the throw of the lever in one direction will tend to open the door and the opposite throw will cause the finger to enter the recess and engage the pin, thereby locking the door closed and securing it against the bulging tendency of the contents of the car.

478,749. PRINTING PLATE AND BLOCK. STEPHEN H. HORGAN, Jersey City, N. J. Filed Nov. 28, 1887. Serial No. 256,288. (No model.)

Claim.—1. The combination of a plate or shell having depending side flanges and a base therefor made in two unequal portions, each of said portions having a groove at its upper outer edge, substantially as specified.

2. As a new article of manufacture, a printing plate or shell made separate from and independent of the base to which it is intended to be applied, said plate or shell having its parts of greatest thickness at its extreme sides, said parts of greatest thickness projecting down from the under surface of the plate or shell and having recesses in the inner sides of said side projections, said plate or shell having other projections on its under surface adapted to fit into recesses in the base to which it is intended to be applied, substantially as specified.

3. The combination of a plate or shell having depending side flanges and projections on its under surface with a base therefor made in more than one piece, said base having grooves at its outer sides, into which the depending side flanges of the plate or shell will fit, and said base having other grooves in its upper surface, into which the projections on the under surface of the plate or shell will fit, substantially as specified.



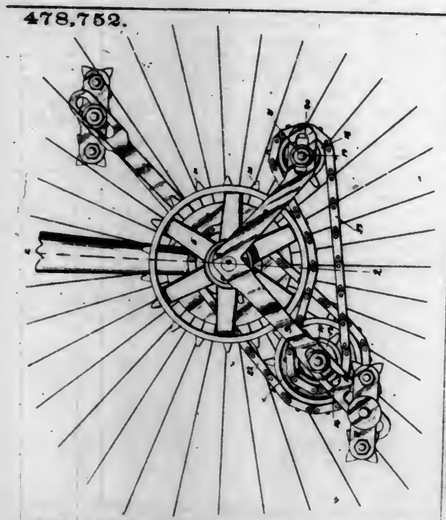
478,750. PRINTING-BLOCK. STEPHEN H. HORGAN, Jersey City, N. J. Filed Oct. 2, 1889. Renewed Jan. 11, 1892. Serial No. 417,634. (No model.)

Claim.—1. In a printing-block, a base provided with means at its outer sides for holding a plate or shell, said base being made in more than one portion, one of said portions at or near the upper end of the side next the adjacent portion receding away from said adjacent portion, substantially as specified.

2. In a printing-block, a base made in more than one portion, two of said portions being hinged together at sides adjacent to each other, so that lateral pressure upon the base will cause the lower sides of the portions of the base adjacent to each other to rest against each other, substantially as specified.

478,751. ASSORTMENT OF STOCKINGS. WILLIAM H. HOWARD, Lowell, Mass., assignor to the Waukenhose Company, Portland, Me. Filed May 17, 1890. Serial No. 352,211. (No specimens.)

Claim.—The combination, with two stockings, each of which is creased along the sides of the leg, around the point of the heel, along the sides of the foot, and around the toe, and each of which is folded with the top or instep portion of the foot against the forward part of the leg, and a tag, of means for fastening the tag and the heel points of the two stockings together, the said two stockings being so secured with the soles of the foot portions outward, substantially as described.



478,752. BICYCLE. LOUIS C. JAQUIER, Chicago, Ill. Filed Mar. 24, 1892. Serial No. 426,316. (No model.)

Claim.—1. The combination, with a hub, a wheel rigidly attached thereto, a crank-axle journaled in said hub, and a bell-crank lever connected to said crank-axle, of mechanism operated from said lever to rotate said wheel and to give said wheel a rotary movement in addition to that caused by the rotation of the said lever, substantially as described.

2. The combination, with a hollow hub, a sprocket-wheel rigidly attached thereto, a crank-axle journaled in said hub, a bell-crank lever connected to said crank-axle, and a sprocket-wheel carried upon each arm of said lever, of mechanism operated from said lever and sprocket-wheels to rotate said sprocket-wheel attached to said hub with a rotation of said bell-crank lever and to give to said sprocket-wheel attached to said hub a rotary motion in addition to the rotation caused by the rotation of said bell-crank lever, substantially as described.

3. The combination, with a hollow hub 1, a wheel 5, rigidly secured thereto, and a crank-axle 6, journaled in said hub, of a bell-crank lever 8, secured to said crank axle and having two arms 9 and 10, wheels 12 and 13, rigidly attached to one another upon a common axis and rotatably secured to the arm 9 of the bell-crank lever 8, and mechanism adapted to rotate said wheel 5 as the wheels 12 and 13 are revolved with said bell-crank lever about the center of revolution and to give a rotary movement to said wheel 5 in addition to the rotation caused by the rotation of said bell-crank lever, substantially as described.

478,752.

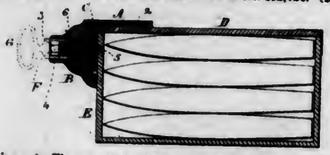
4. The combination, with a hollow hub 1, a wheel 5, rigidly secured thereto, and a crank-axle 6, journaled in said hub, of a bell crank lever 8, secured to said crank-axle and having two arms 9 and 10, a pedal 11, carried by said arm 9 of said lever 8, wheels 12 and 13, rigidly attached to one another upon a common axis and rotatably secured to said arm 9 of the bell-crank lever 8, and mechanism adapted to rotate said wheel 5 as the wheels 12 and 13 are revolved with said bell-crank lever about the center of revolution and to give a rotary movement to said wheel 5 in addition to the rotation caused by the rotation of said bell-crank lever, substantially as described.

5. The combination, with a fork of a bicycle 2, a sprocket-wheel 4, rigidly secured to the lower end of said fork 2, a hollow hub 1, and a sprocket-wheel 5, rigidly secured to said hollow hub, of a crank-axle 6, journaled in said hub, a bell-crank lever 8, secured to said crank-axle 6 and having two arms 9 and 10, sprocket-wheels 12 and 13, rigidly connected with one another upon the same axis and rotatably secured to the arm 9 of the bell-crank lever 8, a sprocket-wheel 18, rotatably secured to the arm 10 of the bell-crank lever 8, sprocket-chain 22, passing around the sprocket-wheels 12 and 4, and a sprocket-chain 23, passing around the sprocket-wheels 13 and 18 and adapted to engage with the sprocket-wheel 5, substantially as and for the purpose specified.

6. The combination, with a fork of a bicycle 2, a sprocket-wheel 4, rigidly secured to the lower end of said fork 2, a hollow hub 1, and a sprocket-wheel 5, rigidly secured to said hollow hub, of a crank-axle 6, journaled in said hub, a bell-crank lever 8, secured to said crank-axle 6 and having two arms 9 and 10, sprocket-wheels 12 and 13, rigidly connected with one another upon the same axis and rotatably secured to the arm 9 of the bell-crank lever 8, a sprocket-wheel 18, rotatably secured to the arm 10 of the bell crank lever 8, mechanism for adjusting said wheel 18 in position upon said arm 10, sprocket-chain 22, passing around the sprocket-wheels 12 and 4, and a sprocket-chain 23, passing around the sprocket wheels 13 and 18 and adapted to engage with the sprocket-wheel 5, substantially as and for the purpose specified.

7. The combination, with a fork of a bicycle 2, a sprocket-wheel 4, rigidly secured to the lower end of said fork 2, a hollow hub 1, and a sprocket-wheel 5, rigidly secured to said hollow hub, of a crank-axle 6, journaled in said hub, a bell-crank lever 8, secured to said crank-axle 6 and having two arms 9 and 10, a pedal carried upon said arm 9 of said lever 8, sprocket-wheels 12 and 13, rigidly connected with one another upon the same axis and rotatably secured to the arm 9 of the bell-crank lever 8, a sprocket-wheel 18, rotatably secured to the arm 10 of the bell-crank lever 8, mechanism for adjusting said wheel 18 in position upon said arm 10, sprocket-chain 22, passing around the sprocket-wheels 12 and 4, and a sprocket-chain 23, passing around the sprocket-wheels 13 and 18 and adapted to engage with the sprocket-wheel 5, substantially as and for the purpose specified.

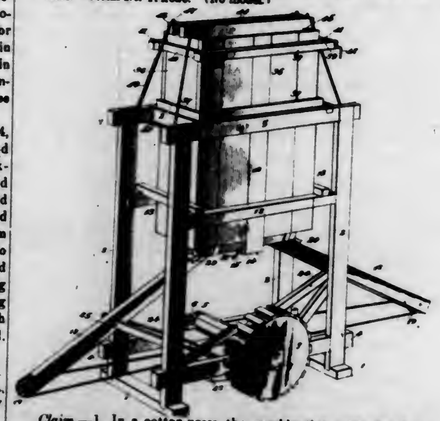
478,758. LAMP-HEATER. HARRIET S. LOURY, Harrisonburg, Va., assignor of one-half to Katharine M. Wilson, same place. Filed Nov 19, 1891. Serial No. 412,447. (No model.)



Claim.—The heating attachment for lamp-chimneys, consisting of the winged plates adapted to be connected together at right angles

478,753.

and having their upper edges folded back and standing at right angles to their vertical portions and the lower edges of their wings corrugated, the folded-back and right-angled upper edge portions of said plates intersecting each other at right angles in the same horizontal plane, causing them to stand flush with each other, substantially as shown and described.



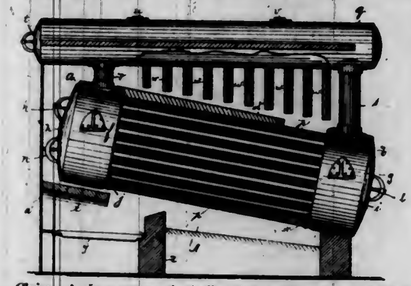
478,754. LOCK. FRANCIS F. MARSHALL and LOUISA F. MARSHALL, New York, N. Y. Filed Nov. 23, 1891. Serial No. 412,726. (No model.)

Claim.—1. The top A, having penetrating-pins 2, in combination with the front B, to which it is connected by the hinge, and the locking-screw F, passing through the front and having a penetrating-point at one end and a head adapted to receive a key at the other end, substantially as set forth.

2. The lock for wooden boxes, composed of the parts A and B at right angles, the penetrating-pins 2, and the locking-screw F, passing through the front portion of the lock and having a penetrating screw-threaded point, and a head adapted to receive a key, the front of the lock having a socket into which the head passes when the locking-screw is screwed into the box, substantially as set forth.

478,755. COTTON-PRESS. PICKENS B. MABEN, Graniteville, S. C., assignor of one-half to William O. Tatum, same place. Filed Dec. 4, 1891. Serial No. 414,090. (No model.)

Claim.—1. In a cotton-press, the combination, with the frame-work, the packing-box, the follower, and means for operating the same, of the baling-chamber seated in the upper end of the packing-box and



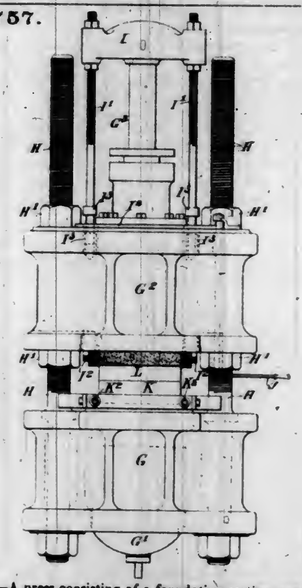
comprising opposite independent and separable side and end walls, longitudinal cleats secured to the side walls and extending beyond the ends of the same and provided at their inner sides with notches, transverse cleats secured to the end walls, projecting beyond the same and at their ends adapted to engage with the notches, and means for locking the side walls against separation, substantially as specified.

2. In a cotton-press, the combination, with the framework, the packing-box, the follower, and means for operating the same, of the baling-chamber seated in the upper end of the packing-box and comprising opposite independent and separable side and end walls, longitudinal cleats secured to the side walls and extending beyond the ends of the same and provided at their inner sides with notches, transverse cleats secured to the end walls, projecting beyond the same and at their ends adapted to engage with the notches, and inverted-U shaped clamps sprung over and connecting the ends of the longitudinal cleats, substantially as specified.

3. In a cotton-press, the combination, with the framework, the packing-box having its central planks of its opposite sides depending from its lower edge, and a rest-strip connecting the lower ends of the planks, of a follower mounted for reciprocation in the box, levers pivoted to and adapted to operate the plunger and located at opposite sides of the rest, and means for operating the levers, substantially as specified.

4. In a cotton-press, the combination, with the framework, the packing-box having the depending central planks, and the rest-bar connecting the same, of the follower located in the packing-box, the diverging guides depending from the follower and adapted to embrace the rest-bar, the inclined guide-blocks located at the ends of the rest-bar, the levers for raising and lowering the follower, and means for operating the levers, substantially as specified.

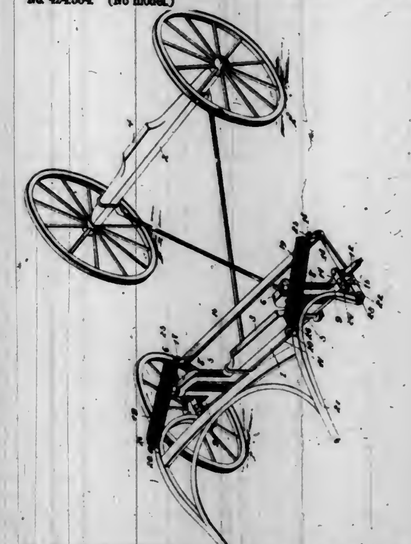
478,756. WATER-TUBE BOILER. ROBERT MUNROE and ROBERT MUNROE, Jr., Allegheny, Pa. Filed Mar. 21, 1892. Serial No. 425,659. (No model.)



Claim.—1. In a water-tube boiler, the combination of the front and rear tube-cylinders, the former having four or more and the latter one manhole located therein and adapted to be closed in any suitable manner, tube-sheets forming the rear walls of said cylinders and provided with series of orifices parallel in every direction, except vertically, and a series of tubes suitably secured in said orifices and connecting said tube-cylinders, and a steam-drum connected with said water-chambers and having a series of downwardly-projecting tubes, substantially as and for the purpose herein set forth.

2. In a water-tube boiler, the combination of the front and rear tube-cylinders, the former having four or more and the latter one manhole located therein and adapted to be closed in any suitable manner, tube-sheets forming the rear walls of said cylinder and provided with series of orifices parallel in every direction, except vertically, and a series of tubes suitably secured in said orifices and connecting said heads, the upper, lower, and extreme side tubes being of greater diameter than the rest and projecting into said heads and suitably secured therein, and a steam-drum connected with said water-chambers and having a series of downwardly-projecting tubes, substantially as and for the purpose herein set forth.

3. A boiler-setting consisting of the furnace A, provided with an arch x, extending from side to side, the frame above the grate-bars, a bridge-wall z, an arch d' above said tubes, terminating a slight distance from the rear ends thereof, and a tile extending from side to side of said furnace its entire length, in combination with the air-admission pipes d' and d'', substantially as and for the purpose herein described.

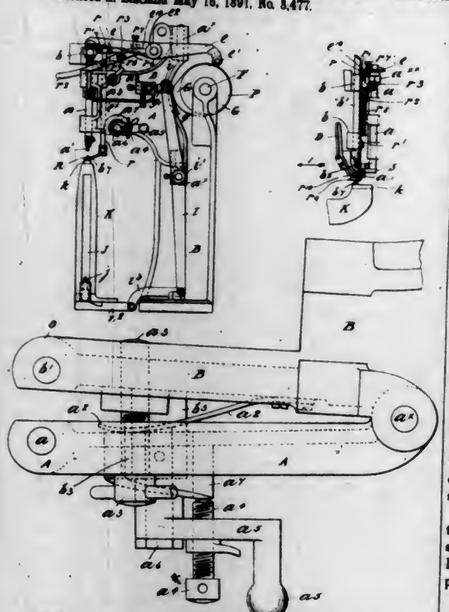


478,757. APPARATUS FOR MAKING SLABS, &c. ALEXANDER McLEAN, West Kensington, assignor of one-half to Christopher W. Wilson, London, England. Filed Jan. 9, 1892. Serial No. 417,491. (No model.)

478,757.

Claim.—A press consisting of a foundation-casting containing a hydraulic ram, an adjustable head containing a second ram, arranged to work in both directions, a cross-head connected to this ram, adjustable pendent rods carrying supporting-pieces, molds for containing the material to be compressed, provided externally with grooves to receive the supporting-pieces, and means for insuring the exit from the mold of the liquid and for retaining the solid matter in the mold, all substantially as herein shown and described.

478,758. RUNNING-GEAR FOR VEHICLES. BENJAMIN H. PAUGH and GEORGE W. FRIDLEY, Philippi, W. Va. Filed Mar. 11, 1892. Serial No. 424,554. (No model.)



Claim.—1. In a running-gear, the combination of an axle provided with L-shaped extensions, the bar secured to the lower face of the axle and projecting therefrom, the arms 9 of the axle, having vertical pivots journaled in the extensions of the axle and in the ends of the bar, the clip-bars secured to the lower faces of the axle-arms and projecting rearwardly therefrom, the clip-plates secured to the upper

face of the axle-arm, the clip-bolts connecting the clip plates and the clip-bars, the connecting-bar secured to the rear ends of the clip-bars, the hooks 18, having shanks pivoting the connecting-bar to the clip-bars, the shafts coupled between the front ends of the clip plates and bars and provided with hooks, and spiral springs provided at their ends with loops engaging the hooks, substantially as described.

2. In a running-gear, the combination of the front axle, the axle-arms having vertical pivots journaled at the ends of the axle, the clip-bars extending forward and rearward from the axle-arms and extending from them, the clip-bolts securing the clip-plates and the clip-bars to the axle-arms, and the coupling-blocks pivoted between the front ends of the clip-plates and the clip-bars, substantially as described.

478,759. EYELETING-MACHINE. MARSHALL H. PEARSON, Leicester, England. Filed Jan. 20, 1892. Serial No. 418,694. (No model.) Patented in England May 16, 1891, No. 8,477.

Claim.—1. In a punching and eyeleting machine, the combination, with the framework, of a hinged cheek, a punching-spindle mounted therein, a reciprocating eyeleting-spindle mounted in the framework, a spring for holding the cheek away from the framework, and adjusting devices comprising a cam for holding the cheek in the desired position relatively to the frame to vary the distance between the punching and eyeleting spindles.

2. In a punching and eyeleting machine, a cheek A, hinged to framework B, having a spring a^3 interposed between the said cheek and framework, and a distance-regulating screw a^4, in combination with punching and eyeleting spindles mounted in the cheek and the framework, all substantially as set forth.

3. In a punching and eyeleting machine, a cheek A, hinged to framework B and spring a^4, with a screw a^4, mounted in a lever a^5, (armed with a pin a^6,) turning on a spindle a^9, attached to said framework, and a cam a^7, in combination with the punching and eyeleting spindles mounted in the cheek and framework, all substantially as set forth.

4. In a punching and eyeleting machine, the combination of punching and eyeleting devices, their power driving and feeding mechanisms, consisting of cams E, G, H, and L, mounted on driving-shaft F, disk P, drivers N N', pulleys O O', wedges Q Q', levers e, l, I, and i^3, lower die-supporting piece J, and cam-piece i^3, all substantially as specified.

5. The combination, in a punching and eyeleting machine, of a reciprocating punching-spindle mounted in a hinged cheek, with a double-ended lever fulcrumed to the framework, a cam for operating said lever, a disk mounted on the driving-shaft and armed with a pin, a driver mounted on the hub of said disk, and a curved wedge hinged to the framework, all as set forth.

6. The combination, in a punching and eyeleting machine, of eyeleting devices, cams E, G, and H, disk P, pin p', spring p^3, driver N, curved wedge Q, driving-shaft F, pulleys O O', levers e, spring e^5, spindle a, cheek A, runner g, carrier g', and bracket a^8, as and for the purpose set forth.

7. In a punching and eyeleting machine, the combination of a spindle b', mounted in bearings on the main framing B, with lever l', cam L, driving-shaft F, pulleys O O', disk P, pin p', spring p^4, driver N', and curved wedge Q', all substantially as and for the purposes set forth.

8. The combination, in a punching and eyeleting machine, of cams E, G, H, and L, driving-shaft F, disk P, pin p', drivers N N', set-screws M M p and p^2, and springs p^3 and p^4, substantially as shown, for the purposes specified.

9. In a punching and eyeleting machine, the combination, with punching and eyeleting devices, of the disk P, armed with a pin p' and having drivers N N' mounted on its hub, and connections between the drivers and the eyelet setting and punching devices, substantially as shown, and for the purposes specified.

10. The combination, with punching and eyeleting devices, of a power-driven shaft, cams thereon, connections between the cams and the punching and eyeleting devices, the drivers, connections between the drivers and the cams, the curved wedges Q Q', having projections q^4 q^4 formed on their sides, and means for operating the wedges, substantially as and for the purpose specified.

11. The combination, in a punching and eyeleting machine, of a driving-shaft, cams loosely mounted thereon, a disk P, secured to the shaft, a driver N', a pin p' for connecting the driver with the disk, a wedge Q' for moving the driver, the support for the lower clinching-die, the spindle of the upper clinching-die, the lever l', connecting the spindle with its operating cam, and connections between the support of the lower clinching-die and its operating-cam.

12. The combination, in a punching and eyeleting machine, of framework B, reciprocating spindle b', die b^2, lever l, cam L, driving-shaft F, wedge Q', driver N', disk P, pin p', with horn K, and lower die b^1, all substantially as specified.

13. In a punching and eyeleting machine, the combination of a vertically-reciprocating punching-spindle a, means for moving it laterally to feed the material, a presser-foot R, the vertically-moving rod on which it is mounted, the lever r^6, connected to the vertical rod of the presser-foot, power-driven devices operating upon said lever for actuating the presser-foot, an eyelet-feeding chute, and eyelet-setting devices.

14. In a punching and eyeleting machine, the combination of vertically-reciprocating punching-spindle, eyeleting devices, means for actuating the punching-spindle and the eyeleting devices, an eyelet-feeding chute D, a vertically-reciprocating presser-foot, and devices carried by the presser-foot for moving the eyelet-chute laterally, substantially as and for the purpose set forth.

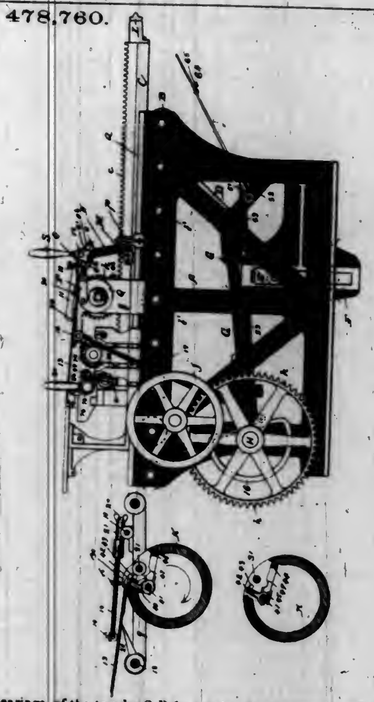
15. The combination, in a punching and eyeleting machine, of the hinged cheek A, connected with the framework B, reciprocating spindle a, reciprocating spindle b', levers e and l', eyelet box C, chute D, presser-foot R, bar r, lifting-lever r^6, set-screw r^7, spring r^8, cam-piece r^9, and pin r^{10}, all substantially as set forth.

16. The combination, in a punching and eyeleting machine, of a cheek A, hinged to framework B, reciprocating spindles a and b', stops a^2 a^4, lever a^5, spindle a^6, cam a^7, cams E, G, H, and L, driving-shaft F, pulleys O O', levers e, I, and l', carrier g', cam-piece i^3, link i^2, supporting-piece J, horn K, drivers N N', treadle-rod O^2, disk P, pin p', springs p^3 p^4, wedges Q Q', presser foot R, bar r, lifting-lever r^6, adjusting-screw r^7, spring r^8, cam r^9, and pin r^{10}, all substantially as herein set forth.

478,760. PRINTING-PRESS. ENOCH PROUTY, Chicago, Ill., assignor to himself, Robert Tarrant, and Olive S. Prouty, same place. Filed Sept. 2, 1891. Serial No. 404,502. (No model.)

Claim.—1. In a printing-press, the combination, with a reciprocating type-bed carriage, of an actuating-lever D, pivotally joined to the bed at one end and pivotally joined to a sliding block E at the other end away from said sliding block, and means for giving motion to said lever, substantially as specified.

2. The combination, with the reciprocating type-bed, of the lever D, sliding block E, slideway F, pitman G, and means for actuating said pitman, substantially as specified.



3. The combination, in a printing-press, of a reciprocating type-bed, an oscillating impression-cylinder, eccentric-bearings for said cylinder, toggles O P, shaft n, lever N, and the dogs upon the type-bed for moving said lever, substantially as specified.

4. The combination, in a printing-press, of a reciprocating type-bed, an oscillating impression-cylinder, eccentric-bearings for said cylinder, toggles O P, shaft n, lever N, and the dogs upon the type-bed for moving said lever, said lever being provided with a friction-creating device, substantially as specified.

5. The combination, with the cylinder and eccentric-bearings, of toggles O P for shifting the eccentrics and means for closing and spreading said toggles, substantially as specified.

6. The combination, with the impression-cylinder and its eccentric-bearings, of the toggles O P for turning the eccentrics, one member of each of said toggles being adjustable as to length, substantially as specified.

478,760.

7. The combination, with the impression-cylinder and its eccentric-bearings, of the toggles O P for turning the eccentrics, one member of each of said toggles being composed of an adjustable bolt, and a box for said bolt, substantially as specified.

8. The combination of reciprocating type-bed, an oscillating impression-cylinder, means for raising and lowering said cylinder, embracing a lever, such as N, dogs upon a type-bed for actuating said lever, and a stop p for limiting the motion of the lever when actuated to lower the cylinder, substantially as and for the purpose set forth.

9. The combination, with the eccentrically-mounted cylinder, the lever N, and the connections between the eccentrics and the lever, of friction-creating devices consisting of spring R and follower r and a stationary surface upon which said follower bears, substantially as specified.

10. The combination, with the cylinder and its eccentric bearings, of the toggles for shifting the bearings and a hand lever 8 for closing the toggles to throw off the cylinder, substantially as specified.

11. The combination, with the rising-and-falling table and the gripping-cylinder, of one or more gages loosely supported upon a shaft 10 and resting by gravity upon the table at their free ends, said gages being also provided with buttons, collars, or enlargements 15, substantially as specified.

12. The combination, with rising-and-falling table and a gripping-cylinder, of a gage loosely pivoted at one end upon a support located in front of the table and resting at its free end upon the table, whereby the acting end of the gage is lifted above and lowered onto the table by the movement of the table, substantially as specified.

13. The combination, with the rising-and-falling feed-table of a printing-press, of a gage loosely supported at one end in front of the table and intermittently resting by gravity at its free end upon the table, whereby the gage is adapted to hold the paper after it is positioned, substantially as set forth.

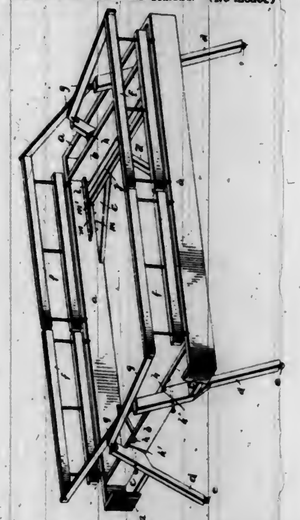
14. The combination, with the feed-table, of the series of gages 12, loosely hinged at one end and resting at their free ends upon the table, and the support to which the gages are thus hinged, substantially as specified.

15. The combination, with the cylinder K and the type-bed carriage having a stop 39, of grippers mounted in the cylinder, a spring for closing the grippers, a lever 33 upon the gripper-shaft encountering said stop, and means for receiving the sheet from the cylinder, substantially as specified.

16. The combination, with the cylinder and grippers, the shaft of the latter having a lever 33, provided with pin 34, of the cams 37 and 38, mounted upon a pivoted support, substantially as specified.

17. The combination, with the fly and its operating-crank 52, of pitman 53, having spring 54 and follower 55, bearing upon shaft H, elongated slot 58, and roller 59, cam 60, and shaft H, passing through said slot and carrying said cam, substantially as specified.

18. The combination, with the fly and the pitman for operating the fly, of a spring inserted in the hollow bore of the pitman and supplying the power to actuate the fly in discharging the paper, substantially as specified.



19. The combination, with the cylinder K, of the devices for securing the tympan-sheet thereon, consisting of a rocking shaft and fingers 40 thereof, means for locking said shaft, the frame 44, and means for holding said frame, substantially as specified

20. The combination, with the cylinder K, of rocking shaft 41, fingers 40, locking-arm 42, and stop-pin 43, substantially as specified.

21. The combination, with cylinder K, of frame 44, a bearing against which said frame may rest, and the gripper shaft acting as a stop to the frame, substantially as specified.

22. In a printing-press, a fly having bars 61 and 62, spring 63, and guard 64 65, whereby it is adapted to grip the sheet and draw it from the cylinder, substantially as set forth.

478,761. FOLDING BED. GEORGE W. RODECAP, Middletown, Ind. Filed Aug. 7, 1891. Serial No. 402,036. (No model.)

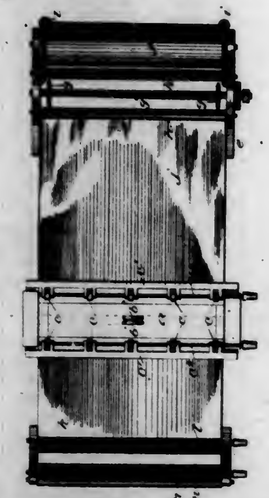
Claim.—1. In a bed, the combination of the rectangular frame, the swinging longitudinal sides formed in independent sections, the independently-mounted transversely-swinging legs, and the links at their outer ends directly pivoted to their respective side sections and at their opposite ends directly hinged to their respective legs at points permanently above the pivotal points thereof, combined and arranged, substantially as set forth, so that the side sections and their links and legs can be folded independently of each other.

2. In a bed, the combination of the rectangular frame, the legs separately pivoted at the ends thereof, and having inclined shoulders above their pivotal points, the swinging sides, the links pivotally connecting the upper portion of each leg and its respective side, and the swinging catches pivoted to the ends of the frame and having the hooked outer ends arranged so as to engage said shoulders of the legs when the legs are spread at their lower ends and thereby lock the legs, as and for the purposes set forth.

3. In a bed, the combination of the frame, the transversely-swinging legs pivoted on opposite sides of the center of the frame ends, each provided with a lateral beveled offset at its side edge above the pivotal point, and the swinging catches for the legs pivoted to the frame ends and having the hooked free ends arranged to be engaged and lifted by said offsets as the legs are spread and to drop over and automatically lock the legs, as set forth.

4. In a bed, the combination of the frame, the transversely-swinging legs pivoted below their upper ends on opposite sides of the ends of the frame, the swinging side frames, the links pivoted to their re-

spective side frames and pivoted to the upper ends of their respective legs permanently above the pivotal points thereof, the catches pivoted to the frame ends to engage said legs and hold them spread, and the corner cleats or braces of the frame located outside of the legs below their pivotal points, and against which the outer edges of the legs bear when spread, thereby relieving strain from the pivots and links, substantially as described.

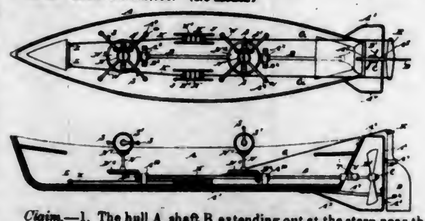


5. In a bed, the combination of the frame, the transversely-swinging legs pivoted below their upper ends on opposite sides of the center of each frame end, the swinging divided side frames, the links at their outer ends pivoted to their respective side frames and at their inner ends pivoted to the upper ends of their respective legs, so that the legs at one end of the bed can be folded independently of those at the other end, substantially as set forth, and the swinging catches, one for each leg, pivoted to the frame ends arranged to engage their respective legs and hold them spread.

6. In a bed, the combination of the frame having the corner cleats to brace the frame on opposite sides of each end, the transversely-swinging legs pivoted below their upper ends on opposite sides of each end between said cleats, so that their outer edges will bear against said cleats when spread to remove strain from the pivots and links, the hinged side frames, and the links at their outer ends pivoted to their respective side frames and at their opposite ends pivoted to their respective legs permanently above the pivotal points thereof, as set forth.

7. In combination, the frame, the corner cleats bracing the frame, a bed-bottom supported on said corner cleats, the swinging side frames, the transversely-swinging legs, pivoted on opposite sides of the frame ends between and above the planes of said cleats, so that the legs rest against the cleats when spread, the links pivotally connecting the legs and side frames, and catches to engage and hold the legs, substantially as described.

8. In a bed, the combination of the frame having the corner cleats, the transversely-swinging legs provided with shoulders and pivoted to the ends of the frame on opposite sides of the center thereof and between said cleats and below their upper ends, so that when the legs are spread they will bear against the inner edges of the cleats, as and for the purposes set forth, the swinging sides, the links pivoted to the sides and to the legs above their pivotal points, as set forth, and swinging catches pivoted to the frame to engage said leg-shoulders and hold the legs spread.

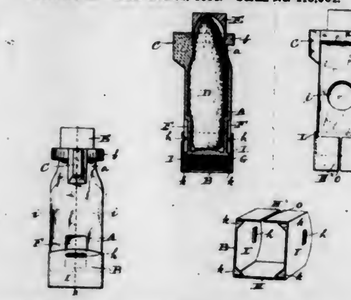


478,762. MACHINE FOR POLISHING PAPER. HENRY E. ROGERS, South Manchester, Conn. Filed May 16, 1891. Serial No. 393,006. (No model.)

Claim.—1. In a machine for glassing or polishing paper, the combination, with a bed, of a glassing-jack and means for drawing strips of paper past the glassing-jack alternately.

2. In a machine for glassing or polishing paper, the combination, with a bed, of a glassing-jack, means for dividing the paper longitudinally into strips, and means for drawing the strips of paper past the glassing-jack alternately.

478,763. BOAT. JAMES SAVAGE, Canarsie, N. Y. Filed July 7 1891. Serial No. 398,856. (No model.)



Claim.—1. The hull A, shaft B, extending out at the stern near the bottom, gears S', carried on horizontal shafts, and vertical shafts N and gears N' thereon, and gears connecting such shafts with the propeller-shaft, in combination with each other and with the two-bladed screw B', arranged to sweep below the keel proper and operated by a shaft B, having a hinge-joint T, adapted to allow the screw to be raised and lowered, and the sleeve U, sliding on the shaft for stiffening such joint when required, arranged for joint operation as herein specified.

2. A detachable frame W, with provisions for securing and detaching it at will in the interior of the hull A, transverse shaft *s*, carried therein, with gear S', hand-cranks S, and an upright shaft N and gears N' N² thereon, in combination with the longitudinal shaft B, supported in bearings near the bottom of the boat and having a screw-propeller and a hinge-joint outside with means for stiffening the joint, and a gear-wheel B², engaged with the gear N², arranged for joint operation as herein specified.

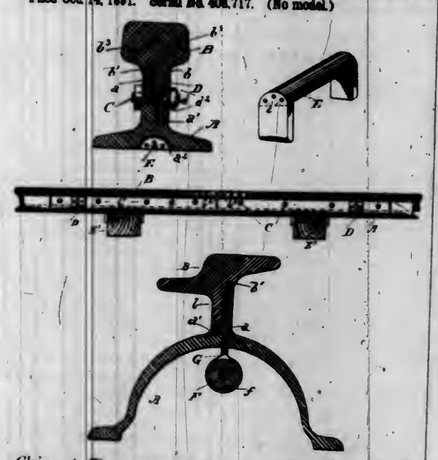
3. In apparatus for the propulsion of boats, the two-bladed screw B', arranged to sweep below the keel proper and operated by a shaft N, having a hinge-joint T to allow the screw to be raised and lowered, and means for stiffening such joint when required, in combination with each other and with the series of longitudinal guards A² A³ A⁴, extending below the keel, all arranged for joint operation as herein specified.

4. In apparatus for the propulsion of boats, the two-bladed screw B', arranged to sweep below the keel proper and operated by a shaft N, having a hinge-joint T to allow the screw to be raised and lowered, and the sleeve U for stiffening such joint when required, in combination with each other and with the series of longitudinal guards A² A³ A⁴, extending below the keel, and an upright portion A², carrying hinge-joints A' A², connecting a rudder D in rear of the whole, all arranged for joint operation as herein specified.

478,764. STAMP OR LABEL AFFIXER. WILLIAM B. SHAFER, Somerset, Pa. Filed Dec. 22, 1891. Serial No. 415,901. (No model.)

Claim.—A stamp-holder composed of spring material, provided with lips to hold the stamps and lugs in the sides of the holder, in combination with a body provided with depressions to receive said lugs, substantially as described.

478,765. TRANSLUCENT SCULPTURE. FREDERICK A. SHAW, Boston, Mass. Filed Feb. 4, 1892. Serial No. 420,301. (No model.)



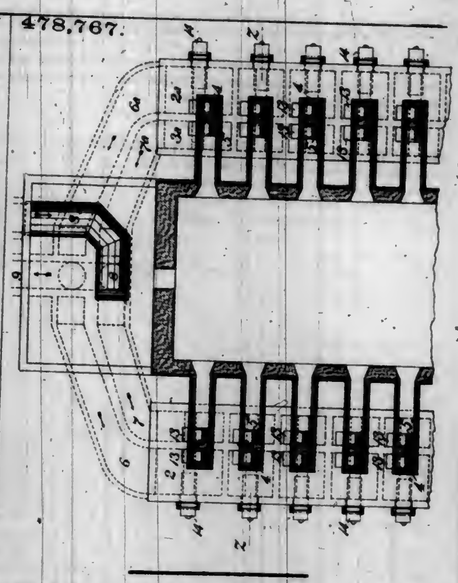
Claim.—1. As an improved article of manufacture, a natural translucent stone having a design sculptured thereon, the variations or gradations of light and shade being secured by differing thicknesses of the stone at predetermined points and the whole design adapted to be developed by transmitted light, substantially as described.

2. The herein-described method of sculpturing translucent natural stone, which consists in cutting the design in the stone in varying degrees of depth, whereby the variations or gradations of light and shade are secured and developed by transmitted light, substantially as described.

478,765.

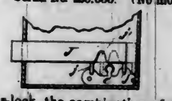
478,766. RAILWAY-RAIL. JOHN T. SMITH, San Francisco, Cal. Filed Oct. 14, 1891. Serial No. 408,717. (No model.)

Claim.—1. The combination of a rail hollowed at the base, ties thereunder, and segmental bars in said base to clamp said ties, substantially as set forth.



2. The combination of a rail hollowed at the base, and segmental bars adapted to support and guide electric wires therein, substantially as set forth.

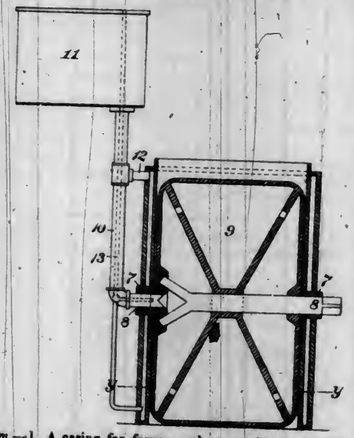
3. The combination, in a rail, of a scarfed upper section, a correspondingly scarfed lower section having a semi-cylindrical base, an electric wire, and means to support said wire within said base, substantially as set forth.



478,767. FURNACE. SAMUEL R. SMITH, Pittsburg, Pa. Filed Mar. 31, 1892. Serial No. 427,226. (No model.)

Claim.—In a tank-furnace for melting glass, the combination of a series of four or more regenerating-chambers for gas and air on each side of the furnace, each regenerating-chamber having an independent flue connection to the hearth of the furnace, flues connecting the gas-conduit with each of the gas-regenerators and the air-conduit with the air-regenerators, valves for cutting off the supply of gas and air from each of the regenerators, and valves for closing the flues from the regenerators to the hearth, substantially as set forth.

478,767.



478,768. KEYHOLE-GUARD. OSCAR STODDARD, Detroit, Mich. Filed Mar. 3, 1892. Serial No. 423,635. (No model.)

Claim.—In a door-lock, the combination of the casing having the sector-flanges, the key having the guiding-recesses, the guard-plate having the raised ends, and the locking-bolt having the depending legs or stops.

478,769. CASING FOR FURNACE-VALVES. JAMES D. SWINDELL, Allegheny, Pa., assignor of one-half to Edward H. Swindell, same place. Filed Dec. 30, 1890. Serial No. 376,248. (No model.)

Claim.—1. A casing for furnace-valves, consisting of a series of independently-removable sections, said sections having double walls and their meeting faces provided with the registering openings, in combination with fluid supply and outlet pipes, substantially as set forth.

2. The combination of a valve provided with a water-chamber, an elevated tank for the reception of the water normally escaping from the valve, an outlet-pipe connecting the water-chamber and the tank, and a supply-pipe connecting the water-chamber of the valve with a suitable source of supply, substantially as set forth.

3. The combination of a furnace-valve casing provided with water-chambers, an elevated tank for the reception of the water normally escaping from the casing, an outlet-pipe connecting the casing and tank, and a supply-pipe connecting the casing and a suitable source of water-supply, substantially as set forth.

478,770. BICYCLE. HENRY H. THORP, Cleveland, Ohio. Filed Aug. 25, 1891. Serial No. 403,643. (No model.)

Claim.—1. In a bicycle, the handle-bar pivotally supported on its standard, a laterally-swinging safety-arm, and operating mechanism connecting the handle-bar with said arm, substantially as described.

2. A bicycle provided with a pivoted arm arranged to swing laterally into safety position and mechanism connecting said arm with the handle-bar to turn said arm to either side, substantially as described.

3. A bicycle having a rod bent substantially at right angles and supported in bearings at an angle to a vertical plane, the lower portion of said rod serving as a safety-arm, in combination with a pivoted handle-bar and operating mechanism connecting said handle-bar and rod, substantially as described.

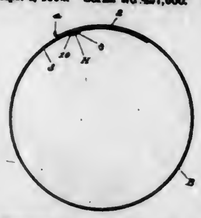
4. In a bicycle, a safety-arm having a standard portion supported in bearings on the bicycle-frame and arranged to swing at right angles to the line of movement, in combination with a pivoted handle bar and mechanism connected with said bar, constructed to turn the said safety-arm to one side or the other, substantially as described.

5. The bicycle-frame, a safety attachment pivoted in bearings on said frame and having a forwardly-projecting arm, with a wheel on its extremity, in combination with a pivoted handle-bar and mechanism proceeding from said bar to turn said arm to one side or the other of the bicycle, substantially as described.

6. In a bicycle, a safety-arm supported in fixed bearings on the main frame and having a wheel at its front end, in combination with a pivoted handle-bar, a rack-bar operated thereby, and a pinion connected with said safety-arm, operated by said rack-bar, whereby said arm is turned laterally, substantially as described.

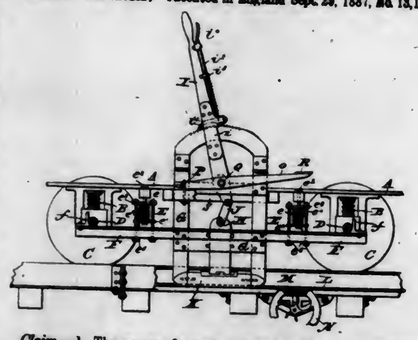
7. In a bicycle, a handle-bar pivotally supported on its standard and temporary locking mechanism connected with said bar, whereby the bar is held normally in horizontal position, and a safety device having connections extending to said handle-bar and operated thereby, substantially as described.

8. In a bicycle, a pivoted handle-bar having an attachment fixed thereon, constructed to lock the said bar temporarily in its normal position, in combination with a safety device supported on the bicycle-frame and mechanism constructed to throw said safety device into working position when the handle-bar is disengaged from its temporary lock, substantially as described.



478,771. CLAMP FOR FRUIT-JAR CAPS, &c. CHARLES E. THOMAS, Williamstown, N. J. Filed Feb. 23, 1892. Serial No. 422,821. (No model.)

Claim.—1. A cover-fastener for fruit and other jars, consisting of the body portion F, having radial hooked arms F' and extension F², and the hooked arm G, pivoted at its inner end to the extension F² and its outer hooked end adapted to engage the lower edge of the collar upon the jar, substantially as described, and for the purpose specified.



2. In combination with a fruit or other jar having an annular collar at its mouth, the cap or cover and the clamping device consisting of a body portion having two hooked arms and a third hooked arm pivotally connected with the body portion, said clamp being adapted to fit over the top of the cap or cover and the ends of the arms to engage the lower edge of the collar upon the jar, substantially as described, and for the purpose specified.

478,772. TROUSERS-GUARD. JUSTUS A. TRAUT, New Britain, Conn. Filed Apr. 4, 1892. Serial No. 427,600. (No model.)

Claim.—The improved clasp herein described, consisting of a band of metal having in one end thereof one or more hook-engaging slots, substantially as described, and having at its other end a hook consisting of a strip extending longitudinally of and cut and struck down from the band and connected at each end thereof with the body of the band and having on the middle portion thereof one or more lateral projections adapted to engage in said slots, substantially as described.

478,778. CABLE-RAILWAY GRIP. CHARLES VOGEL, San Francisco, Cal. Filed May 27, 1887. Renewed Feb. 18, 1891. Serial No. 381,811. (No model.) Patented in England Sept. 29, 1887, No. 13,194.

Claim.—1. The means of securing the grip to the car of an underground cable railway, consisting, essentially, of the equalizing-frame F, extending under and bearing upward against the axles D D and to which the grip-frame is secured, and the elastic hangers E E, from which the equalizing-frame is suspended from any convenient timbers of the car above, substantially as and for the purpose described.

2. The means of lowering the grip of an underground railway below its normal height when necessary, consisting, essentially, of a suitable elastic connection between the grip-frame and the car to which it is secured and a lever O, having a fixed fulcrum upon the car-frame at one end and engaging with the grip-frame by being pivoted thereto or otherwise at about the middle of said frame, substantially as and for the purpose herein described.

3. In combination, the cable, the jaws having their ends normally above the lower face of the cable when grasping the same and adapted to be lifted by the cable into position to pass over the pulleys, the vertically-movable supporting frame, and the tapering pieces at the ends of the jaws, substantially as described.

4. In combination, the grip-jaws and the vertically-movable frame containing horizontally-tapered extremities which bound the jaws at each end and lie normally above the lower face of the cable, by the inclined action of which the jaws and frame may be raised over obstructions, substantially as described.

5. In combination, the jaws having their ends normally above the lower face of the cable when grasping the same and adapted to be lifted by the cable into position to pass over the pulleys and mechanism whereby they may be shoved downward into position to grip a sagging cable between the pulleys, substantially as described.

6. In combination, the cable, the jaws having their ends normally above the lower face of the cable when grasping the same and adapted to be lifted by the cable into position to pass over the pulleys, and mechanism whereby they may be shoved downward into position to grip a sagging cable between pulleys, said last-named mechanism being adapted to automatically yield to the upward pressure of the cable, substantially as described.

7. In combination, the cable, the jaws having their ends normally above the lower face of the cable when grasping the same and adapted to be lifted by the cable into position to pass over the pulleys, mechanism whereby they may be shoved downward into position to grip a sagging cable, a stop limiting their upward movement, and a spring-support holding them up against the stop, substantially as described.

8. In combination, the cable, the vertically-moving jaws lying in their normal position substantially above the level of the lower face of the cable, which will permit them to grasp the cable as it rests upon its supporting-pulleys, a stop whereby said normal position is fixed, and mechanism whereby the jaws may be thrust downward to grasp a sagging cable, substantially as described.

9. A traction-cable-railway car having a grip in which the jaws, when open, are normally in or near the position to grasp the cable as it rests in the supporting-pulleys and provided with mechanism for opening and closing the same and mechanism whereby said jaws may be thrust downward in position to grasp a sagging cable, substantially as described.

10. In combination, the cable, the cable-supports, the vertically-movable gripping-jaws lying normally at or nearly at a level which will permit them to grasp the cable as it rests upon its support, a spring-support for said jaws, in antagonism to which the jaws may be thrust below the level for grasping the cable as it rests on the pulley-supports, and a stop whereby the upward movement of said jaws is stayed at or near said level, substantially as described.

11. In a railway-car, in combination, the grip-supporting frame, a lever fulcrumed on the car, and a grip-operating lever fulcrumed to said first-named lever, substantially as described.

12. In combination, the grip-jaws, the vertically-movable frame containing side uprights, between the lower extremities of which the jaws are supported, and an upper cross-piece, an upright lever pivoted intermediate the cross-piece and the jaws, and jaw-closing mechanism interposed between said lever and the jaws, substantially as described.

13. In combination, the grip-jaws, the vertically-movable frame containing side uprights, between the lower extremities of which the jaws are supported, and an upper quadrant-shaped member, an upright lever pivoted intermediate the quadrant and the jaws, a pawl mounted on the lever and engaging the quadrant, and jaw-closing mechanism interposed between said lever and jaws, substantially as described.

14. In combination, the grip-jaws, the vertically-movable frame containing side uprights, between the lower extremities of which the jaws are supported, and an upper cross-piece, an upright lever embracing said cross-piece and restrained in its movements thereby and pivoted intermediate the same and the jaws, and jaw-closing mechanism interposed between said lever and the jaws, substantially as described.

15. In combination, the grip-jaws, the vertically-movable frame containing side uprights, between the lower extremities of which the jaws are supported, and an upper cross-piece, and jaw-closing mechanism having a bearing on said cross-piece above the space between said uprights, substantially as described.

16. In combination, the grip-jaws and the vertically-movable portion carrying the same, said portion being secured to a member bearing against the running-gear and extending upward through an opening in the car-body and consisting of side uprights, a top cross-piece, and another cross-piece a short distance above the cable-conduit, substantially as described.

17. In combination, the grip-jaws, the vertically-movable portion carrying the same, said portion being secured to a member bearing against the running-gear and extending upward through an opening in the car-body, a vertically-reciprocating grip-shank, and guideways for said grip-shank, substantially as described.

18. In a railway-car, in combination, the gripping-jaws, the grip-shank vertically movable independently of its supporting-frame, mechanism for actuating said shank, and a vertically-movable frame supporting said jaws and said shank, and actuating mechanism whereby said frame can be moved vertically without changing the relative position of the parts for moving said shank, substantially as described.

19. In a railway-car, in combination, jaws moving about a pivot, a vertically-moving grip-shank, toggle-links whereby said shank is moved, and a vertically-movable frame which carries both the pivot of said toggle-links and the pivot of said jaws, substantially as described.

20. In a railway-car, in combination, the jaws, a hand device for operating the same as a portion of said device is depressed, a vertically-movable frame wherein said jaws are mounted, and a foot device whereby said frame may be thrust downward, substantially as described.

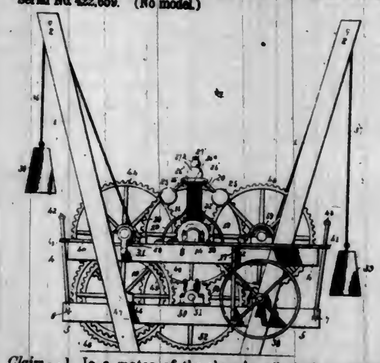
21. In a railway-car, in combination, the gripping-jaws, mechanism whereby said jaws are actuated to grip as a portion of said mechanism is depressed, a vertically-moving frame supporting said mechanism and said jaws, a spring supporting said frame, and mechanism connected with the car whereby said frame may be moved in antagonism to said spring, substantially as described.

22. In a railway-car, in combination, gripping-jaws, a vertically-moving grip-shank actuating said jaws, mechanism for actuating the grip-shank, a vertically-movable frame connecting said actuating mechanism with said jaws, and a spring whereon said vertically-movable frame is supported, substantially as described.

23. In combination, the grip-jaws, the vertically-movable frame containing side uprights, between the lower extremities of which the jaws are mounted, a stop whereby the normal position of the frame is determined, and a spring-support whereby the frame is held in contact with the stop, substantially as described.

24. In combination, the grip-jaws, the vertically-movable frame containing side uprights, between the lower extremities of which the jaws are mounted, a stop whereby the normal position of the frame is determined, a spring-support whereby the frame is held in contact with the stop, and mechanism whereby the frame may be shoved downward, substantially as described.

25. In a railway-car, in combination, the grip-supporting frame, a spring whereby the same is supported, and a stop connected with the running-gear of the car, whereby the highest position of the grip is determined independently of the car-body, substantially as described.



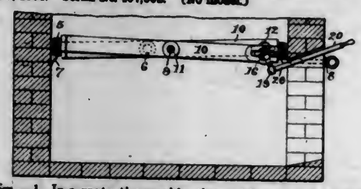
26. In a traction-cable-railway car, in combination, the jaws, mechanism whereby said jaws are operated, a frame wherein said mechanism and said jaws are mounted, a spring whereby said frame is supported, and means whereby the tension of said spring may be regulated, substantially as described.

27. In a traction-cable-railway car, in combination, the jaws, the frame supporting said jaws, a spring supporting each side of said frame, and mechanism adapted to exert a downward pressure in a line substantially equidistant between said springs, whereby said jaws may be thrust vertically downward, substantially as described.

28. In a railway-car, in combination, the horizontal piece F, bearing against the running-gear, provided with an opening for the passage of the grip-shank and also provided on either side of said opening with a bearing adapted to receive a spring, substantially as described.

29. In a traction-cable-railway car, in combination with the running-gear, a horizontal piece F, provided with a passage-way for the grip-shank and on either side thereof with a passage-way for the vertically-moving jaw-supporting frame, substantially as described.

478,774. MOTOR. EDMOND C. WHEAT, Comanche, Tex., assignor of three-eighths to Julius A. Best, same place. Filed Feb. 24, 1892. Serial No. 422,659. (No model.)

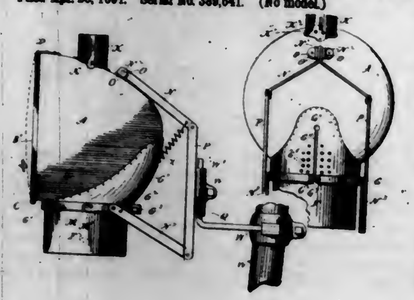


Claim.—1. In a motor of the class described, the combination, with the framework, a main shaft journaled therein, a main gear and two pinions mounted on the shaft, and means for transmitting motion from the gear, of transverse shafts located at opposite sides of the main shaft, drums mounted thereon, cranks for the shafts, weights, guides, and cables passed over the guides and connected with the weights and drums, and gears mounted on the shafts and adapted to engage with the pinions of the main shafts, substantially as specified.

2. In a motor of the class described, the combination, with the framework, a counter-shaft, a main shaft, a gear thereon, means for communicating motion from the gear to the counter-shaft, and pinions mounted on the main shaft, of opposite weight-operated shafts, movable boxes for the same, means for operating the boxes, and gears mounted on the weight-operating shafts and engaging the pinions of the main shaft, substantially as specified.

3. In a motor of the class described, the combination, with the framework, the central main shaft, the large gear thereon, the small pinions on the main shaft, the counter-shaft, and means for communicating motion from the large gear of the main shaft to the counter-shaft, of the opposite pairs of boxes mounted for sliding on the frame, U-shaped bails connecting at their terminals to the boxes, levers fulcrumed on the framework and connected to the bails, shafts located in each side of the main shaft and journaled in the boxes, said shafts terminating in cranks, gears loosely mounted in the shafts and adapted to engage the pinions of the main shaft, ratchet-wheels mounted on the shafts rigidly, pawls pivoted to the gears and engaging the ratchet-wheels, opposite guides, cables passed in reverse directions around the slidable shafts, and weights connected to the outer ends of the cables, substantially as specified.

4. In a motor of the class described, the combination, with the framework, the shaft 9, the gears 10, 11, and 12, mounted thereon, the counter-shaft 55, and an intermediate train of gearing from the gear 10 to the gear on the counter-shaft, of the boxes 29, mounted in ways upon plates 28 at opposite sides of the shafts 9, the winding-shafts 30 and 32, mounted in the boxes, the gears 44 and 45, loosely mounted on the shafts 30 and 32, the ratchet-wheels 62, rigid on the shafts 30 and 32, the pawls 63, pivoted to the gears 44 and 45 and engaging the ratchet-wheels, the ratchet-wheels 61, mounted upon the shafts 30 and 32 at the inner sides of two of the boxes 29, the pawls 59, pivoted to the boxes for engaging the ratchet-wheels and having inclined shoulders 60 at their front ends, the cam-blocks 62, located in the paths of the shoulders, and means for moving the shafts 30 and 32 and their boxes, so as to throw the gears 44 and 45 into and out of engagement with the pinions 11 and 12 of the shaft 9, substantially as specified.



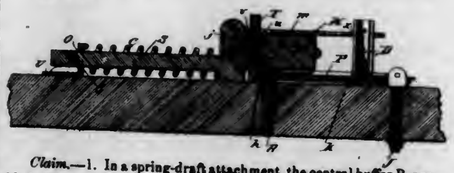
478,775. GRATE. WILLIAM WHITWORTH, Worcester, Mass. Filed Oct. 6, 1891. Serial No. 407,892. (No model.)

Claim.—1. In a grate, the combination, with a suitable frame and a series of grate-bars pivoted on a shaft secured in said frame and having cam-slots formed in the front portions thereof, of a pivoted shaft extending through perforations in the bars and having cams adapted to co-operate with the slots of the alternate bars and means for operating said shaft, as described.

2. The combination, with a grate-frame and the bars 10, pivoted on the shaft 9, secured therein, and having the circular perforations 12 and cam-slots 13 and 14, of a shaft journaled in said frame, extending through said perforations 12, and having cams 17 and 18, a depending arm 19, secured to said shaft, and a shake-handle 20, extending therefrom, adapted to rock said shaft 9, as and for the purpose described.

478,776. CYCLE-LAMP. CHARLES R. W. WOODWARD, Chicopee Falls, Mass., assignor to the Overman Wheel Company, Hartford, Conn. Filed Apr. 20, 1891. Serial No. 389,641. (No model.)

Claim.—1. In a cycle-lamp, the combination, with a parabolic cone arranged horizontally and constructed with fount and air openings in its lower face, of a perforated hood applied to said face of the cone, inclosing the said fount and air openings, forming a draft-chamber vertically split at its rear end and provided at its lower edge with a split ring to embrace and hold the fount, substantially as described.



2. In a cycle-lamp, the combination, with a parabolic cone arranged horizontally and constructed with turret and fount openings, respectively formed in its upper and lower faces, of a perforated cap or turret applied over the said turret-opening, a perforated draft-flue extending into said turret, made enough smaller than the same to form a small air-space between them, and provided at its lower end, which projects into the cone, with an offsetting flange to receive and hold the upper end of the chimney, and a spring located in the cap to press the flue downward upon the chimney, substantially as described.

3. In a cycle-lamp, the combination, with a parabolic cone arranged horizontally and constructed with turret and fount openings, respectively formed in its upper and lower faces, of a cap or turret applied over the said turret-opening, a vertically-movable perforated draft-flue extending at its upper end into the turret and having its lower end, which projects into the cone, furnished with an offsetting flange to adapt it to receive and support the upper end of the chimney, a spring located within the turret for depressing the said flue, a depending fount-support applied over the said fount-opening and forming a draft-chamber, and a glass closing the open end of the cone, substantially as described.

4. In a cycle-lamp, the combination, with a parabolic-cone arranged horizontally and constructed with turret and fount openings, respectively formed in its upper and lower faces, of a turret applied over the said turret-opening, a fount-support consisting of a perforated hood inclosing the said fount and air openings, forming a draft-chamber and having a split collar attached to its lower edge for clasping upon the fount, and a glass closing the front of the cone, substantially as described.

5. The combination, with the body of a cycle-lamp, of a pair of diverging arms pivoted at their meeting points to the upper portion of the said body, a pair of parallel upright arms pivoted to the outer ends of the said diverging arms, a pair of parallel arms having their outer ends pivoted to the lower ends of said upright arms and their inner ends pivotally connected with the lower portion of the said body at a point thereon above the lower ends of the said upright arms, a clip attached to the said upright arms, and springs for controlling the action of the said arms, substantially as described.

478,777. SPRING-DRAFT ATTACHMENT FOR VEHICLES. HIRAM BARBER, Chicago, Ill. Filed July 31, 1889. Serial No. 319,261. (No model.)

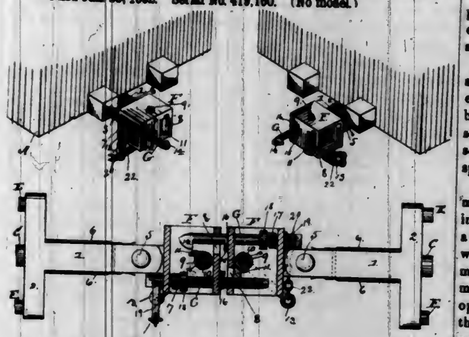
Claim.—1. In a spring-draft attachment, the central buffer B, provided with the shank S and the slotted shoe Y, in combination with the forward buffer U, rigidly attached to the tongue of the wagon, the coil-spring C, the upright bolt T, and standard D, united by the slotted strap P, the slotted hammer-strap H, the bolts R and J, the evener E, and the plate M, provided with the sleeve V, all arranged substantially as and for the purpose herein set forth.

2. In a spring-draft attachment, the central buffer B, provided with the shank S and the slotted shoe Y, in combination with the forward buffer U, rigidly attached to the pole of the wagon, the coil-spring C, the hammer-strap H, the bolts R and J, and the evener E, all arranged as and for the purposes herein set forth.

3. In a spring-draft attachment, the central buffer B, provided with the shank S and the slotted shoe Y, in combination with the forward buffer U, rigidly attached to the pole of the wagon, the coil-spring C, the upright bolt T, the hammer-strap H, the bolts R and J, and the evener E, all arranged as and for the purposes herein set forth.

4. In a spring-draft attachment, the central buffer B, provided with a shank S and the slotted shoe Y, in combination with the forward buffer U, rigidly attached to the pole of the wagon, the coiled spring C, the bolts T and R, and the slotted strap P, all arranged as and for the purposes set forth.

5. In a spring-draft attachment, the central buffer B, provided with the shank S and the slotted shoe Y, in combination with the forward buffer U, rigidly attached to the pole of the wagon, the coil-spring C, the bolts T and R, the evener E, and the plate M, provided with the sleeve v, all arranged as and for the purposes herein set forth.



6. In a spring-draft attachment, the central buffer B, provided with the shank S and the slotted shoe Y, in combination with the forward buffer U, rigidly attached to the pole of the wagon, the coil-spring C, the bolt T, and standard D, united by the slotted strap P, the bolt R, the evener E, and the plate M, provided with the sleeve v, all arranged substantially as and for the purpose herein set forth.

7. In a spring-draft attachment, the central buffer B, provided with the shank S and the slotted shoe Y, in combination with the forward buffer U, rigidly attached to the pole of the wagon, the coil-spring C, the bolt T, and standard D, united by the slotted strap P, the slotted hammer-strap H, attached to the pole of the wagon and held rigidly in position by means of the bolts R and J, the evener E, the plate M, provided with the sleeve v, and the upper hammer-strap K, all arranged as and for the purposes herein described.

8. In a spring-draft attachment, the combination, with the central buffer B, shank S, spring C, slotted shoe Y, having downwardly-projecting ribs i i at its sides, of the slotted strap P, located and held between said ribs and provided with the bolt T and standard D, substantially as and for the purpose described.

9. In a spring-draft attachment, the combination, with the spring C and hammer-strap H, having apertures a and n, of the slotted strap P, provided with a bolt T and standard D, and the confining-bolt J, whereby the device is secured to the tongue of the vehicle, substantially as and for the purpose described.

478,778. CAR-COUPLING. DAVID BELLOR, McKownville, N. Y. Filed Jan. 25, 1892. Serial No. 419,160. (No model.)

Claim.—1. In a car-coupler, the combination of a draw-bar having a spring-controlled longitudinal movement, a draw-head jointed to the outer end of said draw-bar and having in its outer face an opening which is partially closed by a flange which is hinged to said draw-head, and a horizontal coupling-hook journaled in said draw-head and having a partial rotative movement therein, said coupling-hook being adapted to enter the draw-head of a coupler of like construction and to engage with the hinged flange of the latter, as and for the purpose herein specified.

2. In a car-coupler, a draw-head provided in its outer face with an opening which is partially covered by a hinged flange or shutter, a coupling-hook journaled in said draw-head to receive a partial rotative movement, arms secured to said shutter and coupling-hook and connected together, so as to effect a simultaneous movement of the shutter and coupling-hook, as and for the purpose herein specified.

478,779. FEEDING DEVICE FOR ENVELOPE-MACHINES. CHAS. BEYER, Brooklyn, N. Y., and DANIEL M. LESTER, Norwich, Conn., assignors to Lester & Wasley, Norwich, Conn. Filed Sept. 28, 1891. Serial No. 407,013. (No model.)

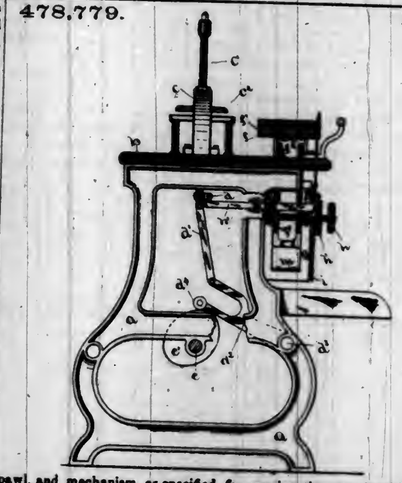
Claim.—1. In an envelope-machine, the combination, with a vertically-movable table for holding the blanks, of mechanism for elevating the table, a lever one end of which is adapted to engage with said mechanism, a plunger-rod provided with a plunger for operating upon the blanks and also formed or provided with means for engaging with the opposite end of said lever, and means for moving said opposite end of the lever into the path of the plunger when the table reaches its upward limit, whereby the lever is rocked upon its fulcrum and one end of it is caused to engage with and to release the lifting mechanism and permit the table to assume its original position, substantially as set forth.

2. In an envelope-machine, in combination with the plunger-rod and a vertically-movable elevator held by a pawl, as set forth, mechanism for moving the elevator upward, a jointed lever of the form described, one of whose ends is immediately over the free end of said pawl, and mechanism, as specified, for moving the opposite (hinged) end of said lever into the path of the plunger-rod, for the purpose stated.

3. In combination with the plunger-rod of an envelope-machine, an elevator held by a pawl *h*, as set forth, mechanism for moving the elevator upward, said elevator having a projecting plate o^3, an angle-bar *o*, having one arm in the path of said plate, a jointed lever *n*, as set forth, and a rod *o'*, connecting said angle-bar with the hinged section of said lever, all being substantially as and for the purpose specified.

4. In an envelope-machine, the combination, with a vertically-movable table, of a ratchet-wheel connected therewith, a plunger-rod in the machine, provided with a plunger for operating upon the blanks, a lever pivotally secured to the frame of the machine, one end of which is movable laterally, said plunger being formed or provided with means for engaging with said movable end of the lever, means for moving said end of the lever, and two pawls for engaging with and operating the ratchet-wheel, one of said pawls having its head between the periphery of the wheel and the other pawl and having its opposite end extended beyond its fulcrum-point into the path of the lever, substantially as set forth.

478,780. PHOTOGRAPHIC CAMERA. WILLIAM H. REDFOOT, Hoboken, N. J. Filed Jan. 27, 1892. Serial No. 419,407. (No model.)



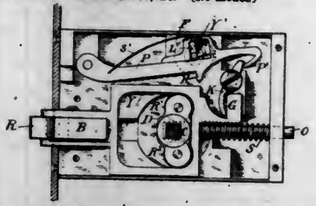
Claim.—1. In a three-compartment camera, a storage-compartment for the exposed plates, provided with an inclined surface for lifting the plates and sustaining the outer side of the stack, and a carrier provided at one end with a hook for transferring the plates in the receiving-compartment one by one to the exposing-compartment and at its opposite end with a projection for supporting the inner side of the stack in the storage-compartment, substantially as and for the purpose set forth.

2. In a magazine-camera, a storage-compartment provided with an elevated inclined surface causing the stack in the said compartment to tilt and bring the inner end of the rear plate into the plane of the plate in the exposing-compartment, and a sliding carrier provided with a projection adapted to lift and support the inner side of the stack in the storage-compartment to permit the passage of the plate from the exposing-compartment to the storage-compartment, substantially as described.

3. In a three-compartment camera, guide-rails extending across the back of the camera, provided with channel-shaped portions in the exposing-compartment for supporting the plate in the same, said rails

---

478,779.



terminating in elevated inclined surfaces in the storage-chamber, substantially as described, and a carrier provided with a hook for transferring the plates and with a projection for supporting one side of the stack in the storage-compartment, substantially as described.

4. In a magazine-camera, the combination of a sliding carrier F, formed of two approximately-parallel parts and provided with means for transferring the plates, a slotted closing-plate *l*, a threaded stud *j*, secured to the carrier and projecting through the slot in the closing-plate, a nut screwed upon the stud and adapted to lock the carrier by contact with the plate, and a light-guard *g*, located between the two parts of the carrier, substantially as described.

5. In a three-compartment camera, a sliding carrier provided with a hook at one end for transferring the plates and an opposite yoke-shaped or bifurcated end provided with projections adapted to lift and support the stack of plates in the storage-compartment, substantially as described.

478,781. LOCK. CHARLES E. CANDEE, New York, N. Y. Filed Sept. 22, 1890. Serial No. 365,723. (No model.)

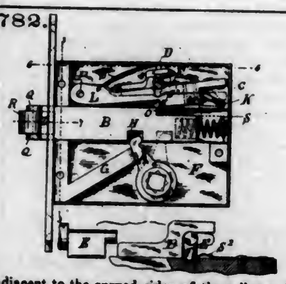
Claim.—1. In locks, an automatic locking-lever, in combination with the positive locking and positive unlocking and freeing cam L, a bolt B, and a tumbler K, one arm of which engages the locking-lever to disengage the same, and the other arm of which engages the bolt B to retreat the same after it is unlocked, substantially as shown and described.

2. In locks, an automatic locking pawl or lever, in combination with a positive locking and positive unlocking and freeing cam L, a bolt B, an unremovable tumbler K, engaging the locking pawl or lever to disengage the same and also the bolt B to retreat the same independently of the knob and spindle, and an eccentric spindle-socket stop stopping the bolt in either of two positions at will, one of which is a locking position in relation to the locking pawl or lever.

3. In locks, an automatic locking pawl or lever, in combination with a positive locking and positive unlocking and freeing cam L, a bolt B, an unremovable tumbler K, engaging the locking pawl or lever to disengage the same, and also the bolt B to retreat the same independently of the knob and spindle, and an eccentric spindle-socket stop stopping the bolt in either one of two positions at will, one of which is a locking position in relation to the locking pawl or lever, the spindle-socket being provided with the rollers R' R³ for retreating the bolt independently of the tumbler.

4. The locking pawl or lever P, fulcrumed at one end and provided with the stop P', in combination with the tumbler K, one arm of which bears upon the other end of the locking pawl or lever P for the purpose of lifting and disengaging the same, and also with the stop P', and also in combination with the cam L, arranged to lift, lock, or free the locking pawl or lever at will.

5. The locking pawl or lever P, fulcrumed at one end and provided with the stop P' and with the springs S' S³, in combination with a tumbler K, one arm of which bears upon the locking pawl or lever P for the purpose of lifting and disengaging the same, and also with the stop P', and also in combination with the cam L, arranged to lift, lock, or free the locking pawl or lever at will.



6. The locking pawl or lever P, fulcrumed at one end and provided with the stop P' and the springs S' S³, in combination with a tumbler K, one arm of which bears upon the locking pawl or lever P for the purpose of lifting and disengaging the same, and also in combination with the cam L, arranged to lift, lock, or free the locking pawl or lever at will, and with a lock-bolt.

478,782. LOCK. CHARLES E. CANDEE, New York, N. Y. Filed Feb. 4, 1891. Serial No. 380,142. (No model.)

Claim.—1. A spring catch-bolt, in combination with an automatic locking-lever engaging therewith in the manner shown and described and with an independently positive lifting, independently positive locking, and freeing cam E.

2. In locks, a positive-locking spring-bolt provided on its outer end with a concave recess, in combination with a roller secured in the front end of the bolt and seated in the concave recess, substantially as shown and described, the most forward part of the bolt which forms

478,782.

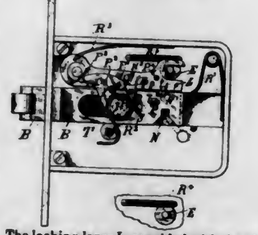
the recess adjacent to the curved sides of the roller making contact with the jamb-escutcheon, so as to hold the door when in its closed position, and thereby relieve the roller of that function, substantially as set forth.

3. In locks, the locking-lever L, pivoted at one end, provided with the springs S' S³, the cam-seat D, and the stop or shoulder N, in combination with the lifting, locking, and freeing cam E.

4. In locks and in combination, the locking-lever L, pivoted at one end, provided with springs S' S³, cam-seat D, stop or shoulder N, and the key-seat C, the cam E, the key K, the bolt B, provided with the shoulder O and notch H, the spring S, and the spindle-arm A.

5. In locks and in combination, the locking-lever L, pivoted at one end, provided with springs S' S³, cam-seat D, stop or shoulder N, key-seat C, the cam E, the key K, and the bolt B, provided with the shoulder O.

6. In locks and in combination, the locking-lever L, pivoted at one end, provided with springs S' S³, cam-seat D, stop or shoulder N, key-seat C, the cam E, and the key K.



7. In locks and in combination, the locking-lever L, pivoted at one end, provided with springs S' S³, cam-seat D, stop or shoulder N, the key-seat C, and the cam E.

8. In locks and in combination, the locking-lever L, pivoted at one end, provided with springs S' S³, cam-seat D, stop or shoulder N, and key-seat C.

9. In locks and in combination, the bolt B, provided with the notch H and the shoulder O, the spring S, the spindle-arm A, the locking-lever L, pivoted at one end, provided with springs S' S³, cam-seat D, stop or shoulder N, and key-seat C, the cam E, and the stop G.

10. In locks, the locking-lever L, lifting, locking, and freeing cam E, cam-seat D, and spring S³, in combination.

478,783. LOCK. CHARLES E. CANDEE, New York, N. Y. Filed July 13, 1891. Serial No. 399,393. (No model.)

Claim.—1. The locking-lever L, provided with the pin P', shoulder O, and spring R⁴, in combination with the positive locking, positive unlocking, and freeing cam E, the bolt B, provided with the stud S, notch N', and spring R', and the spindle-socket H, provided with the cams C and C' and spring R³ for the purpose of unlocking, retreating, and holding in retreat the bolt B.

2. The locking-lever L, provided with the pin P', the shoulder O, and spring R⁴, in combination with the positive locking, positive unlocking, and freeing cam E, the bolt B, provided with the stud S, notch N', and spring R', and the spindle-socket H, provided with the cam C, having the notch N³, the spring R³, and the cam C' for the purpose of unlocking, retreating, and holding in intermediate retreat and tripping the bolt B.

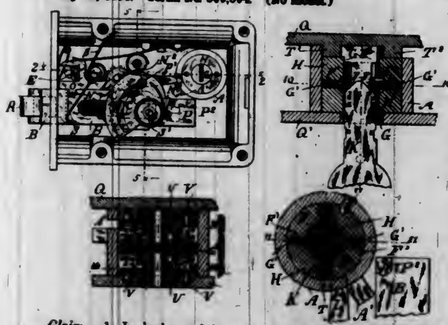
3. The locking-lever L, provided with the shoulder O, the pin P', and the spring R⁴, in combination with the positive locking, positive unlocking, and freeing cam E, the bolt B, provided with the stud S, pin P, notch N', and spring R', the spindle-socket H, provided with the cam C, having the pin P³, the cam C', and the spring R³, and one or more tumblers W' W³ W⁴, provided with notch N³ and slot S³, and springs R⁵, respectively, all in combination for the purpose of unlocking,

retreating, and holding in retreat the bolt B and relocking the same automatically.

4. The locking-lever L, provided with the shoulder O, the pin P', and the spring R⁴, in combination with the positive locking, positive unlocking, and freeing cam E, the bolt B, provided with the stud S, pin P, notch N', and spring R', the spindle-socket H, provided with the cam C, having the notch N³, the pin P³, the cam C', and spring R³, and one or more tumblers W' W³ W⁴, provided with the notch N³ and slot S³ and springs R⁵, respectively, all in combination for the purpose of unlocking, retreating, and holding in intermediate retreat the bolt B and relocking the same automatically.

5. The locking-lever L, provided with the pin P⁴, shoulder O, and spring R⁴, in combination with the positive locking, positive unlocking, and freeing cam E, the bolt B, provided with the pin P, notches N and N', and spring R', the tumblers W' W³ W⁴, one or more, provided with the slot S³, notch N³, and springs R⁵, in combination with the corresponding key K for the purpose of unlocking and retreating the bolt B.

6. A tumbler provided with the notch N³, slot S³, and spring R⁵, in combination with the locking-lever L, provided with the pin P⁴ and the spring R⁴, the positive locking, positive unlocking, and releasing cam E, and the key K.



7. The combination of the cam E, lever L, and tumblers W' W³, and W⁴, one or more, for the purpose of positively locking, positively unlocking, and releasing the bolt B.

8. In locks, the double system of devices shown and described, consisting of the bolt B, lever L, and tumblers W' W³ W⁴, in combination with a suitable key K and a spindle-socket H, provided with cams C and C', whereby the bolt may be operated at will either by the key or by the spindle.

9. In locks, the bolt B, provided with the roller R, in combination with a cam provided with means for engaging and retreating, holding, and automatically tripping the bolt, substantially as shown and described.

10. In locks, the bolt B, provided with a roller R, in combination with a cam which is capable of retreating, holding, and also tripping the bolt, with a locking and unlocking lever and with a cam for locking and unlocking the same, substantially as shown and described.

478,784. LOCK. CHARLES E. CANDEE, New York, N. Y. Filed July 13, 1891. Serial No. 399,394. (No model.)

Claim.—1. In locks and in combination, the bolt B, provided with the pin P', the lever L, provided with the pin P', and the double cam C C', provided with the notches N' N³, and spring S', substantially as shown and described.

2. In locks, a pin-tumbler, a revolving tumbler-barrel, and a key for unlocking and revolving the same, in combination, the pin-tumbler projecting beyond the end of the barrel for the purpose of engagement when in its locking position and actuated by the key, in unlocking and revolving the tumbler-barrel, so as to be drawn inwardly for the purpose of unlocking the same, substantially as shown and described.

3. In locks, a compressible and opposite-moving pair of pin-tumblers, in combination with a spring located between them, substantially as shown and described.

4. In locks, a compressible and opposite-moving pair of twin tumblers with a spring located between them, in combination with an opposite like pair of twin tumblers and spring and with a key adapted to operate both pairs of tumblers in unlocking, substantially as shown and described.

5. In locks, the compressible and opposite-moving twin pin-tumblers T T, provided with engaging tongues, in combination with the spring G³ and with the key K, provided with inclined engaging grooves on its opposite edges, substantially as shown and described.

6. In locks, the compressible and opposite-moving twin pin-tumblers T T, provided with engaging tongues, in combination with the spring G³, and also in combination with a like opposite set of compressible and opposite-moving twin pin-tumblers T T, in combination with their spring G³ and with the key K, provided with opposite inclined engaging grooves on its opposite edges, substantially as shown and described.

7. In locks, the compressible and opposite-moving twin pin-tumblers T T, in combination with the spring G³ and also with the pins F and F' and the spring G', substantially as shown and described.

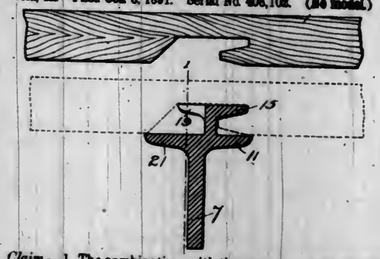
8. In a pin-tumbler barrel or case, the pin-tumbler carriers H H, the compressible and opposite-moving twin pin-tumblers T T and spring G³, the pin F' and spring G', the key-seat cylinder G, and the pin F, substantially as shown and described.

9. In locks and within the pin-tumbler barrel or case and in pairs, the pin-tumbler carriers H H, the pin-tumblers T T, provided with the spring G³, and the pins F F', provided with the springs G' and moving to and fro in planes at right angles to the plane of the motion of the pin-tumblers T T, in combination with the key-seat cylinder G and key K, the corresponding surfaces of the key and of the pin-tumblers being tongued and grooved for the purposes of co-operative action, substantially as shown and described.

10. In locks, a pair of pin-tumblers T T, one or more, in combination with the spring G³ and located between two lock-plates, which are recessed to receive the ends of the tumblers, and thereby hold the tumbler-carrier mechanism in a fixed position until released by the aid of a key, substantially as shown and described.

11. In combination, the key-seat cylinder G, pins F and F', spring G', pin tumblers T, provided on their concave surfaces with the tongues U U, and the key provided with reverse grooves U' U' on opposite edges, substantially as shown and described.

12. In locks, a reciprocating bolt, a pin-tumbler, a revolving tumbler-barrel located between the two plates of the lock, and a key for unlocking and revolving the same, in combination with the pin-tumbler, one or more, projecting beyond the end of the barrel for the purpose of engagement with the adjacent lock-plate when in its locking position and actuated by the key, so as to be drawn inwardly for the purpose of permitting the unlocking and revolving of the tumbler-barrel and also for the purpose of permitting the unlocking and retreating of the reciprocating bolt by the tumbler-barrel, substantially as shown and described.

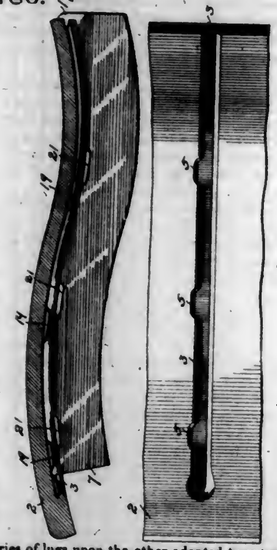


478,785. FIRE-PROOF PAINT. WILLIAM CHURCH, St. Paul, Minn. Filed Feb. 10, 1891. Serial No. 380,946. (No specimens.)

Claim.—1. As an improved article of manufacture, the foregoing-described composition of matter, composed of linseed-oil, lime-water, alum-water, borax, a mineral paint, and a suitable drier, in substantially the manner and proportions specified.

2. The foregoing-described composition of matter, composed of linseed-oil, lime-water, alum-water, borax, a mineral paint, glue sizing, and a suitable drier, substantially as and in the proportions specified.

3. The foregoing-described composition of matter, consisting of linseed-oil, lime-water, borax, glue sizing, a mineral paint, and a drier, substantially as and in the proportions specified.



478,786. SCHOOL FURNITURE. WILLIAM R. COOGER, Springfield, Ill. Filed Oct. 3, 1891. Serial No. 408,102. (No model.)

Claim.—1. The combination, with the seat or wooden portion provided with an undercut groove having upon one side a series of notches with walls inclined from the top to the bottom and toward the center of said groove, of a supporting-iron provided with a rib having a continuous flange at one side of said rib and a series of lugs at the other adapted to engage said notches and force said flange under the wall of said groove as the rib is inserted in said groove, substantially as described.

2. The combination, with the wooden or seat portion with the dovetailed or undercut groove having a continuous wall upon one side and having upon the other side a series of notches with walls inclined from the top to the bottom and toward the center of the groove, of a supporting-iron provided with a rib having a continuous flange upon one

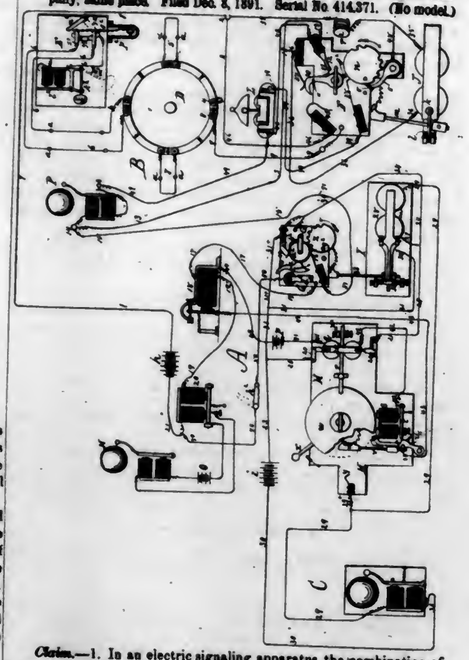
478,786.

side and a series of lugs upon the other adapted to enter the notches in said groove and to force the flange under the wall of the groove as the rib is inserted in said groove, whereby the wooden portion may be locked upon the supporting-iron and be held and supported for the full length of the iron.

3. The combination, with the wooden or seat portion provided with the undercut groove having a series of inclined notches 5 in one side, said notches being inclined toward the center of the groove, of the supporting-iron provided with a rib 9, the flange 15 upon one side of said rib and the lugs 19 upon the other, and with the flanges 11 and 13 and lugs 21, projecting from opposite sides of the base of the rib, said lugs 19 being adapted to engage said notches and force said flange 15 under the wall of the groove as the rib is inserted in the groove, substantially as described.

478,787. HAND-SUPPORT FOR PENHOLDERS AND LEAD-PENCILS. WILEY G. CROOM, Vicksburg, Miss., assignor of one-half to John A. Brennan, same place. Filed Sept. 11, 1890. Serial No. 364,668. (No model.)

Claim.—1. A penholder-rest consisting of an arm connected with the penholder and extending downward therefrom and provided with a ball-bearing foot, substantially as specified.



2. A penholder-rest consisting of a spring or yielding arm connected with the penholder and extending downward therefrom and provided with a ball-bearing foot, substantially as specified.

478,788. ELECTRICAL THERMOSTAT. WILLIAM L. DENIO, Rochester, N. Y., assignor to the Standard Electric Signal Company, same place. Filed Dec. 8, 1891. Serial No. 414,370. (No model.)

Claim.—The thermostat herein described, consisting of the insulator *a*, the electrodes *b b*, the thimbles *c c'*, attached to one of the electrodes and secured together by solder fusible at a given temperature, the spring *d* between the thimbles, which tends to throw the outer thimble off; the shoulder *g* on the outer thimble, and the spring *f*, attached to an electrode and bearing against the outer thimble, as shown and described, and for the purpose specified.

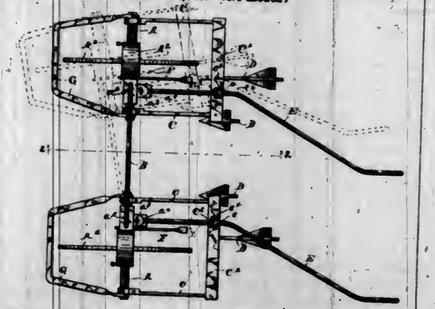
478,789. ELECTRIC SIGNALING APPARATUS. WILLIAM L. DENIO, Rochester, N. Y., assignor to the Standard Electric Signal Company, same place. Filed Dec. 8, 1891. Serial No. 414,371. (No model.)

Claim.—1. In an electric signaling apparatus, the combination of a circuit extending from the central station to the sub station, a thermostat interposed in the circuit at the sub-station, said thermostat acting to automatically open and then close the circuit, another circuit extending from the central station to the fire department, a signaling mechanism connected with the circuit leading to the sub-station, released and set in motion by the opening and closing of the circuit by the thermostat, a registering mechanism for recording the signal at the central station, a return-signaling mechanism for indicating at the sub-station that the alarm has been sent in to the fire department, and suitable sub-circuits and shunts, whereby the alarm is first sent to the central station, there recorded, then sent to the fire department, and then repeated at the sub-station, as herein shown and described.

2. In an electric signaling apparatus, the combination of a circuit extending from the central station to the sub-station, a signaling mechanism, a shunt connected with the circuit, an electro-magnet for releasing and setting in motion the signaling mechanism, said magnet being connected with the shunt connections of the circuit, whereby the signal mechanism can act upon the main line, a registering mechanism at the central station, an electro-magnet for releasing said registering mechanism, another electro-magnet connected with the main line for operating a local circuit, and a local circuit connecting the last-named two magnets, the whole so arranged, as herein described, that the parting or other disarrangement of the wires at the sub-station, whereby the circuit is broken, will be indicated at the central station without sounding an alarm of fire, as herein shown and described.

3. The signaling mechanism herein described, consisting of the break-wheel *n*, the spring 38, connecting therewith, the springs 11 and 12, connecting with the main line, the swinging arm 10, the springs 37 and 46, with which said swinging arm comes in contact, and the stop-spring *o*, as shown and described, and for the purpose specified.

4. The return-signal mechanism consisting of the break-wheel *s*, the spring 16, resting in contact therewith, the circuit-closing wheel s^2, the springs 46 and 47, the swinging tongue s^3, and contact-spring s^4, arranged to operate in the manner and for the purpose specified.



5. The combination, with the registering-wheel *w*, driven by clock-work, and the escapement-arm *v* for controlling the same, of the perforating-arm *r*, the magnet *z*, armature *t*, and swinging detent *u*, the detent swinging inward, locking the armature and holding the same

when drawn up to the magnet and releasing the escapement-arm, as specified.

6. The manual signal E, consisting of an electro-magnet and armature, the swinging arm A^2, the bar 53, the cross-springs 51 and 52, and the circuit-breaking arm n^2, as shown and described, and for the purpose specified.

7. The combination, with the circuit-breaking arm n^2 and cross-springs 51 and 52, of the chain c^3, attached to the circuit-breaking arm, and the glass tube p^3, attached to the bottom of the manual-signal box and inclosing the chain, as shown and described, and for the purpose specified.

478,790. CULTIVATOR. AUGUSTIN ELLIS, Bedford, Ind. Filed Oct. 30, 1891. Serial No. 409,339. (No model.)

Claim.—1. The combination, in a cultivator, of stationary axles, arch-like housings extending from said axles up over the wheels, wings on said housings, and an arch the ends whereof are substantially at right angles with its center, which ends extend down through bearings in said wings and thus unite the two halves of the cultivator, which are otherwise independent, substantially as set forth.

2. The combination, in a cultivator, of two short stationary axles, an arched axle united to said stationary axles by pivotal connections, plow-beams connected to the ends of said stationary axles, hinge-joints in said plow-beams near where they are so connected, cross-beams, connecting the rear ends of said plow-beams, hinge-joints at or near the points of said connection, and plows connected to said cross-beams, whereby provision is made for a greater or less number of plows, all of which may be moved from side to side and maintain their uniform direction toward the front.

3. The combination, in a cultivator, of the axles, housings thereon, plow-beams, handles connected to said housings and extending back through bearings on said plow-beams, and adjusting-collars on said handles alongside said bearings, substantially as and for the purpose set forth.

4. The combination, in a cultivator, of the axles, the plow-beams, housings on the axles, shoes pivoted to said housings above the axles and extending around in front of and below said axles, and collars on said axles adapted to be moved longitudinally thereof to under or alongside said shoes, substantially as and for the purpose described.

5. The combination, in a cultivator, of the axles, housings thereon, plow-beams secured to said axles, handles secured to said housings and to said plow-beams, shoes also secured to said housings and passing under said axles, and adjusting-collars on said handles and on said axles, substantially as set forth.

478,791. APPARATUS FOR BORING WELLS. FULTON GARDNER, Chicago, Ill., assignor of one-half to Samuel T. White, same place. Filed Oct. 16, 1891. Serial No. 408,867. (No model.)

Claim.—1. The combination, with a boring-tool, of a holding device adapted to be set into operation only as the boring-tool is worked upward, substantially as described.

2. The combination, with a boring-tool, of a storage-battery of a diameter adapted to enter the bore of the well and follow up the boring-tool and electrical conductors from said storage-battery to an electrical motor, substantially as described.

3. The combination, with a boring-tool, of a pump mounted on the tool, the pump being of a size to enter the bore of the well and follow the tool in its descent, whereby it may operate from below the surface and while under water, substantially as described.

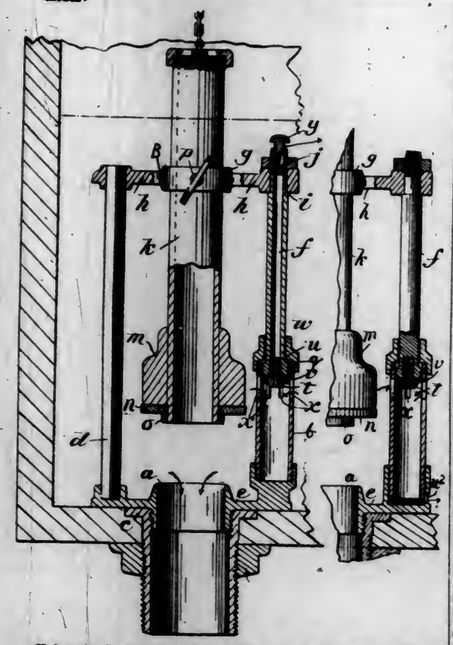
4. The combination, with a boring-tool, of a pump mounted on the tool and an electric motor between the cutting portion of the tool and the pump, imparting rotary motion to both, the pump being of a size to enter the bore of the well and follow the tool in its descent, whereby it may operate from below the surface and while under water, substantially as described.

478,791.

5. In combination with a boring-tool, an electric signaling device adapted to follow the tool down the hole and to be set in operation by a weight thereon and an electrical conductor running from such signaling device to the room of the operator to sound an alarm, substantially as described.

6. In combination with a boring tool, an electric signaling device carried down the hole with the boring-tool and set in operation by diminution of water in the hole and an electrical conductor running to the room of the operator to sound an alarm, substantially as described.

7. In combination with a boring-tool, a telephonic transmitting device carried down the hole with the tool, an electrical conductor running to the room of the operator, and a telephonic receiving device whereby the operator may at all times be apprised by listening of the condition of things at the bottom of the hole, substantially as described



478,792. MOLD FOR GLASS BATTERY-JARS. JOHN GAYNER, Salem, N. J. Filed Nov. 9, 1891. Serial No. 411,948. (No model.)

Claim.—A mold for glass battery-jars, consisting of a hollow block with a base portion extending beyond the vertical main portion

of the sides of the body thereof and a flaring mouth having plane sides at the top of the body portion, said parts being combined substantially as described.

478,793. SLOW-CLOSING VALVE FOR TANKS. JOHN V. SLOVER, Springfield, Mass. Filed Oct. 14, 1891. Serial No. 408,641. (No model.)

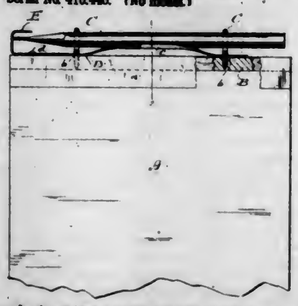
Claim.—1. In a slow-closing valve, the combination, with the tank-section formed to constitute the valve-seat and having an unobstructed opening therethrough and an outwardly-extended member, with a vertical tube or cylinder supported on said member, having one or more ports through an upper portion of its wall, of the valve vertically movable to open from and close upon the said tank-section and provided with an upwardly-extended portion which has an outwardly-extended member and which supports a pending spindle and piston that plays in said tube and a passage leading from the chamber of said tube for the relief thereof, substantially as and for the purposes described.

2. In a slow-closing tank-valve, the combination, with the tank-section having outwardly-projected arms at opposite sides thereof, the one supporting a vertical post and the other a vertical tube, with one or more ports through an upper portion of its wall, of the valve having an upwardly-extended member, with rigid arms outwardly extended therefrom and having a guiding engagement with said post and the other supporting a pending spindle which has at its lower portion a piston that plays in said tube and a passage leading from the chamber in said tube for the relief of the chamber, and means for regulating the degree of freedom of the water-passage from the cushion-chamber through said relief-passage.

3. The combination, with the tank-section and a vertical water-cushion tube supported thereby, of the valve guided vertically to move from and close upon the tank-section, a spindle or plunger and means for securing same adjustably as to height upon the valve and having a piston which plays in said tube, and a passage in communication with the chamber in said tube for the relief thereof, substantially as described.

4. The combination, with the tank-section having an outwardly-extended part and a tube vertically supported thereby, provided at an upper portion thereof with one or more ports, the valve movably guided and having the upwardly-extended spindle-like part and an arm outwardly extended therefrom, a vertical spindle supported by said arm and having its lower end portion exteriorly shouldered and internally screw-threaded, the plug *t*, having the screw-threaded shank and the enlargement at its lower end, a packing applied at the lower end of the spindle and clamped thereon by the union therewith of said plug, the thimble *w*, applied at the upper end of said tube, and the passage communicating with and leading from the water-cushion chamber in the said tube, substantially as and for the purposes set forth.

5. The combination, with the tank-section having an outwardly-extended member *c* and supporting a vertical tube or cylinder having one or more ports at an outer portion thereof, of a valve guided vertically to move from and close upon the tank-section and having the upwardly-extended tube *k*, a spindle or plunger having a piston which plays in said tube and the collar and set-screw for confining the collar on the valve-tube, and said collar provided with an outwardly-extended part which supports the piston-spindle, and a passage in communication with the chamber within said tube, which leads outwardly therefrom for the relief thereof, substantially as described.



6. In a slow-closing valve, the combination, with a tank-section and a vertical water-cushion tube supported thereby, of the valve guided to move from and close upon the tank-section, a spindle or plunger and means for securing the same adjustably as to height upon the valve and having a piston which plays in said tube, a stop or abutment for limiting the upward movement of the valve and its piston-spindle, and a passage in communication with the cushion-chamber for the relief thereof, and means for regulating the degree of freedom of the water-passage from said chamber, all whereby the play of the valve may be adjusted as to its extent of movement and its rate of movement may be regulated, substantially as described.

7. The combination, with the tank-section having the horizontal arms *c c*, each with an upwardly-extended boss, the one supporting the vertical post *d* and the other the vertical tube *b*, with one or more ports *x*, the valve *m*, with the tube *k*, the collar *g*, having the arms *h h*, one being vertically apertured to have a sliding engagement with the post *d* and the other having rigidly connected thereto the vertical spindle, provided at its lower end with the piston which plays in the tube, the passage leading upwardly through the piston and said spindle, and a regulating device for said passage, substantially as and for the purposes described.

8. In a slow-closing valve, the combination, with the tank-section having outwardly-projected arms at opposite sides thereof, the one supporting a vertical post and the other a vertical tube, with one or more ports through an upper portion of its wall, of the valve having the upwardly-extended tube, with a rigid arm outwardly extended therefrom and being vertically apertured to fit and be guided by said post, and another outwardly-extended arm, also vertically apertured, a spindle having at its lower portion a piston which plays in the said tube and which has its upper portion externally screw-threaded with the shoulder *i* and which threaded portion is upwardly passed through said second-named arm and the confining-nut *j*, and a relief-passage leading from the chamber in said tube, substantially as and for the purposes set forth.

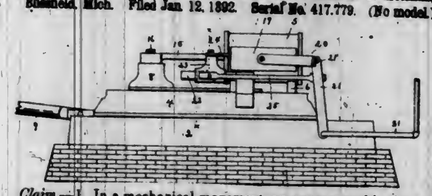
9. In a slow-closing valve, the combination, with the tank-section having an outwardly-extended member and a vertical tube supported thereon, which is provided with one or more ports through an upper portion of its wall, of the valve having the upwardly-extended spindle-like part provided with a rigid outwardly-extended arm, a tubular spindle vertically supported by said arm and having at its lower portion a piston which fits in said tube, a passage leading through the said piston and in communication with the passage through the spindle, and the tapered plug *y*, applied at the upper end of said spindle, substantially as and for the purposes described.

478,794. IMPLEMENT-HOLDER FOR TABLETS, &c. OLE T. HOGEN and GEORGE W. PAULUS, Grand Rapids, Wis. Filed Oct. 31, 1891. Serial No. 410,440. (No model.)

Claim.—1. As an improved article of manufacture, an implement-holder for attachment to tablets and analogous devices, this holder consisting of supports for an implement and a spring-plate having perforations for passage therethrough of the shanks or stems of said supports, one or both of said perforations being elongated, and a portion of said plate forming a spring-guide intermediate of the supports to exert pressure on said implement when in position in the supports, substantially as set forth.

2. A tablet or analogous device provided with an implement-holder consisting of supports for the implement, and a spring-guide intermediate of the supports to exert pressure on said implement, substantially as set forth.

3. A tablet or analogous device provided with an implement-holder consisting of supports for an implement and a spring-plate having a portion thereof intermediate of the supports and a returned end, substantially as set forth.



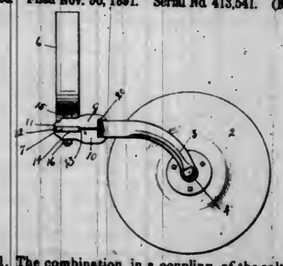
4. A tablet or analogous device provided with an implement-holder consisting of supports for an implement and a longitudinally-slotted spring-plate having a portion thereof bowed up and arranged intermediate of the supports to exert pressure on said implement, substantially as set forth.

5. A tablet or analogous device provided with an implement-holder consisting of supports for an implement and a spring-plate having a bowed portion arranged intermediate of the supports and turned up at the edges thereof to form a guide, substantially as set forth.

6. A tablet or analogous device provided with a continuous independent base having implement-supports thereon and an independent spring-plate having a bowed portion arranged intermediate of the supports, substantially as set forth.

7. A tablet having a strip of wood or other analogous material secured to an edge thereof, implement-supports on the strip, and a spring-guide connected to said strip intermediate of the supports, substantially as set forth.

478,795. MECHANICAL MOVEMENT. FRANKLIN P. HUNNEL, Bloomfield, Mich. Filed Jan. 12, 1892. Serial No. 417,779. (No model.)



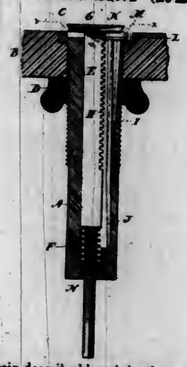
Claim.—1. In a mechanical movement, an upper movable piston-slide provided with a rack-bar, a lower stationary rack-bar, and a cylinder-bed movable between the two, and a pinion carried thereby engaging the rack-bars.

2. In a mechanical movement, an upper piston-slide provided with a rack-bar, a lower stationary rack-bar, and a bed intermediate the two, a pinion carried thereby and engaging the rack-bars, a power device upon the bed, and a piston-rod connecting the same and the piston-slide.

3. In a mechanical movement, a power device, a piston, and rod, a piston-slide attached thereto and provided with a rack-bar, a lower stationary rack-bar, a cylinder-bed intermediate the two, and a pinion meshing with the two rack-bars, said intermediate cylinder-bed being connected to the device to be operated.

4. In a mechanical movement, an upper piston-slide, a rack-bar secured thereon, a lower stationary rack-bar, an intermediate cylinder-bed, a power device secured thereon, and means for applying the power to the upper piston-slide, a pinion meshing with the two rack-bars, and means for connecting the intermediate cylinder-bed with the device to be operated.

478,796. SEPARABLE COUPLING FOR COULTER-YOKES. NILS J. JOHNSON, Minneapolis, Minn., assignor to the Minneapolis Plow Works, same place. Filed Nov. 30, 1891. Serial No. 413,541. (No model.)

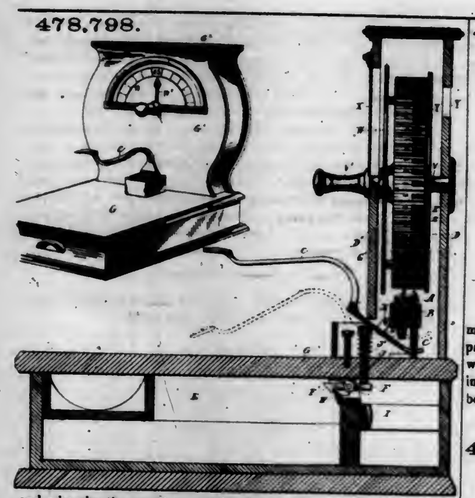


Claim.—1. The combination, in a coupling, of the colter and the yoke thereof with the shank, said yoke provided with a sleeve, and the two grooved parts 9 and 10, arranged to engage said sleeve and to be bolted upon said shank.

2. The combination, with the colter-yoke, of the shank, the longitudinally-divided coupling consisting of the parts 9 and 10, said parts having lugs and shoulders to engage the edges of the shank-foot, said foot provided with a slot, the bolt passing through the same and securing said parts on said foot, and means for pivotally securing said yoke between said parts, substantially as described.

3. The combination, with the colter and the yoke wherein the same is secured, of the shank, said yoke provided with the eye or sleeve 5, the foot of said shank being slotted, the longitudinally-divided coupling having lugs and shoulders to engage the edges of said foot, openings in the same, and a bolt passing therethrough and through the slot in said foot for securing said part thereon, said parts provided with the groove 17 and the annular lugs 18 for receiving and engaging the sleeve of said yoke, substantially as described.

478,797. BENCH-HOOK. CHARLES J. KEMPT, Seymour, Conn. Filed Dec. 14, 1891. Serial No. 414,974. (No model.)



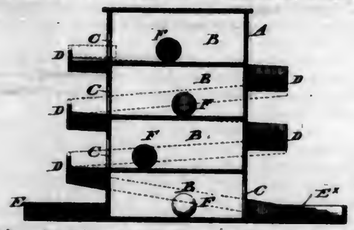
Claim.—The herein-described bench-hook, consisting of the tubular socket A, constructed with a flange C at its upper end adapted to rest upon the top of the bench, combined with a spindle E, movable up and down within the socket, and constructed with a head G at its upper end, the flange C constructed with a recess corresponding to and so as to receive said head in its depressed position and also constructed with a recess L at one side of said recess, the spindle constructed with a toothed rack upon that side corresponding to the said recess L with a vertical spring-dog arranged in the side of the socket in which the said recess L is formed and rigidly secured by its lower end in the socket, the dog extending upward terminating at its upper end with a thumb-piece M in the said recess L, and the dog provided with a nose K, adapted to normally stand in engagement with the teeth of the said rack on the spindle, but by its own elasticity adapted to yield to be withdrawn from such engagement by means of the thumb-piece M, all substantially as and for the purpose described.

478,798. CASH INDICATOR AND RECORDER. MATTHEW LEARY, New Haven, Conn., assignor to Edmund O'Connor and Charles Woodruff, Binghamton, N. Y. Filed Nov. 2, 1891. Serial No. 410,615. (No model.)

Claim.—1. A cash indicator and recorder having a case, a money-drawer located therein, a type-wheel, means for operating the same, locking mechanism for the money-drawer, a printing mechanism co-operating with the type on the wheel, and an operating-lever combined with the said locking and printing mechanisms for their actuation, in combination with a guard connected with and actuated by said operating-lever and located in line with the periphery of the said wheel, toward which it is moved by the same, substantially as described, and whereby the guard by striking the periphery of the wheel checks the depression of the operating-lever and prevents the unlocking of the money-drawer except when the wheel and the printing mechanism are in right relations for recording the opening of the drawer.

2. A cash indicator and recorder having a case, a money-drawer located therein, a wheel provided with type and constructed with guard-openings arranged so that one is located in line with each type member, means for operating the said wheel, printing mechanism co-operating with the type on the wheel, locking mechanism for the money-drawer, and an operating-lever combined with said printing and locking mechanisms for simultaneously operating them, in combination with a guard connected with and actuated by the said operating-lever and located in line with the guard-openings in the wheel toward which it is moved by the said lever, substantially as described.

478,798.



and whereby the guard by striking the periphery of the wheel checks the depression of the operating-lever and prevents the unlocking of the money-drawer except when the wheel and the printing mechanism are in right relation for recording the opening of the drawer.

3. A cash indicator and recorder having a case, a money-drawer located therein, a wheel provided with type and constructed with guard-openings arranged so that one is located in line with each type member, means for operating the wheel, printing mechanism co-operating with the type on the wheel and including a tape, a presser-block for lifting the same against the type, and means for feeding the tape, locking mechanism for the money-drawer, and an operating-lever combined with the said printing and drawer-locking mechanisms for simultaneously operating the same, in combination with a guard connected with and actuated by the operating-lever and located in line with the wheel toward which it is moved thereby, substantially as described, and whereby the guard by striking the periphery of the wheel checks the depression of the operating-lever and prevents the unlocking of the money-drawer except when the wheel and the printing mechanism are in right relations for recording the opening of the drawer.

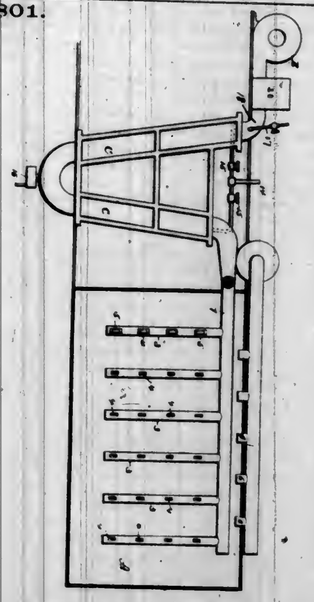
4. In a cash indicator and recorder having a case, a money-drawer located therein, a wheel provided with type and constructed with guard-openings arranged so that one is located in line with each type member, printing mechanism including a tape, a presser-block for lifting the same against the type, and means for feeding the tape, locking mechanism for the money-drawer, and an operating-lever having its inner end horizontally slotted and combined with the said locking and printing mechanism for simultaneously operating the same, in combination with a guard having its lower end connected with the operating-lever through the said slot in which it plays and located in line with the guard-openings in the periphery of the wheel, substantially as described, and whereby the guard by striking the periphery of the wheel checks the depression of the operating-lever and prevents the unlocking of the money-drawer except when the wheel and the printing mechanism are in right relations for recording the opening of the drawer.

5. In a cash indicator and recorder having a case comprising a horizontal body and an upright top, a money-drawer located in the said body, a wheel mounted on a horizontal axis in the said top and provided upon its periphery with type and upon one or both of its faces with numbers corresponding thereto and exposed through openings in the said top and constructed with a series of peripheral guard-openings arranged so that one is located in line with each type member, printing mechanism, including a tape, a presser-block for pressing the same against the type, and means for feeding the tape, a drawer-locking mechanism, and a pivotal operating-lever combined with the presser-block of the drawer-locking mechanism and the feeding device of the printing mechanism and operating the said block and mechanism simultaneously, in combination with a guard consisting of a pin connected at its lower end with the inner end of the said operating-lever and located in line with the guard-openings in the periphery of the wheel, substantially as described, and whereby the guard by striking the periphery of the wheel checks the depression of the operating-lever and prevents the unlocking of the money-drawer except when the wheel and printing mechanism are in right relations for recording the opening of the drawer.

478,799. PUZZLE. MARK W. MARSDEN, Philadelphia, Pa., assignor of one-half to Robert A. Rockhill, same place, and Elbert A. Corbin, Rosemont, Pa. Filed July 9, 1891. Serial No. 398,915. (No model.)

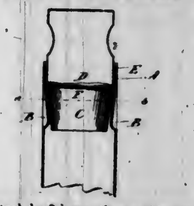
Claim.—A puzzle consisting of a series of angular box-compartments superimposed on each other, forming a tower, each of said compartments being provided with an opening in one of its sides of less width than the compartment, and an inclined plane or chute surrounding said tower and terminating in an inclosed lower field, said parts being combined substantially as described.

478,800. REIN-GUARD. ARTHUR C. MASSEY, Woodville, assignor of one-half to LUMAN N. SPENCER, Grand Rapids, Mich. Filed Feb. 6, 1892. Serial No. 420,521. (No model.)



Claim.—The combination, with singletrees spaced apart and arranged in longitudinal alignment, of an upwardly-curved or arched spring having its ends overlapping the inner ends of the singletrees and permanently pivoted beyond the inner ends and to the upper sides of the same, whereby the singletrees are connected, substantially as described.

478,801. APPARATUS FOR ORDERING TOBACCO. SAMUEL P. MAYO, Richmond, and GUSTAVUS A. PEPLE, Manchester, assignors to the Mayo Tobacco Drying and Ordering Company, Richmond, Va. Filed Aug. 28, 1890. Serial No. 363,317. (No model.)

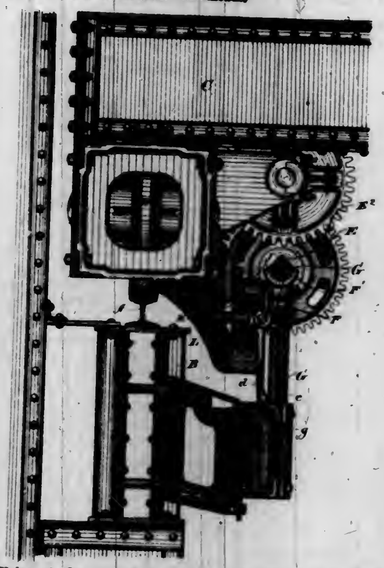


Claim.—1. The combination, with a fan and moistening-channels, of an ordering-room, an air-supply pipe leading from the moistening-channels, pipes leading from this air-supply pipe and located in the room, said pipes having discharge-openings therein, means for regulating the amount of discharge, and pipe or pipes for withdrawing the air from the ordering-room, substantially as set forth.

2. The combination, with a fan and ordering-room, of successive channels with endless cloths of any material in said channels, sprinkling-pipes leading inside of the cloths and having valves to regulate the discharge, and a heater for discharging heat into the channels, substantially as set forth.

478,801.

478,802. CENTRAL-DRAFT LAMP. JOHN C. MILLER, Waterbury, Conn., assignor to the Matthews & Willard Manufacturing Company, same place. Filed Jan. 6, 1892. Serial No. 417,136. (No model.)



Claim.—1. In a central-draft lamp, the combination, with a draft-tube provided at its upper end with longitudinal inwardly-inclined seats or ribs which gradually increase in their inward projection from their upper to their lower ends, of an air-distributer having its lower end tapered in accordance with the inclination of the said seats or ribs on which it is supported and its upper end closed and perforated, substantially as set forth, and whereby the said ribs form friction-seats for the distributer and divide the space between the distributer and tube into compartments or flues broadest at their lower ends, which lead into the draft-tube.

2. In a central-draft lamp, the combination, with a draft-tube provided at its upper end with longitudinal inwardly-projecting inclined seats or ribs which gradually increase in their inward projection from their upper to their lower ends, of an air distributer having its lower end tapered in accordance with the inclination of the said seats on which it is supported and its upper end closed and perforated and made smaller than the diameter of the tube above said tapered portion, substantially as described, whereby the said ribs form friction-seats for the distributer and the space between the distributer and tube is divided into an annular chamber, and a circular series of vertical flues located below the same and having their narrow upper ends opening into the said chamber, while their broader lower ends lead into the draft-tube.

3. In a central-draft lamp, the combination, with a draft-tube having its upper end struck inwardly to form longitudinal inwardly-projecting seats or ribs gradually increasing both in inward projection and in width from their upper to their lower ends, of an air-distributer having its lower end tapered in accordance with the inclination of the said ribs or seats on which it is supported, substantially as set forth, and whereby the said ribs form friction-seats for the distributer and divide the space between the same and the tube into a circular series of compartments or flues, which are broader at their lower than at their upper ends.

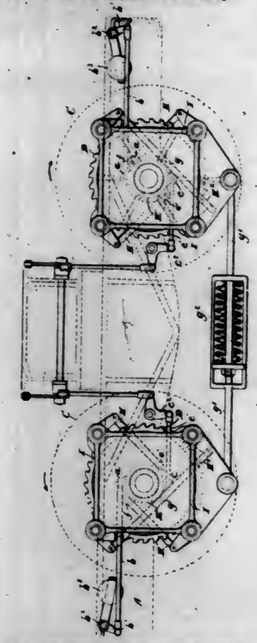
4. In a central-draft lamp, the combination, with a draft-tube having its upper end constructed with longitudinal inwardly-projecting inclined seats or ribs which gradually increase in their inward projection from their upper to their lower ends, of an air-distributer having its lower end tapered in accordance with the inclination of the said ribs and shouldered at the upper end of its said tapered portion, substantially as described, and whereby the said ribs form friction-seats for the distributer and divide the space between the same and the tube into a circular series of compartments or flues which are broader at their lower than at their upper ends.

478,803. OVERHEAD TRAVELING CRANE. JOHN R. MORGAN, Alliance, Ohio, assignor of three-fourths to Thomas R. Morgan, Sr., Thomas R. Morgan, Jr., and William H. Morgan, same place. Filed July 6, 1891. Serial No. 398,631. (No model.)

Claim.—1. In a traveling crane, the combination, with a bridge and a revolving shaft for imparting movement to parts on the bridge, of bearings arranged at intervals for supporting the shaft, a bearing-sustaining device for holding the bearing in an elevated position, a double-inclined guideway for lowering and elevating the bearing, and independent devices located near the ends of said guideway for positively releasing and locking said bearing-sustaining device.

2. In a traveling crane, the combination, with a revolving shaft for imparting movement to parts on the bridge, of a series of movable bearings supporting said shaft, means for elevating and lowering the bearings, a bell-crank lever for each bearing, each lever adapted to hold its bearing in an elevated position, and means for actuating said levers, the means for actuating the levers being independent of the means for lowering and elevating the bearings, substantially as set forth.

3. In a traveling crane, the combination, with a revolving shaft, a series of movable bearings supporting said shaft at intervals, and bell-crank levers for locking the bearings in their elevated positions, of a traveling bridge adapted to move in the direction of length of the shaft, a double-inclined guideway carried by the bridge and arranged to receive a projection on the bearing, whereby the bearing is moved first downwardly and then restored to its normal position, and the short guideways located near the ends of the double-inclined guideway for releasing and locking the bell-crank lever.



4. The combination, with a shaft and pillar or support loosely mounted in a bracket and carrying a bearing, of a weighted pivoted lever carried by the pillar and adapted to normally rest on the top of the bracket for holding the pillar and bearing thereon elevated, substantially as set forth.

5. The combination, with a shaft, vertically-movable pillars, half-bearings on the pillars, and brackets in which the pillars move, of a bell-crank lever for each movable pillar, each bell-crank lever adapted to rest with the free end of its vertical arm on a seat at the top of the bracket, the shorter arm acting as a weight to hold said long arm on its seat, substantially as set forth.

6. The combination, with a shaft, a pillar angular in cross-section,

a bearing on said pillar, a bracket adapted to receive the angular pillar and permit the latter to slide freely therein, and a bell-crank lever carried by said pillar, the longer arm of said lever adapted to rest on a seat at the top of the bracket and hold the bearing in an elevated position, of a movable bridge and devices carried thereby for moving the pillar and bearing vertically and for rocking the bell-crank lever, substantially as set forth.

478,804. OVERHEAD TRAVELING CRANE. JOHN R. MORGAN, Alliance, Ohio, assignor of three-fourths to Thomas R. Morgan, Sr., Thomas R. Morgan, Jr., and William H. Morgan, same place. Filed Aug. 10, 1891. Serial No. 402,302. (No model.)

Claim.—1. The combination, with a winding-drum and a ratchet-wheel connected with the drum so as to move therewith, of a pawl mounted on a yielding support for engaging said wheel, means connected with said pawl for yieldingly holding it in contact with the wheel, and means for moving said pawl out of contact with the wheel, substantially as set forth.

2. The combination, with a winding-drum and a ratchet-wheel connected with the drum so as to move therewith, of a bracket, a yielding device for preventing said bracket from rotating, a pawl carried by said bracket and adapted to engage the ratchet-wheel, means connected with said pawl for yieldingly holding it in contact with the wheel, and means for moving said pawl out of contact with the wheel, substantially as set forth.

3. The combination, with a drum and ratchet-wheel connected thereto, so as to move therewith, of a yielding bracket, a series of pawls carried by said bracket and normally engaging the teeth of the ratchet-wheel, and means for moving said pawls out of contact with the teeth.

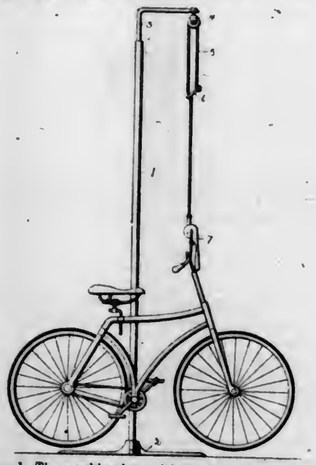
4. The combination, with a drum and a ratchet-wheel rigidly secured thereto, of a yielding bracket carrying a series of pawls, means for holding the pawls in engagement with the teeth of the ratchet-wheel, and means for simultaneously disengaging said pawls and teeth, substantially as set forth.

5. The combination, with a drum and a ratchet-wheel rigidly secured thereto, of a bracket carrying a series of pawls adapted to normally rest in contact with the teeth of the ratchet-wheel, a coupling-disk, rods connecting the coupling-disk with the several pawls, means for moving the coupling-disk in one direction, and a weight and connecting devices for moving said disk in the opposite direction, substantially as set forth.

6. The combination, with a drum and a ratchet-wheel, of a movable coupling-disk, a yielding bracket, pawls mounted on the bracket and engaging the ratchet-wheel, and rods connecting the pawls and coupling-disk, substantially as set forth.

7. The combination, with a drum and a ratchet-wheel rigidly secured thereto, of a movable coupling-disk, a yielding bracket, pawls mounted on the bracket and engaging the ratchet-wheel, rods connecting the coupling-disk and pawls, a weight, and devices connecting the weight and coupling-disk, substantially as set forth.

8. The combination, with a drum and a ratchet-wheel rigidly secured thereto, of a movable coupling-disk, a movable bracket, spring devices connected with the bracket for permitting the latter to yield or partly turn on its axis, pawls carried by the bracket, rods connecting the coupling-disk and pawls, and means for moving the disk, substantially as set forth.



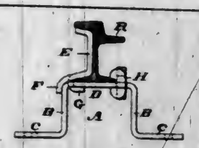
9. The combination, with a drum and a ratchet-wheel connected to the drum so as to turn therewith, of a coupling-disk and a bracket, both mounted on bearings concentric with the axis of the ratchet-wheel, a spring-coupling for limiting the movement of the bracket, pawls carried by the bracket, rods connecting the coupling-disk and pawls, a weight and devices connecting the same with the coupling-disk, and means for moving the coupling-disk against the action of the weight.

10. The combination, with two drums and a ratchet-wheel on each, of movable brackets, a spring-coupling connecting the brackets for limiting their movements, pawls carried by each bracket, means for yieldingly holding said pawls in contact with their respective ratchet-wheels, and means for disengaging the pawls from the ratchet-wheels, substantially as set forth.

11. The combination, with a drum and a ratchet-wheel, of a series of pawls for engaging the teeth of said wheel, a coupling-disk, rods connecting the disk and pawls, and a weight and devices connecting same with the coupling-disk for yieldingly holding the pawls in contact with the ratchet-wheel, substantially as set forth.

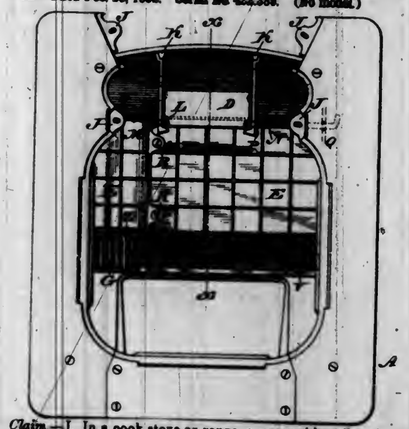
12. The combination, with a drum and a ratchet-wheel, of a yielding device carrying a series of pawls for engaging the ratchet-wheel, the coupling-disk, rods connecting the several pawls with the coupling-disk, a weight, a rod connecting the weight with the coupling-disk, and rods and levers connected to said coupling-disk for moving the same in opposition to the weight, substantially as set forth.

478,805. BICYCLE-EXHIBITING DEVICE. CORYDON W. MUMMON, Toledo, Ohio. Filed Sept. 15, 1890. Renewed Apr. 15, 1892. Serial No. 429,272. (No model.)



Claim.—1. The combination, with a suitable standard, of a rope, the lock-block carried thereby and adjustable thereon, the link attached to the lower end of the rope, a lever pivoted upon the link, and a bifurcated hook pivotally secured to one end of the said lever.

2. In an apparatus for exhibiting bicycles, the combination of a standard, an angle-arm swiveled in the upper end thereof, a lever carrying a hook and a link, a rope connecting the link and the said arm, and a locking-block carried by the rope.



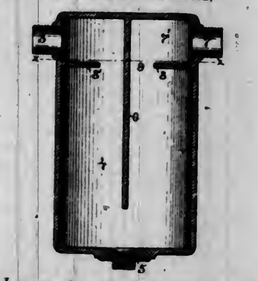
478,806. BRACE-CHAIR FOR RAILROAD-RAILS. GEORGE MURRAY, Johnstown, Pa., assignor to the Johnson Company, same place. Filed May 5, 1890. Serial No. 350,625. (No model.)

Claim.—A rail chair having a rail-brace on one side provided with a tongue passing through a slot in the rail-seat and with an exterior tongue for lapping over one side of the chair.

478,806.

478,807. COOK-STOVE. WILLIAM L. MCDOWELL, Lower Merion, Pa. Filed Feb. 23, 1892. Serial No. 422,389. (No model.)

Claim.—1. In a cook stove or range, a removable collar-plate, in combination with removable flue-strips and damper, a removable fire-plate, and removable top and front oven-plates, substantially as described.



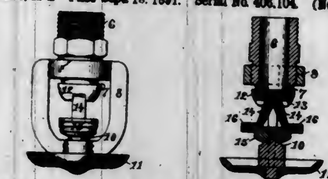
2. In a cook-stove, a stove body with legs on its inner side, a sectional top oven-plate resting on said legs and having grooves at its rear end receiving the top of the rear oven-plate, said parts being combined substantially as described.

3. In a cook-stove, an oven having a bottom plate with flanges, a sectional top plate with a groove on one end, a rear plate with top fitting in said groove, and a plate resting on the bottom wall of the stove and having a shoulder on its upper end supporting one end of the top plate, said parts being combined substantially as described.

4. In a stove, a fire-plate resting on a wall of an oven-plate and having a flange at its upper end embracing an end of the top wall of the oven, said fire-plate having its lower end on the bottom wall of the stove, said bottom wall having a flange bearing against the lower edge of said fire-plate, said parts being combined substantially as described

---

478,808. SEWER-TRAP. ROBERT NEWTON, Providence, R. I. Filed May 23, 1891. Serial No. 393,906. (No model.)



Claim.—1. In a trap, the combination, with a chamber divided by a vertical partition extending from the upper end of the chamber downward to near the bottom and having inlet and outlet openings near the upper end, of a horizontal partition extending from the side of the chamber below the outlet toward the central vertical partition, as described.

2. A sewer-trap having a chamber divided by a vertical partition into a downward and upward duct or chamber provided at their upper ends with lateral inlet and outlet openings, and a horizontal partition extending from the side of the chamber below the lateral outlet-opening toward the vertical partition, so as to form a long and narrow opening between the vertical and the horizontal partitions, as described.

3. In a sewer-trap, the combination, with the chamber 4, divided by the partition 6 into inlet and outlet chambers, the inlet 3, and outlet 7, of the partitions 8 and 8', dividing the inlet and outlet from the chamber 4, adapted to contract the inlet and outlet and permit the reversal of the trap, as described.

4. A trap consisting of a cylindrical chamber having inlet and outlet openings on opposite sides near one end, divided part of its length by a central partition extending from the top to near the bottom of the chamber, and at one end provided with a plug and having two partitions extending horizontally from the sides below the inlet and outlet chambers, and openings toward the central partition, so as to form on each side of the partition long narrow openings connecting the inlet and outlet with the body of the trap-chamber, as described.

478,809. AUTOMATIC SPRINKLER. ROBERT W. NEWTON, Providence, R. I. Filed Sept. 18, 1891. Serial No. 406,104. (No model.)

Claim.—1. In an automatic fire-extinguisher, the combination, with the outlet, a valve for closing the outlet, and a frame supporting a thrust-pin, of a device intermediate the thrust-pin and the valve consisting of two oppositely-inclined arms, a thrust-block, and plates secured by solder, adapted to hold the valve in place until one or both of the holding-plates are released by heat, as described.

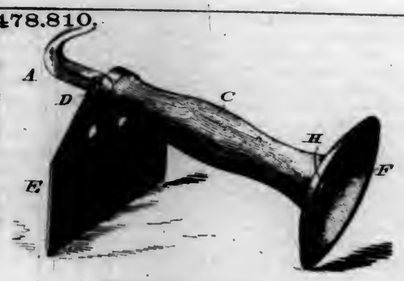
2. In an automatic fire-extinguisher, the combination, with the outlet and the valve for closing the outlet, of a yoke or frame having at its lower end a deflector and a thrust-pin adjustable toward and from the outlet, a thrust-block, two oppositely-inclined arms interposed between the thrust-block and the valve, and plates secured to the thrust-block by solder, as described.

3. A device for holding the valve of an automatic fire-extinguisher or sprinkler against the outlet-opening, consisting of a block, to one surface of which the ends of two oppositely-inclined arms and two thrust-plates are secured by solder fusible at a low temperature, as described.

4. The combination, with the nipple 6 and valve-seat 7, of the yoke 8, the thrust-pin 10, and deflector 11, of the thrust-block 15, the plates 16, secured by solder to the upper surface of the same, the oppositely-inclined arms 14, and the valve 12, adapted to hold the valve to its seat until released by heat, as described.

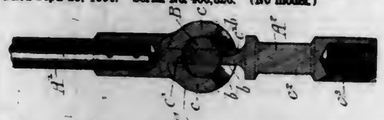
5. In an automatic fire-extinguisher or sprinkler, the combination, with the nipple 6 and the valve-seat 7, of the valve 12, provided with the slot 13, the arms 14, having their upper ends resting in the slot 13, the thrust-block 15, the plates 16, secured to the thrust-block by solder, the yoke 8, the deflector 11, and the thrust-pin 10, adapted to force the valve to its seat, as described.

6. In an automatic fire-extinguisher or sprinkler, the combination, with the nipple 6 and the outlet surrounded by the valve-seat 7, of the yoke 8, the deflector 11, and the thrust-pin 10, provided with the rounded end supported by the yoke, the thrust-block 15, having a cavity on its lower part adapted to receive the rounded end of the thrust-pin, the plates 16, secured to the thrust-block by solder, the oppositely-inclined arms 14, bearing on the thrust-block at the spread ends and in the groove 13 of the valve 12 at the ends placed close together, and the valve 12, the whole adapted to force the valve to its seat or release the same and to be released automatically by heat, as described.



478,810. HOG-SCRAPER AND CLAW-HOOK. AUGUST NITTINGER, Sr., Philadelphia, Pa. Filed Feb. 23, 1892. Serial No. 422,387. (No model.)

Claim.—1. A hog-scraper consisting of a claw with a tang having an ear thereon, a handle on said tang, and a blade secured to said ear, substantially as described.



2. A hog-scraper consisting of a claw with a tang having an inclined ear thereon, a handle on said tang, and a blade secured to said ear and having its inner end between said ear and the end of the handle, substantially as described.

3. A hog-scraper consisting of a claw with a tang having an ear thereon, a handle on said ear, a blade secured to said ear and a bell-scraper on a reduced threaded end of said tang, said parts being combined substantially as described.

478,810.

478,811. UNIVERSAL JOINT. AUGUST J. OEHRING, Chicago, Ill. Filed Sept. 25, 1891. Serial No. 406,326. (No model.)

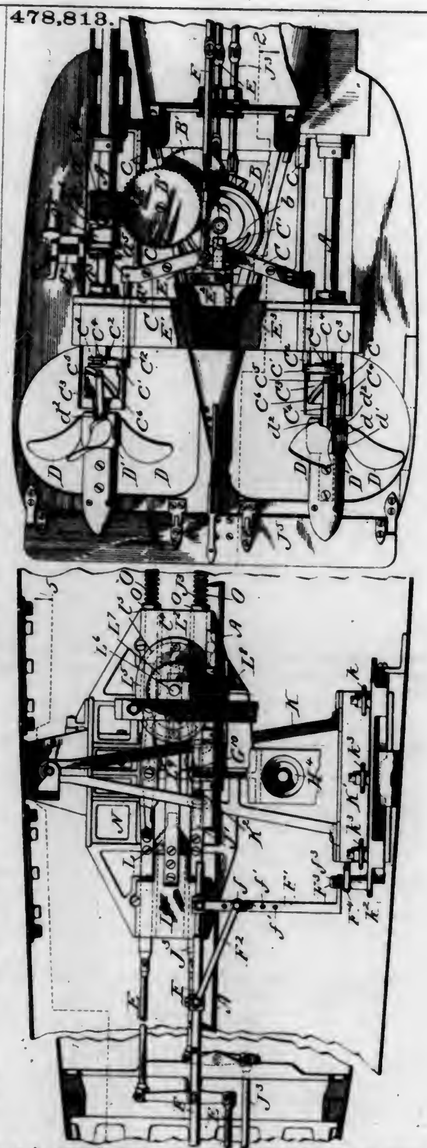
Claim.—1. A universal joint comprising an integral ball or sphere provided with two circumferential annular grooves of equal depth throughout their extent, concentric with the sphere and arranged at right angles to each other, and two forks arranged in planes at right angles to each other and constructed and arranged to fit said grooves and embrace and hold said ball, substantially as described.

2. A universal joint comprising an integral ball or sphere provided with two annular grooves rectangular in cross-section, of equal depth throughout their extent, concentric with the sphere, and arranged at right angles to each other, and two forks also rectangular in cross-section and arranged at right angles to each other, said forks being constructed and arranged to fit said grooves throughout their entire extent, so as to embrace and hold said ball, substantially as described.

478,812. POCKET-KNIFE. WILLIAM O'HARA, Middletown, Conn. Filed May 31, 1892. Serial No. 434,855. (No model.)

Claim.—The herein-described improvement in pocket-knives, consisting in the blade constructed with a bearing-point upon the spring below the pivot and a second bearing-point forward of the pivot and so as to leave a space between the blade and the spring forward of the pivot, the handle constructed with an opening through its side in line with said space, combined with a key adapted to be introduced through said opening, the bit of the key corresponding in thickness substantially to the depth of the said space between the blade and spring, but the bit of a greater width than the depth of such space, substantially as described, and whereby by the introduction and turning of the said key the bit will operate as a cam between the spring and the blade to start the blade in its opening movement.

478,813. DEPTH-REGULATING MECHANISM FOR MARINE TORPEDOES AND OTHER VESSELS. FREDERICK H. PAINE, Paris, France, assignor to the Hotchkiss Ordnance Company, Limited, London, England. Filed Mar. 26, 1892. Serial No. 426,594. (No model.)



Claim.—1. In a marine torpedo, the combination, with a rudder tiller-rod, of a pallet pivoted thereon, a stepped rack adapted to engage with the pallet to graduate the impulse given the tiller-rod according to the angle given the pallet, gear for reciprocating the rack, a hydrostatic piston, and suitable transmitting connections between the piston and the pallet, whereby the piston movement varies the angle of the pallet, substantially as described.

2. In a marine-torpedo-immersion-regulating device, the combination of a hydrostatic piston, a longitudinally-moving rod actuated by the piston, a cam-collar mounted on the rod and having a transverse cam-slot engaging with a pin on the rod, a pivoted angle-guide having yielding spring-guides, as described, and a suitable connection between the cam-collar and angle-guide, whereby the movement of the piston varies the throw of the angle-guide, substantially as described.

3. In a marine torpedo, the combination, with a rudder tiller-rod, of a hydrostatic piston, a longitudinally-moving rod actuated by the piston, a cam-collar mounted on the rod and having a transverse cam-slot engaging with a pin on the rod, a pivoted angle-guide having yielding spring-guides, as described, a suitable transmitting connection between the cam-collar and angle-guide, a pallet pivoted to the rudder tiller-rod and having a pin engaging between the yielding spring-guides of the angle-guides, a stepped rack adapted to engage with the pallet, and gearing for reciprocating the rack, substantially as described, for the purpose set forth.

4. The combination, with a rod having a longitudinal motion, of a device for communicating such motion to the rod, a cam-collar mounted on the rod and having a transverse cam-slot engaging with a pin on the rod, a pivoted guide-lever having guide-spring strips fastened opposite each other to one end of the lever and forming a yielding guide extending along the face of the same, a suitable connection between the cam-collar and the angle-guide, a pallet pivoted to a rudder tiller-rod and having a pin engaging between the yielding spring-guides and an impulse-rack to engage with the pallet, and gear for driving the rack, whereby when the rod is moved longitudinally the pallet is thrown into engagement with the impulse-rack and the impulse is communicated to the tiller-rod, substantially as described.

5. In a marine torpedo, the combination, with a rudder tiller-rod,

of a duplex pallet pivoted thereon, impulse mechanism consisting of two stepped reciprocating racks, the risers of which stand at relatively different levels facing each other, mechanism for alternately causing the racks to approach and recede from each other, a hydrostatic piston, and suitable transmitting connections between the piston and the duplex pallet, substantially as and for the purpose set forth.

6. In a marine torpedo, the combination, with a rudder tiller-rod, of a pallet pivoted thereon, a stepped rack adapted to engage with the pallet, as described, mechanism for reciprocating the rack, a pendulum, and suitable transmitting connections between the pendulum and the pallet, whereby the movement of the torpedo-body relatively to the pendulum varies the impulse imparted to the tiller-rod, substantially as described.

7. In a marine torpedo, the combination, with a rudder tiller-rod, of a duplex pallet pivoted thereon, impulse mechanism consisting of two stepped reciprocating racks, as described, mechanism for alternately causing the racks to approach and recede from each other, a pendulum, and suitable transmitting connections between the pendulum and the pallet, substantially as described.

8. In a marine torpedo, the combination, with a rudder tiller-rod, of a pallet pivoted thereon, a stepped rack adapted to engage with the pallet at different angles assumed by the latter, a pivoted angle-guide having yielding spring-guides engaging with a pin on the pallet, a longitudinally moving and rotating rod, a cam-collar mounted on the rod and having a transverse slot engaging with a pin on the rod, a suitable connection between the collar and the angle-guide, a hydrostatic piston, and transmitting connections between the piston and the rod to impart a longitudinal movement to the latter, a pendulum, and suitable transmitting connections between the pendulum and the longitudinally-moving rod, substantially as and for the purpose described.

9. In a marine torpedo, the combination, with a rudder tiller-rod, of a pallet pivoted thereon, a stepped rack adapted to engage with the pallet at the different angles assumed by the latter, and suitable gear driven by a worm on the propeller-shaft to reciprocate the rack, substantially as described.

10. The combination of the piston G, located in the side of the torpedo, the piston-rod G^2, secured by a ball-and-socket joint to the piston and having the pin g^2, the cam-collar I, mounted on the piston-rod and having the transverse cam-slot *i*, engaging with the piston-rod pin, the pivoted angle-guide I^2, having the guide-springs I^4 I^5, as described, a suitable connection between the cam-collar and the angle-guide, the pallet J', pivoted to the rudder tiller-rod J^3 and having the pin J, engaging with the guide-springs of the angle-guide, the stepped reciprocating racks L L', mounted as described, the oval cam-wheel L^3, keyed to the shaft L^4 and having the cam-groove l^3, engaging at opposite points with the racks, rollers l^2 l^2, the worm-gear L^7, mounted on the shaft L^4, and the worm L^6, meshing therewith and keyed to the propeller-shaft A, substantially as described.

11. The combination, with the impulse mechanism consisting of the stepped reciprocating rack L, its plate L^2, and longitudinal connecting-bar L^3, having the lug l^2, the stepped reciprocating rack L, having the longitudinal slot l^3 for the lug l^2 and its plate L^4, the rack-rollers l^2 l^2, the oval cam-wheel L^3, keyed to the shaft L^4 and having the cam-groove l^3, engaging at opposite points with the rack-rollers l^2 l^2, the worm-gear L^7, mounted on the shaft L^4, and worm L^6, meshing with and keyed to the propeller-shaft A, substantially as described.

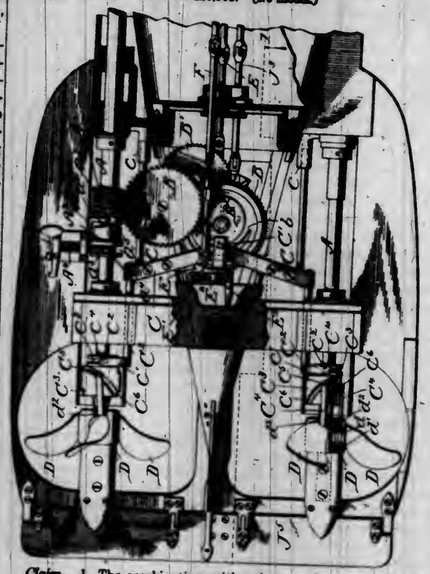
12. The combination, with a hydrostatic piston located in the side of a marine torpedo, of a spiral spring extending across the torpedo, a pivoted lever having one arm bearing on the piston and the other arm secured to one end of the spring, and a tension-adjusting device attached to the other end of the spring and extending into a chamber accessible from the torpedo side, substantially as described.

13. The combination of the piston G, the pivoted lever H', having a forked arm *h'* resting on the piston, the tension-spring H, having one end secured to the lever-arm *h* and the other end to the adjusting-nut H^3, the screw-threaded adjusting-rod H^4, passing through said nut and extending into the chamber H^5, the notch h^5 on the nut H^3, in engagement with the guide h^3, and cap H^6 over the rod-head, substantially as described.

14. The combination, with a hydrostatic piston tension-spring extending across the torpedo, its adjusting-nut H^3, and screw-threaded adjusting-rod H^4, extending into a chamber H^5, located in the torpedo side and having an aperture h^6 in its wall, of the tension-gage H^8, substantially as and for the purpose set forth.

15. In a marine torpedo, the combination, with a pendulum suspended therein, of a pendulum-immobilizing attachment consisting of a pivoted cam-buffer, a sliding frame, suitable transmitting connection between said cam-buffer and sliding frame, the propeller-shaft, and suitable connection between the shaft and the frame to move the latter, substantially as described.

16. The combination, with the pendulum K, of the pivoted cam-buffer F^4, its longitudinally-slotted lever-arm F^5, the pivoted throw-lever F', engaging therewith, the link F^6, pivoted to the pitch-frame rod F and adjustably connected with the throw-lever, the longitudinally sliding pitch-frame C, and gear, as described, for moving the pitch-frame, substantially as and for the purpose set forth.



17. The combination, with a rudder tiller-rod, of a cylinder-case having adjustable head-bearings and a central longitudinally-grooved body, the rod passing through said bearings and having feathers sliding in said grooves, and spiral tension-springs contained within said cylinder and located around said rod and between said head-bearings and the heads of the feathers on the rod, substantially as described.

18. In a marine torpedo, the combination, with an automatic speed-regulating device and an automatic immersion-determining device actuated by a pendulum, of a pendulum-immobilizing device, and transmitting connections between it and the speed-regulating device, substantially as described.

19. In a marine torpedo, the combination, with a propeller-shaft having blades pivotally mounted in the propeller-hub, of a pitch-regulating device for rotating the blades about a pitch-varying axis, a pendulum suspended in said torpedo, a pendulum-immobilizing device, a transmitting connection between said pitch-regulating and immobilizing devices, and mechanism driven by the propeller-shaft to control the pitch-regulating device, substantially as described.

20. In a marine torpedo, the combination, with a propeller-shaft having blades pivotally mounted in the propeller-hub, of a sliding frame, transmitting connections between said frame and the propeller-blades, a pendulum, a pendulum-immobilizing device, transmitting connections between said frame and immobilizer, a cam device engaging with the sliding frame, and mechanism driven by the propeller-shaft to actuate said cam device, substantially as described.

478,814. SPEED-REGULATING MECHANISM FOR TORPEDOES AND OTHER VESSELS. FREDERICK H. PAINE, Paris, France, assignor to the Hotchkiss Ordnance Company, Limited, London, England. Filed Mar. 26, 1892. Serial No. 426,595. (No model.)

Claim.—1. The combination, with twin propellers having blades pivotally mounted in the propeller-hub, of a pitch-regulating device for rotating the blades about a pitch-varying axis, suitable lever connections between it and the blades of each propeller, and driving mechanism between the pitch-regulating device and the shaft of one of the propellers, whereby the pitch of the blades of each propeller is automatically and simultaneously controlled, substantially as described.

2. The combination, with a propeller-shaft and a propeller having blades pivotally mounted in the propeller-hub, of a pitch-regulating device for rotating the blades about a pitch-varying axis and mechanism driven by the propeller-shaft automatically controlling the pitch-regulating device, substantially as described.

3. The combination, with a propeller-shaft and a propeller having blades pivotally mounted in the propeller-hub, of a pitch-regulating device for rotating the blades about a pitch-varying axis, mechanism driven by the propeller-shaft to control the pitch-regulating device, and a device for connecting and disconnecting the driving mechanism and the propeller-shaft, substantially as described.

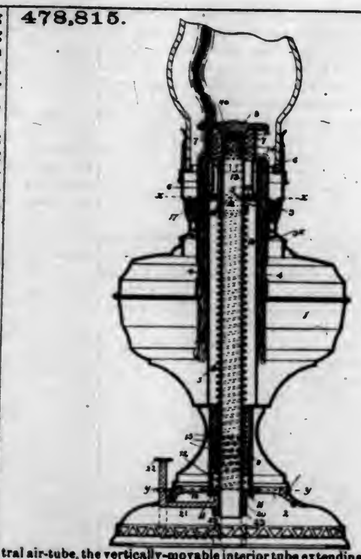
4. The combination, with a propeller-shaft and a propeller having blades pivotally mounted in the propeller hub, of a pitch-regulating device for rotating the blades about a pitch-varying axis, mechanism driven by the propeller-shaft to control the pitch-regulating device, and a device automatically operated by the impact of the water for throwing the driving mechanism into and out of gear with the shaft, substantially as described.

5. The combination, with a propeller-shaft and a propeller having blades pivotally mounted in the propeller hub, of a collar revolving with and sliding longitudinally on the propeller-shaft, lever connections between the collar and the blades, and automatic mechanism between the collar and the propeller-shaft to slide the collar along the shaft, whereby the blades are rotated about a pitch-varying axis, substantially as described.

6. The combination, with a propeller-shaft and a propeller having blades pivotally mounted in the propeller-hub, of a collar revolving with and sliding longitudinally on the propeller-shaft, lever connections between the collar and the blades, a sliding pitch-frame, transmitting connections between the pitch-frame and the collar, a cam device engaging with the sliding pitch-frame to govern its rate of motion, and driving mechanism between the propeller-shaft and cam device, whereby the pitch of the propeller-blades is automatically varied, substantially as described.

7. The combination, with a propeller-shaft and a propeller having blades pivotally mounted in the propeller-hub, of a sliding pitch-frame, suitable transmitting connections between the pitch-frame and the propeller-blades, a cam device engaging with the pitch-frame to govern its rate of motion, and driving mechanism between the propeller-shaft and the cam device, whereby the pitch of the blades is automatically varied, substantially as described.

8. The combination, with a propeller-shaft and a propeller having blades pivotally mounted in the propeller-hub, of a sliding pitch-frame, suitable transmitting connections between the pitch-frame and the propeller-blades, a cam device engaging with the pitch-frame to govern its rate of motion, driving mechanism between the propeller-shaft and the cam device, and an automatic device released by the pressure of the water to throw the shaft and driving mechanism into and out of gear, substantially as described.



9. The combination, with a propeller-shaft, of a sliding frame, a cam device engaging with the sliding frame, and driving mechanism between the propeller-shaft and the cam device, whereby the cam device automatically controls the rate of motion of the frame, substantially as set forth.

10. The combination of the propeller-hub D′, having the screw-threaded recesses d', the blades D, having the threaded bases d, the propeller shaft A, the cam-collar C^3, having flat sides opposite each blade and sliding longitudinally on the feather c^4 of the shaft A, and the lever-arms C^4, secured at one end to the base of the blades and having at the other end the posts c^5, engaging in grooves c^6 in the cam-collar sides, substantially as set forth.

11. The combination of the propeller-hub D′, having the screw-threaded recesses d', the blades D, having the threaded bases d, the propeller-shaft A, having the feather c^4, the cam-collar C^3, sliding longitudinally thereon and having flat sides grooved at c^6, the lever-arms C^4, secured to the blades and having the posts c^5 traveling in the cam-collar grooves, the longitudinally-sliding pitch-frame C, the arms C^5, connected to the pitch-frame and having the pitchforks c' seated in the groove c^3 of the cam-collars C^3, the cam-gear B, having the sinuous cam-groove b, engaging with the stud C′ on the pitch frame, the driving-gear B′ B′, meshing with the cam-gear, the worm A′, loosely mounted on the propeller-shaft and meshing with the driving-gear, the clutch-collar A^3, mounted on shaft A and sliding longitudinally on the feather a^2, and the trigger A^2, having an enlarged head and eccentric-shank a^3, engaging in the groove a^4 of the clutch-collar, and an arm a^6 with post a^7, engaging with the worm and spring A^4, substantially as described.

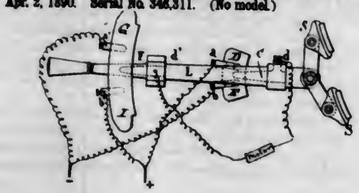
12. The combination, with the propeller-shaft A, of the worm A′, loosely mounted thereon, the clutch-collar A^3, sliding on the feather a^2 on the shaft A, the trigger a^2, having an enlarged head, an eccentric-shank a^3, engaging in the groove a^4 of the clutch-collar, an arm a^6 with a post a^7 engaging the worm and spring A^4, whereby the clutch-collar is thrown into and out of engagement with the worm by the impact of the water on the trigger-head, as described.

478,815. LAMP. JOHN M. PFAUDLER, Rochester, N. Y. Filed Feb. 18, 1892. Serial No. 422,083. (No model.)

Claim.—1. In a lamp of the kind described, the combination, with the central air-tube open at the bottom, of the interior tube extending from the bottom of the lamp, open at the lower end, and having the perforations at the top, and the plate arranged at the burner, having the depending foraminous ring, through which the air from the central tube and interior tube is discharged, substantially as described.

2. In a lamp of the kind described, the combination, with the central air-tube, the vertically-movable interior tube extending to the lower portion of the lamp, open at the bottom, and having the perforations at the upper end, the deflecting plate on said tube extending over the wick, and the depending foraminous ring, of the spring for supporting the interior tube and operating means for moving it downward, substantially as described.

3. In a lamp of the kind described, the combination, with the central air-tube and the interior air-tube movable therein, extending to the lower portion of the lamp, open at its lower end, and having the perforations near its upper end, of the deflecting-plate on said interior tube arranged over the wick and adapted to serve as an extinguisher when depressed, a spring for supporting said tube, and an operating device for depressing it, substantially as described.

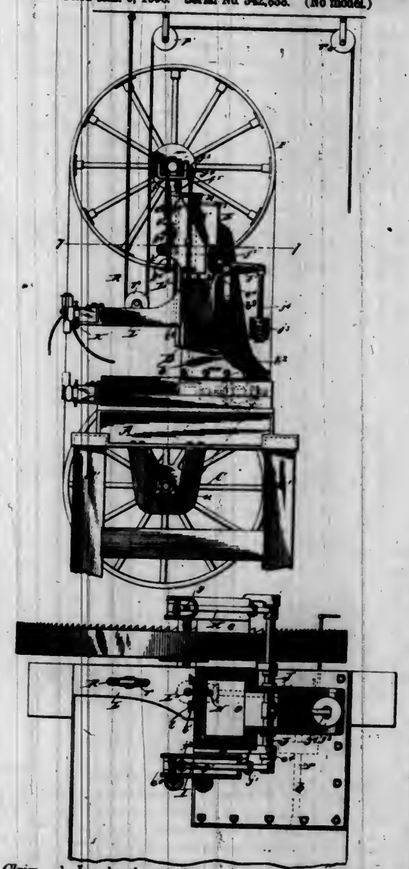


4. In a lamp of the kind described, the combination, with the central air-tube and the interior tube extending to the lower portion of the lamp, having the threaded upper end and the apertures therein, of the deflecting-plate screwing on said tube and extending over the wick, the foraminous ring secured thereto, and devices for operating the interior tube vertically to extinguish the lamp substantially as described.

5. In a lamp of the kind described, the combination, with the circular wick, of the deflecting-plate extending over the wick, having the foraminous ring secured thereto for securing an even supply of air, and a movable support for said plate, whereby it may be depressed to serve as an extinguisher when desired, substantially as described.

6. In a lamp of the kind described, the combination, with the central tube, the interior tube, and the deflecting-plate at its upper end and a projection below it, of the spring encircling said tube, the spider at the lower end of the lamp, and the removable thimble therein, between which and the projection on the tube the spring is confined, substantially as described.

7. In a lamp of the kind described, the combination, with the central tube, the interior tube, and the deflecting-plate at its upper end and a projection below it, of the spring encircling the tube, the spider at the lower end of the lamp, the removable thimble therein, between which and the projection on the tube the spring is confined, and the arm on the tube for actuating it against the spring and serving as a stop for limiting its upward movement, substantially as described.



478,816. ELECTRO-MECHANICAL APPARATUS FOR STARTING OR REVERSING MACHINERY. ALBERT PIAT, Paris, France. Filed Apr. 2, 1890. Serial No. 346,311. (No model.)

Claim.—1. In machines actuated by an electric motor, the combination, with the motor, of a lever for controlling the current to the motor, contacts C F on the lever, electrical connections between said contacts and the motor, fixed contacts D G, arranged at one side of the lever in the path of the movable contacts, fixed contacts arranged at the other side of the lever in the path of the movable contacts, electrical connections between the contacts D I and the positive pole of the generator and between the contacts E G and the negative pole of the generator, hinged levers H, and springs m, the combination being and operating substantially as and for the purpose set forth.

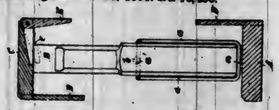
2. In machines actuated by an electric motor, the combination, with the lever L for controlling the current and the motor, contact F, arranged on the under side of said lever, fixed contacts G I, arranged on each side of the lever and in the path of the contact F, hinged levers H, and springs m, whereby a movement of the lever will cause the contact F to move under and raise one of said hinges until the same shall have been passed and a reverse movement of the lever will cause the same to travel above the contact, for the purpose set forth.

478,817. BAND-SAW MILL. DE WITT C. PRESCOTT, Marinette, Wis. Filed Mar. 6, 1890. Serial No. 342,838. (No model.)

Claim.—1. In a band-saw mill, an upright supporting-column B, in combination with a separate supporting-frame E, sleeved and adjustable vertically thereon and constructed with a portion of the frame-body itself overhanging or jutting beyond the said column, at one side thereof, and the upper-band wheel shaft mounted on the said overhanging portion of the supporting-frame, substantially as described.

2. In a band-saw mill, the upright column B, in combination with the separate supporting-frame E, sleeved and adjustable vertically thereon and provided with wings e, projecting from the frame at both front and rear of the column and in a plane therewith and then bent inward beyond the column and upward in a plane inside the latter, and the upper-band-wheel shaft mounted upon the said extensions of said wings, substantially as described.

3. In a band-saw mill, the upright column B, in combination with the independent supporting-frame E, sleeved and adjustable vertically thereon and provided with wings e, projecting at front and rear thereof and extending inward beyond the column, the levers H and I, arranged parallel to each other at front and rear of the column, pivoted to the inward extensions of said wings inside of the column, and extending outward therefrom, the horizontal rock-shaft J, mounted in the outer or back portion of the column and provided with arms linked to said levers, the standards G G′, supported, respectively, on said levers inside the plane of the column, the upper-band-wheel shaft F, mounted on said standards, and a counterpoise on the said rock-shaft, substantially as described.



4. In a band-saw mill, the upright column B, having an outside projecting web b^3, with slot b^3, in combination with the rock-shaft J, passing through said slot, the upper-band-wheel support E, sleeved on the column and adjustable vertically, the wings e at front and rear of said support, provided with slots e^4, and the supporting-levers H and I for the upper-band-wheel shaft, pivoted to said support and extending outward through the slots in the wings and linked to the rock-shaft, substantially as and for the purposes specified.

5. The upper guide-arm L, secured to and adjustable vertically on the support E, in combination with the screw-shaft L′, the stationary nut l^3, provided with a gear-pinion l^3, the shaft N, provided with pinion n, meshing with the pinion l^3, the shaft O, arranged to drive the shaft N, provided with sliding wheels o' o^3, and the driven shaft P, provided with a pinion p', adapted to engage with either of the wheels o' o^3, substantially as and for the purposes specified.

6. The adjustable band-wheel support E, in combination with the bracket M, provided with the two bearings m m', the screw-shaft L′, the nut l^3, mounted in a fixed position in said bracket, the shaft N, the gear-pinion n, provided with hub n', also mounted in a fixed position in said bracket and connected to the shaft N by spline and groove, and the gear-pinion l^3 on the nut, substantially as and for the purposes specified.

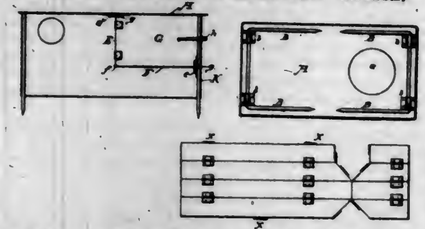
7. The guide-lubricator K′, consisting of an upper grated compartment k' and conduit k^4 in the base, having small passages k^5 passing through therefrom to the saw, in combination with the water-pipes Q, connected to said base-conduit, substantially as and for the purposes specified.

478,818. STAND FOR POISON-BOTTLES. GEORGE L. RANDS, London, England. Filed Mar. 2, 1892. Serial No. 423,553. (No model.) Patented in England Oct. 26, 1891. No. 18,406.

Claim.—1. A stand for bottles, consisting of a base A, having a recess therein, vertical side posts having elongated bearing-slots, a swinging frame having its journals in said slots and supporting the bottle, the fixed stops limiting movement of the frame in one direction, and a pivoted stop E, having movement in one direction only, substantially as described.

2. In combination with a swinging frame, a supporting structure having a base and side posts, and a top with a fixed stop on one of the open sides and a pivoted stop on the opposite side, substantially as described.

3. In a stand for bottles, the combination, with the base, of the vertical side posts having apertures therein, the cradle having trunnions engaging in the apertures, the top opened at the front and back, the hinged stop E, suspended from the top of the frame, and the fixed stops on top and base of stand, substantially as set forth.



478,819. EXPLOSIVE COMPOUND. ADDISON C. RAND, New York, N. Y. Filed Apr. 1, 1891. Serial No. 427,388. (No specimens.) Patented in Canada Apr. 21, 1892, No. 38,779.

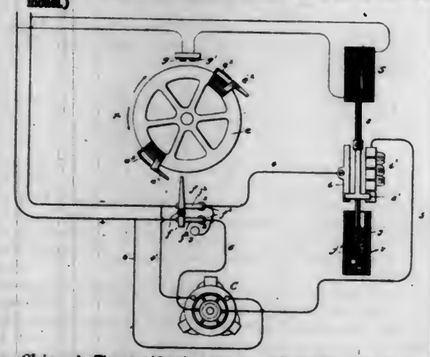
Claim.—1. An explosive compound composed of an oxidant, as chlorate of potash, in a powdered state, and a hard dense non-porous mineral substance in the form of coarse grains, said mineral grains being distributed in about the proportions named throughout the mass of the powdered oxidant, and a fluid hydrocarbon, as nitro-benzol, incorporated in about the proportions named in the mixture of said powdered oxidant and said mineral grains, substantially as and for the purpose specified.

2. An explosive compound composed of an oxidant, as chlorate of potash, in a powdered state, and manganese peroxide in the form of coarse grains in about the proportions named, said grains being distributed throughout the mass of the powdered oxidant, and a fluid

hydrocarbon, as nitro-benzol, in about the proportions named, incorporated in the mixture of said powdered oxidant and said grains, substantially as and for the purpose specified.

478,820. PORTABLE STOVE. FERDINAND T. SCHNEIDER, Washington, D. C. Filed Feb. 6, 1892. Serial No. 420,507. (No model.)

Claim.—1. A stove comprising a top, legs hinged thereto, and sides detachably secured to said legs, substantially as described.



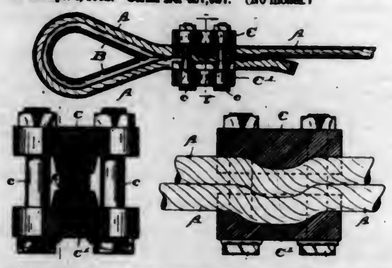
2. A stove comprising a top, legs hinged thereto, and sides provided with eye-brackets fitting upon the legs, substantially as described.

3. In a stove, and in combination, a top provided with eye-brackets arranged in sets and rods passing through the eye-brackets, said rods being bent to form legs for the stove, substantially as described.

4. In a stove, and in combination, a top provided upon its under side with eye-brackets arranged in sets, rods passing through said sets of eye-brackets and bent to form legs for the stove, and detachable sides, also provided with eye-brackets adapted to fit upon the legs, substantially as described.

5. In combination with a stove, a detachable stovepipe consisting of an upper and a lower part, each of which is formed of plates of varying lengths, the plates of each part being hinged together, the longest plate of each part being hinged together end to end, substantially as described.

478,821. ELECTRIC ELEVATOR. ALONZO B. SEE and WALTER L. TYLER, Brooklyn, N. Y. Filed Mar. 14, 1892. Serial No. 424,764. (No model.)

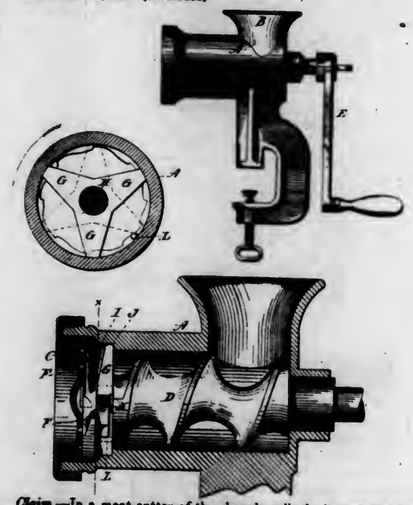


Claim.—1. The combination, with an elevator-car and electric motor therefor, of an electric-circuit-supplying current to the motor, an electro-responsive apparatus in a separate circuit and controlling the motor, a switch controlling the electro-responsive apparatus, a wheel carrying a device arranged to throw the switch, and connections from the car to the wheel, whereby the latter may be turned to move the switch, substantially as described.

2. The combination of an elevator-car, a motor therefor, a switch and rheostat in the motor-circuit, a solenoid in a separate circuit, said solenoid moving the switch and rheostat, a retarding device for the solenoid, a switch in the circuit with the solenoid, and mechanical connections from the car to the switch in the solenoid-circuit, whereby the solenoid may be controlled.

3. The combination, with an elevator-car and electric motor therefor, of a pole-changer in the motor-circuit, an electro-responsive apparatus in a separate circuit and controlling the motor-circuit, a switch controlling the electro-responsive apparatus, and a wheel carrying two pairs of devices, one device of each pair arranged to throw the pole-changer and the other device of each pair arranged to throw the switch, for the purpose set forth.

4. The combination of an elevator-car, a motor therefor, a rheostat in the motor-circuit, a solenoid in a separate circuit and operating said rheostat, a retarding device for the solenoid, a switch in the solenoid-circuit, a pole-changer in the motor-circuit, the wheel *e*, and rope *d'*, said wheel being provided with devices for operating said switch and pole-changer, substantially as described.

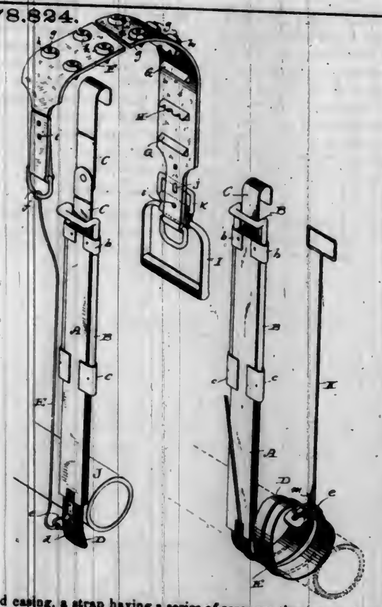


478,822. CLAMP. WILLIAMSON B. SEWARD, Bloomington, Ind. Filed Apr. 4, 1892. Serial No. 427,627. (No model.)

Claim.—1. A clamp for uniting wires, ropes, &c., consisting of two clamp parts adapted to fit on opposite sides of the two portions to be secured together, one of said clamp parts being concaved and the other correspondingly convexed, substantially as shown and described.

2. The combination, with two wires, ropes, or portions of the same, of a clamp consisting of two parts, one of which has a concave formation longitudinally and the other a correspondingly-convex formation, said clamp being thus adapted to form offsets or compound bends in the wire or rope to which it is applied.

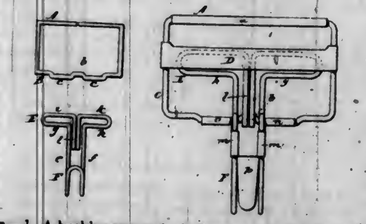
478,823. MEAT-CUTTER. JOHN H. SHAW, New Haven, Conn., assignor to the Sargent & Company, same place. Filed Oct. 19, 1891. Serial No. 409,168. (No model.)



Claim.—In a meat-cutter of the class described, the combination of the feed-screw and the normally stationary or preliminary cutters, the said normally stationary or preliminary cutters being arranged in the case so as to permit a limited rotation thereof, and a stop in the case, against which the said cutters are brought to arrest their rotation and hold them in their normal working condition or permit their partial rotation by a reverse action of the screw, substantially as described.

478,824. CLEANING BOILER-FLUES. JOSEPH SHOSTAK, Milwaukee, assignor of one-half to Jacob Rubin, Whitewater, Wis. Filed Feb. 9, 1892. Serial No. 420,846. (No model.)

Claim.—An apparatus for cleaning the outside of boiler-flues, that consists of a suitable casing provided with guides, a skeleton handpiece loose in the guides and having clips that loosely engage the casing, a jointed bar loose in said casing, a spirally-twisted strip of spring material connected to one end of the bar and retractible within the aforesaid casing, a strap having a series of scrapers thereon, and suitable means for detachably connecting the spring-strip and strap substantially as set forth.

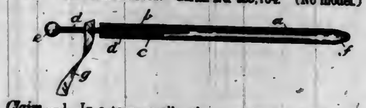


478,824.

478,825. ENVELOPE-CARD. REMY SIMS, Paris, France. Filed Mar. 26, 1891. Serial No. 386,542. (No model.) Patented in France Dec. 31, 1890, No. 210,547.

Claim.—A display card or tablet consisting of a main portion having an opening through it indicating the outline of a garment, and integral strips of the card or tablet material extending inward from edges of the opening, said strips serving to delineate portions of a garment and also serving to brace the card or tablet material, substantially as specified.

478,826. BUCKLE. DWIGHT L. SMITH, Waterbury, Conn., assignor of one-half to Earl A. Smith, same place. Filed Mar. 28, 1892. Serial No. 426,768. (No model.)

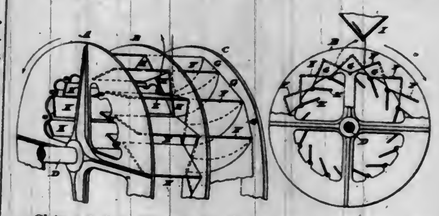


Claim.—1. A buckle composed of a frame having a longitudinal presser-bar, combined with a jaw hinged to a part of the frame parallel with the said presser-bar and so as to swing toward and from the presser-bar, the jaw constructed with a spring extending toward the hinging-point of the lever at substantially right angles to the line of the jaw, and a cam on the bar or side of the frame to which the jaw is hung, the cam being in substantially the plane of the frame, but out of line with the axis of the hinge on which the jaw swings, substantially as described.

2. A buckle composed of a frame having a longitudinal presser-bar, a side or bar of the frame parallel with the presser-bar, bent to form a cam in substantially the plane of the frame, but out of line with the bar of which it forms a part, a jaw made from wire bent to form the longitudinal jaw to bear upon the said presser-bar, with a central projection therefrom toward the said side or bar of the frame carrying the said cam, and the jaw hinged by the said projection to the said cam-bar of the buckle, the axis of the said hinge being out of line with said cam, and the jaw constructed with a spring adapted to bear upon said cam, substantially as and for the purpose described.

3. A buckle composed of a frame made of wire and consisting of two sides A B, ends C C, a presser-bar D, longitudinally across the frame and secured to the two ends thereof, combined with a jaw made from wire, the wire doubled and bent to form the depending hook F, the two branches of the wire extending upward and turned to the right and left and returned inward to form the jaw, the ends of the wire at the center turned downward to form a spring *l* between the two branches, the jaw hinged to the lower side of the frame, and the lower side of the frame constructed with a cam *b*, against which the said spring *l* is adapted to bear, substantially as and for the purpose described.

478,827. TAPE-NEEDLE. ELISABETH STOTT, Huddersfield, England. Filed Mar. 21, 1892. Serial No. 425,784. (No model.)



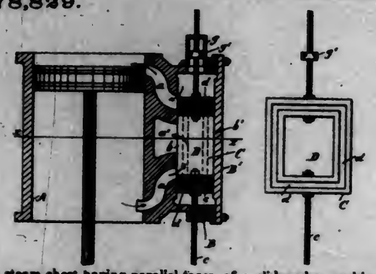
Claim.—1. In a tape-needle, the combination, with a tube, of a rounded head provided with a shank adapted to engage with the tape and with one end of the said tube and to secure the tape crosswise of the end of the tube at the entering end of the needle, substantially as set forth.

2. In a tape-needle, the combination, with a tube, of an inner tube secured in one end of the said tube and a head provided with a pointed shank adapted to be thrust within the said inner tube and to secure the tape crosswise of the said tube at the entering end of the needle.

3. In a tape-needle, the combination, with a tube, of an inner tube secured in one end of the said tube, a perforated plate *n* for spreading the tape, and a head provided with a pointed shank passing through the said plate and engaging with the said inner tube, substantially as and for the purpose set forth.

478,828. WINNOWING-WHEEL FOR SEPARATING GRANULAR SUBSTANCES. OLOF SUNDGREN, Östersund, Sweden. Filed Feb. 20, 1892. Serial No. 422,350. (No model.) Patented in Sweden May 28, 1891, No. 3,251.

Claim.—1. In a separator, the combination, with the rings A B C, of a series of buckets disposed between rings A B and B C, a series of shovels, and communicating means between the buckets and shovels, substantially as set forth.



2. In a separator, the combination, with shaft D, rings A B C, of a series of buckets disposed between said rings, the buckets G, having curved guide-walls, shovels disposed at an inclination to the radius and parallel with shaft D, and openings H in ring B, whereby the material may pass from said buckets to said shovels, substantially as set forth.

3. In a separator, the combination, with the shaft D, of rings A B C, buckets having curved guide-walls, shovels E, openings H between said buckets and shovels E, and pivoted lids K, adjacent to said shovels E, substantially as set forth.

478,829. SLIDE-VALVE. CARL G. WALLS, Brooklyn, N. Y. Filed Apr. 8, 1892. Serial No. 428,359. (No model.)

Claim.—1. The combination, with a cylinder provided with ports

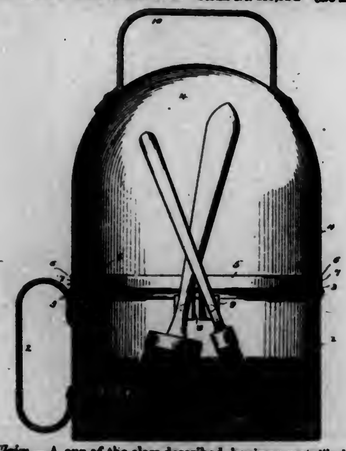
478,829.

and a steam-chest having parallel faces, of a slide-valve working between the said faces and having its opposite sides of equal area, and spring-pressed packing-frames let into the working faces of the said valve, substantially as set forth.

2. The combination, with a cylinder provided with ports and a steam-chest having parallel faces, of a slide-valve working between the said faces and having an exhaust-passage extending through it, and spring-pressed packing-frames let into grooves in the working faces of the valve around the said exhaust-passage, substantially as set forth.

3. The combination, with a cylinder provided with ports and a steam-chest having parallel faces, of a slide-valve working between the said faces and provided with a compensating device whereby the weight of the valve is balanced by the pressure of the steam in the steam-chest, and spring-pressed packing-frames let into the working faces of the said valve, substantially as set forth.

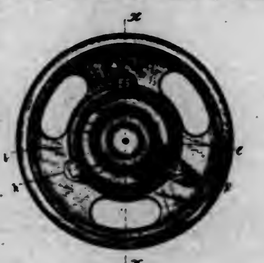
478,830. MEDICAL AND SURGICAL CABINET. JOSEPH R. WEBBAR, East Liverpool, Ohio. Filed Dec. 15, 1891. Serial No. 415,179. (No model.)



Claim.—1. The combination of a foundation, a casing supported above the same to form a hot-air chamber and having a niche in one side provided with sockets for the reception of atomizers, an air-pump connected to the hot air chamber, and a lamp upon the foundation projecting up into the hot-air chamber, substantially as set forth.

2. The combination of a foundation, a casing supported above the same to form a hot-air chamber and having a niche in one side provided with sockets, atomizers in said sockets, an air-pump connected to the hot-air chamber and having its discharge adapted to fit the atomizers, and a lamp upon the foundation projecting into the hot-air chamber and provided with a light-concentrating device, substantially as set forth.

3. The combination of a foundation, a casing supported above the same to form a hot-air chamber, a pocket or fountain upon the front of said chamber and provided with a faucet and a nozzled douche-tube, and means for heating the hot-air chamber, substantially as set forth.



4. The combination of a foundation-casing formed with a basin in its top, having a waste-pipe, and with a cupboard, a casing supported above said foundation-casing and formed with a hot-air chamber and with a niche in its side having sockets, a lamp upon the foundation and projecting into the hot-air chamber and provided with a light-concentrating device, a waste-receptacle in the cupboard and beneath the waste of the casing, a cold-water tank upon the back of the upper casing and having pipe connection and a faucet at the basin, a downwardly-contracted hot-water tank in the upper casing above the lamp and provided with a pipe and a faucet upon the front of the casing, an air-pump connected to the hot-air chamber, and a pocket or fountain upon the front of the upper casing and provided with a faucet and a nozzled douche-tube, substantially as set forth.

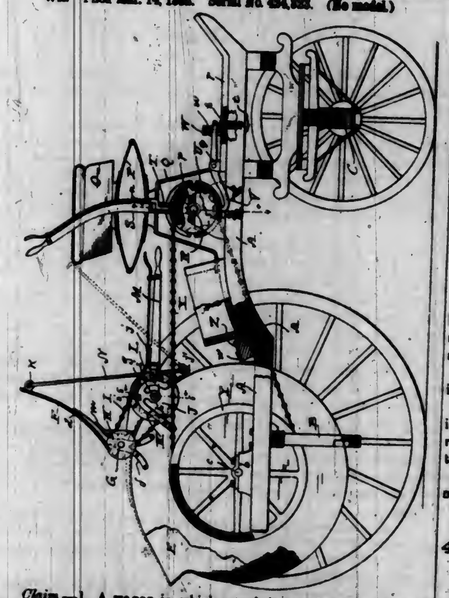
478,831. PAINT AND VARNISH CUP. SAMUEL R. WILMOT, Bridgeport, Conn., assignor to the Wilmot & Hobbs Manufacturing Company, same place. Filed Dec. 30, 1891. Serial No. 416,534. (No model.)

Claim.—A cup of the class described, having a metallic body provided at its upper edge with an outward and inward curve forming a shoulder and a groove, a hollow packing-ring 6, seated in said groove and having a wire or cord 7 within it, and a dome-shaped cover fitting over said ring, substantially as described.

478,832. AXLE-LUBRICATOR. JOHN W. WOODHOUSE, Rich Hill, Mo. Filed Sept. 29, 1891. Serial No. 407,184. (No model.)

Claim.—A car-wheel having an orifice, a pair of semi-spherical caps bolted on opposite sides of the wheel over the orifice in such a manner as to form an oil-chamber, an opening formed in one of the caps and extending entirely through the same, an axle fitting in the opening and projecting across the oil-chamber to the remaining cap, a recess formed in the inner side of the said cap, in which recess the free end of the axle is journaled, and means for holding the axle in place, substantially as described.

478,833. GYMNASTIC APPARATUS. ROBERT WRIGHT, Detroit, Mich. Filed Sept. 17, 1891. Serial No. 406,004. (No model.)

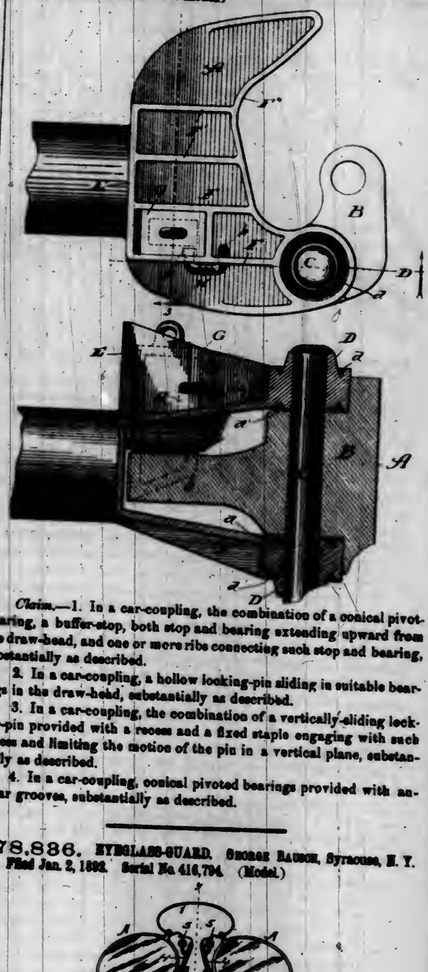


Claim.—In an apparatus of the character described, the combination, with the bracket comprising a base adapted to be attached to a wall or support, a forwardly-projecting arm, and a horizontal transverse arm, of two pulley-supports swiveled in the ends of said transverse arm, each carrying two pulleys, two independent weights and vertical guides therefor, two cords attached to each weight and passing over the pulleys and connected in front of the latter to cross-bars,

478,833.

and hand ropes or cords attached to said cross-bars, substantially as shown and described.

478,834. DUMPING-WAGON. CHARLES ARESEN, Milwaukee, Wis. Filed Mar. 14, 1892. Serial No. 424,923. (No model.)



Claim.—1. A wagon in which a tank is trunnioned to a pair of sills, a sprocket-wheel fast to one of the tank-trunnions and connected by a link belt with another sprocket-wheel loose on a lever-controlled shaft, a latch-rod on the shaft-lever arranged to engage a circular rack rigid with the latter sprocket-wheel, and a detent that is also arranged to engage the rack, substantially as set forth.

2. A wagon in which a tank is trunnioned to a pair of sills, a sprocket-wheel fast on one of the tank-trunnions and connected by a link belt with another sprocket-wheel loose on a lever-controlled shaft, a latch-rod on the shaft-lever arranged to engage a circular rack rigid with the latter sprocket-wheel, and a spring-and-lever controlled detent that is also arranged to engage the rack, substantially as set forth.

3. A wagon in which a dumping-tank is provided with bearings for a shaft, a closure for the tank made fast to the shaft, a sprocket-wheel fast on said shaft and connected by a link belt with a similar wheel loose on a stud that extends laterally from said tank, a lever rigid with the latter sprocket-wheel, a latch-rod on the lever, and a notched bracket arranged to engage the latch-rod, substantially as set forth.

4. A wagon in which a dumping-tank is provided with bearings for a shaft, a closure for the tank made fast to the shaft, a sprocket-wheel also fast on said shaft and connected by a link belt with a similar wheel loose on a stud laterally extended from said tank, a lever rigid with the latter sprocket-wheel, a latch-rod on the lever, a notched bracket for engagement with the latch-rod, and a stay-rod arranged to detachably connect the aforesaid tank and closure when the latter is in its raised position, substantially as set forth.

478,835. CAR-COUPLING. DAVID L. HARRIS, Chicago, Ill., assignor to the Congdon Brake Shoe Company, same place. Filed Feb. 1, 1892. Serial No. 419,869. (No model.)

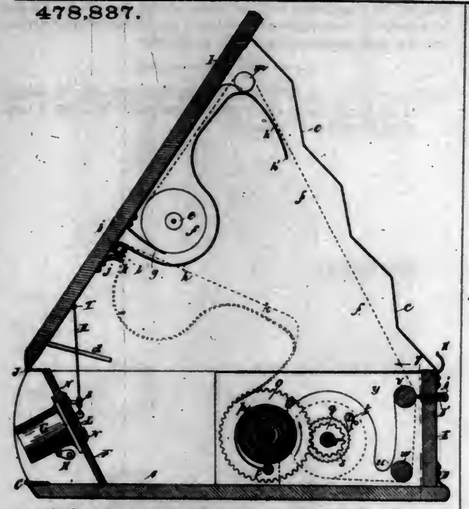
Claim.—1. In a car-coupling, the combination of a conical pivot-bearing, a buffer-stop, both stop and bearing extending upward from the draw-head, and one or more ribs connecting such stop and bearing, substantially as described.

2. In a car-coupling, a hollow locking-pin sliding in suitable bearings in the draw-head, substantially as described.

3. In a car-coupling, the combination of a vertically-sliding locking-pin provided with a recess and a fixed staple engaging with such recess and limiting the motion of the pin in a vertical plane, substantially as described.

4. In a car-coupling, conical pivoted bearings provided with annular grooves, substantially as described.

478,836. EYEGLASS-GUARD. GEORGE RAUSH, Syracuse, N. Y. Filed Jan. 2, 1892. Serial No. 416,794. (Model.)



Claim.—The combination, with the lens-holders and the nose-guards secured thereto, of auxiliary guards detachably connected thereto and consisting of arms provided with pads upon their free ends and adapted to grip the nose between the eyes.

478,837. PHOTOGRAPHIC CAMERA. HIRAM A. REMINGTON, New York, N. Y. Filed Dec. 1, 1891. Serial No. 413,656. (No model.)

Claim.—1. In a photographic camera, the combination of a case, one side whereof is adapted to be opened, means for excluding the light attached to the movable side and also to the body of the case, a roll of sensitized material supported upon said movable side, and take-up mechanism for the slack of the film operated when the movable side is closed, substantially as set forth.

2. In a photographic camera, the combination of a case, one side whereof is adapted to be opened, means for excluding the light attached to the movable side and also to the body of the case, a roll of

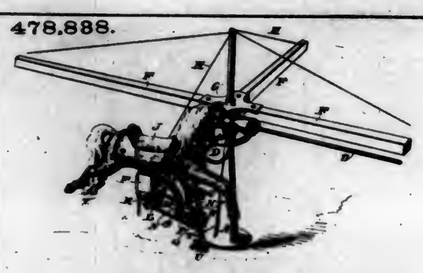
478,887.

sensitized material supported upon said movable side, and take-up mechanism for the slack of the film, operated when the movable side is closed, and shutter mechanism operated by the opening of the said movable side, substantially as set forth.

3. In a photographic camera, the combination of a case, one side whereof is adapted to be opened, means for excluding the light attached to the movable side and also to the body of the case, a roll of sensitized material supported upon said movable side, take-up mechanism for the slack of the film, operated when the movable side is closed, and shutter mechanism operated by the opening of the said movable side, and a shield to protect the roll of sensitized material fastened upon the movable side, substantially as set forth.

4. In a photographic camera, the combination of a case, one side whereof is adapted to be opened, means for excluding the light attached to the movable side and also to the body of the case, a roll of sensitized material supported upon said movable side, take-up mechanism for the slack of the film, operated when the movable side is closed, shutter mechanism operated by the opening of the said movable side, and a shield attached to the movable side, arranged to close down over the lens-opening when the said side is closed, substantially as set forth.

5. A camera comprising the combination of a case, one side whereof is hinged, means for excluding the light attached to the movable side and also to the body of the case, means attached to the hinged side and to the case for the support of a film across the larger end when the device is opened, a lens arranged focally at right angles to the film, and a shutter for the lens, substantially as set forth.



6. A camera comprising the combination of a case, one side whereof is hinged, means for excluding the light attached to the movable side and also to the body of the case, means attached to the hinged side and to the case for the support of a film across the larger end when the device is opened, a lens arranged focally at right angles to the film, a shutter for the lens, and means to take up the slack of the film upon the closing of the said hinged side, substantially as set forth.

7. The combination, in a camera, of a case, a hinged part, means for excluding the light, attached to the hinged part and also to the body of the case, a roll of sensitized material supported upon the hinged part, means to take up the slack of the sensitive material supported upon the case, a lens arranged at right angles to the film when distended, and a shutter connected with and operated by the hinged part, and means to reset the shutter upon closing the same, substantially as set forth.

478,888. MERRY-GO-ROUND. WILLIAM D. BRENAGE, Philadelphia, Pa. Filed July 30, 1891. Serial No. 401,152. (No model.)

Claim.—A merry-go-round consisting of a standard with a circular rack thereon, a beam rotatable on said standard and having a seat thereon, a shaft journaled in hangers on said beam and having a pinion thereon meshing with said rack, two parallel hangers rigidly secured to said beam and having segmental slots, arms having their ends adjustably secured in said slots, a sprocket-wheel journaled in the other end of said arms and having pedals thereon, and a sprocket-chain on said wheel and on a sprocket-wheel mounted on the said shaft, said parts being combined substantially as described.

478,888.

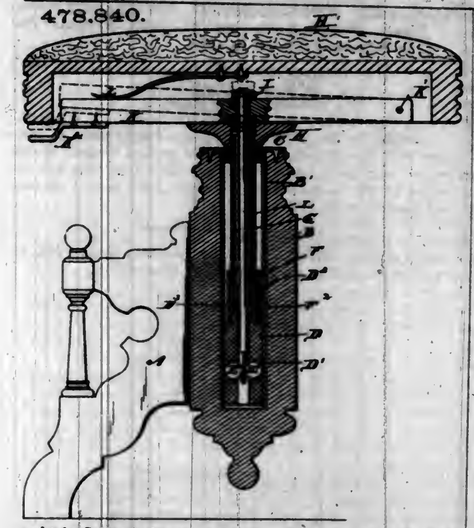
478,889. ROPE-CLUTCH. HARWELL L. BENNETT and RUSSELL R. ADAMS, Westerville, Ohio. Filed Apr. 2, 1892. Serial No. 427,454. (No model.)

Claim.—1. In a rope-clutch, the combination, with the arm *a*, fixed and pivoted jaws carried thereby, and hook-arm *d*, jointedly connected therewith, of connections between said pivoted jaw and arm *d*, substantially as and for the purpose specified.

2. In a rope-clutch, the combination, with the arm *a*, the fixed and pivoted jaws arranged as described thereon, said jaws having curved edges, as described, an arm *d*, jointedly connected with the arm *a*, and connections between the arm *d* and pivoted jaw, substantially as specified.

3. In a rope-clutch, the combination, with the arm *a*, fixed and pivoted jaws a' a^2, arranged thereon, as described, said jaws having grooved edges shaped to form conjointly a substantially compound curve, substantially as specified.

4. In a rope-clutch, the combination of the arm *a*, a pivoted and a fixed jaw thereon, as described, an arm *b*, carried by said pivoted jaw at an angle therefrom, an arm *d*, jointedly connected with said arm *a*, and a link d^3, fulcrumed to said arm *d* and adapted to engage with said arm *b*, substantially as specified.



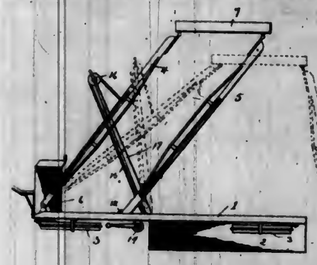
5. In a rope-clutch of the character described, a releasing device consisting of a lever-arm *g*, a notched end portion g^2, and jointed link and rod g^3 g^4, said link fulcrumed to said lever-arm, substantially as and for the purpose specified.

478,840. ADJUSTABLE SEAT. CHARLES H. BIGG and FRANK H. FAIRCHILD, Detroit, Mich. Filed Feb. 8, 1892. Serial No. 420,693. (No model.)

Claim.—1. In combination with the hollow standard and adjustable seat, the lever placed under the seat and extending to or nearly to its periphery, the pointed rod attached to the lever, and wheels carried in a vertically-adjustable cage placed within the standard to form a friction-clutch by the outward pressure of the inclined faces of the rod, forcing the wheels against the interior face of the hollow standard to support the seat at any point within the range of its adjustment, substantially as set forth.

2. In combination with the hollow standard and swiveling seat, the wheel-carrying cage D, means for locking the cage in the standard, and collar F, attached to but free to turn on the cage, the cap C,

478,840.

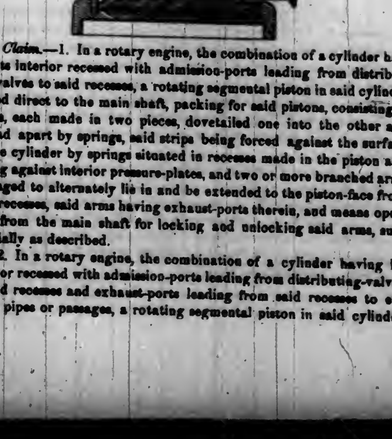


and tube G, attached at one end to the collar and at the other to the seat and intermediately supported by the cap, substantially as set forth.

3. In combination with the hollow standard and adjustable and swiveling seat, the vertically-adjustable cage D, the seat-carrying tube G, resting and free to turn thereon, the lever K, pivoted to the seat, and pointed rod L, attached thereto, and wheels E, placed within a chamber in the cage and capable of being forced outward against the interior wall of the standard by the inclined portion of the pointed rod, substantially as set forth.

4. In combination with the hollow standard and adjustable and swiveling seat, the cage D, constructed with an extension D' and groove D^2, the wheels E, chambered in the cage, collar F, set-screw F', which engages the groove D^2 and permits rotary motion only to the collar in its relation to the cage, tube G, to which the seat is attached and which rests on the collar, the pointed rod I I', the inclined faces of which force the wheels outwardly against the wall of the hollow standard, and spring pressed lever K, pivoted to the seat, substantially as set forth.

478,841. VERTICALLY-EXTENSIBLE PLATFORM FOR WAGONS. GEORGE H. BODWITH, Toledo, Ohio, assignor to Frederick H. Lincoln, same place. Filed Oct. 22, 1891. Serial No. 409,482. (No model.)

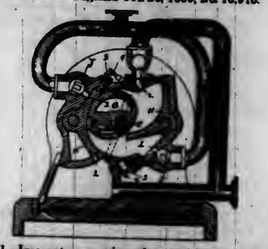


Claim.—1. A wagon-bed having front braces pivotally connected therewith, a platform pivotally connected with the upper end thereof, rear braces pivotally connected with the platform, the lower end of the same being adjustable with relation to the lower end of the front braces, and means for raising and lowering the platform.

2. A wagon-bed having front braces pivotally connected therewith, a platform pivotally connected with the upper end thereof, rear braces pivotally connected with the platform, and stops in different positions upon the wagon-bed, against which the lower ends of the rear braces are held to vary the height of the platform.

3. A wagon-bed having multiple braces sustained thereon at their lower ends, the upper ends being pivotally connected with a platform, a mast pivotally supported upon the bed, having a sheave, a windlass journaled upon the bed, and a rope connected with the windlass, passing over the sheave, and connected with the braces to raise the same.

4. A wagon-bed, front braces pivotally connected with the bed and with a platform, rear braces connected with a platform and adjustably supported upon the bed, a mast pivotally connected with the bed and passing between the front braces, which latter bear upon and are supported by the mast, a sheave journaled in the mast, a rope passing over the same and connected with the front braces at one end, and a windlass journaled on the bed, to which the opposite end of the rope is attached.



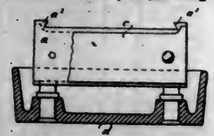
478,842. AWNING. BARTHOLOMEW BROOKS, Philadelphia, Pa., assignor of one-half to Joseph R. G. McAllister, same place. Filed Sept. 30, 1891. Serial No. 407,258. (No model.)

Claim.—1 In an awning, the combination of a pivoted awning-frame, a pivoted support therefor having an end thereof engaging a side of said frame, a weighted locking-dog carried by said support to engage said frame, and a retractile spring connected with the side bar of the frame, substantially as described.

2. In an awning, a pivoted awning-frame, a pivoted supporting-rod having a looped end adapted to embrace a side of the frame, a weighted dog pivoted to said rod and having a serrated upper end bearing against said side of the frame, and a cord for operating said dog, said parts being combined substantially as described.

478,843. ROTARY ENGINE. ALEXANDER F. G. BROWN, Swindridge Muir, Dairy, Scotland. Filed Apr. 15, 1891. Serial No. 389,056. (No model.) Patented in England Oct. 26, 1889, No. 16,913.

Claim.—1. In a rotary engine, the combination of a cylinder having its interior recessed with admission-ports leading from distributing-valves to said recesses, a rotating segmental piston in said cylinder keyed direct to the main shaft, packing for said pistons, consisting of strips, each made in two pieces, dovetailed one into the other and spread apart by springs, said strips being forced against the surface of the cylinder by springs situated in recesses made in the piston and acting against interior pressure-plates, and two or more branched arms arranged to alternately lie in and be extended to the piston-face from said recesses, said arms having exhaust-ports therein, and means operated from the main shaft for locking and unlocking said arms, substantially as described.

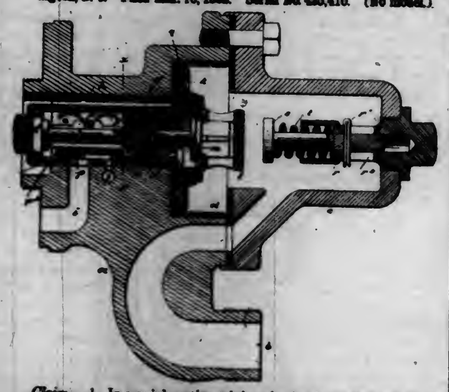


2. In a rotary engine, the combination of a cylinder having its interior recessed with admission-ports leading from distributing-valves to said recesses and exhaust-ports leading from said recesses to exhaust pipes or passages, a rotating segmental piston in said cylinder

keyed direct to the main shaft, and two arms arranged to alternately lie in and be extended to the piston-face from said recesses, each arm having two branches extending in opposite directions from its boss and one of which when the arm lies in the recess covers or closes the exhaust-passage, and means for locking and unlocking said arms, consisting of bolts, said bolts being connected to a rocking lever worked by a crank or eccentric from the main shaft, substantially as described.

478,844. NITRO-GLYCERINE BLASTING-POWDER. LEWIS BROWN, Landing, N. J., assignor to the American Forcite Powder Manufacturing Company, New York, N. Y. Filed Sept. 5, 1891. Serial No. 404,886. (No specimens.)

Claim.—The grading and coating mixture comprising nitrate of soda, wood pulp, sulphur, rosin, and paraffine, combined in the proportions substantially as set forth.



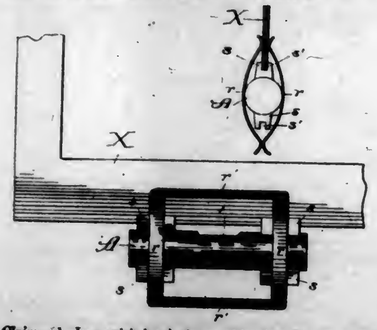
478,845. SCRAPER OR CLEANER FOR BOOTS OR SHOES. FRIEDRICH A. CARR, Hanover, Germany. Filed Dec. 26, 1891. Serial No. 416,179. (No model.) Patented in Belgium Aug. 27, 1891, No. 96,186.

Claim.—1. The herein-described boot-cleaner, consisting of a plurality of alternate plates of metal and rubber, the latter extending above the former and provided with undercut shoulders, and a trough-like base in which are fitted posts supporting the cleaning portion, substantially as set forth.

2. The herein-described boot-cleaner, consisting of a plurality of alternate plates of metal and rubber set edgewise and clamped together by suitable means, the edges of the rubber plates projecting above the metal plates and provided near their ends with undercut shoulders, and a central metallic plate provided with posts fitted in trough-like base *d*, as set forth.

478,846. VALVE FOR AIR-BRAKES. JESSE F. CARPENTER, Washington, D. C. Filed Mar. 18, 1892. Serial No. 425,410. (No model.)

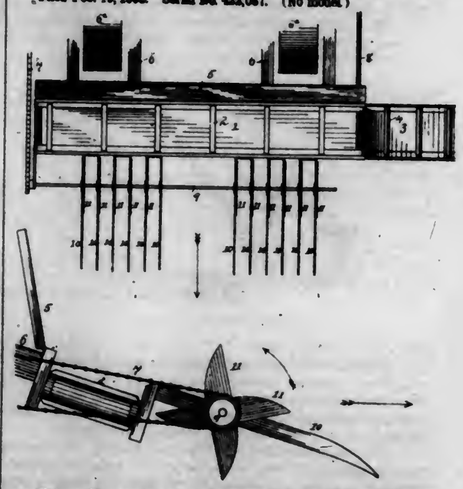
Claim.—1. In a quick-acting triple valve having a direct through-passage from the train-pipe to the brake-cylinder and a check-valve normally closing the same, the combination, with a contracted passage from the reservoir to the brake-cylinder and a large passage from the train-pipe to the brake-cylinder through the same chamber, of a strong spring and stop to mechanically effect the partial return of the slide-valve of the triple valve, thereby nearly closing the said large passage from the train-pipe to the brake-cylinder, substantially as described.



2. In a quick-acting triple valve for air-brakes, the combination, with its piston, its slide-valve, and a slide-valve chamber having a contracted passage from the reservoir to the brake-cylinder, of a check-valve controlling a port between the train-pipe and the slide-valve chamber and preferably located in the piston itself, a spring buffer or stop arranged in the line of movement of said piston, and the piston-trunk, substantially as described.

478,847. WOOD-BLOCK FLOORING. THOMAS CRAWFORD, London, England. Filed Nov. 11, 1891. Serial No. 411,641. (No model.) Patented in England Aug. 9, 1889, No. 12,630.

Claim.—The herein-described flooring-block, provided on both sides with dovetail rabbets *a*, continued to form tongues B, said tongues being made narrower than the width of the block and extending beyond the ends of same and provided with bevels *b* and fastened together, as set forth.



478,848. SPIRIT-LEVEL. JOHN DOEHLER, Chicago Lawn, Ill. Filed Mar. 12, 1892. Serial No. 424,618. (No model.)

Claim.—1. In a spirit-level, the combination of a casing A, provided with an inspection-opening, gages *s'* at opposite end portions and at diametrically-opposite sides of the casing, and clamps at diametrically-opposite sides of the casing, the gages and clamps extending in the plane of a line drawn from the longitudinal center of the casing through the inspection-opening, substantially as described.

2. In a spirit-level, the combination of a casing A, provided with an inspection-opening, gages *s'* at opposite end portions of the casing, and a clamp on the casing, comprising two spring-frames *r*, provided with straight edges *r'* parallel to the plane of the gages, the gages and clamp extending in the plane of a line drawn from the longitudinal center of the casing through the inspection-opening, substantially as described.

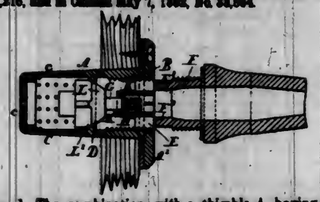
478,849. CORN-HARVESTER. RICHARD W. ERMELING, Bath, Ill. Filed Feb. 19, 1892. Serial No. 422,067. (No model.)

Claim.—The combination of a transverse conveyer and elevator, fingers projecting forwardly from the conveyer, a transverse shaft carried by the fingers, cutters fixed on the shaft adjacent to the fingers, and a lid for the conveyer adapted to act as a feeder for the corn when raised, as set forth.

478,850. PADLOCK. EDWARD T. FRAIM, Lancaster, Pa. Filed Feb. 20, 1892. Serial No. 422,194. (No model.)

Claim.—1. In a padlock, the combination, with a shackle having one limb pivoted in the case, of a flat spring extending across the case contiguous to the top plate thereof and constructed to engage the swinging limb of the shackle and secure it in the case, a rib to hold said spring up against the top plate, and a spring-actuated plunger adapted to force the swinging limb from the case and hold said flat spring in position to again engage the swinging limb, substantially as and for the purpose specified.

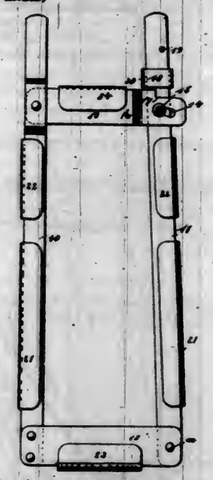
2. In a padlock, the combination, with a shackle, of one limb thereof pivoted in the case and having a rounded extension, a lug formed on the back plate beneath the pivoted limb, a V-shaped spring extending across the case contiguous to the top plate and having its leaves constructed to engage recesses in the swinging limb of the shackle, ribs on the back and closing plates, registering with each other to hold said spring up against the top plate and having winged recesses in their contacting edges, and a spring-actuated plunger adapted to force the swinging limb from the case and hold the leaves of the V-shaped spring open in position to again engage the recesses in the swinging limb, substantially as and for the purpose specified.



3. In a padlock, the combination, with a shackle and a case having a recess a^2 in the top plate thereof, of one limb of the shackle pivoted in the case and having a rounded extension, a V-shaped spring extending across the case contiguous to the top plate and having its leaves constructed to engage recesses in the swinging limb of the shackle, ribs on the back and closing plates, registering with each other to hold said spring up against the top plate and having winged recesses in their contacting edges, a plunger having a head adapted to engage the end of the swinging limb and a heel with a tenon formed thereon, a spring coiled about the tenon, a rib and post to support and guide the stem of the plunger, and a stud registering with the head of the plunger when in its retracted position, substantially as and for the purpose specified.

478,851. TOILET OR OTHER ARTICLE OF PLASTIC MATERIAL. JOSEPH R. FRANK, New York, N. Y. Filed Mar. 7, 1892. Serial No. 424,063. (No specimens.)

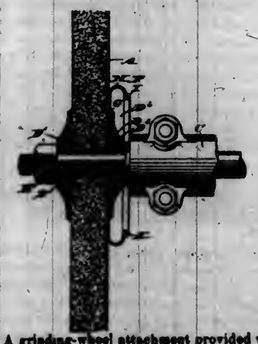
Claim.—As a new article of manufacture, an article of plastic material composed of a composition base having on one or more sides or parts a veneer sheet or coating of pyralin or the like and a strip of the same material round the edge of the composition base at or near the miter, substantially as described.



478,852. BROACHING DEVICE FOR CASKS. GEORGE GARR, London, England. Filed Feb. 1, 1892. Serial No. 419,955. (No model.) Patented in France Jan. 20, 1892, No. 212,007; in Belgium Feb. 4, 1892, No. 96,216, and in Canada May 7, 1892, No. 34,894.

Claim.—1. The combination, with a thimble A, having a valve-seat D, a perforated part in rear of the valve-seat and a screw-threaded part in front of the latter, of a valve I, having a stem G, a disk E, screwed into the thimble, having slots *f* and a sleeve K and loosely engaging the valve-stem, so that when the disk is screwed outward the valve-stem and valve are drawn forward to seat the valve, and a tap having a screw-threaded portion F and provided with projections F' to enter the slots in the disk for screwing the latter inward and outward, substantially as described.

2. The combination, with a thimble A, having a valve-seat D, a perforated part in rear of the valve-seat and a screw-thread in front of the latter, of a valve I, having a stem G, a disk E, screwed into the thimble and having a sleeve K, and a cap H, arranged in the sleeve, adapted to bear against a portion thereof and secured to the valve-stem, so that when the disk is screwed outward the valve-stem and valve are drawn forward to seat the valve, substantially as described.

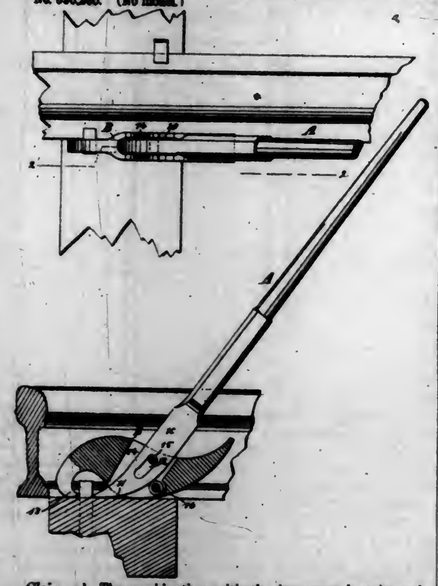


478,853. FABRIC-HOLDING FRAME FOR EMBROIDERING-MACHINES. HERMANN GRÖNEICH, New York, N. Y., assignor to Edmund T. Mason & Co., same place. Filed Feb. 20, 1892. Serial No. 422,907. (No model.)

Claim.—1. In a fabric-holding frame for embroidering-machines, the combination, with an upper and a lower cross-bar and a side bar rigidly secured to both the upper and lower cross-bars, of a second side bar having a pivotal connection with the lower cross-bar and a sliding connection with the upper cross-bar, a gravity locking device having movement upon the movable side bar and adapted for locking engagement with the upper cross-bar, and clamps carried by the side and by the cross bars, as and for the purpose specified.

2. In a fabric-holding frame for embroidering-machines, the combination, with a lower cross-bar, an upper cross-bar provided with a slot at one end and a recess in its slotted end forming a shoulder, and a side bar rigidly secured to both the upper and the lower cross-bar, of a second side bar pivotally attached to the lower cross-bar, a pin carried by the pivoted side bar and capable of movement in the slot of the upper cross-bar, and a gravity locking device having sliding movement upon the pivoted side bar above the upper cross-bar, the said gravity locking device being adapted for locking engagement with the shoulder of the upper cross-bar when the pivoted side bar is in its outermost position, substantially as described.

478,854. GRINDING-WHEEL ATTACHMENT. JOHN H. GÜNTHER, San Francisco, Cal. Filed Feb. 27, 1892. Serial No. 423,073. (No model.)



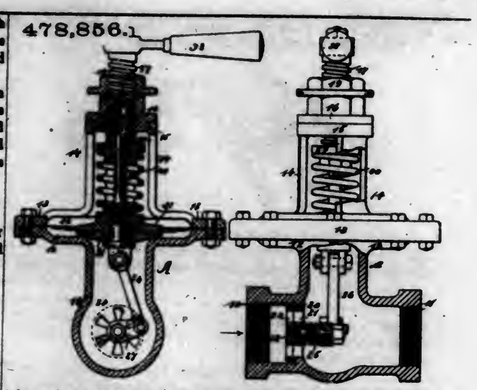
Claim.—1. A grinding-wheel attachment provided with a casing formed with an annular flange for retaining the oil, substantially as shown and described.

2. A grinding-wheel attachment comprising a casing formed with an inner wall and a semicircular annular flange extending from the outer edge of the said wall, and a washer engaging the said wall and extending in the casing, substantially as shown and described.

3. A grinding-wheel attachment comprising a casing formed with an inner wall and a semicircular annular flange extending from the outer edge of the said wall, and a washer engaging the said wall and extending in the casing, the said washer being formed with a curved face to lead the lubricant to the inside of the casing, substantially as shown and described.

478,855. CLAW-BAR. JAMES W. GRAY, Brooklyn, N. Y., assignor of one-half to John P. Heindell, same place. Filed Apr. 24, 1891. Serial No. 390,265. (No model.)

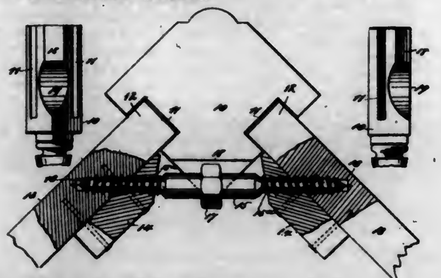
Claim.—1. The combination, with the jaw curved on its under side to rock and having its forward end curved downward and inward to form a beak and a vertical longitudinal slot extending through the jaw in rear of its beak, of the bar extending downward through the slot, having a sliding and pivotal movement therein and having its lower end curved forward toward the opposed beak 13, substantially as shown and described.



2. A claw-bar consisting of a body-bar having its lower end forwardly curved, a jaw loosely and adjustably pivoted upon the lower end of the bar and having its ends curved in opposite directions, the rear end upward and the forward end downward and rearward and forming a beak opposite the lower extremity of the body-bar, and a friction-roller journaled in the jaw and engaging the rear edge of the body-bar, as and for the purpose specified.

3. The combination, with a body-bar having its lower extremity forwardly curved, of a clamping-jaw curved at its extremities in opposite directions, the rear end upward and the forward end downward and inward, forming a beak, the said jaw being also provided with a central opening extending through from top to bottom, a pivot-pin passed through the jaw and an opening in the body-bar, and a friction-roller journaled in the clamping-jaw and engaging with the lower rear edge of the body-bar, as and for the purpose specified.

478,856. PRESSURE-REGULATING VALVE. WALFRID GUSTAFSON, Brooklyn, N. Y. Filed Dec. 16, 1891. Serial No. 415,483. (No model.)

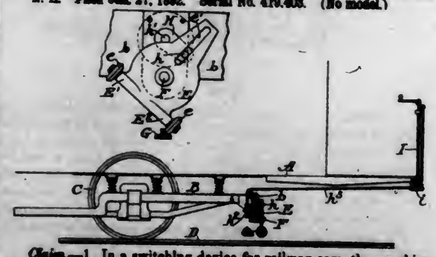


Claim.—A pressure-regulating valve comprising a body having a flaring top and provided with a perforated partition in its inlet, a ring secured to the flaring top and provided with standards projecting from it, a diaphragm secured between the ring and flaring top, disks between which the diaphragm is clamped, a rod secured to the disks, a screw mounted in the upper end of the standards and having its lower end chambered and into which the said rod projects, a collar on the rod and upon which the screw rests, a spring surrounding the rod between the collar and disk, a valve held against the partition of the

478,856.

inlet and provided with openings and with a crank on its stem, and a link pivoted to the lower end of the said rod and to the crank of the valve-stem, substantially as described.

478,857. CONSTRUCTION OF LEGGED ARTICLES. FRANK M. HARMAN and ANDREW L. EATON, Ottumwa, Iowa. Filed Sept. 16, 1891. Serial No. 405,884. (No model.)

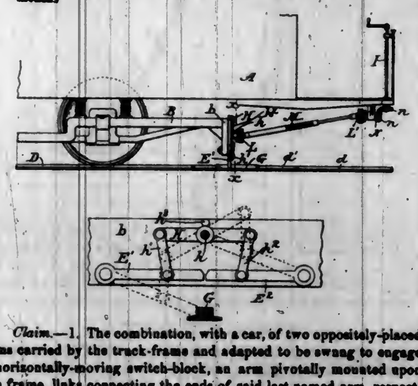


Claim.—1. In an article of furniture, the combination, with the rails spaced apart at their adjacent ends, of a diagonal bolt or screw connecting said ends, and a leg clamped between said rail ends beyond the bolt or screw by the action thereof, the bolt or screw serving to connect and brace the said ends of the rails when the leg is removed for shipment, substantially as described.

2. In an article of furniture, the combination, with rails spaced apart at their adjacent ends and the diagonal right-and-left screw connecting the rails in rear of their spaced ends, of the leg clamped between the rail ends beyond the screw, the said screw serving to connect and brace the rails when the leg is removed, substantially as described.

3. In an article of furniture, the combination, with rails spaced apart at their ends and provided on their inner faces with cleats 14 and diagonal apertures 16, of the diagonal right-and-left screw having a nut between its ends entering the diagonal rail and cleat apertures, and the leg held between the rail ends beyond the screw, substantially as described.

478,858. STREET-RAILWAY SWITCH. IRA F. HARRIS, Nashua, N. H. Filed Jan. 27, 1892. Serial No. 419,403. (No model.)

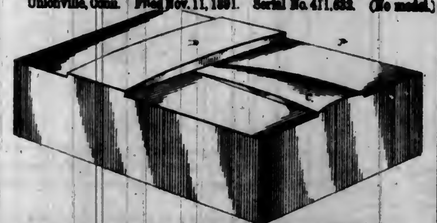


Claim.—1. In a switching device for railway-cars, the combination of two opposing arms pivotally supported upon a cross-bar of the truck-frame to swing in a plane transverse to the line of the track,

means to maintain said arms normally in an elevated position, a shaft supported by the truck-frame, an arm carried by said shaft and adapted to depress one or the other of said first-named arms to cause it to engage with a switch-rail, an operating device mounted on the platform of the car, and yielding transmitting means between said operating device and said shaft, substantially as shown and described.

2. In a switching device for railway-cars, the combination of two opposing arms supported upon the truck-frame to swing in a plane transverse to the line of the track, means to maintain said arms normally in elevated position, a shaft, an arm carried by said shaft and adapted to depress one or the other of said first-named arms to cause it to engage with a switch-rail or guide-rail, a drum on said shaft, a hand-shaft, and a flexible connection between said drum and hand-shaft, substantially as shown and described.

3. In a switching device for railway-cars, the combination of a plate pivoted upon the truck-frame, opposing arms carried by said plate, a shaft, an arm carried by said shaft and having a pin to engage a slot in said plate, and means to rotate said shaft, substantially as shown and described.



478,859. STREET-RAILWAY SWITCHING DEVICE. IRA F. HARRIS, Nashua, N. H. Filed Jan. 27, 1892. Serial No. 419,404. (No model.)

Claim.—1. The combination, with a car, of two oppositely-placed arms carried by the truck-frame and adapted to be swung to engage a horizontally-moving switch-block, an arm pivotally mounted upon the frame, links connecting the ends of said last-named arm, respectively, with the first-named arms, and means to swing said first-named arms, substantially as shown and described.

2. The combination, with a car, of two oppositely-placed arms carried by the truck-frame and adapted to be swung to engage a horizontally-moving switch-block, an arm pivotally mounted upon the frame and adapted to depress one or the other of said first-named arms, a hand-shaft supported upon the car-body, and connections between said shaft and said arms, comprising an extensible shaft and universal joint, substantially as shown and described.

478,860. DIE FOR SWAGING SPOON-BLANKS. HUBERT C. HART, Unionville, Conn. Filed Nov. 11, 1891. Serial No. 411,632. (No model.)

Claim.—1. A fork or spoon blank swaging and shaping die, comprising a male member having a longitudinal projection which tapers toward its inner end and a transverse projection at the tapered end of the said longitudinal projection and a female die having a longitudinal groove which tapers toward its inner end to receive the longitudinal projection of the male member and a transverse groove at and communicating with the tapered end of the longitudinal groove, whereby a blank is shaped and swaged at the same time, substantially as set forth.

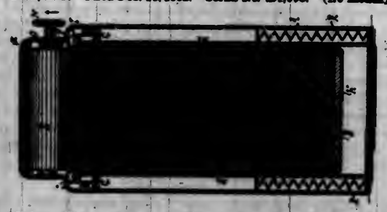
2. A die for shaping and swaging spoon and fork blanks, comprising a male member having a longitudinal projection and a transverse projection at the inner end of the longitudinal projection and a female die having a longitudinal groove and a transverse groove to receive the projections of the male member, the longitudinal groove and projection being reduced in depth at their inner ends to leave the blank thickest at that point, substantially as and for the purpose described.

3. A die for swaging and widening spoon and fork blanks, comprising a female member having a longitudinal and a transverse groove communicating with the inner end of the longitudinal groove and a male member having a longitudinal and a transverse projection at the inner end of the longitudinal groove, one of the members having the longitudinal groove or projection made rounding in cross-section and the transverse groove made rounding in longitudinal section, whereby the blank is correspondingly rounded, for the purpose specified.

4. A die for swaging blanks, comprising a male and a female member, each having, respectively, substantially a T-shaped groove and projection, the ends of the cross-grove and projection thereof extending to the edges of the said members and the outer and inner ends of the longitudinal groove and projection extending, respectively, into the cross-groove and to the edge of the said cross projection, substantially as shown.

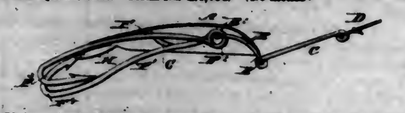
5. A fork or spoon blank swaging and shaping die, comprising a male member having a longitudinal projection which tapers at and toward its inner end and made rounding in cross-section and a transverse projection at the inner tapered end of the longitudinal projection, which transverse projection is rounding in longitudinal section, and a female member having a longitudinal and a transverse groove to receive the projections of the male member, substantially as specified.

478,861. DRINKING ATTACHMENT FOR CUPS, MUGS, &c. JAMES S. HOWARD, New Bedford, Mass. Filed Apr. 13, 1891. Serial No. 388,746. (No model.)



Claim.—As an article of manufacture, a drinking attachment for use with drinking-vessels, consisting of a curved tube to project down into the vessel and engage its inner face, and a spring-clip attached to the tube, extending outward and then downward therefrom and having on opposite sides of its lower outward portion the two inwardly-turned lips projecting in beyond the body of the clip so as to engage the exterior of the drinking-vessel at two points on opposite sides of a longitudinal plane through the tube and below the edge of the vessel, substantially as described.

478,862. GRAVEL ROAD. FRED J. HOYT, Chicago, Ill., assignor to The Hoyt Macadam Gravel Road Company, of Illinois. Filed Sept. 9, 1891. Serial No. 405,205. (No specimens.)

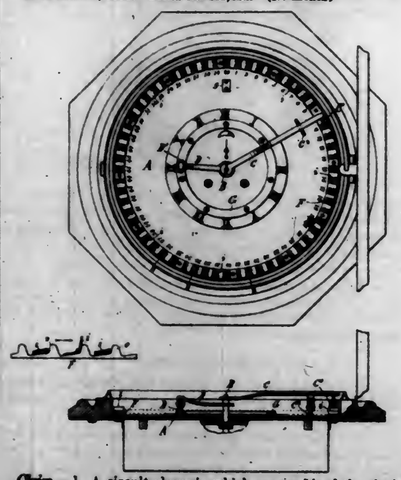


Claim.—A gravel road or pavement consisting of a first or bottom layer of hard-rolled clean coarse gravel covered with a slight dressing of washed sand, a second layer of hard-rolled clean gravel of a finer grade, and a top layer of still finer grade of hard-rolled clean gravel, said top layer mixed with cement, substantially as described.

478,863. CABINET FOR TOILET-PAPER. JAMES T. HOYT, New York, N. Y. Filed Feb. 18, 1892. Serial No. 421,963. (No model.)

Claim.—The combination, with a cabinet or case having a discharge-opening, of a discharge-roller located near the opening, an ascending feeder or supporting board, descending actuating-weights C for the feeder, a cord or chain connected to the actuating-weights and supporting the feeder, and relieving-springs R, located at the lower part of the travel of the actuating-weights C and against which the latter bear as they descend, substantially as described.

478,864. FISH-HOOK. WILLIAM H. HUNTER, Farnhamville, Iowa. Filed Apr. 12, 1892. Serial No. 428,791. (No model.)



Claim.—1. A fish-hook comprising a bowl and two hooks, of which the shank of one hook is fixed in the said bowl and the shank of the other hook is adapted to engage a pin or lug on the said bowl to hold the two hooks in a closed position, substantially as shown and described.

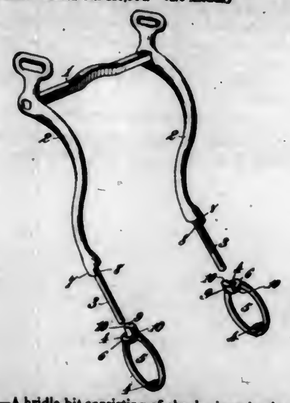
2. A fish-hook comprising a bowl formed at its outer end with a lug or projection, two hooks, of which one has its shank fixed in the said bowl and the other hook has its inner end supported in the bowl, and a pin projecting from the said bowl and adapted to be engaged by the shank of the free hook, substantially as shown and described.

3. In a fish-hook, the combination, with a bowl provided with a fastening having two eyes, of which the outer is connected with the fish-line, of two hooks, of which the shank of one is held rigidly in the said bowl and the end of the shank of the other engages the inner eye of the said fastening, and a pin projecting from the said bowl and adapted to be engaged by the shank of the free hook, substantially as shown and described.

478,865. ELECTRIC TIME-ALARM. JOHN JACOBS, Brooklyn, N. Y. Filed Nov. 17, 1891. Serial No. 412,122. (No model.)

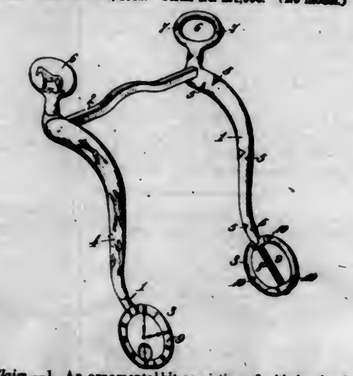
Claim.—1. A circuit-closer in which are combined the clock, radially-hinged metallic flaps at fixed intervals around the center staff of the clock, a stop to each of said flaps for retaining it in raised or operative position, a clock-hand having the spring contact to engage those of the series of flaps which are in operative position, and a means for connecting the flaps and clock-hand, respectively, with either pole of a battery, substantially as and for the purpose herein described.

2. A circuit-closer in which are combined a clock, radially-hinged metallic flaps at fixed intervals around the center staff of the clock, a metallic rail on the clock-face supporting said flaps to connect the series thereof with one pole of a battery, a stop to each of the flaps for retaining it in raised or operative position, a clock-hand having the spring-contact to engage those of the flaps which are in operative position, and a means for connecting said clock-hand with the other pole of the battery, substantially as and for the purpose herein described.



478,866. BRIDLE-BIT. JACK W. JAMES, Memphis, Tenn. Filed Sept. 29, 1891. Serial No. 407,160. (No model.)

Claim.—1. A bridle-bit consisting of cheek-pieces connected by a bit-bar and having their lower extremities formed into pendent cylindrical journals and rein-rings formed with vertical sockets loosely mounted on the cylindrical journals at the lower ends of the cheek-pieces to swing in a horizontal plane, for the purposes specified.

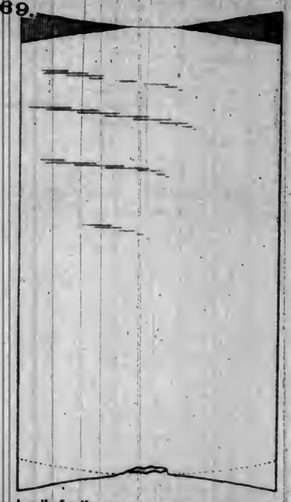


2. A bridle-bit consisting of rein-rings each provided with two sockets or orifices arranged diametrically opposite each other and cheek-pieces having shank extensions at their lower end portions which extend through the sockets or orifices in the rings, substantially as described.

478,867. BRIDLE-BIT. JACK W. JAMES, Memphis, Tenn. Filed Jan. 26, 1892. Serial No. 419,364. (No model.)

Claim.—A bridle-bit consisting of cheek-pieces having their lower ends terminating in cylindrical journals provided with lateral stop-lugs and rein-rings loosely mounted on the cylindrical journals to rotate in an approximately-horizontal plane and provided with offsets to abut the stop-lugs, substantially as and for the purposes described.

478,868. ORNAMENTAL CURB-BIT. JACK W. JAMES, Memphis, Tenn. Filed Feb 18, 1892. Serial No. 421,996. (No model.)



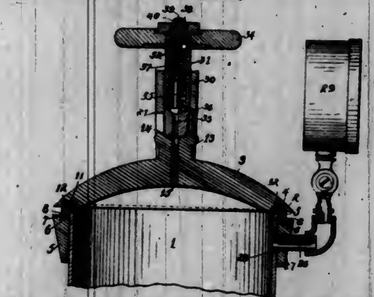
Claim.—1. An ornamental bit consisting of a bit-bar having rein-rings covered at their outer sides by ornamental disks, the edge portions of which extend round and are secured to the rings, substantially as described.

2. An ornamental curb bit consisting of a bit-bar having tapering cheek-pieces covered at their outer sides by tapering ornamented plates extending along the length of the tapering cheek-pieces and formed at the edges with tongue-pieces, which are clasped round the inner sides of the cheek-pieces, substantially as described.

3. An ornamental curb-bit consisting of a bit-bar and tapering cheek-pieces having rein-rings, said tapering cheek-pieces and rein-rings being covered at their outer sides by ornamented plates formed at the edges with tongue-pieces, which are clasped round the cheek-pieces and the rein-rings, substantially as described.

478,869. TOILET-PAPER. EDGAR JEROME, Norwalk, Conn. Filed Mar. 3, 1892. Serial No. 423,562. (No model.)

Claim.—1. A roll of toilet-paper consisting of a web having transverse cuts from the margins inward, determining the units for use and leaving bonds whose margins substantially coincide with the lines of strain between the bonds under stress and the point of application of the thumb and finger.



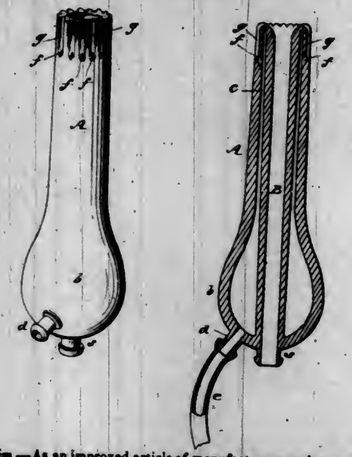
2. A web of toilet-paper having a narrow bond between the sheets and cuts from the margins toward the center at an inclination to the margins, said cuts leaving a re-entrant angle on one sheet and a salient angle on the other, all substantially as described.

3. A roll of toilet-paper formed of sheets connected by bonds and having the contiguous ends of the sheets formed of reversed contour, substantially as and for the purpose set forth.

478,870. DETERGENT PASTE. JOSEPH JUDGE, Pittston, Pa. Filed Mar. 30, 1892. Serial No. 427,015. (No specimens.)

Claim.—The herein-described detergent paste to be used for scouring and polishing purposes, consisting of linseed-oil, coal-oil, mir-bane-oil, adamantine, ammonia, and tripoli, all combined in about the proportions specified.

478,871. DENTAL VULCANIZER. JOHN JOHNSON, St. Louis, Mo., assignor, by direct and mesne assignments, of five-sixths to Albert Barois, Alphinie Martini, and Anna Martini, same place. Filed Apr. 27, 1892. Serial No. 430,856. (No model.)



Claim.—1. A vulcanizer comprising a retort, a rim 2, formed integrally with the same, a flange 3, depending therefrom, a recess 4, formed between said retort and depending flange, a collar 5, approximately V-shaped in cross-section and provided with a flange 7, adapted to fit in recess 4, and with an annular depression 6, in which the depending flange 3 is adapted to fit, internally-screw-threaded projections 16, formed on said collar, screw-threaded bolts mounted in said projections, a yoke mounted on said screw threaded bolts, an adjustable internally-bored and screw-threaded pin 31, mounted in said yoke, a safety-valve located in said pin, coinciding passages formed in said pin and the lid, a spring mounted on said valve, and means for adjusting the tension of said spring, substantially as set forth.

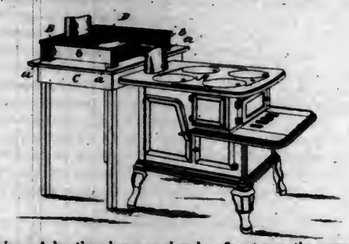
2. A vulcanizer having a retort, a recess and flange formed on the top of the same, a collar provided with a flange and recess, interlocked in said flange and recess of the retort, a detachable lid provided with a hollowed-out projection on its top face and having a passage formed therein, an annular recess formed in said lid lined throughout with rubber, a yoke mounted on said collar, adjustable clamping mechanism carried by said yoke for securing and releasing said lid, a safety-valve mounted in said mechanism, a passage formed in said mechanism coinciding with the passage formed in said lid, and means for holding said valve over said passage, substantially as set forth.

3. A vulcanizer comprising a retort, a steam-gage in communication with the same, a collar secured to said retort, a yoke secured to said collar, a detachable lid, a projection formed on the same, a passage formed in said lid, an adjustable externally-screw-threaded pin provided with an internally-screw-threaded bore mounted in said yoke, a passage formed in said pin coinciding with the passage formed in said lid, a stem 35, provided with the valve 36, located in said internally-screw-threaded bore, a spiral spring mounted on said stem, and an externally-screw-threaded plug provided with a passage mounted in said pin for regulating the tension of said spring, substantially as set forth.

478,872. VAGINAL SYRINGE. JOHN D. KIRKWOOD, Pullman, Wash., assignor to Edwin Bartsch, San Francisco, Cal., and Jay William Kirkwood, Ham's Fork, Wyo. Filed Nov. 14, 1891. Serial No. 411,967. (No model.)

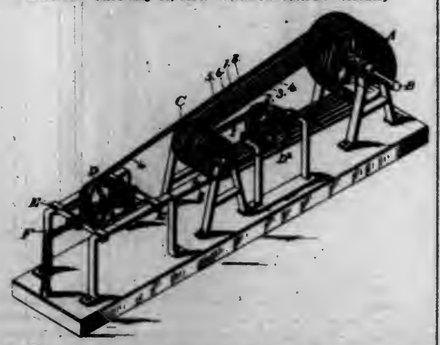
Claim.—As an improved article of manufacture, a syringe consisting in the outer tubular portion A, having its lower end formed into a bulb *b*, having an inlet-nipple *d*, the inner open-ended tube B, between which and the outer portion A is formed an annular chamber, the nipple *e* at the lower end of part B, the upward-inclined discharge-apertures leading from the said annular chamber through part A near its upper end, and a series of grooves or flutes extending from said apertures to the upper end of the part A, the whole being formed in one integral piece without seam or joint, substantially as shown and described.

478,873. COMBUSTIBLE POCKET-SPITTOON. JEAN KOEHLER, Freiburg, Germany. Filed Feb 13, 1892. Serial No. 421,451. (No model.)



Claim.—1. A pocket-spittoon consisting of combustible and elastic sections fitting one within the other and the inner section having a funnel-shaped spittoon-pocket provided with a bottom slot, the edges of which are normally in contact and are separated laterally by compressing the sides of the spittoon-pocket, substantially as described.

2. A pocket-spittoon composed of combustible and elastic mate-



rial and having a funnel-shaped spittoon-pocket provided with a bottom slot, the edges of which are normally in contact and are separated laterally by compressing the sides of the funnel-shaped spittoon-pocket, substantially as described.

478,874. DETACHABLE HEATING-DRUM FOR STOVES. WILLIAM J. LOTH, Waynesborough, Va. Filed Apr. 12, 1892. Serial No. 428,813. (No model.)

Claim.—A heating drum or chamber for stoves, the same being formed with an upper projecting ledge having therein a boiler or kettle opening and an opening for communication with a stovepipe, and a deflector-plate located intermediate of said openings and uniting the ledge with the bottom of the drum or chamber, the said deflector-plate conforming in shape to the edge of the kettle-opening and terminating short of the sides of the drum, so as to leave spaces for the passage of products of combustion, substantially as shown, and for the purpose described.

478,875. ROPE-DRIVING APPARATUS. THEODORE H. MACDONALD, ORLANDO B. WILLIAMS, and LORENZO D. HITTENOUN, San Francisco, Cal. Filed July 10, 1890. Serial No. 358,347. (Model.)

Claim.—1. In a rope-driving apparatus, the driving and driven drums, each formed with grooves, and the rope wound in an uneven number of non-crossing wraps, substantially as described.

2. In a rope-driving apparatus, the combination of driving and driven drums, each having grooves, a tension-pulley, an idle-pulley, and a rope wound in an uneven number of wraps upon the drums and passing around the tension and idle pulleys, substantially as described.

478,876. STRAP-ATTACHING DEVICE FOR HARNESS. THOMAS J. MASSENDER, Marion, Ohio. Filed Feb 2, 1892. Serial No. 420,073. (No model.)

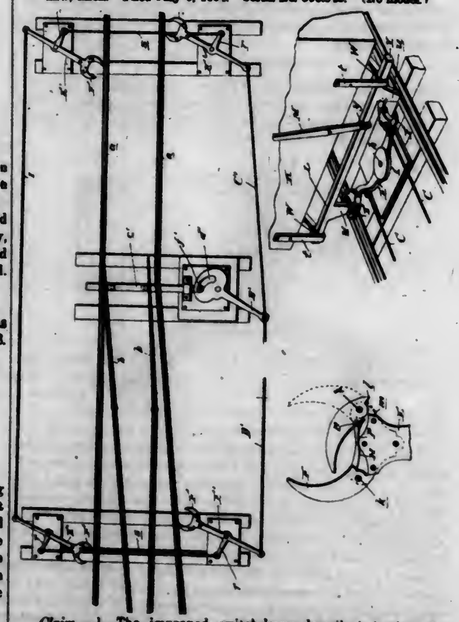
Claim.—The herein-described strap-attaching device, consisting of side bars, the extremities of which are curved upwardly, so that they will be above the surface to which the device is attached, and provided with disks having tongues projecting eccentrically from the inner faces thereof, said tongues being approximately flush with the upper surface of the side bars, and a bridge-bar connecting the side bars and provided with a central aperture and on its under surface with a stud on each side of the aperture, as specified.

478,877. METHOD OF SUPPRESSING HORNS IN CATTLE. JOHN MARCH, White Oak Springs, Wis., assignor to the John March Company, of Wisconsin. Filed Dec. 8, 1888. Serial No. 293,083. (No specimens.)

Claim.—1. The improvement in the art of suppressing horns in cattle, consisting in applying to the incipient horn a substance, substantially as described, to check its growth.

2. The improvement in the art of suppressing or eliminating horns in cattle, consisting in treating the incipient horn with potash, substantially as herein described.

478,878. BICYCLE-SUPPORT. THOMAS B. MARSHALL, Sidney, Ohio. Filed Sept. 16, 1891. Serial No. 405,900. (No model.)



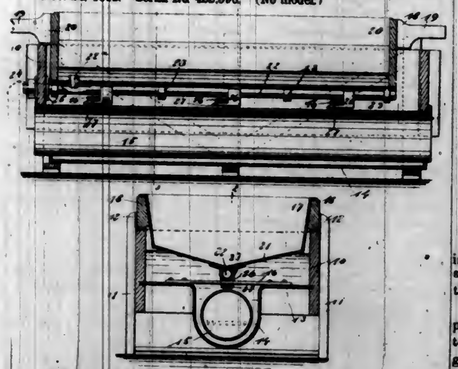
Claim.—1. The combination, with the pilot-wheel and the mud-guard of a bicycle, of a support composed of a pair of arms 9, having lateral journals 10, formed with the crank-bend 11, extending at opposite sides of the tire and engaging the periphery thereof when the pair of arms is swung rearward to rest upon the ground, substantially as described.

2. The combination, with the pilot-wheel and the mud-guard of a bicycle, of the braces 6, connecting the pilot-wheel axle with the mud-guard and provided with the plates 8, and a support composed of a pair of arms 9, having lateral journals 10 arranged in the plates on the braces and formed with the crank-bend 11, which extends at opposite sides of the tire and engages the periphery thereof when the pair of arms is swung rearward, substantially as described.

3. The combination, with the pilot-wheel 1, the fork 2, the mud-guard 7, secured to the fork and provided with a lug 15, and the backbone 3, of the locking device 13, carried by the backbone and provided with a pivoted hook 14, adapted to be swung outward for engagement with the lug on the mud-guard, substantially as and for the purposes described.

478,879. RAILWAY-SWITCH. JAMES D. MATTISON, East Saginaw, Mich. Filed July 6, 1891. Serial No. 398,549. (No model.)

Claim.—1. The improved switch-lever described, having the curved branches F, provided with the shoulders *l* and the notches or



shoulders *n* and pivoted to the opposite ends of said lever, and the springs H, bearing at opposite ends against the inner ends of said arms and at the inner side of the pivot thereof, substantially as specified.

2. A railway-switch having, in combination with the main rails and switch-rails, a bar connecting the free ends of the switch-rails, a lever connected with the bar by a cam or eccentric, and an interposed roller, a rod leading in opposite directions from the eccentric, switch-levers connected together and also connected with the eccentric, said switch-levers having spring-backed and curved pivoted arms, so arranged that while both may be struck by a switch-operating mechanism carried by a moving car but one of said arms will resist the engagement, so as to move its lever in the desired direction, substantially as specified.

3. The combination, with a switch constructed as described and having the switch-levers provided with the curved and pivoted arms, of a car or engine carrying guide-supports, a laterally-movable slide-bar arranged thereon, and depending lugs near opposite ends adapted to contact with the pivoted arms of the switch-levers, and the laterally-movable pivoted hand-lever on the car, adapted to manipulate the slide-bar, substantially as specified.

4. The combination, with the track-rails and switch-rails, of the bar connecting the free ends of the switch-rails and carrying a stud bearing a roller at one end, the slotted cam-lever receiving said stud and roller, the switch-levers connected in pairs at their outer ends by a rod and also connected with the slotted cam-lever, said levers also having angular branches connected by transverse rods, and the curved and spring-backed arms pivoted to the switch-levers, substantially as specified.

478,880. CHEESE-VAT. LEOPOLD MEYER, Ahnapee, Wis. Filed Feb. 24, 1892. Serial No. 423,598. (No model.)

Claim.—1. In a cheese-vat, the combination, with a water-tank, of a milk-vat fitted to slide on the tank and provided with a discharge-pipe on the under side of its bottom, said pipe projecting beyond the end of the vat and entering an aperture in one end of the water-tank, substantially as described.

2. In a cheese-vat, the combination, with a water-tank, of a milk-vat having a sliding and detachable connection with the tank and provided with a discharge-pipe extending longitudinally along the under side of its bottom and having its end projecting beyond the end of the vat, said projecting end entering an aperture in one end of the tank when the vat is secured to the tank, substantially as described.

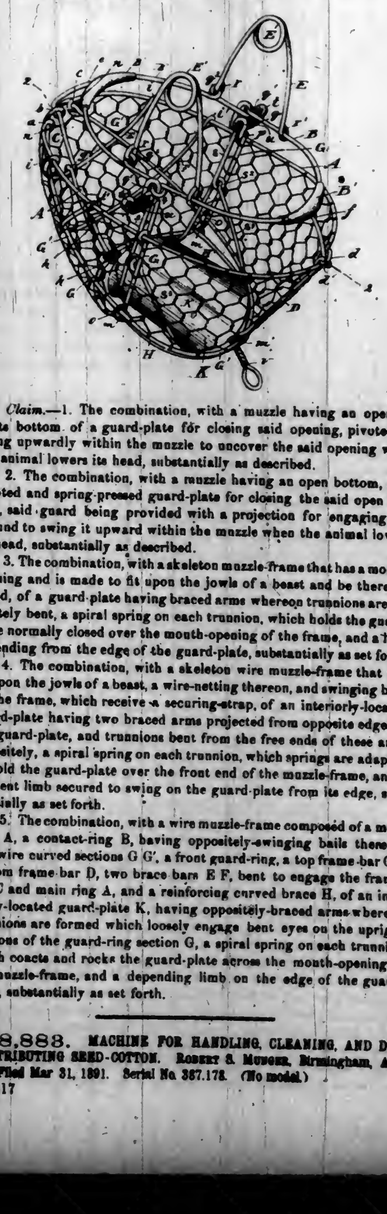
3. The combination, with the water-tank having a hole in one end, of the milk-vat slidably mounted upon the tank and a longitudinal discharge-pipe secured to the under side of the milk-vat and adapted to project through a hole in the water-tank, said pipe having a collar thereon to abut with the wall of the tank, substantially as described.

4. In a cheese vat, the combination, with a water-tank provided with cross-bars in its bottom, of a milk-vat fitted to slide on the sides of the tank and provided on its bottom with downwardly-projecting hooks for engaging the cross-bars of the tank, substantially as described.

5. The combination, with the water-tank having a heating-pocket in the bottom and cross-bars extending across said pocket, of the detachable vat mounted upon the tank and hooks secured to the vat-bottom and adapted to engage the cross-bars, substantially as described.

478,881. DENTAL TOOL. EDWARD C. MOORE, Detroit, Mich. Filed Jan. 20, 1892. Serial No. 419,631. (No model.)

Claim.—1. In a dental-disk holder, the combination, with an apertured disk, of a mandrel having two or more spring-arms formed



with seats on their outer faces arranged to correspond with the shape of the aperture in the disk, substantially as described.

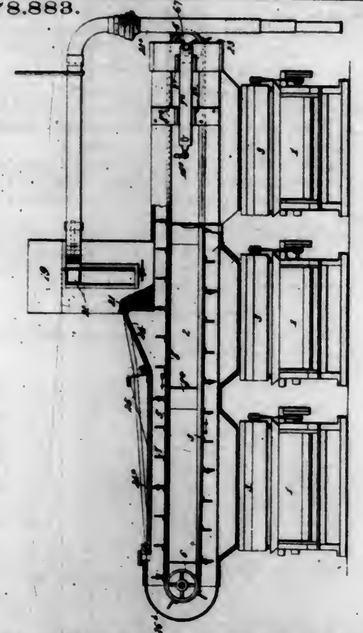
2. The combination, with a dental disk having a rigid hub, of a mandrel terminating in a spring-chuck adapted to engage said hub to detachably secure the disk upon the mandrel, substantially as described.

3. The combination, with a dental disk having a rigid apertured hub, of a mandrel terminating in an expanding spring-chuck, the shoulder F, beveled upon both sides, and the shoulder G, forming a stop for the hub, substantially as described.

478,882. MUZZLE. MARCUS S. MORRMEN, Switzerland, Fla. Filed May 6, 1891. Serial No. 391,741. (Model.)

Claim.—1. The combination, with a muzzle having an opening in its bottom of a guard-plate for closing said opening, pivoted to swing upwardly within the muzzle to uncover the said opening when the animal lowers its head, substantially as described.

2. The combination, with a muzzle having an open bottom, of a pivoted and spring-pressed guard-plate for closing the said open bottom, said guard being provided with a projection for engaging the ground to swing it upward within the muzzle when the animal lowers its head, substantially as described.



3. The combination, with a skeleton muzzle-frame that has a mouth-opening and is made to fit upon the jowls of a beast and be there secured, of a guard-plate having braced arms whereon trunnions are oppositely bent, a spiral spring on each trunnion, which holds the guard-plate normally closed over the mouth-opening of the frame, and a limb depending from the edge of the guard-plate, substantially as set forth.

4. The combination, with a skeleton wire muzzle-frame that will fit upon the jowls of a beast, a wire-netting thereon, and swinging bails on the frame, which receive a securing-strap, of an interiorly-located guard-plate having two braced arms projected from opposite edges of the guard-plate, and trunnions bent from the free ends of these arms oppositely, a spiral spring on each trunnion, which springs are adapted to hold the guard-plate over the front end of the muzzle-frame, and a pendent limb secured to swing on the guard-plate from its edge, substantially as set forth.

5. The combination, with a wire muzzle-frame composed of a main ring A, a contact-ring B, having oppositely-swinging bails thereon, two wire curved sections G G', a front guard-ring, a top frame-bar C, a bottom frame-bar D, two brace-bars E F, bent to engage the frame-bar C and main ring A, and a reinforcing curved brace H, of an interiorly-located guard-plate K, having oppositely-braced arms whereon trunnions are formed which loosely engage bent eyes on the upright portions of the guard-ring section G, a spiral spring on each trunnion which coacts and rocks the guard-plate across the mouth-opening of the muzzle-frame, and a depending limb on the edge of the guard-plate, substantially as set forth.

478,883. MACHINE FOR HANDLING, CLEANING, AND DISTRIBUTING SEED-COTTON. ROBERT S. MUSGER, Birmingham, Ala. Filed Mar 31, 1891. Serial No. 387,178. (No model.)

478,883.

Claim.—1. In an apparatus for conveying, cleaning, and distributing seed-cotton to a gin or a series of gins, the combination, with a distributer-casing, of an endless spiked belt provided with transverse valve-strips closely fitting said casing, pulleys arranged in the ends of said casing to carry the belt, and a vacuum-box having its lower open end seated upon or discharging into the distributer-casing, substantially as described.

2. In a distributer for feeding seed-cotton to one or more gins, the combination, with a casing mounted upon and communicating with each gin-feeder, of an endless spiked belt provided with a series of transverse valve-strips arranged at suitable intervals and substantially fitting the casing, and a vacuum-box discharging its contents upon the distributer-belt, substantially as described.

3. In a distributer for feeding one or more cotton-gins, the combination, with a casing, of an endless spiked belt, a vacuum-box seated upon or communicating with said casing, and valve strips or plates within the distributer-casing to maintain the suction, substantially as described.

4. In a distributer for feeding one or more cotton-gins, the combination, with a casing having communication with each gin-feeder, of an endless spiked belt traveling in said casing and a vacuum-box seated upon or communicating with the distributer-casing, the distributer-belt being provided with flexible or elastic valve strips or plates arranged at suitable intervals, substantially as described.

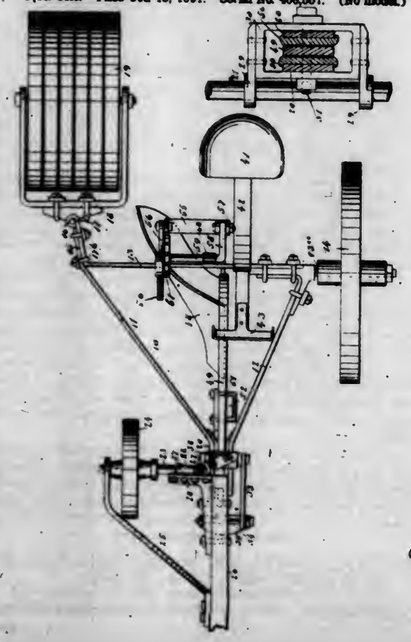
5. In an apparatus for ginning cotton, the combination, with a distributer arranged above and communicating with one or a series of gins, of an endless spiked belt moving in said casing, a vacuum-box seated upon or discharging into the distributer, and flexible or elastic valve strips or plates carried by the spiked belt and having support upon or against the spikes at suitable intervals, substantially as described.

6. In an apparatus for conveying, cleansing, and distributing seed-cotton to one or a series of gins, the combination, with a conveyer and with a vacuum-box having a wall formed wholly or in part of foraminous material, of one or more beaters arranged within the vacuum-box and having a constant rotation, a distributer having a casing resting upon and communicating with each gin, an endless spiked belt traveling in said casing and receiving the cotton from said beater or beaters, and flexible or elastic valve-strips carried by said belt and cutting off the inward air-current on both sides of the opening communicating with the distributer, substantially as described.

7. In an apparatus for ginning cotton, the combination, with one or more gins, of a distributer-casing having a spiked belt running therein and provided with flexible or elastic valve-strips and a vacuum-box having direct communication with the distributer-casing, the cover thereof on one side of the vacuum-box being formed in two parts hinged together, one of said parts being short and inclined with its end resting against the vacuum-box or other support and the other part being substantially horizontal and extended toward the end of the distributer-casing and loosely connected thereto, substantially as described.

8. In an apparatus for ginning cotton, the combination, with one or more gins, of a distributer-casing having an endless spiked belt traveling therein, said casing having one end formed of a curved foraminous or netted material, and a vacuum-box communicating with and delivering the cotton to said distributer-belt, substantially as described.

9. In an apparatus for conveying, cleansing, and feeding seed-cotton to one or more gins, the combination, with a pneumatic conveyer and with a vacuum-box having a foraminous screen, of a closed casing having communication with the vacuum-box, a spiked distributer-belt arranged in the closed casing and having a series of flexible elastic valve-strips mounted on the belt, and a fan maintaining a suction in the vacuum-box, the said closed casing having a section of its cover hinged to a movable portion of said cover to yield either separately or in conjunction with the movable portion to unusual accumulations of cotton upon the distributer-belt, substantially as described.



10. In an apparatus for distributing and feeding cotton to one or more gins, the combination, with a spiked distributer-belt, of an inclosing casing having a portion of its cover longitudinally movable and provided with an inclined section hinged at one end to the main portion and resting at its other end against the device feeding the cotton to the distributer, the sides of the casing being provided with angular blocks upon which the hinged connection between the two-part cover rises and falls, substantially as described.

11. In an apparatus for cleaning and conveying seed-cotton, a distributer-casing having a continuously-traveling spiked belt, one end of said casing being constructed of foraminous material, and a belt-carrying pulley concentric with the end of the distributer, substantially as described.

12. In an apparatus for cleansing, conveying, and feeding seed-cotton to a gin or a series of gins, the combination, with a vacuum-box provided with duplex foraminous diaphragms, of a distributer with which said vacuum-box has direct communication and duplex spiked beaters revolving in opposite directions in the foraminous diaphragms in said vacuum-box and acting upon the cotton successively to loosen up the same and deliver it to the distributer, substantially as described.

13. In an apparatus for cleansing, conveying, and distributing seed-cotton to one or more gins, the combination, with the conveyer-pipe, of the flexible or elastic joint to enable one part of said tube to be moved to gather up the cotton, said joint having substantially the form of a frustum of a cone, substantially as described.

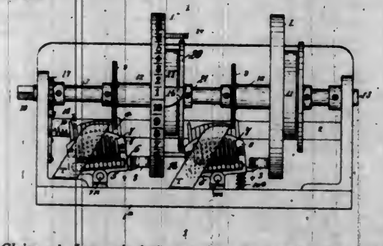
478,884. COMBINATION-PLOW. HENRY M. MCCAFFERTY, Montrose, Colo. Filed Oct. 13, 1891. Serial No. 408,557. (No model.)

Claim.—1. The combination, with the plow and its frame, of a wheel supporting the frame at the landside and a land-roller hinged centrally between its ends at its forward side to the opposite side of the frame to support it and adapted to have a free lateral swinging movement, substantially as set forth.

2. The combination, with the plow and its frame, having a rearward extension at its furrow side, of a wheel supporting the landside of the frame and a land-roller having a yoke hinged centrally in front of and between the ends of the roller by a vertical pivot to said rearward extension and traveling outside and in rear of the plow, substantially as set forth.

3. The combination, with the wheeled plow-frame formed of side bars 11 12 and a rear transverse bar 13, the forward ends of the side bars converging and then projecting forward in parallel planes, as at 20, and bolted together, of wear-plates 50 50 on the inner faces of the parts 20, and the plow-beam pivoted between said wear-plates, and a vertical-wheeled bar on which the front end of the frame is adjustably supported, substantially as set forth.

4. The combination, with the plow-frame, of a vertical ∩-shaped bar having a stud-axle secured to its lower ends and carrying a wheel, the inner member of the bar having a sliding connection with the front end of the frame, a sleeve on said member and provided with a rack, a lever pivoted to the sleeve and having a latch engaging the rack, and a link connecting it with the plow-frame, substantially as set forth.



5. The combination, with the plow-frame, of the vertical ∩ shaped frame, one member of which has a sliding connection with the front end of the frame, a stud-axle secured to the lower ends of the arm, a tongue secured to the upper end of the arm at its bend, a brace extending from the tongue to the outer end of the stud-axle, a sleeve on the inner member of said vertical arm and having an attached rack, a lever pivoted to said sleeve and having a latch engaging the rack, and a link connecting the lever with the forward extremity of the plow-frame, substantially as set forth.

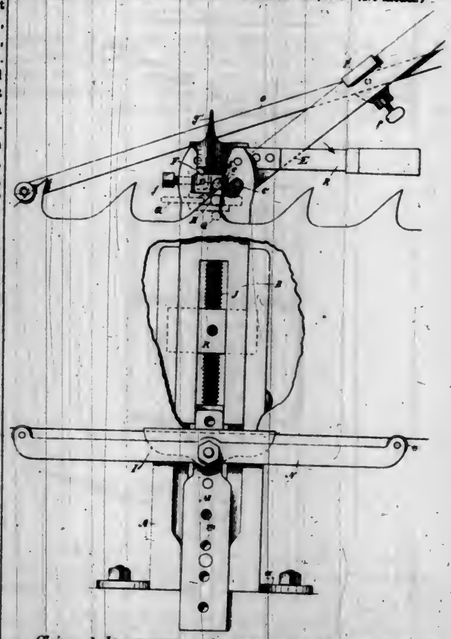
6. The combination, with the wheeled plow-frame and the plow having its beam pivoted in the frame, of a crank-shaft 59 above the rear end of the plow, a bell-crank lever connected at its angle with said shaft and having an adjusting latch and rack, links 57 connecting the landside of the plow with the crank 58 of said crank-shaft, and the inclined brace-link 55, extending from the same point outward and upward and pivoted to the short arm of said bell-crank lever, substantially as set forth.

7. The combination, with the frame having its side bar 11 and rear cross-bar 13 extended rearward face to face and clipped together, as shown at 17^b, the rear extremity of the cross-bar extension terminating in a vertical knuckle 16, of the land-roller having a yoke 18 coupled to said knuckle by a vertical pin 17, and a brace connecting the clip 17^b with the lower end of the bolt by means of the collar 17^c, substantially as set forth.

8. The combination, with the nearly vertical front support mounted on a supporting wheel and connected with the pole of the machine, of the main frame having its rear portion mounted, as described, and having an elongated front end, the plow suspended upon the main frame and having its beam pivoted in the elongated end of the main frame, a coupling-frame secured to the plow-beam and the main frame and held to slide on the support, and a lever mechanism for moving the coupling-frame, substantially as described.

478,885. CALCULATING-MACHINE. WILLIAM M. MCCAFFERTY, Mount Sterling, Ohio. Filed Dec. 22, 1891. Serial No. 415,883. (No model.)

Claim.—1. In a calculating machine, the combination, with the spring-impelled ratchet-wheel 9, of the oscillatory pawl-box 5, containing a series of pawls for successively engaging the ratchet-wheel, and lever mechanism for operating the pawl-box, substantially as described.



2. In a calculating-machine, the combination, with the spring-impelled ratchet-wheel 9, of the oscillatory pawl-box 5, provided with a series of spring-pressed pawls for successively engaging the ratchet-wheel, and a lever mechanism for operating the pawl-box, substantially as described.

3. In a calculating-machine, the combination, with the spring-impelled ratchet-wheel 9, of the oscillatory pawl-box 5, provided with a series of spring-pressed pawls for successively engaging the ratchet-wheel, the cam T for holding the pawls in their forward position, and a lever mechanism for operating the pawl-box, substantially as described.

4. In a calculating-machine, the combination, with the spring-impelled ratchet-wheel 9, of the oscillatory pawl-box 5, provided with a series of pawls for successively engaging the ratchet-wheel, the cam T, the wheel L, provided with a projection 14, the pivoted lever 3 for engaging a part of the pawl-box, and means for operating the lever, substantially as described.

5. In a calculating-machine, the combination, with a spring-impelled ratchet-wheel 9, of an oscillatory pawl-box 5, provided with a series of pivoted spring-pressed pawls for successively engaging the ratchet-wheel, a pivoted lever 3 for engaging a part of the pawl-box, and a series of keys for depressing the lever, substantially as described.

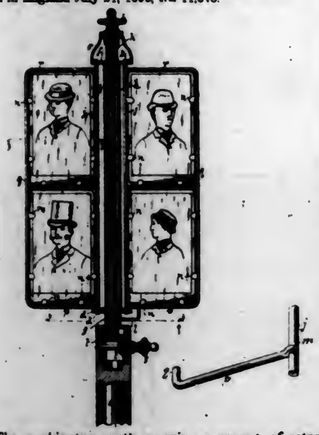
478,886. SAW-SWAGING DEVICE. ANTONIO L. MAYOUR, Calistoga, Cal. Filed Nov. 11, 1891. Serial No. 411,627. (No model.)

Claim.—1. In a saw-swage, the combination of the rocking swage-cam, the swinging opposing anvil adapted by its movement to conform to the inclinations of the backs of different teeth, and the sliding bearing carrying said anvil, whereby it can be adjusted properly with relation to the cam independently of its individual adjustment, substantially as herein described.

2. In a saw-swage, the combination of the rocking swage-cam having the straight face terminating below in the rounded contact-point, the swinging opposing anvil having the straight face terminating above in the contact edge, and the sliding bearing carrying the anvil and adapted to adjust the latter to the cam without regard to its inclination on the saw-tooth back, substantially as herein described.

3. In a saw-swage, the combination of a frame, the rocking swage-cam carried by the frame and having a straight face terminating below in the rounded contact-point, the opposing anvil carried by the frame and having a straight face terminating above in the contact edge, and the eccentric-headed lever pivoted to the frame and adapted to clamp the saw between it and said frame, substantially as herein described.

4. In a saw-swage, the combination of a frame, the rocking swage-cam carried by the frame and having a straight face terminating below in the rounded contact-point, the opposing anvil carried by the frame and having a straight face terminating above in the contact edge, and the eccentric-headed clamping-lever and the opposing abutment-stud both carried by the frame and between which the saw is clamped, substantially as herein described.



5. In a saw-swage, the combination of a frame, the rocking swage-

cam carried by the frame and having a straight face terminating below in the rounded contact-point, the opposing anvil carried by the frame and having a straight face terminating above in the contact edge, the eccentric-headed clamping-lever and the opposing abutment-stud both carried by the frame and between which the saw is clamped, and the spring-actuated push-plunger carried by the frame for throwing the saw out from between the cam and anvil when relieved by the clamping-lever, substantially as herein described.

6. In a saw-swage, the combination of the stock A, having the fixed plate M, with series of holes, the saw-support adapted to be secured in any of said holes, the frame B, mounted in the stock, the cam, the anvil, and clamping-lever carried by the frame, and the means for vertically moving said frame, consisting of the fixed nut, the screw seated in the nut and connected with the frame, and the connections for operating the screw, substantially as herein described.

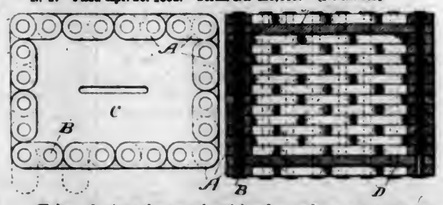
7. In a saw-swage and in combination with the operating-lever thereof, the pawl-bar engaging the saw-teeth and the connection between said bar and lever, consisting of the clip P, sliding on the lever and set by a screw, and the sleeve p', pivoted to the clip and sliding on the pawl-bar with a screw to set it, substantially as herein described.

478,887. STAND FOR EXHIBITING PICTURES, &c. VICTORIEN L. M. RENARD, Paris, France, assignor to Charles Ferdinand Velt, London, England. Filed Sept. 3, 1891. Serial No. 404,649. (No model.) Patented in France Oct. 23, 1889, No. 201,512; in Belgium July 20, 1890, No. 91,323, and in England July 21, 1890, No. 11,375.

Claim.—1. The combination, with an axis or support, of rotary frames secured to said support and a check-piece or stop having inclined faces, over which the frames glide in their rotation, substantially as described.

2. The combination, with an axis or support, of rotary frames secured to said support, a check-piece or stop having inclined faces, over which the frames glide in their rotation, a laterally-projecting finger-piece for each frame, and a disk having an inclined edge and engaged by said finger-piece, substantially as described.

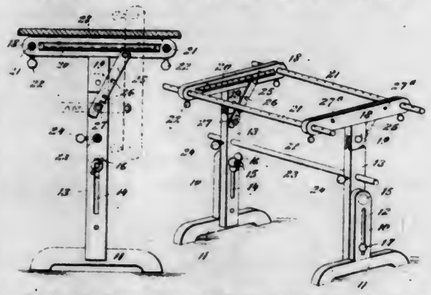
478,888. CALENDAR FOR WATCH-CHARMS. FAYETTE W. ROE, Omaha, Nebr. Filed May 17, 1892. Serial No. 433,333. (No model.)



Claim.—A combined watch-charm and perpetual calendar formed of two parts, the one adapted to move relative to the other, the upper part provided with seven symbols corresponding to the days of the week and having a tongue or projection on the under side thereof adapted to engage the lower part and the said lower part provided with seven equidistant groups of figures corresponding to the days of the month in the order of weeks, with an indentation adapted to receive the said tongue or projection on the said upper part, substantially as and for the purposes described.

478,889. ENVELOPE-OPENER. WILLIAM D. ROGERS, Alameda, and JAY D. VAN BUREN, San Francisco, Cal. Filed Dec. 11, 1891. Serial No. 414,742. (No model.)

Claim.—A device for opening envelopes, consisting of a card made narrower at one end than the other and placed within the envelope with the broadest end in contact with the end of the envelope and a tape or thread attached to the upper acute angle of the card, projecting through the corresponding corner of the envelope, whereby the edge of the card acts as a paper-knife to cut open the end of the envelope when the thread is pulled, substantially as herein described.



478,890. TOY MONEY-SAFE. GEORGE R. ROWLAND, Brooklyn, N. Y. Filed Apr. 20, 1892. Serial No. 429,835. (No model.)

Claim.—1. As an improved article of manufacture, a toy money-safe having its sides formed of a series of links pinned together and its top and bottom united to the sides by the same pins that secure the links, substantially as described.

2. A box having its sides formed of a series of links united by pins and provided with a divided pin for opening a portion of the links, substantially as described.

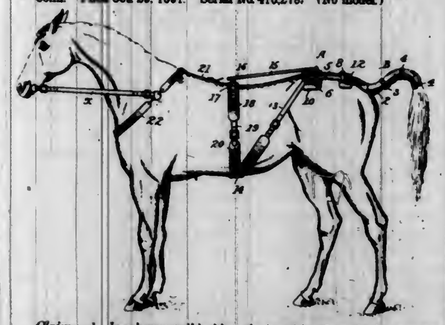
478,891. TABLE AND EMBROIDERY-FRAME. MAURICE SCHNIRR, Fayette, Mo. Filed Mar. 6, 1890. Serial No. 342,881. (No model.)

Claim.—1. An embroidery-frame comprising two standards adjustable toward and from each other and having aligned transverse apertures intersected by set-screws 24, a rigid rod 23, extending through said apertures and clamped by said screws, a vertically-rocking frame composed of end bars pivotally connected between their ends with the upper ends of the standards and provided with aligned end apertures intersected by set-screws 22, parallel rods 21 21, passed through the apertures in the said end bars and clamped by the screws 22, and means for adjusting the frame at any desired angle, substantially as set forth.

2. A combined quilting-frame and table consisting in the standards adjustable toward and from each other, parallel end bars on the upper ends of the standards and having transversely-apertured ends, parallel rods 21, extending through the apertures in the two end bars, set-screws 22, clamping the rods in place, apertures 27^a, also in the said end bars, the said end bars and rods constituting an embroidery-frame, and the table-top having transverse battens or cleats on its lower side provided on their faces next to the end bars with transverse pins 30 to enter the apertures 27^a when the said end bars are moved toward the cleats or battens, substantially as set forth.

478,892. TRANSFER-PAPER AND COMPOSITION FOR COATING THE SAME. WILLIAM SCHWARTZ, New York, N. Y., assignor to himself, Hugo Guttmann, and Ernest G. Rost, same place. Filed Oct. 8, 1891. Serial No. 408,127. (No specimens.)

Claim.—1. As an improved article of manufacture, a surface adapted to receive an impression and transfer the same, provided with a coating, the component parts of which are glycerine, carpenters' glue, agar-agar, Russian glue, and sirup, prepared and in the proportions stated, substantially as specified.



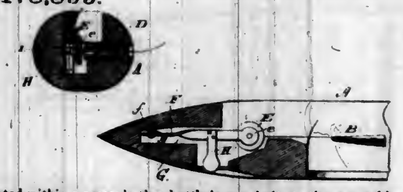
2. An absorbent coating for paper and like material, for the purpose specified, comprising glycerine, carpenters' glue, Russian glue, agar-agar, and sirup, in the proportions set forth.

478,893. MEANS FOR SECURING COVERINGS OF NETTING TO BASKETS. ADELINE E. STORY, Clay Centre, Kans. Filed Feb. 5, 1892. Serial No. 420,426. (No model.)

Claim.—The combination, with a basket, of the bails pivoted thereto, provided with a series of metallic hooked plates, and the plate at the center of the bail, adapted to pass between the splints and rim and then bent outwardly to secure the bail in place, substantially as and for the purpose set forth.

478,894. HORSE-TAIL HOLDER. JOHN C. TALLMAN, Bridgeport, Conn. Filed Oct. 29, 1891. Serial No. 410,278. (No model.)

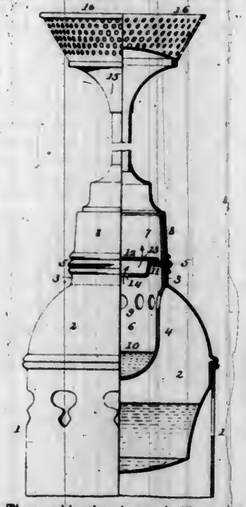
Claim.—1. In a horse-tail holder, the combination of a frame, such as A, and means for holding it in a fixed position upon the back of a horse, with a substantially-inflexible supporting-frame, such as B, rigidly connected to and extending rearwardly from the frame A, and devices for securely holding the tail in the frame B, substantially as described.



2. The combination of a frame, such as A, and means for holding it in a fixed position upon the back of a horse, with a tail-support consisting of curved side strips rigidly connected to the frame and extending rearwardly upon opposite sides of the tail, and cross pieces and straps upon the curved strips for securely holding the tail, substantially as described.

3. In a tail support for a horse, the combination of a frame A, the belly-band, the side straps 13 13, connecting the frame with the belly-band, whereby the frame is held from turning upon the horse's back, and the tail-support carried by the frame, substantially as set forth.

4. The combination, in a tail-support for horses, of the frame A, provided with a rod 15, support B, belly-bands, and straps connecting the belly-bands and the frame A, substantially as set forth.



478,895. TENSION DEVICE FOR LOOM-SHUTTLES. JOHN P. THOMPSON, Olneyville, R. I. Filed Jan. 15, 1892. Serial No. 418,147. (No model.)

Claim.—1. In a shuttle, the combination of the eye, a spring located within a recess in the shuttle in proximity to the eye and having a presser-disk at its free end bearing against the inner end of the eye, and a screw bearing with its inner end against the spring, substantially as set forth.

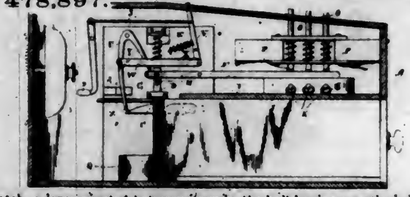
2. The combination of the shuttle-body provided with the eye D and recess G, spring F, provided with the revoluble disk E, and finger-piece H, and adjusting-screw I, all constructed and combined to operate substantially in the manner and for the purpose herein shown and set forth.

478,896. VOLATILIZER. GEORGE B. UNDERWOOD, Chicago, Ill. Filed Dec. 17, 1891. Serial No. 415,439. (No model.)

Claim.—1. The combination, in a volatilizer, of the water-boiler 2, the holder 4, and an eduction-tube provided with an enlarged head 15 and a marginal perforate guard or hood 16, extending beyond the head 15 and adapted to surround and inclose its outlet-orifice, substantially as set forth.

2. The combination, in a volatilizer, of the water-boiler 2, the holder 4, and an eduction-tube provided with an enlarged head 15 and a marginal perforate guard or hood 16, of perforate sheet metal, extending beyond the head 15 and adapted to surround and inclose its outlet-orifice, substantially as set forth.

3. The combination, in a volatilizer, of the water-boiler 2 and the cup-shaped holder 4, having a marginal outer rim 5, a pendent portion 6, and an upwardly-projecting portion or neck 7 to receive an inhaler-tube or other attachment, the walls of the pendent portion being perforated for the passage of vapor, substantially as set forth.



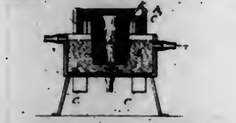
4. The combination, in a volatilizer, of the water-boiler 2 and the cup-shaped holder 4, having an inturned annular ledge 11, and the duplex partition 12, formed of two perforated disks, the perforations of which are out of line with each other, substantially as described.

478,897. TILL-LOCK. WARREN R. VAN VLIET, East Stroudsburg, Pa. Filed May 6, 1891. Serial No. 391,802. (No model.)

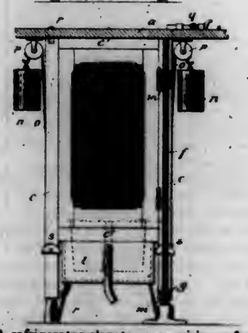
Claim.—1. A cash-drawer having a catch, a locking-bolt, a lever pivoted between its ends and having one end connected with the bolt, spring-actuated sliding bars placed under the opposite end of the lever for preventing it from being depressed, and keys which operate the lever and move the bars from under it, the parts combined to operate substantially as described.

2. A cash-drawer having a catch, a locking-bolt for engaging the

478,897.



catch, a lever pivoted between its ends, the bolt having a vertical slot, and a projection at one end of the lever which enters the said slot, spring-actuated sliding bars placed under the opposite end of the lever for preventing it from being depressed, and keys which move the bars from under the lever and at the same time depress it, the parts combined substantially as specified.

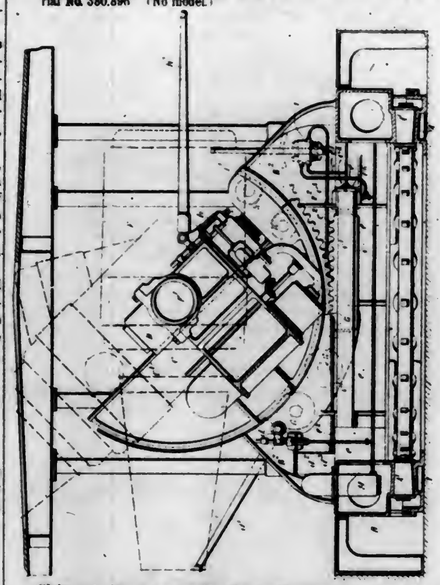


3. A cash-drawer having a catch, a locking-bolt which engages the catch, a lever pivoted between its ends and having one end connected with the bolt, spring-actuated sliding bars placed under the opposite end of the lever, the inner ends of the bars being inclined, and keys which engage the inclines of the bars for moving them from under the lever and at the same time engaging the lever for depressing it, the parts combined substantially as shown and described.

4. A cash-drawer having a catch, a spring-actuated locking-bolt, a lever pivoted between its ends and having one end connected with the bolt, spring-actuated sliding bars placed under the opposite end of the lever, keys for operating the bars and the lever, a finger at the opposite end of the lever, which engages the adjacent end of the lever and prevents it from being raised, and a handle for operating the finger, the parts combined to operate substantially as set forth.

5. A cash-drawer carrying a catch, a locking-bolt, a lever pivoted between its ends and having one end connected with the bolt, spring-actuated sliding bars placed under the opposite end of the lever, keys for operating them and the lever, a finger at the opposite end of the lever pivoted between its ends and having two depending arms, one arm normally resting over the adjacent end of the said lever, a catch for holding the other arm of the finger, and an arm upon the drawer for releasing the finger from the catch, and a handle for operating the finger, the parts combined substantially as specified.

478,898. REFRIGERATOR AND ELEVATING CUPBOARD. JOHN T. WHITWOOD, Wheeling, W. Va., assignor to the Wheeling Novelty Manufacturing Company, same place. Filed Apr. 4, 1892. Serial No. 427,591. (No model.)



Claim.—1. A refrigerator-elevator comprising a fixed floor provided with the well or guideway, an elevating cupboard having a closed top, a removable open-bottom frame for holding depending receptacles, and a guide-arm, the guide-rod provided with the upper and lower springs, the lower fixed stop, the elevating ropes and weights, and the fixed tank containing a cooling liquid and adapted to receive the depending receptacles when the cupboard is lowered, at which time the closed top is flush with and forms a continuation of the fixed floor, substantially as described.

2. In a refrigerator-elevator wherein a cupboard has a closed top which when in its normal position is flush with and forms a continuation of a fixed floor having a well or guideway, the removable open-bottom frame seated in the open bottom of said cupboard for holding depending receptacles, the guide-arm and the cushions on the walls of the lower part of the cupboard, the guide-rod for said arm having the upper and the lower springs, the elevating ropes and weights, the fixed tank for containing a cooling liquid, and the fixed stop below said floor, the said top and bottom rod springs being arranged in relation to the cupboard-wall cushions so as to act upon the said rod guide-arm in advance of the cushions on the ascent of the refrigerator and in advance of the contact of the latter with the bottom stop on the descent of the refrigerator to immerse the depending receptacles in said cooling-tank, substantially as described.

478,899. GUN CARRIAGE OR MOUNTING. JOHN H. R. WHINFIELD and JAMES HORNE, London, England. Filed Feb. 10, 1891. Serial No. 380,896. (No model.)

Claim.—1. In a gun-mounting, the combination, with a base plate, a turn-table mounted thereon and having arc-shaped guide-cheeks projecting therefrom, and a segmental upper carriage provided with slides, of a gun-cradle mounted on said slides, a gun trunnioned in said cradle, mechanism for elevating said gun independent of said segmental upper carriage to a degree limited by the gun-cradle, and mechanism for oscillating said upper carriage and gun in unison to a further degree of elevation, substantially as described.

2. In a gun-mounting, the combination, with a base-plate, a turn-table mounted thereon and having arc-shaped guide-cheeks projecting therefrom, and a segmental upper carriage provided with slides, of a gun-cradle mounted on said slides and provided with recoil-brakes and recuperator apparatus, rack-and-gear mechanism for elevating said gun to a degree limited by the gun cradle, and mechanism for oscillating said upper carriage and gun in unison to a further degree of elevation, substantially as described.

3. A gun mounting for high-angled fire, comprising, in combination with each other, a base-plate or roller path A, a turn-table B, mounted thereon and having arc shaped guide-cheeks B^3 projecting therefrom, an upper carriage C, mounted within the guide-cheeks B^3 and having slides C', a cradle comprising the brake-cylinders D and transom E, mounted on the slides C and having bearings for the trunnions of the gun, the said cradle being so constructed as to prevent the gun being turned or elevated to a higher angle than that of the slide C', and a hydraulic cylinder c, provided with a rack c^2, gearing with a toothed segment c^3, fixed on the upper carriage C, and a pump *d*, connected to the said inlet-pipes, whereby the said carriage may be actuated and caused to oscillate between the lowest and highest angles of fire, substantially as described.

4. A gun-mounting for high-angled fire, comprising, in combination with each other, a base-plate or roller path A, a turn-table B, mounted thereon and having arc-shaped guide-cheeks B^3 projecting therefrom, an upper carriage C, mounted within the guide-cheeks B^3 and having slides C', a cradle comprising the brake-cylinders D and transom E, mounted on the slides C and having bearings for the trunnions of the gun, the said cradle being so constructed as to prevent the gun being turned or elevated to a higher angle than that of the slide C', and a hydraulic cylinder c, provided with a rack c^2, gearing with a toothed segment c^3, fixed on the upper carriage C, and a pump *d*, connected to the said inlet-pipes, a pump *d*, connected to the said inlet-pipes, and an accumulator *g* and distributing-valve *f*, substantially as described, and for the purpose specified.

5. A gun-mounting for high angled fire, comprising, in combination with each other, a base-plate or roller path A, a turn-table B, mounted thereon and having arc-shaped guide-cheeks B^3 projecting therefrom, an upper carriage C, mounted within the guide-cheeks B^3 and having slides C', a cradle comprising the brake-cylinders D and transom E, mounted on the slides C and having bearings for the trunnions of the gun, the said cradle being so constructed as to prevent the gun being turned or elevated to a higher angle than that of the slides C', and a hydraulic cylinder c, provided with a rack c^2, gearing with a toothed segment c^3, fixed on the upper carriage C, and with suitable inlet and outlet pipes, the former connecting the said cylinder to an external source of hydraulic power or liquid supply through the center pivot-pipe I of the gun-mounting, and a distributing-valve *f*, substantially as and for the purpose above described.

6. The combination, with the gun, its cradle, and upper carriage, of a stop *i*, fixed on the said upper carriage, a lever *j*, pivoted to the gun-cradle, a spring j^3, connected to the lever *j* and to the cradle, and an arc or projection *a*, secured to the gun, substantially as described, and shown in the drawings, and for the purpose specified.

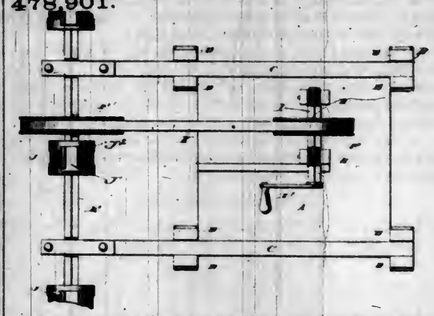
7. The combination, with the gun, the cradle, and the upper carriage, of a bolt or stop *k*, fixed to the gun, and a recess *k'*, formed in one of the slides C', substantially as described, and shown in the drawings, and for the purpose specified.

8. The combination, with the gun-cradle, the upper carriage, and the arc-shaped bearings B^3, of rollers H, mounted in the said upper carriage directly in rear of the recoil-brake apparatus and provided with elastic bearings, substantially as and for the purpose specified.

9. For actuating the elevating-cylinders by energy derived from the recoil, the apparatus comprising the auxiliary cylinders *l*, mounted on the upper carriage, rams *l'*, working therein and secured to the gun-cradle, the valve-box *p'*, connected to the cylinders *l*, the reservoir *q* and accumulator *p*, connected to the said valve-box, and suitable inlet and outlet pipes forming communications between the said accumulator and the elevating-cylinders, substantially as above described, and shown in the drawings.

10. For actuating the elevating-cylinders by energy derived from the recoil, the apparatus comprising the auxiliary cylinders *l*, mounted on the upper carriage, rams *l'*, working therein and secured to the gun-cradle, the valve-box *p'*, connected to the cylinders *l* by means of pipes *m n*, having a swivel-joint at *o*, reservoir *q* and accumulator *p*, connected to the said valve-box, distributing valve *f*, and suitable inlet and outlet pipes forming communications between the said accumulator and the elevating-cylinders, substantially as above described, and shown in the drawings.

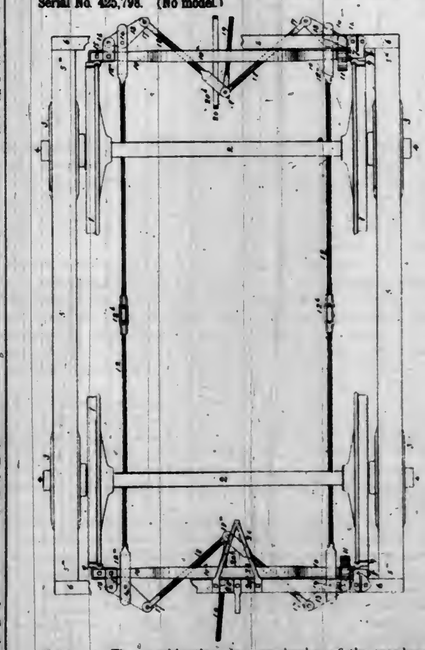
478,900. PICKET FENCE. CHARLES E. WINTRODE, Huntington, Ind. Filed Jan. 13, 1892. Serial No. 418,000. (No model.)



Claim.—The combination, with a panel of a picket fence and a downwardly-bent truss secured at its ends to the opposite upper ends of the panel, of an upwardly-bent brace secured at its ends to the lower portion of the panel at opposite sides of the center, the ends of the brace and truss being twisted together, substantially as shown and described.

478,901. POWDER-DUSTER. JOHN P. WRIGHT, Thomaston, Tex. Filed Dec. 14, 1891. Serial No. 415,070. (Model.)

Claim.—1. An improved poison-distributer comprising a bed or platform provided at its opposite sides with keepers, the side beams fitted in said keepers, devices whereby said beams may be secured at different heights in the said keepers, the distributer-shaft journaled at the rear ends of the said side beams and provided with the poison-distributers, the hand-shaft geared with the distributer-shaft, and the supports for the hand-shaft, said supports being mounted on the bed or platform, substantially as set forth.

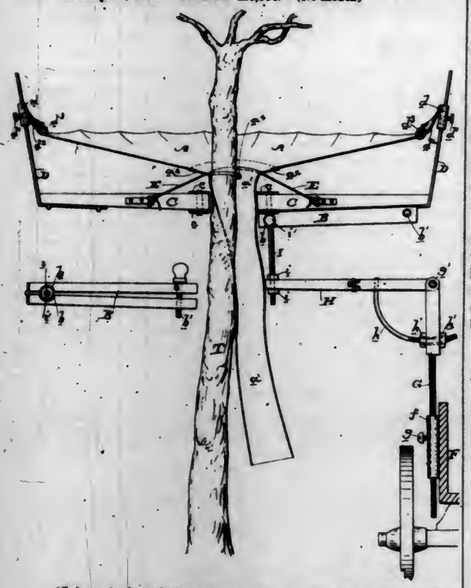


478,901.

2. In a poison-distributer, a distributer proper consisting of a cylinder having ends and a perforated side and provided with bands adjustable along the perforated sides, said bands being independent of the distributer ends, whereby the discharging-surface of the distributer may be varied without affecting the holding capacity of said distributer substantially as set forth.

3. The improved poison distributer, substantially as herein described and shown, consisting of the bed or platform adapted to be secured upon a cart or wagon and provided at its sides with uprights forming keepers, the uprights H, mounted on said bed, the hand-shaft journaled in the said uprights and provided with a pulley and a handle, the side beams fitted in the keepers, devices for securing the side beams at different heights in the keepers, the distributer-shaft journaled to the side beams and provided with a pulley, a belt connecting said pulley with that of the hand-shaft, and the perforated distributing-cylinders having central tubular portions fitting on the distributer-shaft and provided with adjustable bands whereby to regulate the discharge of material, substantially as set forth.

478,902. CAR-BRAKE. FREDERICK A. BAIER, St. Louis, Mo., assignor to the Brownell Car Company, same place. Filed Mar. 21, 1892. Serial No. 425,798. (No model.)



Claim.—1. The combination, in a car-brake, of the toggle-rods 18, hinged together and to the pull-rod 19, brake-bars 10, the connecting-rods 12, extending from one brake-bar to the other, and levers 13, fulcrumed to the rods 12 and connected at the ends with the toggle-rods 18 and the brake-bar, substantially as set forth.

2. The combination, in a car-brake, of the toggle-rods 18, levers 13, and brake-bar 10 of the spider 20, adapted to support and guide the ends of the toggle-bars, substantially as set forth.

3. The combination, in a car-brake, of the rods 12, slotted at the ends 12ª, the brake-bars 10, working in the slots, levers 11, also working in said slots and pivoted to the rods and the brake-bars, toggle-rods 18, connected together and to the levers 13, and a draw-rod connected to the toggle-rods at their points of connection with each other.

4. The combination, in a car-brake, of the toggle 18, the levers 13, rods 12, and a brake-bar arched at its middle over the toggle, substantially as and for the purpose set forth.

478,908. FRUIT-GATHERER. SAMUEL R. BALL, Winters, Cal. Filed Apr. 8, 1892. Serial No. 428,256. (No model.)

Claim.—1. In a fruit-gatherer, the combination of the expansible and collapsible receiver having a side opening to fit it about a tree-trunk, the discharge-spout from said receiver adapted to pass down beside the trunk, the sectional separable hub adapted to open from and close about the trunk, said hub encircling the discharge-spout, and the swinging radial arms of said hub supporting the receiver, substantially as herein described.

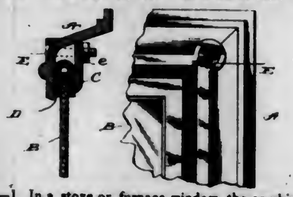
2. In a fruit-gatherer, the combination of the expansible and collapsible receiver having a side opening to fit it about a tree-trunk, the discharge-spout from said receiver adapted to pass down beside the trunk, the sectional separable hub adapted to open from and close about the trunk, said hub encircling the discharge-spout, the swinging radial arms of said hub, and the standards connected with said arms and with the rim of the receiver, whereby the latter is held above the arms and hub, substantially as herein described.

3. In a fruit-gatherer, the combination of the expansible and collapsible funnel-shaped receiver with its side opening and discharge-spout, the separable sectional hub encircling said spout, the swinging radial arms of the hub, the standards of the arms, and adjustable connections between said standards and the rim of the receiver, whereby the concavity of the latter may be varied, substantially as herein described.

4. In a fruit-gatherer, the combination of the expansible and collapsible receiver having an open center and a radial side opening to fit it about a tree-trunk, the tubular discharge-spout adapted to pass down beside the trunk and secured at its upper end to the open center of the receiver, except at one portion opposite the side opening thereof, which said portion is elastic, and the pivoted curved arms secured to the spout-top and having their free ends at the elastic portion thereof, whereby they clamp said portion about the tree trunk, substantially as herein described.

5. In a fruit-gatherer, the expansible and collapsible receiver having the side opening and discharge-spout, and the supporting-frame therefor, consisting of the separable sectional hub, radial swinging arms, and standards, in combination with an adjustable bracket by which said frame is carried and may be adjusted to different positions, substantially as herein described.

6. In a fruit-gatherer, the expansible and collapsible receiver having the side opening and discharge-spout, and the supporting-frame therefor, consisting of the separable sectional hub, radial swinging arms, and standards, in combination with a bracket carrying said frame, said bracket being hinged horizontally, whereby it may move in a vertical arc to lower the receiver, and means to set said bracket in the position to which it is adjusted, substantially as herein described.



7. In a fruit gatherer, the expansible and collapsible receiver having the side opening and discharge-spout, and the supporting-frame therefor, consisting of the separable sectional hub, radial swinging arms, and standards, in combination with a bracket supporting said frame and a vertically adjustable standard carrying the bracket, substantially as herein described.

8. In a fruit-gatherer, the expansible and collapsible receiver having the side opening and discharge-spout, and the supporting-frame therefor, consisting of the separable sectional hub, radial swinging arms, and standards, in combination with the jointed bracket carrying said frame, substantially as herein described.

9. In a fruit-gatherer, the expansible and collapsible receiver having the side opening and discharge-spout, and the supporting-frame therefor, consisting of the separable sectional hub, radial swinging arms, and standards, in combination with a bracket supporting said frame, and a controllable ball-and-socket connection between said bracket and frame to keep the receiver level independent of the position of the bracket, substantially as herein described.

10. A fruit-gatherer consisting of the expansible and collapsible funnel-shaped receiver having the side opening and discharge-spout, the separable sectional hub, swinging radial arms and standards forming a frame for supporting the receiver, the vertically-adjustable standard, the pivoted jointed bracket, and the rod I of the bracket connected with the supporting-frame of the receiver by a controllable ball-and-socket joint, substantially as herein described.

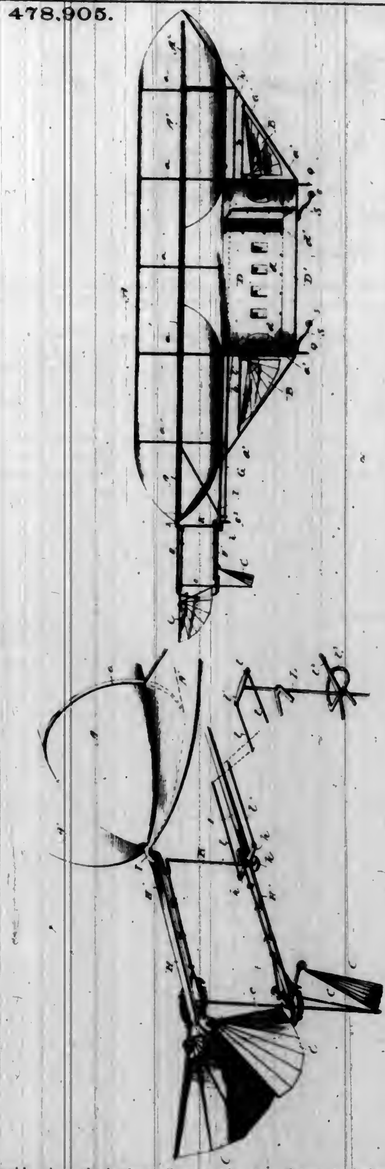
478,904. MEANS FOR SECURING GLASS PLATES IN WINDOWS OF STOVES AND FURNACES. LAURA C. BALLENTINE, Port Huron, Mich. Filed Sept. 23, 1889. Serial No. 324,862. (No model.)

Claim.—1. In a stove or furnace window, the combination of a metal frame, a glass plate secured therein, and a packing of asbestus surrounding the edges of the glass plate and interposed between said plate and the metal frame, substantially as shown and described, as and for the purpose set forth.

2. In a stove or furnace window, the combination of the metal frame *a*, the retaining-frame C, provided with retaining-bolts E, the glass plate B, having its edges secured between the said frames, and the asbestus packing D, surrounding the edges of the glass plate and interposed between the same and the frames, substantially as shown and described, as and for the purpose set forth.

478,905. AIR-SHIP. DURR F. BARNES, Circleville, Ohio. Filed Dec. 5, 1891. Serial No. 414,086. (No model.)

Claim.—1. In combination with the buoyant device, the two sets of propelling-wings arranged in pairs and operating alternately, substantially as shown and described.



2. In combination with the buoyant device, the two sets of propelling-wings arranged in pairs and vibrating on the same vertical axis, the crank-shaft connected with said wings, and suitable means to operate said shaft, substantially as described.

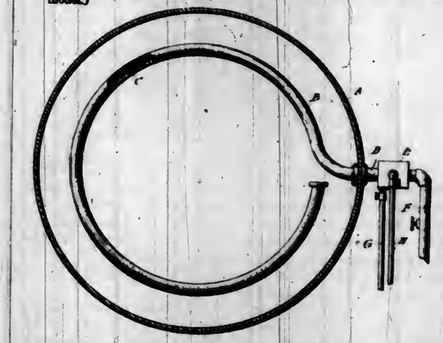
3. In combination with the buoyant device, the swinging frame journaled at the front end thereof, the two pairs of wings arranged one above the other and vibrating on the same vertical axis, the crank-shaft connected to said wings, a motor to drive said shaft, and means to move the swinging frame, substantially as shown and described.

4. In combination, the balloon, the cab supported thereby, the compartment beneath the cab, the battery and the motor in the latter, the main shaft, the vertically-vibrating wings geared to the latter, and the horizontally-vibratory wings likewise geared thereto, substantially as shown.

5. In combination, the balloon, the cab supported thereby, the motor in the cab, the main shaft driven from the motor, the vertically-

478,905.

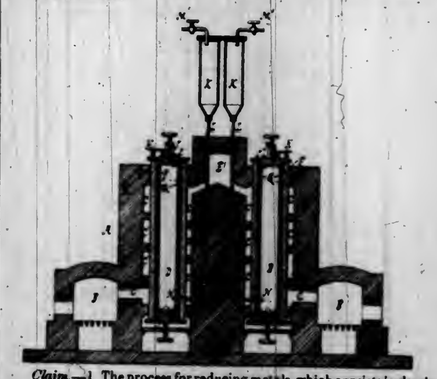
movable wings, the horizontally-movable wings driven both but dissimultaneously by said shaft, the swinging frame carrying the latter wings, and means for moving said frame from within the cab, substantially as shown and described.



6. In combination, the cab, the pair of lifting and lowering wings, the driving-shaft, the wheel thereon, the wheel on the crank-shaft of each wing, and the chain or band passing from the wheel on the driving-shaft to and around one of the wheels on the wing crank-shaft, over the wheel of the other, and then to the driving-wheel shaft, substantially as shown and described.

7. In combination, the propelling-wings, the lifting and lowering wings, the main driving-shaft, and gearing between the latter and said wings, the shaft being longitudinally movable, so as to connect with one or the other set of wings, substantially as shown and described.

8. In combination, the buoyant device, the bars thereon with inturned ends, the swinging frame journaled on said ends, the crank-shaft journaled in the latter, the wings on said frame, and the steering device connected to said arms, substantially as shown and described.

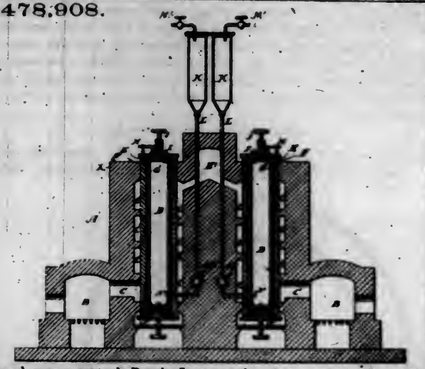


9. In combination with a buoyant device having means for its propulsion, consisting in part in a shaft, the anchoring device adapted to be operated by said shaft, consisting of a screw or auger and the rotary shaft connected thereto by a pin and slot, substantially as shown and described.

478,906. FEED-PIPE FOR VACUUM-PANS. HENRY BASANTA, Ponce, Porto Rico. Filed Sept. 25, 1890. Serial No. 366,063. (No model.)

Claim.—The combination, with the vacuum-pan and its perforated feed-pipe, of the chamber E, having a pipe D connecting it with the feed-pipe, a sirup-supply pipe F, entering the chamber, and valved steam and chemical supply pipes G H, also entering the said chamber E, substantially as set forth.

478,907. PROCESS OF REDUCING METALS. HENRY S. BLACKMORE, Mount Vernon, N. Y. Filed June 18, 1891. Serial No. 396,731. (No specimens.)

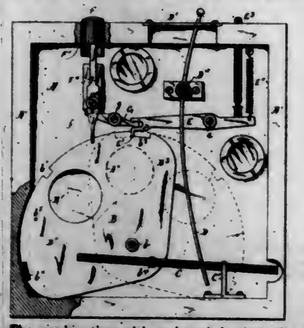


Claim.—1. The process for reducing metals, which consists in slowly introducing suitable reducing agents in a molten state into the molten material to be reduced, both the reducing agents and the material to be reduced being under pressure, by means of gravity and expansion of neutral gas, substantially as described.

2. The process for reducing metals, which consists in slowly introducing reducing agents in a liquid state into a molten metallic salt or combination by gravity and expansion of neutral gas, both materials being under super-atmospheric pressure, substantially as described.

478,908. FURNACE FOR REDUCING METALS. HENRY S. BLACKMORE, Mount Vernon, N. Y. Filed June 18, 1891. Serial No. 396,732. (No model.)

Claim.—1. In a furnace for the reduction of metals, the combination of a fire box B, a suitable heating-flue C about chamber or receptacle D for the purpose of melting or fusing the material to be reduced, the receptacle D, the receptacle K for containing the reducing agent in a fused or melted state and situated within or above the furnace, so as to be heated by it or its flue C and so that said reducing agent therein shall always be above the level of the fused material in

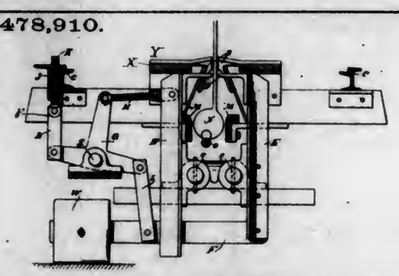


478,908.

chamber or receptacle D, tube L, connecting the receptacles D and K, valve M in the tube L for controlling the flow of the reducing agent from receptacle K into receptacle D, receptacle D being provided with a pressure-valve H for keeping the fused materials therein under pressure, and a vacuum-valve I for admitting air to take the place of the metal or slag when drawn from the receptacle D through the tap-hole O, substantially as shown and described.

2. In a furnace for the reduction of metals, the combination, with a fire-box and a heating-flue C, of a retort or chamber D for containing the material to be reduced in a fused or molten state, the retort or receptacle K, in which the fused or molten reducing agent is contained, it being situated so that said reducing agent therein shall always be above the level of the fused material in chamber or receptacle D, the pressure and vacuum valves H I in the reducing-chamber, and the valve M for controlling the discharge of the reducing agent into the reducing-chamber D, substantially as described.

478,909. CAMERA-SHUTTER. THOMAS H. BLAIR and FRED H. KELLEY, Boston, Mass., assignors to the Blair Camera Company, same place. Filed Nov. 4, 1891. Serial No. 410,872. (No model.)



Claim.—The combination, with a plate A, having a lens-opening, and an oscillatory shutter B, having an exposure-orifice B' and notches at one edge, of a lengthwise-sliding rod C, pivotally connected with the shutter in proximity to the pivot on which the latter oscillates, a spring D, having a fulcrum D' and connected at its inner extremity with the lengthwise-sliding rod, a lever E, pivoted intermediate its ends and provided at one extremity with a tooth E', adapted to engage the notches at the edge of the oscillatory shutter, a push-button E², acting against the other end of the lever to move its tooth from engagement with the shutter-notches, a spring E³, acting on the lever to force its tooth into the shutter-notches, a lever G, loosely engaged with the toothed lever, a push-button F, and a rod or spindle F', operated by the push-button, provided with a pin *f*, and having its extremity adapted to move into the path of a projection on the shutter, substantially as described.

478,910. AUTOMATIC TRAP FOR CABLE-CONDUITS. IRA BISHOP and ARTHUR F. L. BELL, San Francisco, Cal. Filed Jan. 29, 1892. Serial No. 419,709. (No model.)

Claim.—1. In a cable railway having a tube or tunnel provided with an opening for the removal and insertion of the grip from and into said tube or tunnel, a door or cover controlling said opening, and

478,910.

connections with said door or cover actuated by the car to operate it and cause it to expose and cover said opening, substantially as herein described.

2. In a cable railway having a tube or tunnel provided with an opening in its top for the removal and insertion of the grip-frame from and into said tube or tunnel, a swinging door or cover controlling said opening, and connections with said door or cover actuated by the car to swing the door or cover open and closed, substantially as herein described.

3. In a cable railway having a tube or tunnel provided with an opening in its top for the removal and insertion of the grip-frame from and into said tube or tunnel, a door or cover controlling said opening, a lever in the roadway actuated by the car, and connections between said lever and the door or cover, whereby the latter is operated to expose and cover the opening, substantially as herein described.

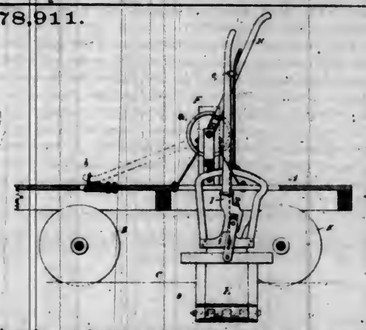
4. In a cable railway having a tube or tunnel provided with an opening in its top, the opposing plates D, separated to form the slot and constituting the door or cover of the opening, and connections actuated by the car to throw said plates from and toward each other to expose and cover the opening, substantially as herein described.

5. In a cable railway having a tube or tunnel provided with an opening in its top, the opposing plates D, separated to form the slot and constituting the door or cover of said opening, a lever in the roadway above actuated by the car, and connections between said lever and the plates D to throw them from and toward each other to expose and cover the opening, substantially as herein described.

6. In a cable railway having a tube or tunnel provided with an opening in its top, the combination of the opposing separated plates D, controlling said opening, the pivoted levers E, upon which said plates are carried, connections with said levers actuated by the car for moving them from each other to cause their plates D to expose the opening, and a weight to return them to cover the opening, substantially as herein described.

7. In a cable railway having a tube or tunnel provided with an opening in its top, the combination of the opposing separated plates D, controlling said opening, the pivoted levers E, by which said plates are carried, a lever above actuated by the car, and connections between said lever and the levers E, whereby the latter are separated to cause their plates to expose the opening, and a weight to return them to close the opening, substantially as herein described.

8. In a cable railway having a tube or tunnel provided with an opening in its top, the combination of the opposing separated plates D, controlling said opening, the pivoted levers E, by which said plates are carried, the weighted arm F, connected with one of said levers, the bell-crank lever connected with said weighted arm and with the other of said levers, and connections with said bell-crank lever actuated by the car above to operate it, substantially as herein described.



9. In a cable railway having a tube or tunnel provided with an opening in its top, the combination of the opposing plates D, controlling said opening, the pivoted levers E, by which said plates are carried, the weighted arm F, connected with one of said levers, the bell-crank lever connected with said weighted arm and with the other of said levers, the pivoted presser-lever in the roadway above, adapted to be actuated by the car-wheels, and the link connecting said presser-lever with the bell-crank lever, substantially as herein described.

10. In a cable railway having a tube or tunnel provided with an opening in its top to permit the removal and insertion of the grip, the fixed separated guide-bars in said tube or tunnel for directing the descending grip to position to take the cable, substantially as herein described.

478,911. LIFTING MECHANISM FOR CABLE-GRIPS. IRA BISHOP and ARTHUR F. L. BELL, San Francisco, Cal. Filed Jan. 29, 1892. Serial No. 419,710. (No model.)

Claim.—1. In combination with a vertically-movable grip of a cable-railway car, the means for raising said grip out of and lowering it into the tube or tunnel, consisting of a rotary sheave mounted upon the car and the chain or rope secured to the grip and to said sheave

478,911.

and adapted to wind upon and unwind from said sheave, substantially as herein described.

2. In combination with the vertically-movable grip of a cable-railway car, the means for raising and lowering said grip out of and into the tube or tunnel, consisting of the rotary sheave, the operating-lever attached to it, whereby it is rotated, and the chain or rope connecting said sheave with the grip, substantially as herein described.

3. In combination with the vertically-movable grip of a cable-railway car, a locking device for holding it in place on its suspending devices and releasing it and a mechanism carried by the car and connected with the grip for raising and lowering it when released out of and into the tube or tunnel, substantially as herein described.

4. In combination with the vertically-movable grip of a cable-railway car, a locking device for holding it in place on its suspending devices and releasing it and the means for lifting and lowering the grip when released out of and into the tube or tunnel, consisting of the rotary sheave with its lever and the chain or rope connecting the sheave and grip, substantially as herein described.

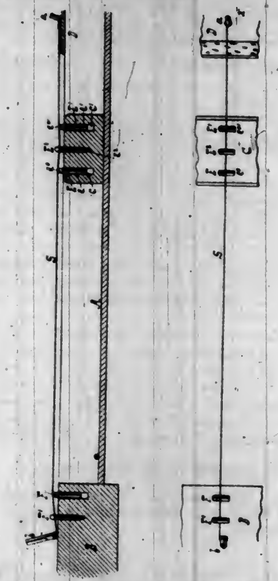
5. In combination with the vertically-movable grip of a cable-railway car, a mechanism for lifting the grip out of the tube or tunnel and lowering it therein and the pins J, having extensions *j'*, over which said grip is fitted and on which it moves up and down and is guided in said movement, substantially as herein described.

6. In combination with the vertically-movable grip of a cable-railway car, the fixed pins with their extensions, upon which said grip is fitted and guided in its movement, locking devices carried by the grip for engaging and disengaging said pins to hold the grip in place and to relieve it, and means for operating said locking devices, substantially as herein described.

7. In combination with the vertically-movable grip of a cable-railway car, the fixed guide-pins over which said grip is fitted, said pins having notches or grooves, the pivoted hooks carried by the grip and adapted to be thrown into and out of engagement with said notches or grooves, and a lever and connecting devices for operating said hooks, substantially as herein described.

8. In a cable-railway car, the combination of the grip, the fixed guide pins over which it is fitted, said pins having notches or grooves, the pivoted hooks carried by the grip for engaging said notches or grooves, a lever and connections for operating the hooks to throw them into and out of engagement, and a means for raising and lowering the grip when released by its hooks, substantially as herein described.

9. In a cable-railway car, the combination of the grip, the fixed guide-pins over which it is fitted, said pins having notches or grooves, the pivoted hooks carried by the grip for engaging said notches or grooves, a lever and connections for operating the hooks to throw them into and out of engagement, and a means for raising and lowering the grip when released from the pins, consisting of the sheave, the lever for operating the sheave, and the chain or rope connecting the sheave with the grip, substantially as herein described.

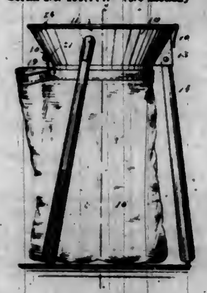


10. In combination with the vertically-movable grip of a cable-railway car, the rotary sheave carried by the car, the lever connected with the sheave, and the chain or rope connecting the sheave with the grip, whereby said grip is raised and lowered, and a friction attachment operating upon the sheave to control its return movement when lowering the grip, substantially as herein described.

11. In combination with the grip of a cable-railway car, the means for raising and lowering the grip, consisting of the rotary sheave G and the chain or rope I, connecting said sheave with the grip, and the means for controlling the return movement of the sheave when the grip is being lowered, consisting of the friction-disk N, having the pawls *n*, and the series of ratchet-teeth *g'* of the sheave, with which the pawls engage in one direction, substantially as herein described.

12. In combination with the grip of a cable-railway car, the means for raising and lowering the grip, consisting of the rotary sheave G and the chain or rope I, connecting said sheave with the grip, and the means for controlling the return movement of the sheave when the grip is being lowered, consisting of the friction-disk N, having the pawls *n*, the series of ratchet-teeth *g'* of the sheave, with which the pawls engage in one direction, and the fixed friction-plate against which the friction-disk bears, substantially as herein described.

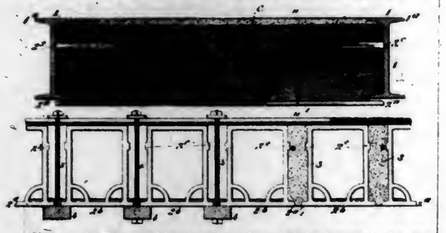
13. In combination with the grip of a cable-railway car, the means for raising and lowering the grip, consisting of the rotary sheave G and the chain or rope I, connecting said sheave with the grip, and the means for controlling the return movement of the sheave when the grip is being lowered, consisting of the friction-disk N, having the pawls *n*, the series of ratchet-teeth *g'* of the sheave, with which the pawls engage in one direction, the fixed friction plate against which the friction-disk bears, and the pivot pin or axle and nuts for regulating the degree of said friction, substantially as herein described.



478,912. STRINGING PIANO-FORTES. DOMINIK L. BOLLERMANN, New York, N. Y., assignor to Arthur Bollermann, same place. Filed Apr. 14, 1892. Serial No. 429,150. (No model.)

Claim.—1. In a piano-forte, the combination, with a string, of right-angled supporting-pins located at the ends of the sounding portions of the string and having their lateral heads provided with convex surfaces, and means for depressing the string upon the lateral heads of the right-angled supporting-pins, substantially as described.

2. In a piano-forte, the combination, with a string, of right-angled supporting-pins located at the ends of the sounding portions of the string and having their lateral heads provided with convex surfaces, and screw-threaded depressors screwed into the bridge and wrest-plank and having lateral heads which rest on the string, substantially as described.

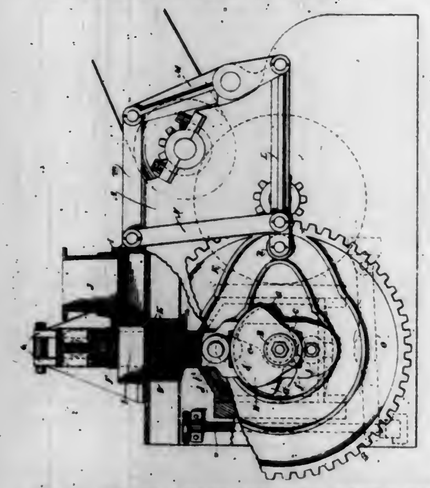


478,918. SACK-HOLDER. JAMES C. BRATNEY, Sparta, Ill. Filed Sept. 25, 1891. Serial No. 406,777. (No model.)

Claim.—1. The combination, with a funnel having suitable supports, of hooks pivoted on the funnel and adapted to engage a sack, said hooks having their wires extending through the wall of the funnel and formed into a loop within the funnel, and a hook or catch to engage the loop when swung up, substantially as shown and described.

2. The combination, with a funnel having suitable supports and provided on the outer side of its neck with projections or teeth and with apertures, of hooks pivoted on the wall of the funnel and adapted to engage the sack at said apertures, said hooks having their wires extending through the funnel-wall and formed into a loop within the funnel, and a catch secured to the inner funnel-wall and adapted to engage the loop, substantially as shown and described.

478,914. FIRE-PROOF FLOOR-ARCH. PRESTON M. BRUNER, St. Louis, Mo. Filed Mar. 2, 1892. Serial No. 423,543. (No model.)

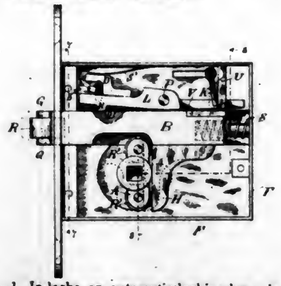


Claim.—1. The combination, in a floor, of the beams 1, the bars or rods C, the blocks arranged in rows, extending from beam to beam, and the filling 3, said rows of blocks having spaces between them and said bars or rods and said filling fitting in said spaces, substantially as set forth.

2. The combination, in a floor, of the beams 1, and the rows of blocks 2, extending from beam to beam, the said blocks having ribs 2^a upon their sides, with the concrete filling 3 between the blocks, substantially as set forth.

3. The combination, in a floor, of the beams 1, the rows of blocks 2, extending from beam to beam, and the concrete filling between the same, said filling composed of an upper layer 3^a and a lower layer 3^b, with hollow space between them, substantially as set forth.

4. The combination, in a floor, of the beams 1, the rows of hollow blocks 2, extending from beam to beam, the concrete filling 3 between the blocks, and the plates 7 at the lower part of the filling, substantially as set forth.



478,915. BRICK-MACHINE. WALFRID BURKMAN, San Francisco, Cal. Filed May 15, 1891. Serial No. 392,893. (No model.)

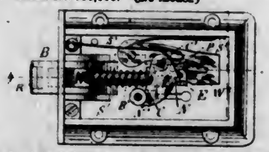
Claim.—1. The mode of pressing plastic material in molds by means of plungers, which consists in first partially compressing the material from one side and holding the plunger stationary to said compression, second, compressing the material from the other side to a line beyond its central plane and holding the plunger stationary to said compression, and, finally, compressing the material fully from the first side, substantially as herein described.

2. In a brick-machine, the combination of the mold, the upper plunger, the lower plunger having the hollow base, the main shaft passing through said base, the cam C on said shaft within the hollow base and adapted to raise and lower the lower plunger, an adjustable stop-bar below for limiting the movement of said lower plunger, the cams G on the main shaft, operating on the side arms of the upper plunger to draw said plunger down and other cams H on said main shaft operating on said arms to raise the upper plunger and to control its downward movement under the action of the cams G, substantially as herein described.

478,916. LOCK. CHARLES E. CANDEE, New York, N. Y. Filed Feb. 4, 1891. Serial No. 380,143. (No model.)

Claim.—1. In locks, an automatic locking-lever, in combination with a positive locking, positive unlocking, and freeing cam E, a bolt B, and a removable key K, engaging the locking-lever to disengage the same and also the bolt B to retreat the same, substantially as shown and described.

2. In locks, the locking-lever L, fulcrumed centrally, in combination with the positive locking, positive unlocking, and freeing cam E, the bolt B, and the removable key K, engaging, first, the locking-lever L to unlock the same, and, second, the bolt B to retreat the same, substantially as shown and described.



3. In locks, an automatic locking-lever, in combination with the positive locking, positive unlocking, and freeing cam E, a bolt B, a removable key K, engaging the locking-lever to disengage the same and also the bolt B to retreat the same independently of the knob and spindle, and an eccentric spindle-socket stopping the bolt in either one of two positions at will, one of which is a locking position in relation to the locking-lever.

4. In locks, the locking-lever L, fulcrumed centrally, in combination with the positive locking, positive unlocking, and freeing cam E, the bolt B, the removable key K, engaging, first, the locking-lever L to unlock the same, and, second, the bolt B to retreat the same, and an eccentric spindle-socket stopping the bolt B into two positions at will, substantially as shown and described.

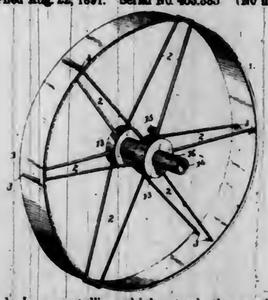
5. In locks, an automatic locking-lever, in combination with the positive locking, positive unlocking, and freeing cam E, a bolt B, a removable key K, engaging the locking-lever to disengage the same and also the bolt B to retreat the same independently of the knob and spindle, and an eccentric spindle-socket stopping the bolt in either one of two positions at will, one of which is a locking position in relation to the locking-lever, the spindle-socket being provided with the rollers R' for retreating the bolt independently of the key.

6. In locks, the locking-lever L, fulcrumed centrally, in combination with the positive locking, positive unlocking, and freeing cam E, the bolt B, the removable key K, engaging, first, the locking-lever L to unlock the same, and, second, the bolt B to retreat the same, and an eccentric spindle-socket stopping the bolt B in two positions at will and provided with the rollers R' for retreating the bolt B independently of the key K.

478,917. LOCK. CHARLES E. CANDEE, New York, N. Y. Filed July 13, 1891. Serial No. 399,395. (No model.)

Claim.—1. A lock-bolt provided with an anti-friction roller for contact with the jamb or striking plate, hinged in the lock-frame, normally projecting from the lock-frame in the path of the jamb or striking plate, and also hinged to a reciprocating stem or false bolt, the false bolt having an outward-thrusting spring in charge of both bolts, in combination with a retreating, holding, and tripping cam acting directly on the reciprocating false bolt for those purposes.

2. A lock-bolt provided with an anti-friction roller for contact with the jamb or striking plate, hinged in the lock-frame, normally projecting from the lock-frame in the path of the jamb or striking plate, and also hinged to a reciprocating stem or false bolt, the false bolt having an outward-thrusting spring in charge of both bolts, in combination with a retreating, holding, and tripping cam acting directly on the reciprocating false bolt for those purposes, and also with a disengaging cam and an engaging tumbler, (one or more,) which may be disengaged thereby, so as to permit the retreat of both bolts by one and the same movement.



3. A lock-bolt provided with an anti-friction roller for contact with the jamb or striking plate, hinged in the lock-frame, normally projecting from the lock-frame in the path of the jamb or striking plate, and also hinged to a reciprocating stem or false bolt, the false bolt having an outward-thrusting spring in charge of both bolts, in combination with a retreating, holding, and tripping cam acting directly on the reciprocating false bolt for those purposes, and with a jamb-escutcheon or strike-plate provided with an incline for retreating the hinged bolt within its frame, and an engaging seat behind the incline to receive the released hinged bolt end secure the door in position.

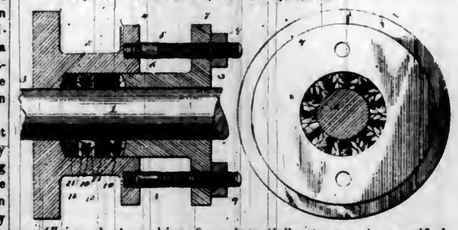
4. A lock-bolt provided with an anti-friction roller for contact with the jamb or striking plate, hinged in the lock-frame, normally projecting from the lock-frame in the path of the jamb or striking plate, and also hinged to a reciprocating stem or false bolt, the false bolt having an outward-thrusting spring in charge of both bolts, in combination with a retreating, holding, and tripping cam acting directly on the reciprocating false bolt for those purposes, with a removable key, which may disengage the tumbler (one or more) and retreat the bolt independently of the cam or cams, and with a jamb-escutcheon or strike-plate provided with an incline for retreating the hinged bolt within its frame, and an engaging seat behind the incline to receive the released hinged bolt and secure the door in position.

5. The false bolt or stem B', provided with the pins P P' and the head E and the cams C C', in combination with the key K and tumbler W, (one or more,) provided with the slot L and notch N^2.

6. The false bolt or stem B', provided with the pins P P' and the head E and the cams C C', in combination with the tumbler W, (one or more,) provided with the slot L and notch N^2.

478,918. VEHICLE-WHEEL. CLINTON D. CANNON, Battle Creek, Mich. Filed Aug. 22, 1891. Serial No. 403,385. (No model.)

Claim.—1. In a metallic vehicle-wheel, the combination, with the metal rim, of the opposite spaced anchorihg-ring, the double spokes having their opposite ends secured to said rim and anchoring-ring, the soft-metal hub-jacket inclosing said ring and the hub ends of said spokes, and a supplemental axle-box detachably secured within said hub-jacket, substantially as set forth.

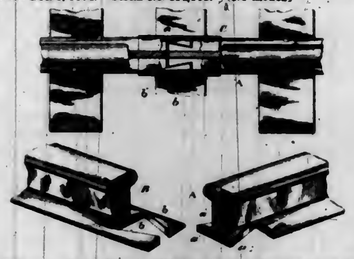


2. In a metallic vehicle-wheel, the combination, with the rim, of the anchoring-rings provided with a series of perforations, the U-shaped double spokes passing through said rim and engaging the perforations in said rings, and of the soft-metal integral hub inclosing said rings and the hub ends of said spokes, substantially as set forth.

3. In a metallic vehicle-wheel, the combination, with the rim, of the spaced anchoring-rings provided with a series of perforations, the U-shaped double spokes passing through said rim and provided with hooked ends adapted to engage the perforations in said spaced anchoring-ring, and of the soft-metal integral hub inclosing said rings and the hub ends of said spokes, substantially as set forth.

4. In a metallic vehicle-wheel, the combination, with the rim, of a central anchoring-ring provided with an outwardly-projecting lug having a screw-threaded perforation, spokes secured to said rim and said anchoring-ring, a soft-metal hub inclosing said ring and the hub ends of said spokes, an axle-box located within said hub, and a set-screw adapted to pass through the hub and said perforated lug and ring and secure said box within the hub, substantially as set forth.

5. In a metallic vehicle-wheel, the combination, with the rim, of spaced anchoring-rings provided with a series of perforations, a screw-threaded lug projecting outwardly from one of said anchoring-rings, the U-shaped double spoke passing through perforations in said rim and terminating in hooked ends, adapted to engage the perforations in said spaced anchoring-rings, a soft-metal integral hub inclosing said rings and the hub end of said spokes, an axle-box registering with the interior bore of said hub, and a set-screw adapted to pass through the hub and said perforated lug and ring and secure said box within the hub, substantially as set forth.



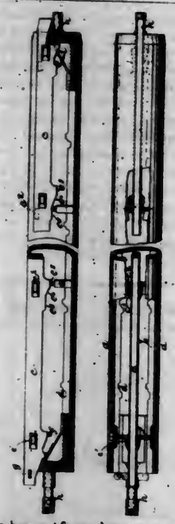
478,919. ROD-PACKING. ROSS CARLIN, New Orleans, La. Filed Jan. 26, 1892. Serial No. 419,326. (No specimens.)

Claim.—1. A packing for substantially the purpose specified, formed of segments of fibrous fabric or material arranged with the cut ends for contact with the surface to be packed, as explained.

2. The packing for substantially the purpose specified, formed of segments of woven or analogous fibrous material arranged with the cut ends in contact with the surface to be packed and having interspaced continuous rings, substantially as and for the purpose specified.

478,920. RAILROAD-RAIL JOINT. WARREN H. CARR, Bath, Me. Filed Dec. 8, 1891. Serial No. 414,363. (No model.)

Claim.—1. In a railroad-rail joint, the combination, with the end of a rail having its base only extended and said extension provided with a dovetail recess, of the opposing end of a meeting rail having its base recessed at opposite sides to form a dovetail portion fitting within said dovetail recess, but of less length than the latter, substantially as and for the purpose set forth.

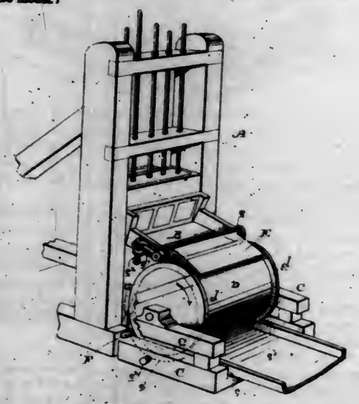


2. In a railroad-rail joint, the combination, with a rail having an extension at one end provided at opposite sides with outwardly-flaring lugs, the latter forming, conjunctively, a dovetailed portion, of the opposing end of a meeting rail having its base extended to provide two ears diverging outwardly at their inner faces and forming an intermediate dovetailed recess adapted to receive said dovetail portion, and means for locking the latter in the recess therefor, substantially as and for the purpose set forth.

3. The herein-described railroad-rail, having its base only extended at one end and provided with a dovetail recess extending from top to bottom of said extension, said rail being formed at its opposite end with a dovetail portion of less length than the dovetail recess, substantially as and for the purpose set forth.

478,921. COLLAPSIBLE CORE-BARREL. FREDERICK CHAMBERS, Derby, England. Filed Sept. 14, 1891. Serial No. 405,728. (No model.)

Claim.—1. The combination, with a core-bar composed of hinged segments *a a b*, said core-bar formed with journals and the segments *a a* provided at their upper edges with wedges, of a longitudinal key-



478,921.

bar located in said core-bar and formed at its upper portion with wedges to engage the wedges of the core-bar and having projections c^3 c^4 and incline c^5 formed on its under portion, and stay-bars *f*, engaging the segments *a a* and adapted in connection with said projections and incline to throw said key-bar into engagement with the core-bar to expand the latter.

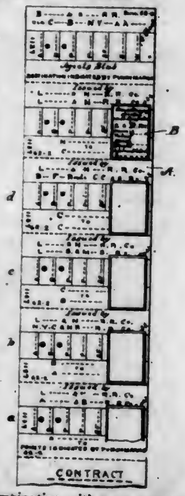
2. The combination, with a core-bar composed of hinged segments *a a b*, said core-bar formed with journals and the segments *a a* provided at their upper edges with wedges, of a key-bar located and longitudinally movable in said core-bar, provided at its upper portion with wedges to engage the wedges of the core-bar and having projections c^3 c^4 and incline c^5 formed on its under portion, stay-bars *f*, engaging the segments *a a* at intervals, stay-pieces *v*, projecting interiorly from the core-bar, the cotter *g*, engaging a slot in the key-bar for locking the core-bar in its expanded position, and the hook *i*, formed on the key-bar to retain the same in its retracted position after the core-bar is collapsed, substantially as described.

478,922. AMALGAMATOR. WILLIAM J. CONNORS and WILLIAM W. EDDY, Grass Valley, Cal. Filed Jan. 15, 1892. Serial No. 418,206. (No model.)

Claim.—1. In an amalgamator, a rotating cylinder having an amalgamating outer surface or periphery upon which the material is fed, in combination with a feed-regulating plate having an amalgamated under surface to catch the free fine gold, substantially as herein described.

2. In an amalgamator, a rotating cylinder having an amalgamating outer surface or periphery, in combination with a feed-regulating plate contiguous to said cylinder, having a crank-arm and screw for adjusting the plate and regulating the feed, substantially as herein described.

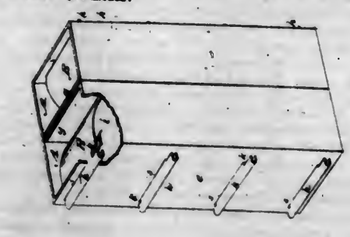
3. In an amalgamator, the combination of a rotating cylinder having an amalgamating outer surface or periphery, an apron to feed the material to the cylinder-surface, and a regulating-plate in the apron and extending over the cylinder, substantially as described.



4. In an amalgamator, the combination of a rotating cylinder having an amalgamating outer surface or periphery, an apron to feed the material to the cylinder-surface, and the swinging adjustable regulating-plate in the apron and extending over the cylinder, substantially as described.

5. In an amalgamator, the combination of the rotating cylinder having an amalgamating outer surface or periphery, the supply-apron over said cylinder, the adjustable regulating plate in said apron and extending over the cylinder, and means for cleaning the surface of the cylinder as it rises, substantially as described.

6. In an amalgamator, the combination of the rotating cylinder having an amalgamating outer surface or periphery, the supply-apron over said cylinder, the adjustable regulating-plate in said apron and extending over the cylinder, the underlying bed with its receiving-chamber and discharge-chute, and means for cleaning the surface of the cylinder as it rises, substantially as described.

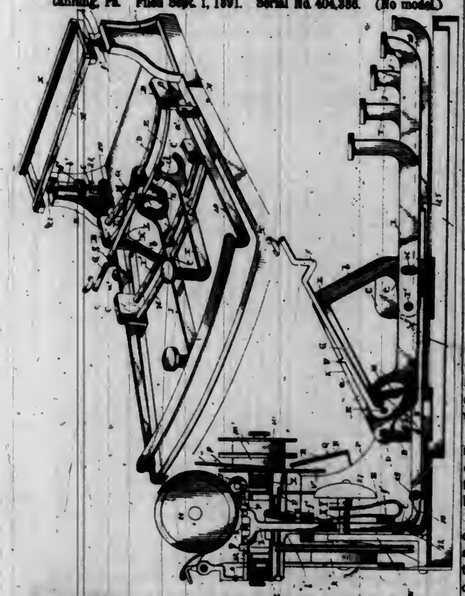


7. In an amalgamator, the combination of the rotating cylinder having an amalgamating outer surface or periphery, the supply-apron over said cylinder, the adjustable regulating-plate in said apron and extending over the cylinder, the underlying bed with its receiving-chamber and discharge-chute, and means for cleaning the surface of the cylinder as it rises, consisting of the water-sprinkler and the scraper, substantially as described.

478,928. EXCESS-BAGGAGE STAMP OR CHECK FOR RAILROAD-TICKETS. THOMAS M. CUNNINGHAM, Nashville, Tenn. Filed Dec. 14, 1891. Serial No. 414,961. (No model.)

Claim.—The combination, with a passenger's coupon-ticket, of an excess-baggage stamp or check adapted to be permanently secured to a coupon of the ticket, substantially as and for the purpose set forth.

478,924. EGG-CARRYING PACKAGE. ROBERT G. DALE and WALTER S. WEIGHTMAN, Durango, Colo. Filed Apr. 14, 1892. Serial No. 429,129. (No model.)



Claim.—1. An egg-carrying package or case composed of an outer body part made of pasteboard or thick paper bent or folded to form two tubular sections lying side by side with their inner walls dividing them but left free to open, and of inner thin paper or flexible strips looped to form a series of separate egg chambers in each tubular section of the case, substantially as specified.

2. In a divided or sectional egg-carrying package or case of the character described, the two folded tubular sections of the opening and closing case provided with a series of slots in two of their opposite outer walls, in combination with thin paper or flexible strips folded over upon themselves and looped to form a series of separate egg-chambers within the tubular sections and constructed at their folding portions with incisions in their edges forming locking-tongues, which engage with the slotted portions of the tubular sections, essentially as shown and described.

3. The blank for a sectional egg carrying package or case of the character described, composed of a strip of pasteboard or stiff paper creased or marked, as at *b b*, *c c*, and *d d*, to fold over from reverse ends and having a series of slots *a* in the portions *e e* between the folding lines or creases *b c* and *b c*, substantially as described.

478,925. TYPE-WRITING MACHINE. JAMES D. DAUGHERTY, Kittanning, Pa. Filed Sept. 1, 1891. Serial No. 404,386. (No model.)

Claim.—1. In a type-writing machine, a platen, a series of pivoted type-bars, a series of pivoted key-levers which vary in length, and two pivotal points for the key-levers, one of said pivotal points of the key-levers being nearer the pivotal point of the type-bars than the others, the short and long levers being respectively pivoted at one of said pivotal points and extending around the other pivotal point to allow them to vibrate, substantially as specified.

2. In a type-writing machine, a series of type-bars and key-levers, the type-bars having each two characters, a base having vertical supports at each side of its inner end, which are provided with vertical guideways at their inner sides, a guide-rail, vertical bars connected to the guide-rail and moving vertically in the guideways, and a U-shaped frame pivoted between its ends and having its inner ends connected with the lower ends of the said vertical bars for moving them vertically, the type-bars and key-levers being entirely within the U-shaped frame, the transverse portion of the frame being thereby outside of the outer ends of the key-levers to be depressed, all combined substantially as described.

3. A pivoted type-bar for a type-writing machine, having a projection at its pivoted end which is convex upon its outer edge and provided with a projection upon its inner edge, combined with a key-lever having a projection which engages the convex surface of its outer edge and a second projection which engages the said projection upon the inner edge of the type-bar projection, the parts operating substantially as specified.

4. In a type-writing machine, a platen, a series of pivoted type-bars, a series of key-levers which vary in length, two pivotal bars for the key-levers, one of said bars being nearer the pivotal point of the type-bars than the other, the levers having an opening to receive one of said pivotal bars, and a slot through which the other pivotal bar passes, all combined as specified.

5. In a type-writer, a carriage having two parallel racks, one of said racks being pivoted, a spacing-lever carrying a dog which has two ends that alternately engage the two racks, and key-levers and type-bars, all combined to operate substantially as specified.

6. In a type-writing machine, a carriage carrying a rack, a feed-lever having a vertical portion carrying a dog which engages the said rack, a spring-pulley, a shaft therefor, which has one end extending inside of the vertical portion of the feed-lever, an adjustable stop upon the inner end of the said shaft, and a spring engaging the said stop and the vertical portion of the feed-lever, all combined substantially as specified.

7. In a type-writing machine, a carriage carrying a rack, a feed-lever having a vertical portion carrying a dog which engages the said rack, a spring-pulley, a shaft therefor, which has one end extending inside of the said vertical portion of the feed-lever and screw-threaded, a screw-threaded socket upon the said shaft, carrying a bell, and a spring between the said socket and the vertical portion of the feed-lever, the parts combined substantially as described.

8. In a type-writing machine, a vibrating feed-lever having a vertical portion, and a vibrating ribbon guide or carrier, which is engaged and tilted by the said vertical portion of the feed-lever, the parts combined substantially as specified.

9. In a type-writing machine, a vibrating feed-lever having a vertical portion, and a vibrating ribbon-guide pivoted in front of the said vertical portion of the feed-lever, having a depending portion which is engaged by the vertical portion of the feed-lever, the parts combined substantially as set forth.

10. In a type-writing machine, a vibrating feed-lever having a vertical portion, and a vibrating ribbon-guide pivotally supported in front of the feed-lever and having a depending portion which is pivotally connected with the said vertical portion of the feed-lever, all combined substantially as shown.

11. In a type-writing machine, a vertically-shifting platen-frame carrying a platen, ribbon-spools, and a ribbon-feed mechanism, combined with type-bars carrying each two characters, and key-levers, all combined as set forth.

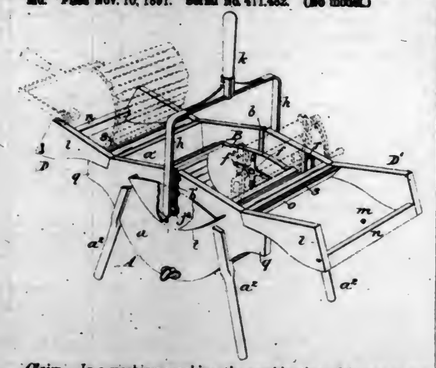
12. A ribbon-feed mechanism for type-writing machines, comprising a ribbon-spool carrying an operating-wheel, a vibrating frame upon one side of the spool, a lever pivoted at the opposite side of the spool from the frame, having its free end adapted to engage therewith, and a dog upon the lever between its free end and pivotal point for engaging the said operating-wheel, substantially as described.

13. The combination, in a type-writing machine, with a printing mechanism and a vibratory ribbon-frame for the purpose described, of a ribbon-spool upon each side thereof, pivoted levers having their free ends engage the said frame, and dogs upon the levers for operating the said spools, substantially as described.

14. In a type-writer, the combination, with a printing mechanism, of a vibratory ribbon-frame for the purpose described, a ribbon-spool at each side thereof, levers pivoted at opposite sides of the spools from the said frame, having their free ends engaging the said frame, and dogs upon the levers between their free ends and pivotal points which engage the said spools, substantially as set forth.

15. A ribbon-feed mechanism for type-writing machines, comprising ribbon-spools, a vibrating frame between the said spools, a bar sliding transverse the said spools, carrying pivoted levers having their free ends alternately engage the vibrating frame when the sliding bar is moved, and dogs upon the levers for operating the spools, substantially as described.

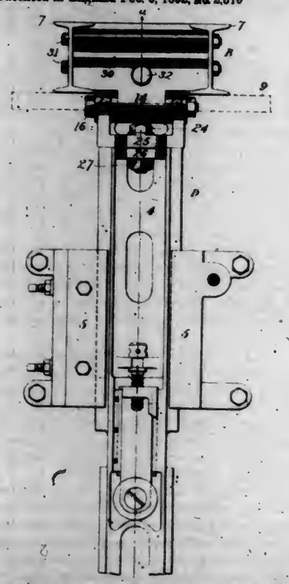
16. A ribbon-feed mechanism for type-writing machines, comprising ribbon-spools carrying ratchet-wheels, a vibrating frame between the said spools, a bar sliding transverse to the vibrating frame, levers pivoted at their outer ends to the said sliding bar and their inner ends having slots which engage the said vibrating frame alternately when the sliding bar is moved, and pawls upon the levers for engaging the ratchet-wheels, whereby the ribbon is made to travel in the reverse direction, substantially as specified.



17. A ribbon-feed mechanism for type-writing machines, ribbon-spools carrying ratchet-wheels, a vibrating frame between the spools, a bar sliding transverse the vibrating frame, carrying pivoted levers having their free ends adapted to alternately engage the vibrating frame when the sliding bar is moved, actuating-pawls upon the levers for engaging the said ratchet-wheels, and holding-pawls upon the sliding bar for engaging the ratchet-wheels, whereby the levers and pawls are moved together, substantially as set forth.

18. In a type-writing machine, a vertically-shifting carriage having a rack-bar, a vibrating feed-lever carrying a pawl which engages the said rack and which is wider than the distance of the vertical

movement of the carriage, whereby it remains in engagement with the rack when the carriage is moved vertically, type-bars having each two characters, and key-levers, all combined substantially as specified.



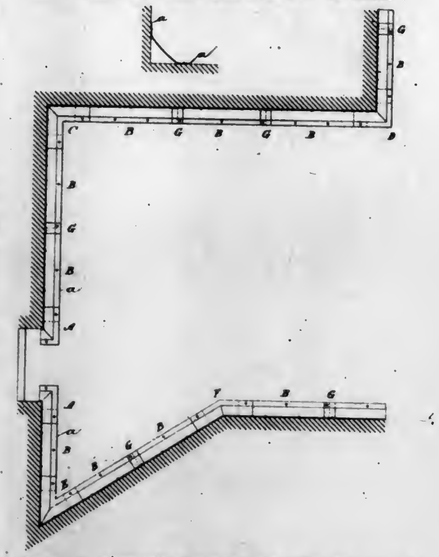
19. In a type-writing machine, a platen, type-bars pivoted at their inner ends between the said platen, having each a tapered projection on its inner face between its free ends, and a plate between the pivotal points of the type-bars and the platen, having a series of perforations to receive the said projections, substantially as specified.

478,926. WASHING-MACHINE. EDGAR A. BOHLETON, Easton, Md. Filed Nov. 10, 1891. Serial No. 411,482. (No model.)

Claim.—In a washing-machine, the combination of the tub A, provided with slots *b b* and castings *b' b'*, a rubber B, provided with handle-arms *h h*, extending outside of the tub and having ends *g* rigidly secured to the sides of the rubber, and adjustable collars *j j*, mounted upon the ends *g g* and adapted to be brought into contact with the castings *b' b'* to prevent side play of the rubber.

478,927. MACHINE FOR PRINTING OIL-CLOTH. GEORGE F. EISENHARDT, Philadelphia, Pa., assignor to Dienelt & Eisenhardt, same place. Original application filed June 1, 1891, Serial No. 394,736. Divided and this application filed May 19, 1892. Serial No. 433,575. (No model.) Patented in England Feb. 6, 1892, No. 2,316.

Claim.—1. The combination of the frame of a block-printing machine having guides, a cross-head for supporting the printing-blocks, vertical end pieces on the cross-head movable in said guides, and horizontal joints connecting the cross-head and end pieces, substantially as set forth.



2. The combination of the frame of a block-printing machine having guides, a cross-head for supporting the printing-blocks, vertical end pieces on the cross-head movable in said guides, and vertical joints connecting the end pieces and cross-head, substantially as set forth.

3. The combination of the frame of a block-printing machine, a cross-head for supporting the printing-blocks, vertical end pieces on said cross-head movable in guides of the frame, and vertical and horizontal joints connecting the cross-head and the end pieces, substantially as and for the purpose set forth.

4. In a block-printing machine, the combination of the cross-head for the printing-blocks, and end pieces to which the cross-head is detachably connected, and trunnions projecting from the cross-head and arranged below the center of gravity thereof, substantially as and for the purpose set forth.

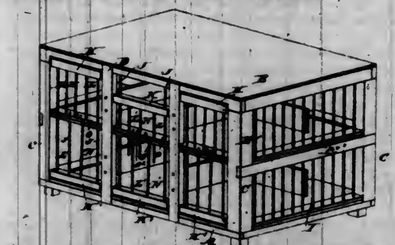
5. In a block-printing machine, the combination, with the cross-head for the printing-blocks, consisting of connected parallel I-beams and intermediate web-pieces provided with projecting lugs, of end pieces having ears and bolts passing through the lugs and ears, and guides for the end pieces, substantially as described.

478,928. ANGLE-FINISH FOR ROOMS. AARON D. ELLIS, Rutland, Vt. Filed July 14, 1890. Serial No. 358,679. (No model.)

Claim.—1. An angle-finish consisting of straight strips having integral marginal portions formed at obtuse angles with the strips and at right angles with each other, and the angular strips adapted for recess-terminals and angles, each formed of a single piece of material shaped to form two body portions and provided with a continuous horizontal margin which is integral with the strip from end to end, substantially as described.

2. An angle-finish for rooms, consisting of a narrow inclined strip formed in angular sections shaped to form two body portions, having their ends lapped with the ends of the straight sections adjacent, each body portion having a narrow margin integral therewith and continuous from end to end of the angular section, a parallel margin being formed on each body portion to rest against the vertical wall, substantially as described.

478,929. SAD-IRON. CHARLES G. ETTE and BARNEY H. SANDERS, St. Louis, Mo., assignors to said Ette. Filed Oct. 29, 1891. Serial No. 410,203. (No model.)

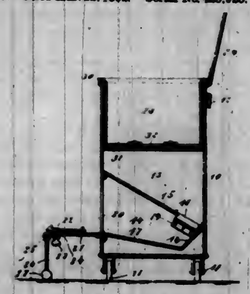


Claim.—1. In a sad-iron, the combination of the main recessed body, the intermediate plate rivated thereto, as described, so as to leave an air-space between the plate and the body, said plate having a longitudinal slot, the handle-provided shield-plate located upon the intermediate plate with an intermediate air-space, said shield-plate having an enlargement that enters the slot in the intermediate plate, and the locking device consisting of a rotary pin carrying at its top suitable knobs and at its bottom a locking-bar which operates in conjunction with the under face of the intermediate plate, substantially as described.

2. In a sad-iron, the combination of the recessed body A, having ribs *g*, the intermediate plate H, having a central slot I, reverse inclines J J on its under side, provided with stops *j* and lugs or projections *k* on its upper face, said plate H being riveted to body A, the handle-provided shield-plate C, having on its under side the longitudinal enlargement C', and the locking device consisting of the pin D, locking-bar E, rigid on the lower end of pin D, yoke F, rigidly connected to the upper end of pin D, and knob *f'*, carried by said yoke, substantially as described.

3. In a sad-iron, the combination of the main body A, having recess A' and ribs *g*, the intermediate plate H, riveted to body A and having longitudinal slot I, lugs *k* on its upper face, and the shield-plate C having enlargement C' on its under side adapted to enter the slot I, together with the locking-bar E, substantially as described.

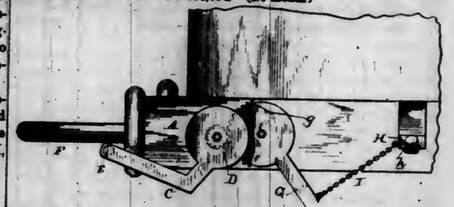
478,930. FOWL-CRATE. FRIEDRICH W. EWERT, Wood Lawn, Ill. Filed Apr. 15, 1892. Serial No. 429,370. (No model.)



Claim.—1. A fowl-crate comprising single compartments, one for each fowl, and a door arranged on the front end of each compartment and formed of a bar fitted to slide on vertical rods, guide-rods held on the said bar and fitted to slide in bearings on the crate, and a locking-rod also secured on the said bar and adapted to engage an enlarged recess in its guiding-opening, substantially as shown and described.

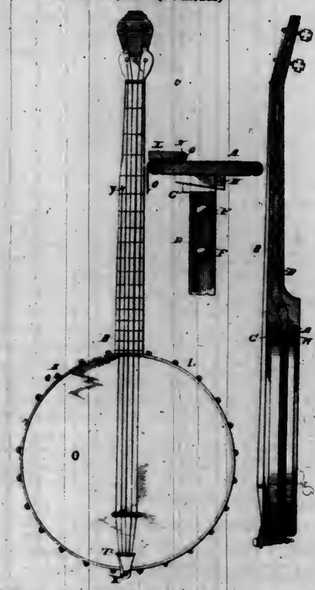
2. A fowl-crate comprising a bottom, a top, posts for connecting the top and bottom, a transverse partition dividing the crate into upper and lower compartments, and transverse and longitudinal bars arranged in each upper and lower compartment for dividing the latter into single compartments, one for each fowl, substantially as shown and described.

3. A fowl-crate comprising a bottom, a top, post for connecting the top and bottom, a transverse partition dividing the crate into upper and lower compartments, transverse and longitudinal bars arranged in each upper and lower compartment for dividing the latter into single compartments, one for each fowl, and a door arranged in the front of each single compartment and comprising a bar fitted to slide vertically, guide-rods for the said bar, and a locking-rod held on the said bar and adapted to engage an enlarged recess in its guide opening, substantially as shown and described.



478,931. WOOD AND COAL BOX. RUDOLPH FREDERROLL, New York, N. Y. Filed Mar. 22, 1892. Serial No. 426,925. (No model.)

Claim.—1. A wood and coal box comprising a main open-topped case having an inclined partition therein, with an opening through the same, and having a swinging door in its lower portion, and a wood-box held to slide freely in the upper portion of the case, substantially as described.



2. The combination, with the main case having an upper and a lower compartment therein and an opening into the lower compartment through one wall, of a wood-box held to slide in the upper portion of the main case, said wood-box having a removable bottom grate, substantially as described.

478,932. LINK-LIFTER. JOHN FINNEY, Portland, Oreg. Filed Nov. 6, 1891. Serial No. 411,094. (No model.)

Claim.—The combination, with a draw-bar, of the arms C, carrying cross-bar E, a cog-wheel D, connected to the arms, a lever G, having toothed segment *g* meshing with the wheel D, a lever H, and a chain I, connecting the levers G and H, all substantially as described.

748,933. MUSICAL INSTRUMENT. JOHN R. HENNIVE, Kansas City, Mo., assignor, by mesne assignments, of one-half to W. S. Harvell and H. F. Carson, Chicago, Ill. Filed Apr. 29, 1890. Renewed June 9, 1892. Serial No. 436,119. (No model.)

Claim.—1. In a musical stringed instrument, the combination, with the body of the instrument and its neck, of a metallic brace extending through the neck and across the body, and means for securing the brace to the body, substantially as set forth.

2. In a musical stringed instrument, the combination, with the body and the neck of the instrument, and a metallic brace extending through the neck and across the body, of a screw-threaded end upon the brace, adapted to pass through the side of the rim and be secured thereto by a nut, clamps upon the brace within the body of the instrument, and wedging devices for tightening the body against the clamps, substantially as set forth.

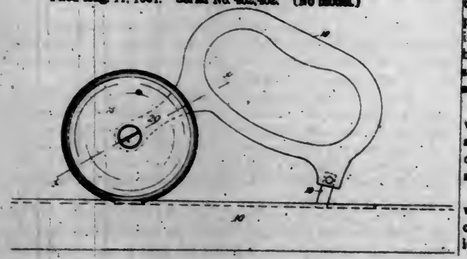
3. In a musical stringed instrument, the combination, with the tail-piece, of a boot pin secured thereto, and an adjustable connection between the pin and the rim, whereby the tail-piece may be fastened

to the instrument and draws against the tension of the strings, substantially as set forth.

4. In a banjo, the combination, with a smooth-sided neck and the body of the instrument, of a peg Y in the side of the neck, a tail-piece adapted to be secured to the body, and a key upon the tail-piece, adapted to stretch a string from the peg Y, substantially as set forth.

5. In a musical instrument, the combination, with the body and a tail-piece adapted to be secured thereto, of a pin secured to the body and the tail-piece and adapted to hold the parts together, a socket in the top of the pin, and a key X, adapted to fit into the socket and carry a string, substantially as set forth.

478,934. RAZOR-STROP. WILLIAM C. HOWARD, Brooklyn, N. Y., assignor to the Howard Manufacturing Company, Boston, Mass. Filed Mar. 7, 1892. Serial No. 423,964. (No model.)

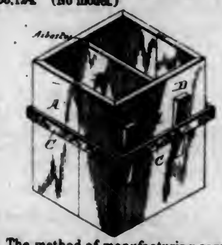


Claim.—1. The combination, with block *a*, of cushions *b* on opposite sides of the block and a holding-strip extending into the cushions and around the ends of the block, substantially as described.

2. The combination, with a block *a*, of cushions *b* on opposite sides of the block, a holding-strip extending into the cushions and around the ends of the block, and a handle having a shank passing through said strip and into the end of the block, substantially as described.

3. The combination, with block *a*, of cushions *b* on opposite sides of the block, having covers *c*, provided with flaps extending over and secured at the ends of the block, a holding-strip extending into the cushions and around the ends of the block, and a handle having a shank passing through said strip and into the end of the block, substantially as described.

4. The combination, with block *a*, of cushions *b* on opposite sides of the block and strip *d*, consisting of two separate pieces extending about the opposite ends of the block and having their ends passed into the cushions, substantially as described.



478,935. PAPER-CUTTER. ALBERT L. KARSHNER, Denver, Colo. Filed Aug. 11, 1891. Serial No. 402,402. (No model.)

Claim.—1. In a paper-cutter, a rotating disk suitably mounted, in combination with a guideway or track having a metal bottom and side plate, substantially as and for the purpose set forth.

2. In a paper-cutter, the combination, with a rotating disk, of a strip of suitable material having a guide-track for the disk and retaining mechanism consisting of a plural number of spring-actuated needles and a series of controlling-levers suitably connected and simultaneously manipulated for the purpose of releasing or depressing the needles, substantially as described.

478,936. MANUFACTURE OF STEEL INGOTS. CHARLES W. KENNEDY and JOHN W. GRANTLAND, Philadelphia, Pa.; said Grantland assignor to said Kennedy. Filed May 30, 1891. Renewed May 16, 1892. Serial No. 433,124. (No model.)

Claim.—1. The method of manufacturing compound ingots composed of inseparably united strata of metal, which consists in casting two malleable metals or two qualities or grades of the same malleable metal simultaneously in a mold on opposite sides of a diaphragm made of a material of less specific gravity than said metals and capable of being disintegrated and reduced to impalpable powder by the heat of the poured metals, substantially as and for the purpose set forth.

2. The combination, with a mold for metals, of one or more interiorly-arranged diaphragms or partitions of asbestus-board or its equivalent capable of being disintegrated and reduced to impalpable powder by the heat of the poured metals, substantially as and for the purpose set forth.

478,937. SPRING-VEHICLE. THOMAS D. LINES, Syracuse, N. Y., assignor to Charles A. Denison, same place. Filed Mar. 31, 1891. Serial No. 387,140. (No model.)

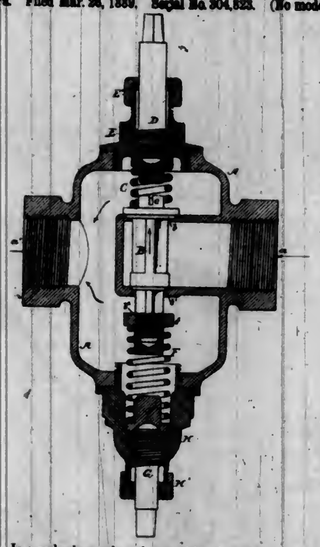
Claim.—1. The combination, with the axle, of saddles mounted rigidly on the end portions of the axle and terminating with posts formed integral with the saddles, and a bar connected at opposite ends to said posts and shouldered thereon to resist inward strain of said posts, and thereby brace the axle and side springs hung on said bar, as set forth.

2. The improved trussed running-gear consisting of the axle formed with a depressed central portion, saddles mounted rigidly on the end portions of said axle, rigid posts rising from said saddles, and a bar over the axle and in a vertical plane therewith and secured at opposite ends to the aforesaid posts and shouldered thereon to resist inward strain of the posts, as set forth.

3. The combination of the axle formed with a depressed central or main portion, posts rising from said portion and provided with journal-bearings approximately in line with the end portions of the axle, an equalizing and strut bar mounted in said journal-bearings, and side springs hung on said bar, as set forth.

4. The combination of the axle formed with a depressed central portion, saddles mounted rigidly on the end portions of said axle and terminating with posts near the junction of the depressed and end portions of the axle and integral with the saddles, journal-bearings on the posts approximately in line with the end portions of the axle, an equalizing and strut bar over the axle, mounted on the aforesaid journal-bearings, and having fixed shackle-ears at the inner sides of the aforesaid posts, and side springs hung on said equalizing-bar, substantially as described and shown.

5. The combination, with the axle B, reach C, saddle H, formed with the post H', journal-bearing *f*, and removable cap on said post, and the equalizing and strut bar D, mounted in said bearing, of the clip *g*, embracing and firmly tying said axle, reach, saddle, bearing, and cap together, substantially as described and shown.



6. The combination, with the front bolster and a side spring provided with an eye, of a ferrule having a socket fitting over the end of the bolster, and an extension formed on said socket and provided in its under side with a recess or cavity, in which the eye of the spring is arranged, and a bolt passing through the eye of the spring and the ferrule, substantially as set forth.

478,938. TAG FOR CLOTH-BOARDS. JOHN V. MOORE, Hiawatha, Kans. Filed Aug. 26, 1891. Serial No. 403,796. (No model.)

Claim.—In a device for marking goods, substantially as described, a plate adapted to be attached to the bolt-board of the goods, said plate having an extended central portion to form guides for the goods, as well as to receive marks designating the price and quantity of goods in the roll, and perforated arms projecting from the central portion, the width and projection of the arms corresponding with the thickness and width of the board, and pins for securing the plate to the board, substantially as set forth.

478,939. REGULATING-VALVE. JOHN S. MCDANIEL, Philadelphia, Pa. Filed Mar. 26, 1889. Serial No. 304,823. (No model.)

Claim.—In a reducing-valve, the combination of the valve-casing, the inlet-chamber, valve-seats thereon, a valve-stem, two flanges or disks thereon, forming valves adapted to said seats, the two adjustable caps *c'* and *f'*, and springs interposed between the valve-stem and the caps *c'* and *f'*, with mechanism for adjusting said springs, substantially as specified.

478,940. ATOMIZER. THOMAS E. OGRAM, Washington, D. C. Filed Sept. 16, 1891. Serial No. 405,572. (No model.)

Claim.—1. In an atomizer comprising a fluid-receptacle, a storage-bulb, and a compressible bulb, and a valve-chamber and valve located intermediately between the expansion-bulb and the compressible bulb, the valve serving, normally, to close the air-passage to the fluid-receptacle, for the purposes specified.

2. In an atomizer comprising a fluid-receptacle, compressible bulb, and storage-bulb, a stopper closing the mouth of the fluid-receptacle, having a recess therein that connects with the storage-bulb and with the interior of the fluid-receptacle, and a valve serving, normally, to close the air-passage to the fluid-receptacle.

3. In an atomizer comprising a fluid-receptacle, compressible bulb, and storage-bulb, and a valve serving, normally, to close the passage to the fluid-receptacle, having a push-rod operated from the outside.

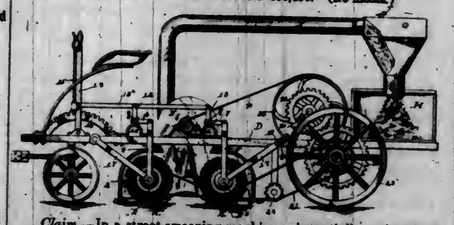
4. In an atomizer comprising a fluid-receptacle, a compressible bulb, and a storage-bulb, the stopper closing the mouth of the fluid-receptacle, having a recess with separate openings that communicate with the compressible bulb and with the storage-bulb and with the interior of the vessel, and a valve arranged in said recess and serving, normally, to close the passage to the fluid-receptacle.

5. In an atomizer comprising a fluid-receptacle, a compressible bulb, and a storage-bulb, the stopper closing the mouth of the fluid-receptacle, having a recess and a valve arranged in said recess, a valve-rod having a spiral spring, and a thumb-button for operating the same.

6. The combination, in an atomizer, of a fluid-receptacle, a stopper closing the mouth of the fluid-receptacle, a compressible bulb arranged at the side of the stopper, a storage-bulb arranged upon the top of the stopper, and a valve located in the stopper and serving, normally, to close the passage to the fluid-receptacle.

7. In an atomizer, the combination, with the receptacle for the fluid, of a stopper closing the mouth of the fluid-receptacle, having a recess communicating with the interior of the vessel, the sleeve fitting therein, the discharge-tube having a shouldered end fitting and turning in said sleeve, and the packing surrounding the tube and located between the shoulder of said tube and the end of the sleeve, for the purposes specified.

8. The combination, in an atomizer, with the valve and valve-rod, said rod projecting exteriorly and by which the valve is operated, of a sleeve inclosing said rod, for the purposes specified.



478,941. WOVEN FABRIC FOR MACHINE-BELTING. JOHN OLDFIELD, Medford, Mass. Filed Oct. 18, 1890. Serial No. 368,573. (Specimens.)

Claim.—1. A woven fabric for machine-belting and other like purposes, consisting of a series of plies, the warps of all of which are of fibrous material, and the wefts of two of the inner ones are metallic, and a series of metallic binder-warps passing alternately from the metallic weft of one of the inner plies to the metallic weft of the other inner ply, thereby binding the inner plies together, and the exterior plies being bound to the inner plies by means of fibrous binding-warps passing from one face of the belt to the other, substantially as described.

2. A woven fabric for machine-belting and other like purposes, consisting of facing-plies, interior plies, and intermediate plies, the warps of all of which are of fibrous material and the wefts of the intermediate plies are of metal, and a series of metallic binder-warps passing alternately from the metallic weft of one of the intermediate plies to the metallic weft of the other intermediate ply, thereby binding them together, and the facing-plies being bound to the inner plies by means of fibrous binding-warps passing from one face of the belt to the other, substantially as described.

478,942. SWEEPING-MACHINE. EDWIN O. PEASE, Jersey City, N. J. Filed Sept. 18, 1891. Serial No. 406,139. (No model.)

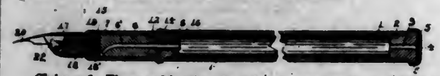
Claim.—In a street-sweeping machine, substantially as described, the combination, with the platform mounted on supporting and guide wheels, the brush-carrying shafts, and a suitable means for rotating

said shafts, of the bell-crank levers mounted on bearings upon the platform above the brush-carrying shafts, the hanger-rods connected at one end to the brush-carrying shafts and at their opposite ends to one branch of the bell-crank levers, the link-rods 17 18, pivotally connected at their upper ends to the platform and at their lower ends to the brush-carrying shafts, the pitmen connected to the vertically-disposed branches of the bell-crank levers, the transverse bar connecting the forward ends of said pitmen and having a forwardly-extending branch, a hand-lever connected to the forwardly-extending branch of the transverse bar, and a suitable means for adjustably fixing said lever, substantially as and for the purpose set forth.

478,948. TOOL-HOLDER. GEORGE RENFORS, MARTIN O. RENFORS, and JOHN G. RENFORS, Philadelphia, Pa., assignors to Henry D. Justi, same place. Filed Sept. 22, 1890. Serial No. 365,846. (Model.)

Claim.—1. A tool-holder having a casing with a tapering or conical end, a head movable in said casing and having secured thereto a sleeve with tapering ends, a toggle-lever having one end pivoted to the casing and the other to the head, and mechanism, substantially as described, for operating said toggle-lever, said parts being combined substantially as described.

2. A tool-holder having a casing with a tapering end having an opening therein, a head movable in said casing and having a compressible sleeve secured thereto, a toggle-lever pivoted to the casing and head, and a spindle with mechanism attached thereto, substantially as described, for opening and closing said toggle-lever, said parts being combined substantially as described.



3. A tool-holder having a casing with a tapering end having an opening therein, a head movable in said casing, a compressible sleeve connected with said head, a toggle-lever pivoted to said head and casing, a spindle with a cross-piece adapted to contact with the said lever, so as to open the same, and means, substantially as described, connected with the spindle for closing said lever, said parts being combined substantially as described.

4. A tool-holder having a casing, a compressible sleeve within said casing consisting of sections, a head connected to each of said sections by pins passing through enlarged openings in said sections, and mechanism pivotally connected with said head and casing for closing said sleeve, said parts being combined substantially as described.

5. A tool-holder having a casing, a compressible sleeve within said casing formed of longitudinal sections, a head connected with said sections, a toggle-lever pivoted to said head and casing, a head with a spindle, and a strip or neck secured to said last-mentioned head and having an inclined front portion adapted to contact with one side of a member of the said toggle-lever, said parts being combined substantially as described.

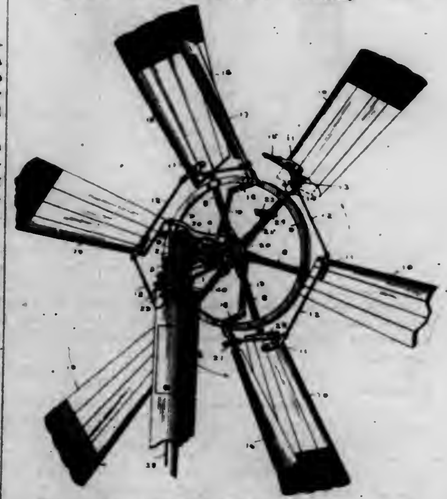
6. A tool-holder having a casing, a spindle therein provided with a sleeve having an enlarged portion with an annular groove therein, a collar on said spindle within said groove, and screws securing the collar to said spindle, said sleeve having openings in its sides for the passage of said screws, said parts being combined substantially as described.

478,944. FOUNTAIN-PEN. ALBA H. ROBINSON, Meeker, Colo. Filed Jan. 27, 1892. Serial No. 419,435. (No model.)

Claim.—1. The combination, in a fountain-penholder, of the ink well or tube 1, the tube 6, having an eccentric bore communicating with the interior of said tube 1, the tube 7, rotatable in a constant plane about tube 6, and a perforated disk fixed to and rotatable with tube 7, whereby the bore of tube 6 and the perforations in the disk can be made to register without moving said disk lengthwise of the pen and without compressing the same, substantially as set forth.

2. In a fountain-penholder, the combination of an ink-well, the tube 7, filled with the brush, the tube 18, fitting said tube 7, the pen adapted to be held on tube 18, and devices for regulating the flow of ink to the brush, substantially as set forth, whereby ink is automatically supplied to the brush whether the pen be in place or be removed.

3. In a fountain-pen, the combination of an ink-well, the tube 7, filled with the brush, the tube 18, fitting said tube 7, the removable pen and ink-guide, and devices for regulating the flow of ink to the brush, substantially as set forth, whereby ink is automatically supplied to the brush whether the pen be in place or be removed.



4. In a fountain-penholder, the combination of the ink-well, the tube 7, the removable perforated disk 15, the removable brush, and brush-tube 18, substantially as set forth.

5. In a fountain-penholder, the combination of the ink-well, the detachable tube 7, the removable perforated disk 15, the removable brush, brush-tube 18, and a pen, substantially as set forth.

6. In a fountain-penholder, the combination of the ink-well, the detachable tube 7, the removable perforated disk 15, the removable brush, the brush-tube 18, a pen, and devices 23, consisting of a tubular part and an ink-guiding needle, substantially as set forth.

7. In a fountain-penholder, the combination of the ink-well, the tubes 6 and 7, connected to said well and having a recess between them, the bearings 10, fixed to one of said tubes in the recess, the projections 12, fixed on the other, the elastic packings, plates interposed between said bearings and projections, an eccentric ink-passage in tube 6, and a perforated disk bearing against the foot of said latter tube, substantially as set forth.

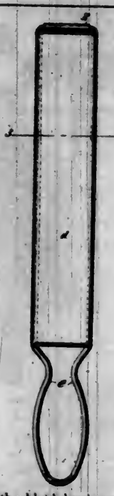
478,945. WIND-ENGINE. SETHOUR A. ROUSE, Indianapolis, Ind. Filed Apr. 22, 1891. Serial No. 389,970. (No model.)

Claim.—1. In a windmill, a wind-wheel, its spokes extended beyond the wheel-frame, sails pivoted to such spokes, an equal number of sails on one side the wheel, connected together by links to insure simultaneous action, a spring mounted on one of the spokes of each series and its extended end also connected to and through the several links, whereby its force is normally exerted to hold such series of sails in position to catch the force of the wind, a brake-wheel loosely mounted on the wheel-hub, a governing-vane pivoted to the wheel-frame and also connected to such series of sails and to the brake-wheel, and a spring mounted on one of the wheel-spokes within the wheel-frame, its inner extended end pivoted to the brake-wheel, the tension

of each spring normally acting to control the governing-vane and in opposition to the force of the spring that controls the angle of the sails, all combined substantially as shown and described.

2. In a wind-engine, a main casting suitably supported, a wheel-frame mounted on a shaft revolving in bearings therein, sails pivoted to the spokes outside the wheel-frame and connected in an equal series on each side the wheel, a spring mounted on one of the spokes outside the wheel-frame, controlling each series of sails and holding them in position to catch the force of the wind, a brake-wheel loosely mounted on the hub of the wind-wheel, a governing-vane pivoted to the wheel-frame, connected to one of the sails of each series outside the wheel-frame, its inner end connected by a link to the brake-wheel in combination with a spring mounted on one of the spokes of the wind-wheel, its inner end connected to the brake-wheel, the tension of such latter spring operating to draw the vane away from the sail in front of it and to hold the link connections of the governing mechanism taut, thereby preventing all noise and wear of parts, substantially as shown and described.

3. In a wind-engine, a wind-wheel revolving on a shaft having bearings in a main casting suitably supported, sails pivoted to the spokes of the wheel, an equal number thereof connected to each other, and a spring secured to one of the spokes, whose tension normally holds the sails of its series to the wind, a brake-wheel loosely mounted on the inside of the hub of the wind-wheel, notched to engage with a stop formed upon the spider, in combination with a governing-vane set between each series of sails, pivoted to the wheel-frame and to the brake-wheel, and a spring connected to the brake-wheel and to each vane, whose tension normally operates against the tension of the spring that controls the sails, substantially as shown and described.



4. In a wind-engine, a revolving wheel suitably mounted on the framework, sails hinged thereto and connected in two equal divisions, springs holding such sails to the wind, a governing-vane between each series of sails, a spring connected to the wheel, whose tension normally operates to draw the vane away from the sail in front of it, in combination with a brake-wheel loosely mounted on the inside of the hub of the main wheel, provided with notches for engaging a stop upon such wheel, and a brake-lever adapted to contact frictionally with the inner periphery of such brake-wheel, the vanes and sails of both series connected together through such brake-wheel, whereby the increase of the force of the wind operates against and is resisted by the combined tension of both sets of springs, substantially as shown and described.

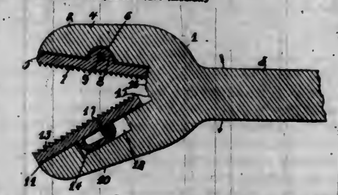
5. In a wind-engine, a wind-wheel revolving on a shaft having bearings in a main casting, sails hinged outside the wheel-frame to the spokes, the sails connected together on opposite sides of the wheel in two separate and equal divisions, a pair of governing-vanes set opposite each other across the diameter of the wheel between the sails and pivoted to the wheel-frame, a brake-wheel loosely mounted inside and upon the hub of the wind-wheel, such governing-vanes pivotally connected to the brake-wheel, the latter notched to engage with a stop formed on the spider, a spring mounted on one of the spokes near the lower end of its sail and pivotally connected to the links that connect each series of sails, by whose tension such sails are held to the wind, and a spring connected to one of the spokes within the wheel-frame and to the brake-wheel, its tension normally operating to take up the slack of the links connecting the vane and sail mechanism, preventing noise and wear of the parts, substantially as shown and described.

6. In a wind-wheel, a main casting suitably supported, a wind-wheel whose shaft is revolved on bearings in such main casting, projections formed on the shaft of the main casting, cored out to form oil-cups, a brake-wheel mounted on the hub of the wind-wheel, and a brake-lever pivoted to the main casting, forming a cover for the oil-receptacles and operated by a suitable rod or cord below, whereby the inner end of the brake-lever is brought into frictional contact with the inner periphery of the brake-wheel, substantially as shown and described.

7. In a wind-engine, a wind-wheel mounted on a shaft revolving in bearings in the main casting, such main casting suitably supported upon the mast-post, in combination with a pair of friction-wheels carried in bearings on the mast and contacting with the outer periphery of the post-cap, such wheels located on either side of a line drawn through the center of the shaft of the wind-wheel and bearing radially against the post-cap on either side of such line, whereby lateral displacement is prevented and the weight of the main wheel thrown upon such friction-wheels, substantially as shown and described.

478,946.

2. The combination, with a block having edge grooves, of cushions *b* on said block, cover *d*, wrapped about said block and cushions and having its edges overlapped within one of the grooves, and wire holder *c* in said grooves, securing the overlapping edges of the cover and forming a handle for the strop at one end, substantially as described.

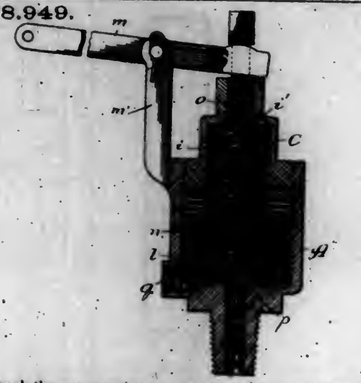


478,947. BOX. AZEL AMES, Jr., Chelsea, assignor to S. K. Hamilton, Wakefield, Mass. Filed Apr. 13, 1892. Serial No. 429,018. (No model.)

Claim.—1. The combination, with a box formed of two parts, one of which has a weakened or frangible integral portion, of an adhesive band or label secured to the box outside said weakened portion.

2. The combination, with a box composed of the parts A and B, the latter having a lip *b*, provided with annular groove *b'*, and entering the part A, of an adhesive band or label C, secured to both of said parts A and B, substantially as described.

478,948. PIPE-WRENCH. ALBERT BARRIS, St. Louis, Mo., assignor, by direct and mesne assignments, of five-sixths to John Johnson, Alphinie Martini, and Anna Martini, same place. Filed Apr. 6, 1892. Serial No. 428,007. (No model.)



Claim.—A pipe-wrench consisting of a handle 3, a jaw 2, composed of extensions 4 and 10, a semicircular depression 6, formed in the said extension 4, a ratchet-tooth plate 7, provided with a rounded projection 8, adapted to be received by the said depression, a rivet or bolt 9, passed through said extension 4 and projection 8, a movable ratchet-tooth plate 13, provided with a staple-shaped extension 14, an elongated depression 12, formed in the said extension 10, and a rivet or bolt 17, passed through the said extension and the staple-shaped extension 14 for limiting the movement of the said jaw 13 in one direction, substantially as described.

478,949. SAFETY-VALVE. SAMUEL M. BERRY, Chicago, Ill., assignor to the Berry Valve Company, same place. Filed Apr. 5, 1892. Serial No. 427,880. (No model.)

Claim.—1. In a valve device, the combination, with the valve-chamber having an inlet and an outlet, of a cap for the open end of the chamber, a valve seated over the inlet and having its stem extend-

478,949.

ing through the cap, a spring on the stem, and a shield formed in telescoping sections surrounding the spring and stem in the chamber and confined between the valve and cap, the section which extends from the cap encircling and closely fitting toward its inner end the exterior of the adjacent end of the companion section, and the spring operating to distend the shield and seat the valve, substantially as described.

2. In a valve device, the combination, with the valve-chamber having an inlet and an outlet, of a cap for the open end of the chamber having a valve-seat in its under side, a valve seated over the inlet and having its stem extending through the cap and valve-seat thereon, a spring on the stem, and a shield formed in telescoping sections surrounding the spring and stem in the chamber, one section extending from the said valve and the other having a head surrounding the stem to engage the said seat in the cap, the spring operating to distend the shield and seat the valve and head at its opposite ends, substantially as described.

3. In a valve device, the combination, with the valve-chamber having an inlet and an outlet, of an adjustable cap for the open end of the chamber, a valve seated over the inlet and having its stem extending through the cap, a spring on the stem, and a shield formed in telescoping sections surrounding the spring and stem in the chamber and confined between the valve and cap, the upper section being beveled to form a knife-edge at its lower end, and the spring tending to distend the shield and seat the valve, substantially as described.

4. In a valve device, the combination, with the valve-chamber having an inlet and an outlet, of an adjustable hollow cap C for the open end of the chamber, having a seat in its outer side, a valve *p*, seated over the inlet and having its stem extending through the cap and seat therein, a spring *n*, surrounding the stem in the chamber, and a shield B, formed in telescoping sections *l* and *i*, surrounding the spring and stem in the chamber, the section *l* extending from the valve *p*, and the section *i* being confined in the hollow cap and having a head *i'* surrounding the stem to engage the seat in the cap, the spring operating to distend the telescoping sections of the shield and seat the valve and head at its opposite ends, substantially as described.

5. A valve device comprising, in combination, a valve-chamber A, having an inlet *r* and an outlet *q*, an adjustable hollow cap C for the open end of the chamber, having a seat in its under side, a valve *p*, seated over the inlet and having its stem *o* extending through the cap and seat therein, a spring *n*, surrounding the stem in the chamber, a shield B, formed in telescoping sections *l* and *i*, surrounding the spring and stem in the chamber, the section *l* extending from the valve *p*, and the section *i* being confined in the hollow cap and having a bevel *x* on its lower edge and at its upper end a head *i'* surrounding the stem to engage the seat in the cap, the spring operating to distend the telescoping sections of the shield and seat the valve and head at its opposite ends, and a lever *m*, fulcrumed on the chamber A and engaging at one end the projecting end of the stem, the whole being constructed and arranged to operate substantially as described.

478,950. ALARM-CLOCK. CHARLES D. BROWN, Ames, Iowa, assignor of two-thirds to H. L. Munn and J. L. Stevens, same place. Filed Oct. 24, 1891. Serial No. 409,732. (Model.)

Claim.—1. An alarm attachment for clocks, comprising an alarm-dial carrying a cam constructed with two tracks, one of which is cam-shaped for the purpose of releasing the drop-lever and the other approximately circular in form and provided with a passway whereby to permit the said lever to pass from the cam portion to the circular track.

2. An alarm attachment for clocks, comprising an alarm-dial carrying a cam constructed with two tracks, one of which is cam-shaped and the other circular in form and provided with a passway to permit the drop-lever to pass from the cam portion to the circular portion, the latter portion being arranged in a plane approximately diagonal to that occupied by the cam portion.

3. An alarm mechanism for clocks, consisting of an alarm-dial carrying a wire bent to form two tracks, one of which is circular and the other cam-shaped and separated at their ends by a passway.

4. An alarm mechanism for clocks, consisting of an alarm-dial carrying a wire bent to form two tracks, one of which is circular and the other cam-shaped and separated at their ends by a passway, in combination with a drop-lever having a lateral arm provided with a toe designed to engage the said tracks.

478,950.

478,951. PLASTER. CHARLES CASTNER, St. Louis, Mo., assignor to the Cincinnati Mortar Manufacturing and Builders' Supply Company, Cincinnati, Ohio. Filed Oct. 12, 1891. Serial No. 408,505. (No specimens.)

Claim.—1. A composition consisting of water, lime, gypsum, and coke, substantially as described.

2. A composition consisting of water, lime, gypsum, and coke, and a mixture of lime, alum, and sugar, in the proportions specified.

3. A composition consisting of water, lime, gypsum, and coke, and a filling material, as and in the proportions specified.

4. A composition consisting of water, lime, gypsum, and coke, a mixture of sugar, alum, and lime, and a filling material, as and in the proportions specified.

5. A composition consisting of water, lime, gypsum, coke, and brick-dust, in the proportions specified.

478,952. HAT. SAMUEL COHEN, New York, N. Y. Filed Apr. 23, 1892. Serial No. 430,347. (No model.)

Claim.—A hat provided with a brim made in sections adapted to fold one upon the other and comprising a covering material, a lining, stiffening-plates filling the spaces between the said covering and lining, and joints formed by the covering material and lining at the ends of adjacent plates, substantially as shown and described.

478,953. GAS OR LAMP LIGHTER. ROBERT J. G. CORNER, Chicago, Ill., assignor of one-half to Carroll Bouse Vastine, same place. Filed Jan. 28, 1892. Serial No. 419,511. (No model.)

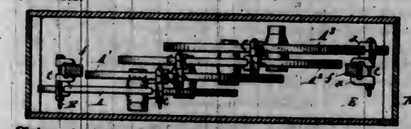
Claim.—1. The combination of the casing having an orifice for the discharge of the flame or flash and a discharge-aperture for the tape, a scratcher adjacent to said flame-orifice, and means for drawing the tape past said scratcher and ejecting it through said tape-aperture, said means being adapted to grip the tape between the scratcher and the said tape-discharge opening after it passes the scratcher, substantially as set forth.

2. The combination of the casing having an orifice for the discharge of the flame or flash and a discharge-aperture for the tape, a scratcher adjacent to said flame-orifice, a rotary drum and pressure-wheel, between which the tape passes, and which drum and pressure-wheel are arranged to grip the tape after it passes said scratcher, and means for actuating said drum, substantially as set forth.

3. The combination of the casing having an orifice for the discharge of the flame or flash and a discharge-aperture for the tape, a scratcher adjacent to said flame-orifice, a drum over which the tape passes to said tape-discharge aperture, a lever having a pawl, a ratchet-wheel with which said pawl engages, connected to said drum, the shaft E, upon which said drum, lever, and ratchet-wheel are journaled, a pressure-wheel arranged to bear upon said drum, and means for actuating said lever, substantially as set forth.

4. The combination of the casing having a flame-orifice and a tape-discharge aperture, a scratcher arranged adjacent to said flame orifice, means for feeding the tape past said scratcher and toward said tape-discharge orifice, arranged between the scratcher and said discharge-orifice, and guides for directing the waste tape from said feeding mechanism into said discharge-aperture, substantially as set forth.

5. The combination, with the casing having a flame-orifice, of the drum journaled in said casing, means for actuating said drum, a rubber or elastic roller journaled in said casing, with its periphery bearing upon said drum, and a scratcher impinging the periphery of said drum adjacent to said flame-orifice, substantially as set forth.



6. The combination, with the casing having a flame-orifice, of the drum journaled in said casing, means for actuating said drum, a rubber or elastic roller journaled in said casing with its periphery bearing upon said drum, and a scratcher impinging the periphery of said drum adjacent to said flame-orifice and being arranged and adapted to impinge the tape before the tape reaches the said roller, substantially as set forth.

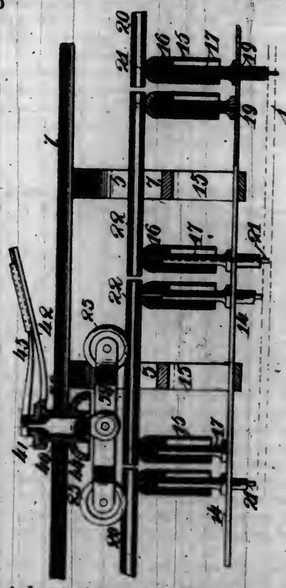
7. The combination, with the casing having the flame-orifice, of the drum journaled in said casing, a ratchet-wheel for actuating said drum, a bell crank having a pawl engaging said ratchet-wheel, a spring bearing upon one arm of said bell-crank, the hollow handle communicating with said casing and having a pull or trigger, a wire or cord connecting said trigger with one arm of said bell-crank, a pressure-roller bearing upon the periphery of said drum, and a scratcher impinging the periphery of said drum adjacent to said flame-orifice, substantially as set forth.

8. The combination, with the casing having a flame-orifice in one side and a tape-discharge aperture in its other side, of a drum journaled between said orifice and aperture in the upper part of said casing, a tape-reel journaled in said casing directly below said drum, a pressure-roller journaled in the casing and arranged to bear upon the drum at a point between the said flame-orifice and tape-discharge orifice, a scratcher arranged to impinge the drum adjacent to said flame-orifice, a handle secured to said casing under said tape-reel, and means for actuating the drum, substantially as set forth.

9. The combination of an upright casing having a flame-orifice in its side edge, a drum journaled in the upper portion of said casing, a tape-reel journaled in said casing immediately below said drum, a hollow handle secured to the lower side of said casing immediately below said tape-reel, a scratcher arranged to impinge the periphery of the drum adjacent to said flame-orifice, a pressure-wheel journaled in the casing and arranged to impinge the periphery of the drum on its upper side, and a wire for actuating said drum, passing downward through said handle, substantially as set forth.

478,954. DEVICE FOR PACKING VEHICLE-WHEELS. FRANCIS G. DAVIS, Watertown, N. Y. Filed Jan. 11, 1892. Serial No. 417,626. (No model.)

Claim.—1. A clamping device for packing wheels, consisting of a series of connected movable jaws bearing against opposite sides of each wheel and capable of movement toward and from each other, thereby firmly grasping each wheel and also forming space-blocks between the wheels, whereby the wheels are held out of contact with each other, substantially as set forth.



2. A device for packing wheels, comprising several clamps, each of which consists of two jaws capable of movement toward and from each other and bearing against opposite sides of the same wheel, and a tightening device whereby the clamps are attached together and tightened upon the wheels, substantially as set forth.

3. The combination, with two clamps, each of which consists of two jaws adapted to embrace the rim of a wheel, and a tie-bolt passing through the jaws of both clamps and operating to tighten each pair of jaws upon the wheel-rim which is grasped by them and also attaching the two clamps together, substantially as set forth.

478,955. COMPOUND OF SULPHURETED OILS. WALTER D. FIELD, Millburn, N. J. Filed Dec. 16, 1891. Serial No. 415,290. (No specimens.)

Claim.—A composition of matter consisting of glycyl or glyceryl others, combined with sulphuric acid to form sulpho fatty acid compounds and pyroxyline or nitro-cellulose, substantially as described.

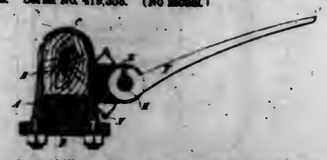
478,956. CONDUIT SYSTEM FOR ELECTRIC RAILWAYS. WILLIAM H. FORD, St. Louis, Mo., assignor of one-half to William A. Stickney, same place. Filed July 6, 1891. Serial No. 398,516. (No model.)

Claim.—1. In a conduit electric railway, the combination of a main insulated conductor located in or adjacent to a conduit, sections and sub-sections of bare conductor also located in a conduit a current-collector, such as a wheeled trolley, adapted to travel on the sections of bare conductor, a hydraulic cut-out having a float arranged to rise and fall when a body of water collects in said conduit, a switch arranged to be actuated by said float and to cut out said sub-sections when said float rises, a water and moisture proof switch-box, and electro-mechanical devices located in said switch-box in the line between said switch and said sub-sections and adapted to throw in and cut out said sections and sub-sections of bare conductor upon passage of the current-collector thereover, substantially as specified.

2. In a conduit electric railway, a pneumatic chamber consisting of a shell having an upper portion impermeable to water or air and a lower end open to the atmosphere, a body of insulating material located in the upper portion of said chamber at a distance from the open end thereof, and a vertical supporting-pin upon which the body of insulating material is mounted, in combination with a main insulated conductor and a bare conductor, between which said pneumatic chamber is located, and a conducting-wire passing from the main conductor up through the pneumatic chamber to the bare conductor, substantially as specified.

3. In a conduit electric railway, a main conductor, a series of pneumatic chambers containing bodies of insulating material within their upper ends, sections and sub-sections of bare conductor in circuit with said main conductor at times, said sub-sections and sections being mounted upon the exterior of said pneumatic chambers, and a series of pins or tubes upon the upper ends of which the several bodies of insulating material within said pneumatic chambers are mounted, and a conducting-wire passing from the main conductor up through the pneumatic chamber to the bare conductor, substantially as specified.

4. In a conduit electric railway, a pneumatic chamber comprising



a suitable shell closed at the top and open at the bottom, a body of insulating material in the upper portion of said chamber, a suitable base, as 14, a vertical pin, a tube supported on said base and carrying upon its upper end the body of insulating material, a main conductor below said chamber, and a sectional conductor supported on the top thereof, and a conducting-wire, as 21, passing from the main conductor up through said tube and pneumatic chamber and connecting with the bare conductor, substantially as described.

5. In an electric-railway system comprising a main insulated conductor and sectional bare conductors, a conduit composed of upper and lower chambers for the respective conductors, the lower chamber having cross-walls 90, with drain-pipes leading therefrom, and pneumatic chambers supported in the lower chamber and passing up into the upper chamber and supporting the bare conductors upon their upper ends, substantially as described.

6. In an electric railway, a main insulated conductor, a bare conductor supported above the same and in electrical connection therewith, a lower conduit for the main conductor, an upper conduit for the bare conductor, and pneumatic insulating-chambers interposed between the main and bare conductors supported in the lower conduit, but extending into the upper conduit and supporting from its upper end the bare conductor, substantially as described.

7. In an electric-railway system, a main insulated conductor, a sectional bare conductor composed of one long and two short sections alternately, suitable connections between the main and sectional conductors, and switches between the same under the control of the moving vehicle, substantially as described.

478,957. THILL-COUPLING. AMADEUS A. FROEHLICH, Brooklyn, assignor of one-half to William Hodgson, New York, N. Y. Filed Jan 26, 1892. Serial No. 419,358. (No model.)

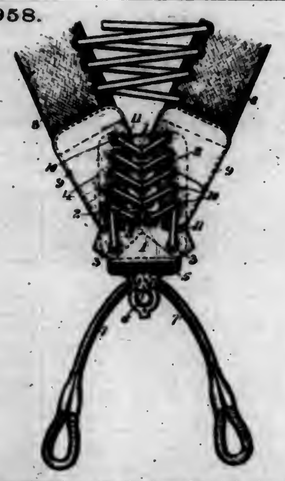
Claim.—1. A thill-coupling spring consisting of strips of leaf or plate metal arranged edge to edge and joined together at their ends, the strips being bent flatwise apart and one of them being shaped to adapt it to engage one of the parts of a thill-coupling when inserted in the same, substantially as described.

2. A thill-coupling spring consisting of a metal plate or leaf cut into strips which are integral with one another at their adjacent ends and bent apart, one or more of the strips being shaped to engage a part of a thill-coupling when inserted in the same, substantially as described.

3. A thill-coupling spring composed of a plate of metal I, cut into strips K L M, which strips are integral with the plate at their ends and one of which is bent away from the others and formed to engage a thill-iron head, substantially as described.

478,958. SUSPENDERS. JAMES P. GALVIN, Bridgeport, Conn. Filed Dec. 9, 1890. Serial No. 374,053. (No model.)

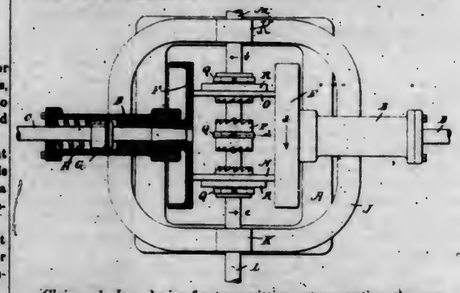
Claim.—1. The combination, with the shoulder-straps having lacing-eyelets in their extremities, of a base-piece provided with eyelets along its edges, and a lacing-cord whereby the straps are held in abutment with the edges of the base-piece, substantially as described.



2. The combination, in a suspender, with a perforated base-piece common to all the straps and provided with lacing-eyelets, of the shoulder-straps whose ends are provided with eyelets and are adapted to said base-piece, and an elastic lacing connection passing through the eyelets on the base-piece, and the eyelets carried by the straps, substantially as described.

3. In a suspender, the combination, with a base-piece common to all the straps, of the shoulder-straps whose ends are eyeleted and fit closely against the edges of the base-piece, an elastic lacing-cord whereby said straps are connected to the base-piece, and a guard or shield arranged behind the base-piece, whereby the clothing of the wearer is protected from abrasion.

4. In a suspender, the combination, with a base-piece common to the shoulder-straps and the straps independently secured to said base-piece by elastic lacing-cords, of a supplemental lacing-cord extended across between the straps above the base-piece, substantially as described.

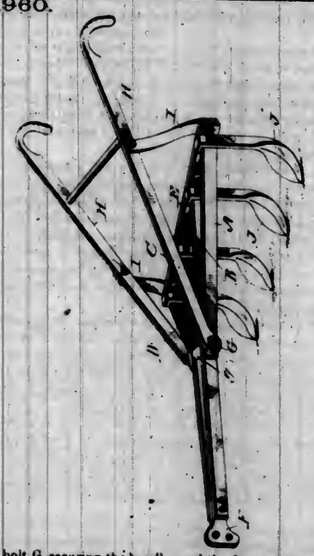


5. The combination, with the base-piece 1, having eyelets 2, of the straps 8, provided with eyelets 10, and having their ends conformed to the outline of the base-piece and the lacing-cord 11, all arranged substantially as described.

478,958.

6. The combination, with the base-piece 1, having eyelets 2, of the straps 8, provided with eyelets 10, the lacing-cord 11, and the guard or shield 4, arranged behind the base-piece, substantially as and for the purpose set forth.

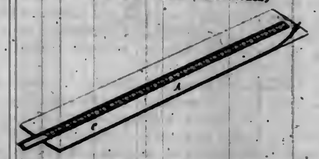
478,959. DEVICE FOR TRANSMITTING ROTARY MOTION. FREDERICK W. GORDON, Philadelphia, Pa., assignor to the Philadelphia Engineering Works, Limited, same place. Filed Aug. 13, 1891. Serial No. 402,510. (No model.)



Claim.—1. In a device for transmitting rotary motion, the combination, substantially as set forth, of a shaft, two brush-wheels of equal diameter thereon and provided with means for transmitting rotary motion to or from them, two flat-faced disks arranged in a common axial line and engaging opposite sides of both said brush-wheels and adapted for motion lengthwise of their axes, thrust-bearings with yielding pressure, means adapted to press the disks to the brush-wheels, and mechanism for adjusting independently the points of engagement between the two brush-wheels and disks.

2. In a device for transmitting rotary motion, the combination, substantially as set forth, of a frame, two flat-faced disks journaled therein in a common axial line, thrust-bearings and pressure means for urging the disks toward each other, a second frame adapted for independent self-adjusting motion with reference to the first frame, a shaft journaled in said second frame at right angles to the axial line of said disks, two brush-wheels on said shaft, and means for transmitting rotary motion to and from said brush-wheels.

478,960. HARROW. ROBERT B. GRAVES and DANIEL F. MERRITT, Millville Depot, Miss. Filed Sept. 17, 1891. Serial No. 406,003. (No model.)

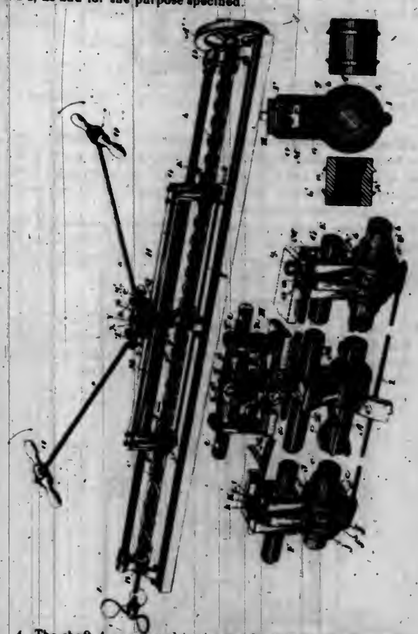


Claim.—The hereinbefore shown and described harrow, composed of the frame-bars A, B, C, and D, diverging from front to rear, the bars B and C being extended forward to form a beam and having the clevis secured between their front ends, the rear ends of the said bars being bent, the oblique bar E, bolted to the bent ends of the said bars, the teeth having their upper ends bent to overlap the edge of the frame-bars to which they are bolted, the rear edges of the said teeth touching the bolts which secure the frame-bars and the bar E together, the

478,960.

handles, the bolt G, securing the handles and the frame-bars together, substantially in the manner shown, and the braces I, between the handles and the frame and secured to the bar E by the same bolts which secure the frame-bars A and D thereto, substantially as set forth.

478,961. GARMENT-STAY. DAVID GROTTA, New Haven, Conn. Filed Jan. 11, 1892. Serial No. 417,624. (No model.)



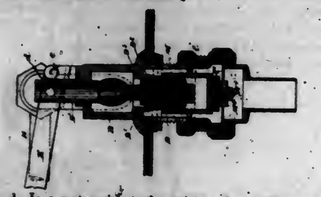
Claim.—As an improved article of manufacture, a garment-stay consisting of a fabric strip having a strip of resilient material secured upon one or more of its faces in direct contact with the surface of said fabric strip by means of a series of thread or cord loops bearing directly upon the resilient strip to permit of a slight backward and forward movement of the parts upon one another when the stay is bent, substantially as and for the purposes hereinbefore set forth.

478,962. PROPELLING-POWER. JAMES B. HALL, Toronto, Canada, assignor of one-fourth to Maurice Major Vardon, same place. Filed Apr. 8, 1892. Serial No. 428,345. (No model.)

Claim.—1. As a propelling-power, the shaft supported in suitable standards and having a propelling-wheel secured on its end, a right-hand spiral formed on the shaft from the center to one end, and a left-hand spiral formed on the shaft from the center to the opposite end, in combination with a sleeve correspondingly internally threaded and designed to act on the right-hand spiral, and a sleeve correspondingly internally threaded and designed to act on the left-hand spiral, and means for holding one sleeve solid, so as to rotate the shaft by means of one spiral, and further means in holding the other sleeve loose so that it may rotate with the shaft while the other sleeve is being pulled along the shaft in order to rotate it, substantially as and for the purpose specified.

2. The shaft A, supported in the standards B, C, and D and having the right-hand spiral *b* formed from the center to the one end of the shaft and a left-hand spiral formed from the center to the other end of the shaft, and a propelling-wheel Z, secured on one end of the shaft, in combination with the sleeve N, located on the right-hand spiral portion of the shaft correspondingly internally threaded to the right-hand spiral supported in the retaining block G and designed to be held solid with the same by the friction-clutch *g*, and the sleeve J, located on the left-hand spiral portion of the shaft correspondingly internally threaded to the left-hand spiral supported in the retaining-block F and designed to be held solid with the same by the friction-clutch *f*, and means whereby each sleeve may be held alternately in its retaining-block, so as to rotate the shaft or to revolve loosely with it, as and for the purpose specified.

3. The shaft A, supported in the standards B, C, and D and having the right-hand spiral *b* formed from the center to the one end of the shaft and a left-hand spiral formed from the center to the other end of the shaft, and a propelling-wheel Z, secured on one end of the shaft, in combination with the sleeve N, held in the retaining-block G upon the right-hand spiral portion of the shaft, and the sleeve J, held in the retaining-block F upon the left-hand spiral portion of the shaft, the said retaining-blocks being connected together by the bar H and rod I, as and for the purpose specified.

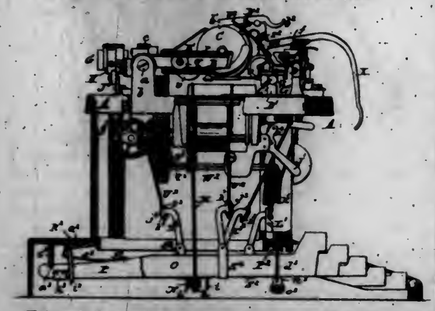


4. The shaft A, supported in the standards B, C, and D and having the right-hand spiral *b* formed from the center to the one end of the shaft and a left-hand spiral formed from the center to the other end of the shaft, and a propelling-wheel Z, secured on one end of the shaft, in combination with the retaining-blocks F and G, connected together by the bar H and rod I, the sleeves N and J, having bearings in the retaining-blocks F and G, respectively, and the friction-clutches *f* and *g*, hinged on the rod I at the lower portion of the retaining-blocks F and G, connected at the top portion by the bell-cranks O and K, respectively, to the rod M, which is operated as and for the purpose specified.

5. The shaft A, supported in the standards B, C, and D and having the right-hand spiral *b* formed from the center to the one end of the shaft and a left-hand spiral formed from the center to the other end of the shaft, and a propelling-wheel Z, secured on one end of the shaft, in combination with the retaining-blocks F and G, connected together by the bar H and rod I, the sleeves N and J, having bearings in the retaining-blocks F and G, respectively, and the friction-clutches *f* and *g*, hinged on the rod I at the lower portion of the retaining-blocks F and G, connected at the top portion by the bell-cranks O and K, respectively, to the rod M, upon which is secured the standard Q, having jaws *g*, between which is inserted the block V, secured to the sleeve S on the spindle T, which is supported in the bracket A and is slightly adjustable by the handles U, connected to the outer ends by the rod S, as and for the purpose specified.

6. The shaft A, supported in the standards B, C, and D and having the right-hand spiral *b* formed from the center to the one end of the shaft and a left-hand spiral formed from the center to the other end of the shaft, and a propelling-wheel Z, secured on one end of the shaft, in combination with the retaining-blocks F and G, connected together by the bar H and rod I, the sleeves N and J, having bearings in the retaining-blocks F and G, respectively, and the friction-clutches *f* and *g*, hinged on the rod I at the lower portion of the retaining-blocks F and G and connected at the top portion by the bell-cranks O and K, respectively, to the rod M, upon which is secured the standard Q, the lever X, pivoted at *x*, connected to the standard Q at *y*, and the block

V, designed to be brought to fit within the narrow upper portion y of the slot Y by turning the handles U to the perpendicular, as and for the purpose specified.



478,968. VALVE FOR WATER-CLOSETS. JULIUS HANKENSON, New York, N. Y., assignor to Frank Cook, same place. Filed May 11, 1891. Serial No. 392,276. (No model.)

Claim.—1. In a water-closet, the combination, with a valve having its body B extended in the direction from which the water is received, of a casing M and a loose connection of the latter to the fixed portions of the mechanism, adapted to allow slight lateral movement of the casing, as herein specified.

2. In a water-closet, the extension C, cross-bar C', and loosely but strongly connected casing M, in combination with the valve-casing B, valve D, lever E, and operating-float E', adapted to be readily applied together and separated, as herein specified.

478,964. TYPE-WRITING MACHINE. WILLIAM MCK. JENNE, Ilion, N. Y. Original application filed Jan. 30, 1888, Serial No. 261,408. Divided and this application filed May 26, 1892. Serial No. 434,776. (No model.) Patented in England May 16, 1888, No. 7,269.

Claim.—1. In combination with a carriage provided with a rigid and a yielding dog, a rock-shaft, a rack-bar carried by said shaft, a collar loosely encircling the rock-shaft, a screw swiveled in the collar and meshing with worm-teeth in the rock-shaft, and a spring having one end bearing against a fixed part of the machine and the other end attached to the collar, substantially as shown.

2. In combination with the key-levers of a type-writing machine, a series of springs, one for each lever, said springs being connected at their forward end with the key-levers and serving to hold them up against a fixed stop and having their rear ends bent upward and forward, and a clamping-bar bearing upon the rear ends of the springs and serving to hold them firmly against the frame of the machine.

3. In a type-writing machine, the combination, with key-levers, of elevating-springs located above said levers and clamped at one end between the base of the main frame and an adjustable clamping-bar, substantially as described.

4. In combination with a frame A, having recess R^2, key-levers O, elevating-springs c^2, clamping-plate Q^2, and screws or bolts g^2 for drawing said plate with greater or less force against the rear ends of the springs.

5. In a type-writing machine, the combination, with a series of key-levers having headed pins in their upper sides or edges and with a fulcrum bar or rib above said levers, of a series of springs having forked ends straddling said pins beneath their heads and serving to hold the levers up to the fulcrum bar or rib.

6. In combination with key-bars O and springs c^2, plate Q^2, provided with rods j^2 and arranged to bear upon the rear ends of the springs, and fastening bolts or screws serving to draw the plate Q^2 against the springs with greater or less force, whereby the plate is held in position and the tension of the springs is determined.

7. In combination with a type-bar and its actuating-lever, an intermediate connecting-rod consisting of two pieces of wire, one drilled longitudinally and the other inserted and secured in the cavity thus drilled.

8. The connecting-rod U^3, provided with hooks m^3, formed of a separate piece of metal and inserted into a hole drilled in rod U^3.

9. The connecting-rod consisting of a body U^3, longitudinally drilled at one end, and hook m^3, having its shank inserted in the socket thus formed, the metal of the outer body being crimped or compressed upon the shank of the hook and embedded into the same, whereby the two are firmly united.

10. In combination with a type-bar and a key-lever of a type-writing machine, an intermediate connection consisting of a draw-piece I^2, provided with tubular boss, and rod U^3, threaded at one end, passing through said boss and provided above and below the same with nuts k^3, substantially as and for the purpose specified.

11. In combination with a key-lever and a type-bar, an outwardly-curved draw-piece connected with the key-lever and a rod extending through the tubular boss of said draw-piece and secured thereto, substantially as set forth.

12. In a type-writing machine, the combination of a roll provided with a ratchet-wheel, a supporting-frame therefor, a hand-lever pivoted in said frame and having a forwardly-extending nose or end to bear upon the periphery of the wheel to limit the motion of the lever, and a pivoted dog carried by said lever and adapted to engage with the teeth of the ratchet-wheel to rotate the same.

13. In combination with the frame B' and roll C, mounted therein and provided with a ratchet-wheel, pulleys v in front and rear of said roll, studs x, attached at one end to frame B' and serving to carry the front pulleys v, and a hand-lever X, mounted upon one of said studs and provided with a dog or pawl to act upon the teeth of the ratchet-wheel.

14. In a type-writing machine, the combination, with the platen-roll and its actuating-lever, of an elastic plate Z, provided with shoulders, as c', d', and e', and with notches or cavities, as l', m', and n', corresponding therewith, and a fixed stud or pin secured to the platen-frame in the path of the cavities and adapted to enter one or another thereof as the plate is moved to different positions.

15. In combination with a platen-roll and its carrying-frame, an envelope or card holder provided with a clamp having a series of notches or grooves whereby it may be set and secured at different angles upon the frame.

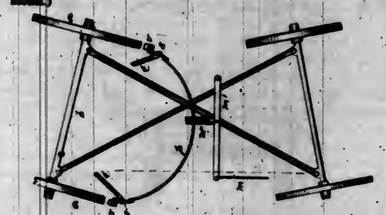
16. In combination with a platen-roll and its frame, a card or envelope holder secured to said frame and an adjusting-screw bearing upon the spring-arm of said holder and serving to force the same toward the platen.

17. In combination with roll C and its frame, the herein-described card or envelope holder, consisting of a rigid supporting-arm provided with a groove in one face, a clip pivoted thereto and provided with a series of grooves, a set-screw for forcing the clip and supporting-arm against opposite edges of the platen-roller frame, an elastic arm secured to the supporting-arm and provided at its free end with a roller, and a set-screw passing through the supporting-arm and bearing against the elastic arm to vary the position or pressure of the roller.

18. In a type-writing machine, a paper guide and holder having grooved arms to fit upon the framing and provided with a screw for drawing said arms against the framing.

19. In combination with lever P, provided with a laterally-projecting clip or support h^3, a key-lever, as H' or I', resting upon the clip and supported thereby.

478,965. STOVEPIPE-FASTENING. JOHN H. JOHNSTON, Little Rock, Ark., assignor of one-half to George Purves, same place. Filed Feb. 2, 1892. Serial No. 420,064. (No model.)



Claim.—1. The combination, with two adjacent pipe-sections, of metal loops riveted to the said pipe-sections inside of the same near their ends, and a separate connecting strap or tie bent around the loops and connecting the opposite pipe-sections, substantially as shown and described.

2. The combination, with two adjacent pipe-sections, of metal loops B, formed of a strip of sheet metal bent in triangular shape, with their ends brought together and riveted to the pipe-sections and their middle parts b^3 offsetting, as described, and a connecting strap or tie

bent around the loops, as described, and connecting the pipe-sections, substantially as shown and described.

478,966. VEHICLE-BRAKE MECHANISM. ROYAL L. MUNGER and THOMAS R. CAPWELL, Dunkirk, N. Y., assignors to the Dunkirk Wagon Company, same place. Filed Oct. 12, 1891. Serial No. 408,405. (No model.)

Claim.—1. The combination, with the wheels of a swinging truck, of brake-shoes connected to a brake-beam, a brake-beam supported by and swinging concentric with the truck, a guide through which said beam passes, and a lever system for operating said beam and shoes.

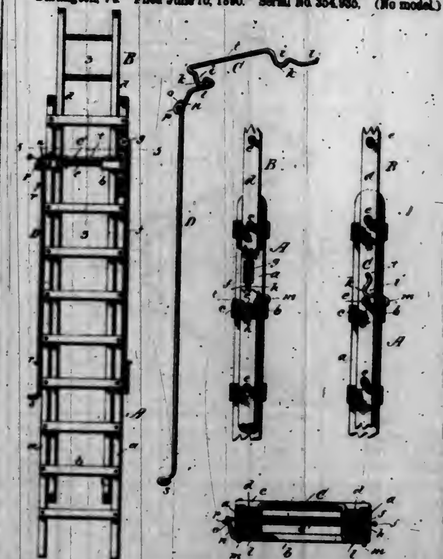
2. The combination, with the wheels of a swinging truck, of brake-shoes connected to the brake-beam, a brake-beam supported by and swinging concentric with the truck, a guide provided with anti-friction rollers, between which said beam passes, and a lever system for operating said beam and shoes.

478,967. COVER-HOLDER FOR TEA-KETTLES, &c. JOSEPH MUSGROVE, Milwaukee, Wis., assignor to the Gender & Passchke Manufacturing Company, same place. Filed Apr. 11, 1892. Serial No. 428,720. (No model.)

Claim.—1. The combination, with a kettle, pail, or other utensil provided with a removable cover, of a yielding holder attached to the top of the kettle inside and projecting slightly into the cover-opening, substantially as and for the purposes set forth.

2. The combination, with a kettle, pail, or other utensil having a contracted opening in the top and a removable cover for closing said opening provided with a rim adapted to be inserted therein, of a yielding holder secured to the inside of the top at a distance from the cover-opening and projecting slightly into said opening, so as to bear with a yielding pressure against the rim of the cover when it is inserted in said opening and thereby hold the cover in place, substantially as and for the purposes set forth.

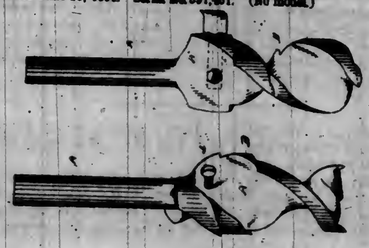
3. The combination, with a kettle, pail, or other utensil having a contracted opening in the top and a removable cover for said opening, provided with a rim adapted to be inserted therein, a semi-elastic holder attached to the inside of the kettle or the like a short distance from said opening and projecting slightly into the same, so as to bear against the rim of the cover and hold the same in place, said holder being capable of being bent so as to project more or less into said opening, substantially as and for the purposes set forth.



478,968. ELECTRIC MOTOR. HARLOW F. OSE, Newberg, Oreg. Filed Apr. 4, 1891. Serial No. 387,583. (No model.)

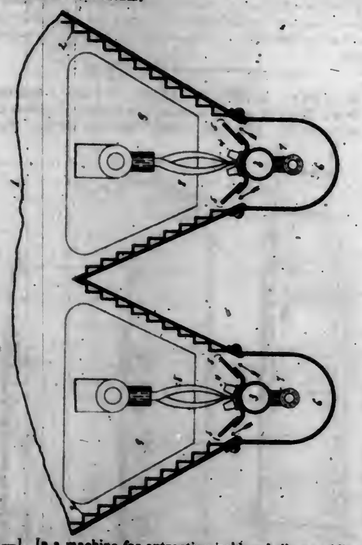
Claim.—1. In an electric motor, a series of armature-sections connected in parallel, a communicator connected electrically with the armature-sections formed of two rings, each divided at diametrically-opposite points, with the divisions of one-half arranged ninety degrees distant from those of the other part, and a pair of commutator-brushes held in contact with both of the commutator-rings, substantially as specified.

2. In an electric motor, the combination of an armature formed of a number of sections and provided with a commutator, a field-magnet formed of a number of sections corresponding with those of the armature, and a multiple switch for sending the current through one or more of the field-magnet sections in either direction, substantially as specified.



478,969. EXTENSION-LADDER. WILLIAM J. ROBERTSON and JOHN R. GIBLIN, St. Albans, assignors to themselves and Edwin L. Ripley, Burlington, Vt. Filed June 10, 1890. Serial No. 354,935. (No model.)

Claim.—1. In an extension-ladder, a ladder-section having rungs arranged in pairs connected to the section upon opposite sides thereof and an extensible ladder-section located between the rungs forming the pairs, in combination with a pivoted support consisting of a transverse horizontal connecting-bar having at each end a U-shaped seat to sustain the rung of the extensible ladder-section at both its ends and on the same plane with the rungs of the respective pairs, substantially as and for the purpose described.



2. In an extension-ladder, a ladder-section having rungs arranged in pairs and connected thereto upon opposite sides and an extensible ladder-section located between the rungs forming the pairs, in combination with a pivoted wire support consisting of a transverse connecting-bar having a U shaped seat at each end and operating-rod connected to the support and a rope and pulley for raising the extensible ladder-section, substantially as and for the purpose specified.

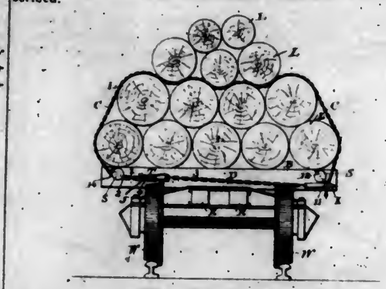
478,970. AUGER. GRANVILLE L. SAVAGE, New York, N. Y., assignor to the Golden Gate Safety Faucet Company, San Francisco, Cal. Filed June 25, 1891. Serial No. 397,461. (No model.)

Claim.—The combination, with a spiral blade of an upwardly-increasing diameter provided with outwardly-projecting spurs, each one of which projects beyond the next spur below, of a lateral shaving-knife removably secured to the blade above the spurs.

478,971. MACHINE FOR EXTRACTING GOLD FROM PULVERIZED ORES, &c. THOMAS C. SIMCOTON, Paterson, N. J., assignor of one-half to Thomas C. Simcoton, Jr., same place. Filed May 16, 1891. Serial No. 392,970. (No model.)

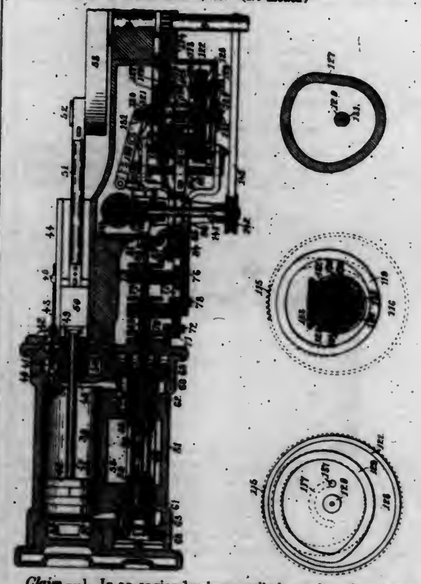
Claim.—1. In a machine for extracting gold and silver and lined with amalgamated plates, the combination of a supply pipe or pipes having a series of jet-nozzles on the upper side of the pipe attached thereto, and such pipe or pipes running through the tank longitudinally at or near the bottom thereof, with a mercury receptacle or receptacles partly separated from the main tank and supplied with a pipe or pipes through which water may be forced, for the purposes above set forth.

2. The combination of tank 1, lined with amalgamated plates 2 and having supply-pipes 3 running longitudinally along the valley or valleys of the tank and having jet-nozzles 4 on the upper surface and agitators 8 between the jet-nozzles 4 with the mercury-receptacles 6, provided with T-nozzles 7 and connected with tank 1 through spaces 5, substantially as and for the purposes above set forth.



3. In a machine for extracting gold from auriferous ores, a tank lined with amalgamated plates and having a longitudinal angular bottom or bottoms and having a supply-pipe in each bottom, upon the upper surface of each of which is a row of diagonal jet-nozzles, between which latter are agitators, in combination with a mercury-receptacle in the bottom of the tank, connected therewith by slight openings and having a pipe or pipes connected with the said mercury-receptacle for the supplying of water therein under pressure, substantially for the purposes above set forth.

4. In a machine for extracting gold and lined with amalgamated plates, the combination of a mercury-receptacle having connected therewith a pipe or pipes through which water may be introduced therein with a tank lined with amalgamated plates and said tank connected with the mercury-receptacle through spaces or openings, substantially for the purposes hereinabove set forth.



5. In an amalgamating-machine the tank of which is lined with amalgamated plates, the combination of a supply pipe or pipes having upon its or their upper surfaces a row of diagonal jet-nozzles and upon its or their under surface a series of jet-nozzles with a mercury-receptacle connected with the main tank by small openings, substantially for the purposes above set forth.

478,972. LOG-BINDER. ROBERT J. THOMPSON, Grandin, Mo., assignor of one-half to John R. White, same place. Filed Dec. 31, 1891. Serial No. 416,716. (No model.)

Claim.—In a log-binder, the combination of a carriage having sway-bars, a forked catch connected to one of said sway-bars by an eyebolt, a chain connected to the free end of said catch, an adjusting-link on the opposite end thereof and having a reduced extension, a chain connected to the other sway-bar and a trip-lever carried by a link at the end of the same, and a ring on the said latter chain adapted to be adjusted over and hold the said trip-lever, substantially as described.

478,973. VALVE-GEAR FOR ENGINES. FRANK J. WATERS, Providence, R. I., assignor of one-half to George Howe, same place. Filed Dec. 22, 1891. Serial No. 415,865. (No model.)

Claim.—1. In an engine having a cylinder and a valve-chamber, the combination, with a slide-valve longitudinally movable in said chamber and provided with a tubular valve-stem and inlet and outlet ports, of a forward cut-off valve contained within said slide-valve and provided with a tubular valve-stem extending through the stem of the slide-valve, a rear cut-off valve also contained within said slide-valve and provided with a valve-stem extending through the stem of the forward cut-off valve, and means for operating said valves, as described.

2. The combination, with the drive-shaft of an engine and a gear carried thereby, of one or more rotatable plates provided with cams, one of said plates having a circumferential gear intermeshing with the gear of the drive-shaft, a connecting-rod having roller-bearings traveling on said cams and connecting with a valve-stem, and a slide-valve contained within a suitable case and adapted to be reciprocated, as described.

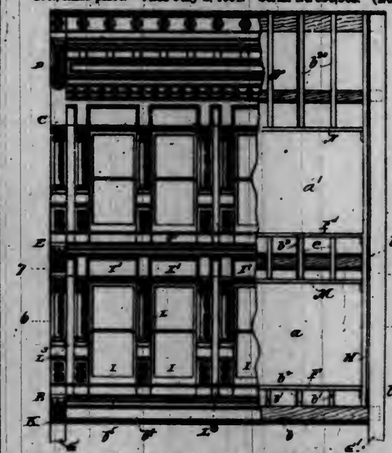
3. The combination, with the cut-off valves of an engine, provided with valve-stems, and connecting-rods secured to said stem and provided with roller-bearings, of rotatable plates having cams adapted to engage said roller-bearings and means for rotating said plates independently to operate said valves simultaneously, for the purpose described.

4. In an engine having valves, as described, the combination, with the rotating plates 116 and 122, supported on a shaft journaled in bearings and provided with the cams 119 and 124, one of said plates provided with a circumferential gear, and a connecting-rod having roller-bearings working on said cams and adapted to operate the slide-valve,

of the cam-plates 126 and 128, journaled on said shaft and having cams 127 and 129, roller-bearings moving on said cams and pivoted to the connecting-rods of the cut-off valves, and means for operating said valves, as described.

5. The combination, with the rotatable plates 115 and 122, supported on the shaft 120, journaled in suitable bearings, provided with the cams 119 and 124, the cam-plates 126 and 128, having cams 127 and 129, independently rotatable on said shaft in depressions in the outer faces of said first-mentioned plates, a transverse slot formed in the central enlarged portion of said shaft and a rack movable therein and operated by a rod extending through a longitudinal perforation in said shaft, and a vertical shaft journaled in said longitudinal shaft and carrying an interior gear 134, adapted to be operated by said rack, of a sleeve surrounding the central portion of the longitudinal shaft and having a central semi-circumferential slot and enlarged ends, one of which has gear-teeth, a beveled gear carried by the outer end of the vertical shaft and intermeshing with the gear of said sleeve, and pins secured in said enlarged ends of the sleeve and extending through radial slots in the cam-plates 116 and 118, the other ends being fastened in the plates 126 and 128 and adapted to operate the same, as described.

6. The combination, with the rack 130, contained within a central transverse slot in the shaft 120, the rod 131, extending through a central longitudinal perforation in said shaft and secured to said rack, the pinion-gear 134, also contained within said slot and adapted to be rotated by said rack, a vertical shaft 132, journaled in said horizontal shaft and operated by said pinion, and a beveled gear 113, secured to the outer end of said shaft, of a sleeve 135, surrounding said shaft 120 and having a semi-circumferential slot through which the vertical shaft is free to move, enlargements on the ends of said sleeve, one of which forms a gear intermeshing with the gear 113, and rotatable cam-plates secured to said enlarged ends of the sleeve and adapted to operate the cut-off valves through suitable connections, as described.



7. The combination, with the slide-valve and cut-off valves of a steam-engine, a system of cams adapted to operate said slide-valve through a connecting-rod, an independent system of cams for operating said cut-off valves, and mechanism for shifting the same, of a regulating device consisting of two gears rotating in parallel planes in directions opposite to one another and driven by a third gear, a clutching device supported between said gears, adapted to be drawn into contact with the lower gear when the speed of the engine is above the normal and into the upper gear when said speed decreases below said point, the lower portion of said clutch having depending fingers, a sleeve supported in bearings and having a cross-bar at its upper end adapted to be rotated by said clutching device, a screw-thread formed around said sleeve and a nut working thereon and pivoted in a suitable frame secured to a rock-shaft, and mechanism intermediate said shaft and the shifting mechanism of the cut-off-valve motion to operate the same, as described.

8. In an engine, the combination, with a hollow shaft carrying independently-rotatable cam-plates and having a transverse slot, a rack contained within said slot and means by which the motion of the rack is conveyed to said cam-plates, a rod secured to said rack and extending through the hollow end of said shaft, a tube having a square outer surface working in a square bearing, a flange at one end bearing against said rod and provided with a screw-threaded portion, and a sleeve screw-threaded on a portion of its interior surface and journaled at one end in a suitable bearing, of a friction-clutch surrounding the free end of said sleeve and keyed thereto to allow of independent longitudinal movement and to prevent independent rotatory motion, a beveled gear secured to the end of said tubular shaft and having a friction-cavity in the face thereof in which one end of the friction-clutch moves, a similar gear working in an independent bearing parallel to said first-mentioned gear and also having a friction-cavity in its face, in which the opposite end of the friction-clutch moves, a third gear intermeshing with said gears and working on a shaft and adapted to transfer the motion of one to the other in the opposite direction, and mechanism operated by the movement of the engine to shift the friction-clutch from the cavity of one gear to the cavity of the other, substantially as described.

9. The combination, with the connecting-rod 84, having a slot 90 and having its end transversely split and a transverse perforation in said end, a split sleeve 86, clamped within said perforated end, the shafts 87 87, having enlarged ends journaled within said sleeve, and the rolls 88 88, carried on the outer ends of said shafts, of a block formed of two halves 91, adapted to fit the slot 90 and having lips extending beyond the edges of said slot, the shafts 92, having enlarged ends journaled in bearings in the halves of this block and carrying the rolls 93 93 on their outer ends, and the key-pin 94, working in a vertical slot in said connecting-rod and bearing against said blocks, as and for the purpose described.

10. The combination, with the connecting-rod 76, having the stud 96, a perforation extending through said rod and stud and a tubular shaft journaled therein and carrying the cross-plate 98, having lips 99, formed on the edges at one end, and a block 100, carrying the shaft 101, and a roll 109, secured to the outer end of said shaft, of a cross-plate 103, having a block 104, carrying a shaft 105, and a roll 110, secured to the outer end of said shaft and adapted to move between the lips 99 of the plate 98 and having lips 106, engaging the edges of said block 100, a slot in said lipped end, in which the shaft 101 may move and hold in place by the bolt 102, having a square head engaging a slotted recess in said plate 103, and a key 108, bearing against the square edges of said lips 106 and against a transverse rib on the plate 98 to force these plates one over the other and to draw the rolls together, as and for the purpose set forth.

478,974. BUILDING-FRONT. AUGUST BRUEKBORST, ARTHUR WIEBE, and CHARLES T. RICHARDS, St. Louis, Mo., assignors to Meeker & Bro., same place. Filed July 2, 1891. Serial No. 398,302. (No model.)

Claim.—1. The combination of the lintel *b*, the stud *b'*, the plate F, extending horizontally across the building-front, and the lookout b^3, substantially as described.

2. The combination of the stud *b'*, the lookouts b^3, the plate F, extending horizontally across the building-front, and the sheet-metal facing b^4, substantially as described.

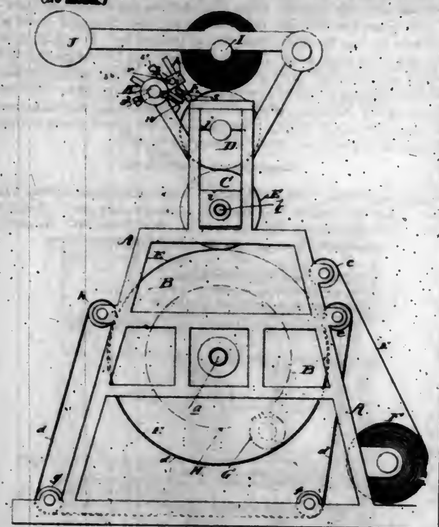
3. The combination of the lintel *b*, the studs *b'*, the lookouts b^3, the plate F, extending horizontally across the building-front, and the sheet-metal facing b^4, substantially as described.

4. The building-front having the windows I' and the plate F, said plate extending horizontally across the building-front and also constituting the sills of said windows, substantially as described.

5. The combination of the lintel *b*, the studs *b'*, the plate F, and the windows I', said plate extending horizontally across the building-front and also constituting the sills of said windows, substantially as described.

6. The combination of the box-frames and the plate F, the pulley-stiles of said box-frames resting mediately, as described, upon said plate and the inside finish-board of said box-frames extending downward and being fastened to said plate at the inner side thereof, substantially as described.

7. The building-front having the windows and the lintel M, said lintel extending horizontally across the building-front and also constituting the heads of said windows, substantially as described.



8. The building-front having the windows, the plate F, and the lintel M, said plate and lintel extending horizontally across the building-front and also respectively constituting the sills and the heads of said windows, substantially as described.

9. The building-front having the window-frames, the end studs H, extending from the upper part of the first story to the upper part of the front, and the plate F, and the lintel M, said plate and lintel extending horizontally across said front from stud to stud and respectively constituting the sills and the heads of said window-frames, substantially as described.

10. The building-front having the plate F, and the lintel M, and the box-frames and columns, as described, the inside finish-board of said box-frames being extended vertically and attached to the inner side of said plate and lintel, substantially as described.

11. The building-front having the box-frames, and the metallic columns, and the plate F, and lintel M, extending horizontally across the front and having connected thereto said box-frames and columns, substantially as set forth.

478,975. PAPER DRYING AND CUTTING APPARATUS. GOTTLOB T. LEONHARD, Paterson, N. J. Filed Oct. 31, 1891. Serial No. 410,490. (No model.)

Claim.—1. In a paper drying and cutting apparatus, a drying and calendering cylinder, a cutting-cylinder, the spooling-rolls, and knives acting on the cutting-cylinder to sever the web longitudinally, said cylinders and rolls having contact with one another in the successive order named at the transferring-points of the paper between them, for the purpose described.

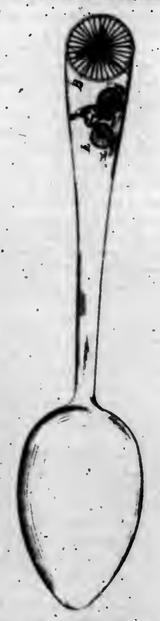
2. In a paper drying and cutting apparatus, a drying and calendering cylinder, a cutting-cylinder resting by gravity on the drying-cylinder, spooling-rolls for receiving the paper, resting by gravity on the cutting-cylinder, knives acting on the cutting-cylinder to sever the web longitudinally, and vertically-movable weighted bearings for the journals of the said spooling-rolls, adapted to compress the same and the said cylinders together.

3. In a paper drying and cutting machine, the drying or calendering cylinder and a cutting-cylinder bearing thereon to receive the paper, as described, and knives acting on the paper while it is upon the said cutting-cylinder.

REISSUES.

11,253. CUFF-HOLDER. HENRY E. SHOW, Albany, N. Y., assignor of one-half to Carl F. Mende, same place. Filed Apr. 19, 1892. Serial No. 429,821. Original No. 466,311, dated Dec. 29, 1891.

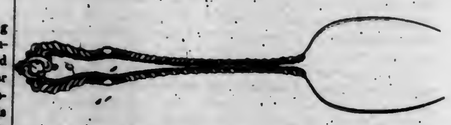
Claim.—1. The herein-described improved cuff-holder, comprising a wire loop or shank, the opposite sides of which are bent into sinuous form, providing intermediate eyes, at one end having an enlarged eye adapted to take over the head of a cuff-button and at the other end having its terminals oppositely curved to form spring-arms, a transverse plate secured to the extremities of the curved ends, and studs located at opposite sides of the shank and projecting from the transverse plate and adapted to engage with the opposite holes of a cuff, substantially as specified.



2. The herein-described improved cuff-holder, the same consisting of the loop-shaped wire shank, the opposite sides of which are bent into sinuous form to form eyes adapted to be connected with a shirt-sleeve button, and the U-shaped plate connected to the shank, the terminals of the plate being provided upon their outer faces and at opposite sides of the shank with buttonhole-engaging studs, substantially as specified.

3. The herein-described improved cuff-holder, the same consisting of the spring-wire shank having the triangular loop located at one end and slightly bent, the spring-terminals of which are bent in a sinuous form to provide a series of eyes and at their extremities are deflected and curved to form spring-arms, and the U-shaped securing-plate, through the arms of which the wire terminals of the shank are passed and headed, and the headed studs mounted upon the arms of said plate and adapted to engage the buttonholes of a cuff, substantially as specified.

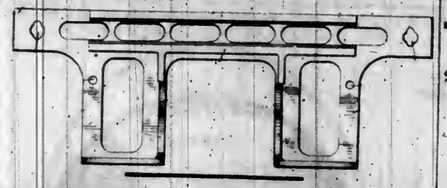
4. A cuff-holder consisting of a shank having a loop or opening at one end and eyeholes in the body of the shank to engage with the shirt-sleeve button or fastener and having a bar or prolongation laterally projecting from each side of the other end of the shank, the terminals of said bar or prolongation being arranged to engage with the oppositely-located buttonholes of the cuffs, substantially as described.



DESIGNS.

21,699. SPOON. WILLIAM W. BERRY, Scranton, Pa. Filed June 2, 1892. Serial No. 435,312. Term of patent 7 years.

Claim.—The design for a spoon, as herein shown and described.



21,700. SPOON, &c. GILBERT L. CROWELL, Jr., Arlington, N. J., assignor to Dominick & Haff, New York, N. Y. Filed June 2, 1892. Serial No. 435,318. Term of patent 14 years.

Claim.—The design for handles of spoons and similar articles, substantially as herein shown and described.

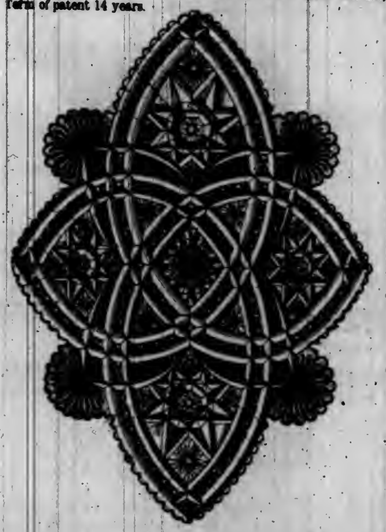
21,701. ELECTRIC-LAMP FRAME. JAMES R. GASTON, Sparta, Ill., assignor to the Gaston Electrical Manufacturing Company, same place. Filed June 4, 1892. Serial No. 435,567. Term of patent 14 years.

Claim.—The design for an electric-lamp frame, as herein shown and described.

21,702. LAMP-SHADE. HUGO HOHENSTEIN, New York, N. Y. Filed May 27, 1892. Serial No. 434,674. Term of patent 3½ years.

Claim.—The design for a lamp-shade, substantially as herein shown and described.

21,703. MEDAL. ALBERT O. QUIMBY and THOMAS H. BATES, Fresno, Cal. Filed June 4, 1892. Serial No. 435,566. Term of patent 3½ years.



Claim.—The design for a medal herein shown and described.

21,704. BADGE. JAMES F. ROCHE, Boston, Mass., assignor to the Regular Army and Navy Union of Ohio. Filed Apr. 21, 1892. Serial No. 430,129. Term of patent 3½ years.

Claim.—The design for a badge, substantially as herein shown and described.

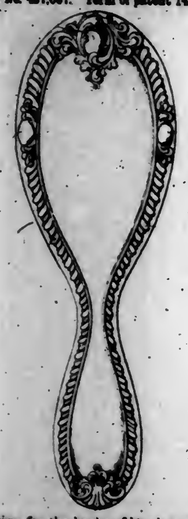
21,705. ORNAMENTATION OF GLASS VESSELS. THOMAS G. HAWKES, Corning, N. Y. Filed June 16, 1892. Serial No. 436,989. Term of patent 14 years.

Claim.—The design for the ornamentation of glass and other vessels, substantially as herein shown and described.

21,706. KNOB AND LOCK ESCUTCHEON. RUDOLPH W. E. CHRISTMANN, New Britain, Conn., assignor to the Russell & Erwin Manufacturing Company, same place. Filed May 31, 1892. Serial No. 435,079. Term of patent 14 years.

Claim.—The design for a knob and lock escutcheon, as herein shown and described.

21,707. RUBBER MAT. JOHN J. VOORHEES, Jersey City, N. J., assignor to the New Jersey Car Spring and Rubber Company, of New Jersey. Filed Apr. 15, 1892. Serial No. 429,363. Term of patent 14 years.



Claim.—A design for a rubber mat, substantially as shown and described.

21,708. BROOM-RACK. PETER E. WHITSON and ORREN G. NORRIS, Sheldon, Ill. Filed June 13, 1892. Serial No. 436,567. Term of patent 14 years.

Claim.—The design for a show-rack, substantially as herein shown and described.

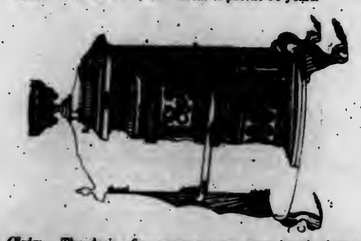
21,709. BACKS FOR BRUSHES, &c. GILBERT L. CROWELL, Jr., Arlington, N. J., assignor to Dominick & Haff, New York, N. Y. Filed June 17, 1892. Serial No. 437,067. Term of patent 14 years.

Claim.—The design for the backs of brushes and similar articles, substantially as herein shown and described.

21,710. BREAD-PAN. THOMAS H. MURPHY and PHILIP M. ZOBGELE, New Bedford, Mass. Filed June 2, 1892. Serial No. 435,313. Term of patent 7 years.

Claim.—The design for an inclosed bread-pan herein shown and described.

21,711. BOTTLE. BENJAMIN I. MOTT, Brooklyn, N. Y. Filed May 14, 1892. Serial No. 433,051. Term of patent 14 years.

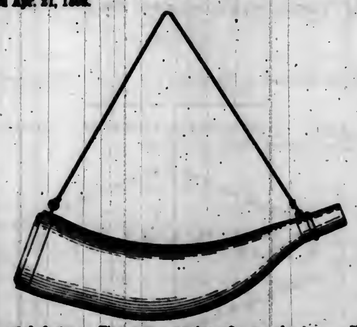


Claim.—The design for a bottle, as herein shown and described.

21,712. CAP. MOSES S. BRUNDAGE, McConnell, Ill. Filed Nov. 9, 1891. Serial No. 411,395. Term of patent 3½ years.

Claim.—The design for a cap, substantially as shown and described.

21,718. STOVE. FRANK A. MAGEE, Boston, Mass. Filed June 10, 1892. Serial No. 436,283. Term of patent 14 years.



Claim.—The design for an open-grate stove herein shown and described, the same comprising the fluted hood A, the semi-oval hearth B, fluted legs C, having claws inclosing a ball, the draft-door D, fire-pot front P, bead-moldings F and T, sliding doors G, scroll-panel H, the fluted pillars K, the top L, having a wide fluted molding R, and wing-pieces M, as set forth.

TRADE-MARKS

REGISTERED JULY 12, 1892.

21,428. TOOTH-POWDER. WILLIAM R. BURROWS, Providence, R. I. Filed Apr. 21, 1892.

Essential feature.—The representation of a powder-horn. Used since April 11, 1891.

21,429. SALT FROM GREAT SALT LAKE FOR BATHING PURPOSES. MARIA W. HOPKINS, Brooklyn, N. Y. Filed May 21, 1892.

Essential feature.—The word "SALTONIC." Used since March 15, 1892.

21,430. PHOTOGRAPHIC PAPER. EDUARD LIESEGANG, Dusseldorf, Germany. Filed Apr. 2, 1892.

Essential feature.—The representation of a frame inclosing lines representing rays radiating from a central light. Used since 1890.

21,431. BLENDED TEA. L. H. PARKE & Co., Philadelphia, Pa. Filed Nov. 16, 1891.

HUN KEE

Essential feature.—The words "HUN KEE." Used since March, 1885.

21,432. TEA. L. H. PARKE & Co., Philadelphia, Pa. Filed Nov. 16, 1891.

WING KEE

Essential feature.—The words "WING KEE." Used since March, 1885.

21,433. REMEDY FOR DISEASES OF THE BLOOD AND KIDNEYS. HORACE C. SOUTHWORTH, Londonville, N. Y. Filed June 9, 1892.

H. C. Southworth

Essential feature.—The fac-simile signature "H. C. SOUTHWORTH." Used since February 8, 1892.

21,434. GELATINE CAPSULES. JAMES W. GERDEY, New York N. Y. Filed May 4, 1892.

KEYSTONE

Essential feature.—The word "KEYSTONE." Used since March, 1885.

21,435. GLUE. A. & G. W. HOLBROOK, Providence, R. I. Filed June 6, 1892.

OXIDENTAL

Essential feature.—The word "OXIDENTAL." Used since May 24, 1892.

21,436. CASTOR-OIL. INDIANAPOLIS DRUG Co., Indianapolis, Ind. Filed June 6, 1892.

MELOL

Essential feature.—The word "MELOL." Used since April 15, 1892.

21,437. PERFUMES, POWDERS, SOAPS, AND TOILET ARTICLES GENERALLY. LADD & COFFIN, New York, N. Y. Filed May 14, 1892.

NADA

Essential feature.—The word "NADA." Used since May 5, 1892.

21,438. LARD AND ITS SUBSTITUTES. THE W. J. WILCOX LARD AND REFINING COMPANY, Guttenberg, N. J., and New York, N. Y. Filed May 31, 1892.

CANARIO

Essential feature.—The representation of a canary and the word "CANARIO." Used since March 20, 1892.

21,439. LARD AND ITS SUBSTITUTES. THE W. J. WILCOX LARD AND REFINING COMPANY, Guttenberg, N. J., and New York, N. Y. Filed May 31, 1892.

COLIBRI

Essential feature.—The representation of a humming-bird and the word "COLIBRI." Used since March 20, 1892.

21,440. LARD AND ITS SUBSTITUTES. THE W. J. WILCOX LARD AND REFINING COMPANY, Guttenberg, N. J., and New York, N. Y. Filed May 31, 1892.

LA INMEJORABLE

Essential feature.—The words "LA INMEJORABLE." Used since November 6, 1891.

21,441. LARD AND ITS SUBSTITUTES. THE W. J. WILCOX LARD AND REFINING COMPANY, Guttenberg, N. J., and New York, N. Y. Filed May 31, 1892.

ROSALINDA

Essential feature.—The representation of two moss-roses and a twig and the word "ROSALINDA." Used since February 1, 1892.

21,442. HAIR-RESTORATIVE AND DANDRUFF-CURE. H. D. WASHER & Co., Grinnell, Iowa. Filed June 7, 1892.

GLOBE

Essential feature.—The word "GLOBE." Used since May 25, 1892.

21,443. DISINFECTANT. EMMA B. FARRER, Paterson, N. J. Filed June 10, 1892.

A NEW IDEA

Essential feature.—The words "A NEW IDEA." Used since April 1, 1892.

21,444. BREAD. JOHN D. HEINBRST, New York, N. Y. Filed June 16, 1892.

DORE

Essential feature.—The word "DORE." Used since June 1, 1892.

21,445. LEATHER, INCLUDING BELTING. A. & C. W. HOLBROOK, Providence, R. I. Filed June 6, 1892.

Essential feature.—The representation of two elephants' heads facing in opposite directions and the word "ALBINO." Used since September, 1891.

21,446. PINEAPPLES. INDIAN RIVER AND LAKE WORTH PINEAPPLE GROWERS ASSOCIATION, Eden, Fla. Filed June 6, 1892.

Essential feature.—The representation of a pineapple and the figure of an Indian at each side. Used since May, 1, 1892.

21,447. LABELS OR CLIPS FOR INDICATING THE PRICES OF CIGARS. IMPERIAL METAL CARD COMPANY, Boston, Mass. Filed June 6, 1892.

IMPERIAL.

Essential feature.—The word "IMPERIAL." Used since November 1, 1891.

21,448. SAWED TIMBER. WILLIAM S. KEYSER, Pensacola, Fla. Filed May 14, 1892.

CCC

Essential feature.—The three letters "CCC." Used since January, 1887.

21,449. STEEL INGOTS, SLABS, BLOOMS, BILLETS, BARS, RODS, &c. ALBERT C. ISAACS, Baltimore, Md. Filed May 11, 1892.

CORONET

Essential feature.—The word "CORONET." Used since 1885.

21,450. ILLUMINATING OR BURNING OIL. CHARLES KIMBER, London, England. Filed Apr. 23, 1892.

GLENSHALE

Essential feature.—The word "GLENSHALE" and a diamond-shaped figure inclosing said word. Used since March 29, 1892.

21,451. VETERINARY MEDICINES AND PREPARATIONS. STEPHEN PITTIFER & SON, Creedwell, near Malmesbury, England. Filed May 23, 1892.

HERBAL TONIC OR
FLOCKMASTER'S FRIEND.

Essential feature.—The words "HERBAL TONIC OR FLOCKMASTER'S FRIEND." Used since 1869.

21,452. ANTISEPTICS. SANFORD G. PLUMB, New York, N. Y. Filed June 9, 1892.

Essential feature.—The words "ODORLESS DEODORIZER," the first "O" and first "D" of the words being enlarged and inclosing the remaining letters of the words, respectively. Used since October 1, 1890.

21,453. SILK PLUSH. SIR TITUS SALT, BART., SONS & COMPANY; Limited, Saltaire, England, and Bridgeport, Conn. Filed May 30, 1892.

SALTS SILK SEALS

Essential feature.—A round disk in solid color and the words "SALT'S SILK SEALS" printed thereon. Used since April 15, 1892.

21,454. PAPER BAGS. UNION BAG AND PAPER COMPANY, Chicago, Ill. Filed June 6, 1892.

AUTOMATIC

Essential feature.—The word "AUTOMATIC." Used since May 16, 1892.

THE NORRIS PETERS CO., PHOTO-LITHO., WASHINGTON, D. C.

DECISIONS
OF THE
COMMISSIONER OF PATENTS
AND OF
UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

EX PARTE REQUA.

Decided May 12, 1892.

DESIGN PATENTS—ILLUSTRATION OF NON-ESSENTIAL FEATURES.

Where it appeared from the specification that certain words and figures shown on the face of the Design in the drawing did not constitute an essential feature of the Design, *Held* that the patent should not be permitted to seem to make them so, and that they should be erased.

ON petition.

DESIGN FOR A BADGE.

Application of Emma M. Requa filed April 8, 1892, No. 428,892.

Messrs. Baldwin, Davidson & Wight for the applicant.

SIMONDS, *Commissioner:*

This is a petition taken from the action of the Primary Examiner requiring the words and figures "World's Columbian Exposition 1893" to be removed from the face of the Design for a badge shown in the illustration forming a part of the application.

The specification says upon this point:

The Design, as shown in the accompanying drawing, consists of a representation in relief of the head of Christopher Columbus, from which is suspended an annulus having a space upon which may be placed any suitable inscription and within which is hung a representation of the Western Hemisphere.

The only reference to the words objected to in the specification is in the language "any suitable inscription," showing clearly that they are not an essential feature of the Design, and of course the patent should not be permitted to seem to make them so.

The decision of the Primary Examiner is affirmed.

EX PARTE HUNTER.

Decided June 2, 1892.

DIVISIONAL APPLICATIONS—SUBJECT-MATTER OF.

Where an alleged divisional application describes and claims something different from what was disclosed in the original application, it is not properly a division of such original application.

ON petition.

ELECTRIC RAILWAY.

Application of Rudolph M. Hunter filed October 1, 1891, No. 407,387.

Mr. R. M. Hunter pro se.

SIMONDS, *Commissioner:*

This is a petition taken from the action of the Primary Examiner expressed as follows:

The matter embraced in the first two pages of the specification and in page 3 down to the last paragraph thereon is objected to as being argumentative instead of descriptive of the alleged invention, and for this reason it is wholly out of place in a specification.

This is a petition asking that the Examiner be instructed that the above application is properly a division of a former application, filed July 14, 1885, No. 171,625, the Examiner having refused to so consider it.

The Examiner makes the objection that the invention now described and claimed is not identical with that disclosed in the original application. An inspection of the original application shows that applicant regarded the subject-matter which he eliminated, as above stated, as merely an electric brake, there being no intimation of anything else either in the original specification or claims. He now seeks in both his specification and claims to patent a device for magnetizing the car axle and wheels in order that the wheels may be prevented from sliding upon the rails when the brake is applied. He describes and claims such a structure having such a function not only in connection with his brake, but says, further, that the core of the solenoid may be omitted altogether, which would obviously be the omission of a feature necessary to make the device a brake. For this reason the present application is not properly a division of the original application.

The petition is denied.

EX PARTE JOHNSTON.

Decided June 23, 1892.

ARGUMENTATIVE SPECIFICATION.

An applicant is entitled to state as specifically and categorically as he chooses the difficulties and troubles which are cured or ameliorated by his improvement, but he is not entitled to state such matters in a way that amounts to a recital of the history of the art as he understands it, combined with an argument as to the importance of the improvement.

ON petition.

ART OF GRINDING CUTLERY AND OTHER TEMPERED-STEEL ARTICLES.

Application of Allen Johnston filed June 18, 1888, No. 276,947.

Messrs. Pollok & Mauro for the applicant.

SIMONDS, *Commissioner:*

The Examiner's objection is well taken. The applicant is entitled to state as specifically and categorically as he chooses the difficulties and troubles which are cured or ameliorated by his improvement. Such a recital can include all matters of substance in the language which the Examiner objects to; but applicant is not entitled to put such matters into his specification in a way which amounts to a recital of the history of the art as he understands it, combined with an argument as to the importance of the improvement. It is a question upon which no hard and fast line can be drawn; but it is thought that the applicant has exceeded the bounds of reasonable statement of the difficulties which his improvement is designed to obviate.

The petition is denied.

CHALLONER *v.* PERKINS.

Decided June 30, 1892.

1. INTERFERENCE—PRIORITY OF INVENTION—CLAIMS IN ISSUE—WHEN MADE AND BASIS THEREFOR.

P.'s date of filing being earlier than the date of conception proved by C., *Held* that P. is the prior inventor, though the claims of the issue were not made by him until after the patent to C. issued. *Held*, further, that P.'s application as originally filed contained sufficient basis for the claims in issue.

2. SAME—CAPABILITY OF USE OF INVENTION—KNOWLEDGE OF CAPABILITY.

The inventor of a machine is entitled to the benefit of all the uses to which it can be put, no matter whether he had conceived the idea of the use or not. (*Roberts* v. *Ryer*, 91 U. S., 150.)

APPEAL from Examiners-in-Chief.

SHINGLE SAWING MACHINE.

Patent granted Frank Challoner December 9, 1890, No. 442,171; application filed July 21, 1890. Application of Willis J. Perkins filed August 2, 1889, No. 319,528.

Messrs. Winkler, Flanders, Smith, Bottum & Vilas for Challoner.

Mr. Wallace A. Bartlett for Perkins.

SIMONDS, *Commissioner:*

This is an appeal from the decision of the Examiners-in-Chief awarding priority of invention to Challoner as to the following issues:

1. The combination, with the carriage provided with a movable dog, mechanism arranged to shift the dog at a proper position to drop the spalt, and a trip which is movable into abnormal position to actuate the dog-shifting mechanism so as to drop the spalt.

2. In a shingle-sawing machine, the combination of a rotary carriage having a number of bolt-receptacles, each provided with a movable dog, mechanism arranged to shift said dogs at the proper point in the rotation of the carriage for dropping the spalts, a movable part arranged to set said mechanism in operation, and a trip for each bolt-receptacle of the carriage, the trip being movable into abnormal position, so as to actuate said movable part and put the dog-shifting mechanism into operation to drop the spalt.

3. In a shingle-sawing machine, the combination of a rotary carriage having a number of bolt-receptacles, each provided with a movable dog and having a trip for each receptacle movable into abnormal position, dog-shifting mechanism, a movable part connected with the dog-shifting mechanism and arranged to be engaged by said trips when the latter are in abnormal position, and a device to automatically return said trips to their normal position when they have acted on said movable part.

4. In a shingle-sawing machine, the combination, with the carriage having shingle-bolt receptacles provided with movable dogs, of mechanism arranged for opening said dogs automatically for dropping the spalts, and means under control of the operator for setting said mechanism in motion.

5. In a shingle-sawing machine, the combination, with the carriage having shingle-bolt receptacles provided with movable dogs, of mechanism arranged to open said dogs at the proper position for discharging spalts, and trips on the carriage by which the dog-shifting mechanism is set in operation at the will of the operator to discharge any spalt.

Perkins's application was filed August 2, 1889. Challoner's application was filed July 21, 1890. A patent has issued thereon; but as both applications were pending at the same time the status of both contestants for the purpose of deciding the question of priority of invention is that of applicants.

Challoner proves no conception of the invention in controversy prior to August 2, 1889, the date when Perkins filed his application. On this state of facts it would seem that the case should be decided in favor of Perkins at this point without further discussion; but Perkins did not make his claims which are now in interference until after Challoner's patent issued, whereupon Challoner claims that Perkins has no right to make these claims in his present application, and that Perkins, as a matter of fact, did not conceive of the invention in controversy until after Challoner had that conception. This contention of Challoner's may be said to have two phases or branches—one to the effect that while Perkins's machine was capable of use in accordance with the claims in interference Perkins had no knowledge of that capability until after Challoner had made his conception, and, second, that Perkins's application now in interference as it existed up to the time that Challoner's patent issued was not properly susceptible of having in it the claims now in issue. The first phase or branch of this contention is disposed of by the following language used by the Supreme Court:

> It is no new invention to use an old machine for a new purpose. The inventor of a machine is entitled to the benefit of all the uses to which it can be put, no matter whether he had conceived the idea of the use or not. (*Roberts* v. *Ryer*, 10 O. G. 204, 91 U. S., 150.)

Now as to the second branch of Challoner's contention. In his original specification Perkins said:

> The object of the present invention is to improve the construction of the block clamping and supporting devices; also, to place the operating parts of the machine well under the control of the operator, who by the adjustment of suitable stops or catches with reference to any of the bolt carriages or carriers can then depend on the machine to automatically complete the function for which said catch or stop was intended, as to throw out the spalt, feed in new block or bolt, or perform other operations generally performed by hand.
>
> In general the object of the invention is to produce a machine which shall be nearly self-operating or automatic when driven by a suitable motor. * * * It will thus be seen that the bolt is never supported on a fixed way or track beneath the bolt-compartment at that point in the rotation of the carriage where it is desired to expel it from the machine, but that at certain times the inner end of the bolt may be supported by the movable shelf 30 I have described, and this will occur whenever the bolt slips or tips in the binding-dogs and at no other time. The shelf is held back by the hook 32 for the purpose of dropping the spalt, as now described. * * *
>
> From the foregoing it will be seen that I provide absolutely automatic or self-operating devices for feeding the bolts into the machine and dropping the spalts from the same when the shingles have been cut away so as to leave only the spalt, and at the same time I have provided mechanism by which the spalts or blocks may be readily dropped when the operator sets a proper trip for the purpose.

These statements are consistent with the making of the claims in issue by Perkins. The Examiners-in-Chief say as much in using this language:

> The point made for Challoner that the amendments of January 8, 1891, were entire new matter and should have been excluded from the application for that reason will hardly hold, since there is just enough of specification-writer's suggestion touching possible uses for parts of the combinations originally contemplated and actually shown to give him a basis for an amendment without violation of rule.

As both branches of Challoner's contention fail, Perkins must be given the date of invention cotemporary with the filing of his application, which precedes Challoner's conception thereof.

The decision of the Examiners-in-Chief is reversed, and priority of invention is awarded to Perkins.

EX PARTE LEESON & COMPANY.

Decided June 6, 1892.

FEES PAID BY MISTAKE—PAYMENT UNDER EXISTING LAW AND RULES NOT A MISTAKE.

A filing fee of ten dollars having been paid on an application for registration of a Trade-Mark in 1879, under the law and rules in force at that time, *Held* that it was not paid under a mistake and that it could not properly be refunded.

ON petition.

TRADE-MARK REGISTRATION.

Application of J. R. Leeson & Company filed September 29, 1879, No. 11,309.

Messrs. Foster & Freeman for the applicants.

FROTHINGHAM, *Assistant Commissioner:*

This is a petition requesting that the Government fee of ten dollars paid September 29, 1879, on the filing of the above-entitled application for registration of a Trade-Mark be refunded on the ground that it was paid under a mistake.

It is stated in the petition as follows:

> At that time (September 29, 1879) there was no valid law under which Trade-Marks could be registered in the United States Patent Office, and there is no law authorizing the Commissioner of Patents to receive a fee of ten dollars, and which seems evident that the fee was unlawfully received and held by the Patent Office.

It appears that the said application was filed under the law of 1870, then in force, and that at that time (September, 1879) the rules contained a provision for the division of fees in applications for the registration of a Trade-Mark—that is to say, on the filing of each petition for the registration of a Trade-Mark a fee of ten dollars was required, and on registering each Trade-Mark fifteen dollars additional was required.

Applicants paid their fee of ten dollars under this provision of the rules, which had the force of law.

The act of 1870, above referred to, was declared unconstitutional by the Supreme Court of the United States (*Trade-Mark Cases*, 100 U. S., 82) subsequently to the filing of this application, and applicants were notified that the application would not be further considered unless, with full knowledge of said decision, they should request registration. They were also informed that the fee could not be refunded without legislation by Congress. Since the date of this notice the case has never been called up, and no action was afterward taken on the part of the Office until the present petition was filed.

On March 3, 1881, the present law relating to the registration of Trade-Marks was enacted. This law provided for further registration and fixed the status of cases registered and applied for under the law of 1870. It made no provision for the return of fees paid on such applications, but merely provided that applicants should be credited in future applications "for any fee or *part* of a fee" heretofore paid with intent to secure protection on the same marks. Here, it is to be observed, was an indirect sanction of the practice relating to the division of fees, above referred to.

Under the state of facts presented in this case I am of the opinion that the payment of the fee of ten dollars in the filing of said application was not a payment made under a mistake; that the law of 1881 determined what disposition was to be made of the fees paid under the law of 1870, and that the said fee was not unlawfully received and held by the Patent Office.

The petition is denied.

DECISIONS OF THE U. S. COURTS.

U. S. Circuit Court—Southern District of New York.

ELECTRICAL ACCUMULATOR COMPANY *v.* NEW YORK & HARLEM RAILROAD COMPANY.

Decided April 9, 1892.

1. PATENTS FOR INVENTIONS—INVENTION—ELECTRIC ACCUMULATORS.

Reissued Letters Patent No. 11,047, granted to the Electrical Accumulator Company, as assignee of Joseph Wilson Swan, December 17, 1889, claiming a perforated plate for secondary batteries, having the perforations extending through the plate and the active material packed in the perforations only, cover a patentable invention.

2. SAME—UTILITY.

The fact that before the date of this invention Professor Eaton had packed active material in perforations extending through the plate, at the same time covering the surfaces thereof, and that Mr. Brush had packed it into grooves in the plate without covering the surfaces, does not show a want of invention in the idea of confining it entirely to perforations extending through the plate, since this apparently slight change avoided the difficulties before encountered and produced an electrode which has to a great extent superseded all others and has become the electrode of commerce.
